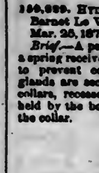
159,823. CLOTHES-DRIERS. Chas. Howes, Hudson, Mass. [Filed Dec. 4, 1874.]

Brief.—The drier may be elevated and lowered by a rod and bracket, and revolves on a rod and sleeve, the sleeve being held by a slot and stud.

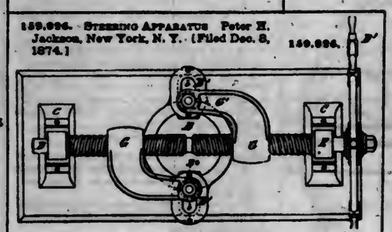
In a clothes-drier, constructed substantially as described, the bracket K, provided with the stud r, and the conical sleeve L, provided with the aperture P, combined and arranged to operate with the rods C N, and hub M, substantially as and for the purpose specified.



159,824. CAR-AXLE BOXES. C. A. Hussey, New York, N. Y. [Filed Sept. 21, 1874.]

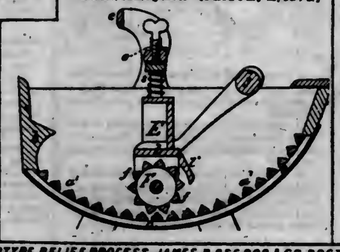
The flexible pipes F F, to lead to a superposed reservoir, the bearing D having cavities I, not opening into the axle-box, but connected with said pipes by the tubes E H, all combined as and for the purpose specified.

159,825.



159,826. CIGAR-BOXES. Sigmund Jacoby, New York, N. Y. [Filed Feb. 2, 1875.]

Brief.—In a metal cigar-box a branding-surface is provided by leaving a slot, within which such branding-surface is exposed.



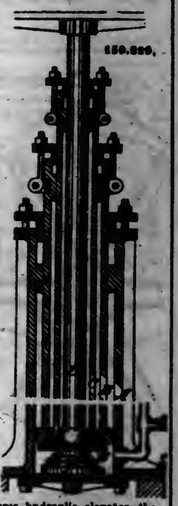
A cigar-box made entirely of metal, and provided with a hole, a, against the inside of which is placed a branding-surface, C, substantially as and for the purpose shown and described.

159,826. STEERING APPARATUS. Peter H. Jackson, New York, N. Y. [Filed Dec. 8, 1874.]

The nut G, with the arm G' rigidly joined or in one therewith, in combination with the screw D, and so connected to the arm B' on the rudder B that it is directly confined thereto to allow the device to resist the twisting effect of the shaft without the necessity for a guide-rod, all substantially as herein specified.

159,827. WASHING-MACHINES. John W. James and Josiah Streit, Centre Town, Mo., assignor to Josiah Streit and James Streit, same place. [Filed July 11, 1874.]

The rubber F, rotating in bearings in the oscillating hangers E, in combination with the strips f f and check-rib b, substantially as described, and for the purpose set forth.

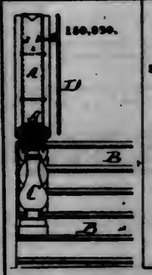


159,828. WAGON-BODIES. Chas. W. Kerr, Cortland, N. Y. [Filed Aug. 27, 1873.]

The combination of the bent plies A A B B and the correspondingly-bent rail D, forming the sides and ends of a wagon body, substantially as and for the purpose set forth.

159,829. HYDRAULIC ELEVATORS. William Barnet Le Van, Philadelphia, Pa. [Filed Mar. 26, 1874.]

Brief.—A perforated plate supported upon a spring receives the rams upon their descent, to prevent concussion. The stuffing-box glands are secured to the frame by sectional collars, recessed into them, and by eyebolts held by the bolts that unite the sections of the collar.



1. In a telescopic hydraulic elevator, the combination of a hollow column or ram, recessed at or near its upper end, so as to be of substantially uniform thickness, with a clamp-collar composed of two or more segments, resting in the recess of the ram, and united by bolts, which carry the bolts or studs of the gland or follower, substantially as set forth.

2. The combination, in a telescopic hydraulic elevator, of an outer casing, A, a series of columns or rams, and a perforated plate, B, and spring F, substantially as set forth.

159,830. WINTER-RAILS FOR HIGH STOOPS. Remigio Lo Forte, New York, N. Y. [Filed Dec. 11, 1874.]

Brief.—A detachable hand-rail to be attached in winter to the large stone rails of outside steps, thus forming a convenient safety-rail for grasping when the steps are slippery from rain or ice.

159,830.

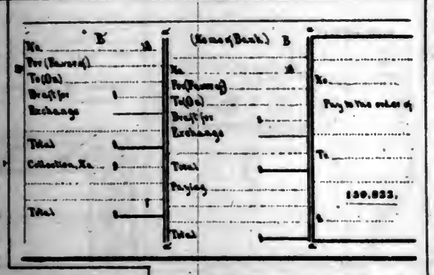
An improved winter-rail for high stoops, provided with projecting arms a a and rods b b, for convenient application to and removal from the broad main rail A of a high stoop, substantially as specified.

159,831. FLUXES FOR TREATING ORES. P. N. Mackay, San Francisco, Cal. [Filed Dec. 31, 1874.]

A flux or refining compound of borax or any of the borates, or crude borax, with silica in the form of infusorial earth or siliceous diatoma, cryolite, and chloride of sodium, substantially as herein set forth.

159,832. CORN-PLANTERS. A. M. Manny, Rockford, Ill. [Filed May 14, 1874.]

Brief.—"Check-row" planter. A rope is stretched across the field, and operates the dropping mechanism, producing uniformity in the cross-rows.



1. The combination, in a check-row corn-planter, of the main frame, the tongue, the friction-wheel, having its axis in the vertical plane of the tongue, the guides over the tongue, the rope, and the seed-slide; these members being constructed and operating in combination, substantially as hereinbefore set forth.

2. The combination of the main frame, the hoppers, the seed-slide, the friction-wheel, the endwise-moving sliding shaft, connecting the wheel and slide, and the shipping-lever, these members being constructed and operating in combination, substantially as set forth.

3. The combination of the friction-wheel and a single reversible carrier-arm, pivoted in the same vertical plane as the tongue and the axis of the friction-wheel, these members being constructed and operating in combination, substantially as and for the purposes specified.

4. The combination of the main frame, the stationary frame, the guides therein, the horizontal friction-wheel, and the single reversible arm pivoted in the vertical plane of the tongue, substantially as set forth.

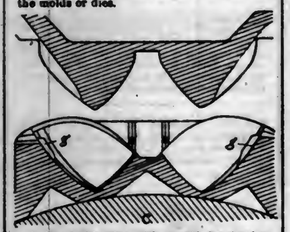
159,833.

159,833. BANK-CHECKS. Chas. V. Mead, Chillicothe, Mo. [Filed July 23, 1874.]

A bank-check consisting, essentially, of a main part or body, A, printed in the usual form with blanks for dates, amounts, &c., and provided with duplicate detachable stubs B B', printed or otherwise impressed in correspondence with the body A, substantially as and for the purposes specified.

159,834. CONSTRUCTION OF ORDNANCE. R. R. Moffatt, Brooklyn, N. Y. [Filed Feb. 4, 1875.]

Brief.—Construction and combination, whereby the inequalities of radial expansion of an inner tube and the gun is compensated, and provision made to allow of longitudinal expansion of such inner tube without undue transverse strain being made upon the main gun.



1. The tapered cylinder B, in combination with the gun A, arranged so that its longitudinal expansion will relieve the pressure on the gun A caused by the radial expansion of the cylinder B, substantially as described.

2. The combination, in a gun, of a lining tube or cylinder, B, and breech-plug D, when arranged so that there is a space between the rear end of the tube and the breech-plug, as and for the purpose specified.

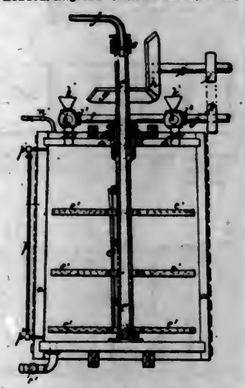
159,835. APPARATUS FOR SHAPING COUNTER-STIFFENERS FOR BOOTS AND SHOES. J. R. Moffitt, Chelsea, Mass. [Filed Jan. 13, 1875.]

Brief.—The molding or forming mechanism is combined with a steam-chest for heating the molds or dies.

1. In combination with a mold for shaping heel counters or stiffeners from blanks, a guard, *a*, substantially as and for the purpose set forth.

2. A mold for shaping heel counters or stiffeners from blanks, provided with the spurs or stops *g g*, substantially as and for the purpose set forth.

3. A mold for shaping heel counters or stiffeners from blanks, provided with external projections *i i*, in combination with strips or bars on the steam-chest or heater-floor, substantially as and for the purpose set forth.



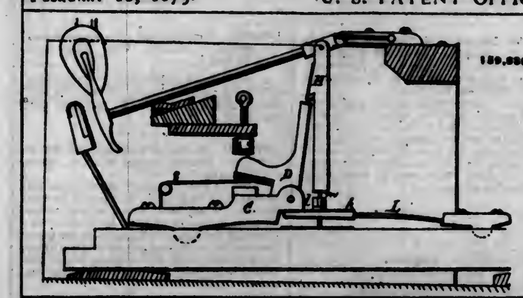
159,836. DENTAL REFLECTORS. Francis M. Osborn, Port Chester, N. Y. [Filed Aug. 1, 1874.]

Brief.—A small mirror is arranged upon a ball-and-socket-jointed arm, which arm is sprung by its forked end over a rubber-dam clamp. It serves to show the cavity during the operation of excavating or filling.

The disk A, provided with a reflecting-surface upon its front side, and a ball-stem, *c*, upon its rear side, and the arm B, provided with a spherical socket, *b*, upon one end, and spring-clasps *b'* upon its other end, in combination with each other, substantially as herein shown and described, to adapt them for use, as set forth.

159,837. MANUFACTURE OF GRAPE-SUGAR. Edwin E. Pearce, New Wandsworth, assignor to the Patent Grape-Sugar Company, Limited, Rupert Street, Whitechapel, London, England. [Filed Feb. 20, 1874.]

1. The described process of producing saccharine liquid by one operation, in the manufacture of glucose or grape-sugar from whole grain, by feeding such whole grain into a vessel containing sulphuric acid, in successive and regulated quantities, such vessel being supplied with steam by hollow stirrers, performing the double function of stirring and of conveying and distributing the steam.



2. The combination of the vessel *a*, the hollow shaft *a'*, for the passage, supply, and distribution of the steam, and the feeding devices *h h i i*, as shown and described.

3. In combination with an apparatus for producing saccharine liquid from whole grain, the grain-feeding devices described, consisting of the supply reservoir or hopper and the automatic revolving cylinder I, supplied from the hopper, and provided with a circular series of pockets, and operating to feed intermittently and regularly, in the manner described

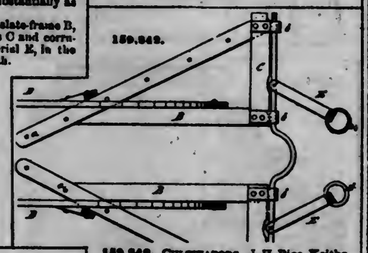
159,838. REPEATING ACTIONS FOR PIANOS. Ferdinand Polster, Baltimore, Md. [Filed Oct. 28, 1874.]

Brief.—A resilient spring attached to the upper surface of the key-lever supports the hammer-standard, and coacts with the fly-lever, acted on by a spring, to produce the repeating action.

L, provided with the tongue *h* and the regulating tenon rocker-butt *g*, in combination with the key-lever B, the buffer-block *l*, on the set-screw *m* of the hammer-standard H, and the fly-lever butt C, with its resilient spring *s* acting on the fly-lever D, substantially as and for the purposes specified.

159,886.

159,886. SLATE-FRAMES. Nancy A. Porter, Warren, Ohio. [Filed Jan. 14, 1875.]



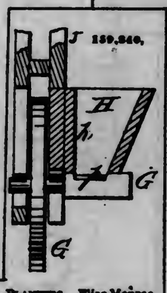
1. The slate-frame B, provided with perforations C and corrugations D, substantially as and for the purpose described.

2. The combination, with the slate-frame B, provided with the perforations C and corrugations D, of the muffling material E, in the manner substantially as set forth.

As a new article of manufacture, the within-described compound implement, consisting of the punch, eraser, and paper-cutter, being provided with an eye, for the purposes herein described.

159,839.

159,842.



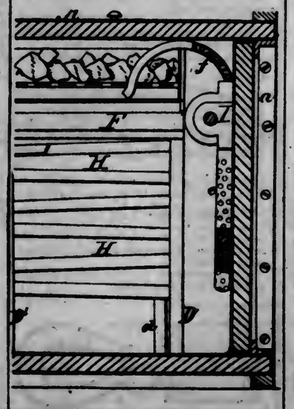
159,840. SEED-PLANTERS. Elias Monroe Potter, Rutherford Depot, Tenn. [Filed Oct. 10, 1874.]

Brief.—In vertically-slotted standards is journaled the axle of the bearing-wheel. One end of the axle is made large, and has a pocket. This axle also forms the bottom of the adjustable hopper.

Wheel G on an axle, G', having a pocket, p, in it, in combination with the seed-hopper H and its slide h, the whole being applied to standards J for the purpose of accommodating themselves to the inequalities of the ground.

159,841. COMPOUND IMPLEMENTS. Edwd. Livingston Price, Newark, N. J. [Filed Dec. 28, 1874.]

159,840.



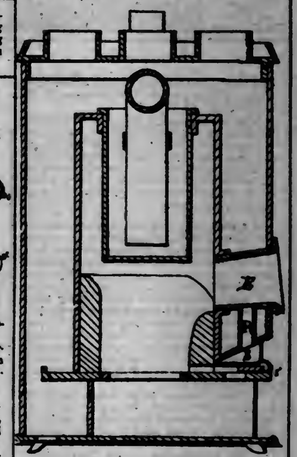
159,842. CULTIVATORS. J. H. Rice, Keithsburg, Ill. [Filed Dec. 29, 1874.]

Brief.—A pair of triangular cultivator-frames coupled, the broad end forward, by an arched rod, upon which the frames are pivoted, and the draft-devices.

The angular frames A B C, carrying handles D, in combination with the arched rod *d*, having two bearings, *b*, upon each frame, and the pivoted bars E and draft device, all constructed as and for the purpose herein specified.

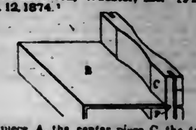
159,843. REFRIGERATORS. J. H. Ridgway, Philadelphia, Pa. [Filed Sept. 11, 1874.]

Brief.—A refrigerator formed of packed boxes banded together. Each drip-trough catches the moisture condensed on the outsides of the trough above it. Fan sucks air in through absorbents, and drives it out through absorbents into the drip-pan.



1. The combination of the ice-box of a refrigerator with a series of V shaped troughs, arranged one above the other, inclined alternately in contrary directions, and serving to conduct the drip-water from the ice-box, as set forth.

2. The combination, in a refrigerator, of a fan-blower, I, with the perforated suction-pipe *e*, containing absorbent material, and the outlet-pipe *f*, also containing absorbent material, and discharging the air into the drip-catcher below the ice-box, all substantially as and for the purpose set forth.



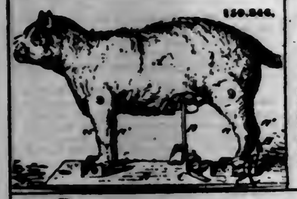
159,844. HEATERS. Matthew H. Roberts, Philadelphia, Pa., assignor of one-half his right to John McCoy, same place. [Filed Dec. 7, 1874.]

Brief.—A dust-flue connecting the feeder-neck and poke-hole, poke-hole mouth-piece, and a damper.

The combination of the feeder-neck F, poke-hole mouth-piece S, the connecting dust-flue R, and the damper *s'*, connecting the mouth-piece S with the ash-pit, substantially as herein described.

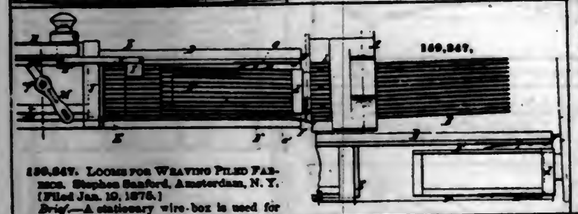
159,845. PACKAGES FOR PRINTS OF BUTTER. Alpson Robinson, Webster, Ma. [Filed Nov. 12, 1874.]

The piece A, the center piece C, the two pieces B B', and the fastening-wires D D', combined substantially as and for the purpose described.



159,846. PIGEON-STARTERS. H. A. Rosenthal, Brooklyn, N. Y. [Filed Jan. 25, 1875.]

Brief.—If necessary, to insure the flight and spring into the air of the pigeon when the trap is opened, an artificial animal is made to jump toward the bird from a crouching position.



1. An improved pigeon-starter, formed by the combination of the body A, the rigid pivoted legs *a'*, the spring C, lever D, spring-catch E F, and trip-cord G with each other and a base-board, B, substantially as herein shown and described.

2. A pigeon-starter consisting of a figure made to represent the body of an animal, and provided with suitable mechanism to enable it to be set in a crouching position, and to be sprung into an erect position, substantially as herein shown and described.

150,846.

150,847.

150,847. LOOMS FOR WEAVING PILED FABRICS. Stephen Sanford, Amsterdam, N. Y. [Filed Jan. 19, 1874.]

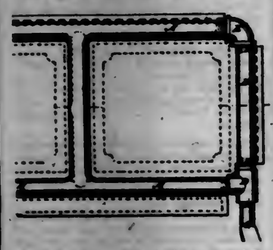
Brief.—A stationary wire-box is used for withdrawing and inserting the wires, in place of the ordinary vibrating or oscillating trough, and by means of a series of wires arranged in the box each wire, as it is withdrawn, so moves the series of wires as to bring a wire on the opposite side into position to be inserted by the pusher.

1. A stationary wire-box, D, in combination with a series of wires arranged side by side therein, as described, whereby each wire, as it is withdrawn from the woven fabric, places a wire in position for insertion into the open shed, as specified.

2. The combination of the following parts in a wire-motion of a loom for weaving pile fabrics, viz., the stationary wire-box D, supplied with wires B', a stationary box, A, which supports the heads of the wires in the fabric woven, a withdrawing-hook, I, and a wire-pusher, J, substantially as and for the purpose described.

3. The stationary receiver and holder D, constructed with one or more grooves, D^1 D^2, and a bed for wires, B', operating as set forth, substantially in the manner and for the purpose described.

4. The combination of the holding-down ledge d and spring g with wire-box D, substantially as described.



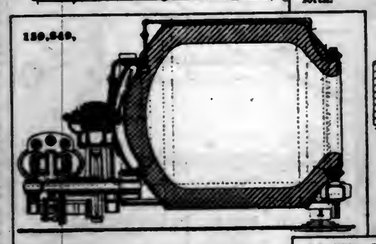
5. The combination of the spring g with wire-box D, provided with the groove D^2, substantially as described.

6. The combination of the device G for directing the end of the wire toward the open shed with the wire-box D, substantially as and for the purpose set forth.

7. The rib or tongue on the head of the box D, in combination with the wires B B', having the notches in their heads, substantially as and for the purpose described.

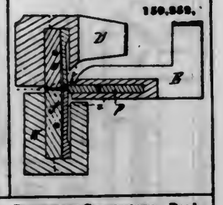
8. In combination with a main pusher, J, the auxiliary pusher L for starting the wire, the two operating together, substantially as described.

150,848. DAM-BOARDS. C. C. Schwaner, Winterset, Iowa. [Filed Jan. 4, 1875.]



The dash-frame, formed of bars A and B, and the screw-couplings, combined as and for the purpose specified.

150,849. REVOLVING PUDDLERS. Wm. Sellers, Philadelphia, Pa., and G. H. Sellers, Wilmington, Del.; said G. H. Sellers assignor to John Sellers, Jr., Philadelphia, Pa. [Filed Dec. 7, 1874.]



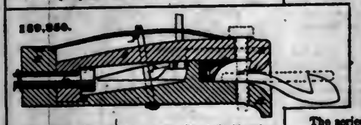
Brief.—Water enters the hollow pins, seated at both ends in the hollow journal at f, passes thence through pipe h to the open end of the puddler, and returns through pipe i to the water-back, and out through the plug, and a pipe leading from the chamber at the outer end of the latter. The system of water-pipes revolves with the puddler.

150,849.

150,849.

150,849.

1. The combination, with the rotary puddling-vessel open at one end only, of a water-circulation pipe within the rotary vessel at the open end, substantially as and for the purposes set forth.



2. A rotary puddling-vessel open at one end only, and having a water circulation within the rotating vessel at both the open and closed ends, substantially as and for the purposes set forth.

3. The combination of a circulation-pipe at the open end of a rotary puddling-vessel with the hollow journal at the closed end of the vessel, substantially as and for the purposes set forth.

4. The combination of a circulation-pipe at the open end of a rotary puddling-vessel with the hollow journal and water-back at the closed end of the vessel, substantially as and for the purposes set forth.

5. The combination, with the hollow journal of the double-seated plug, substantially as and for the purposes described.

150,850.

150,850. CAR-COUPLINGS. Benj. B. Sherfy, Knoxville, Tenn. [Filed Jan. 11, 1875.]

1. The clamping-jaw B and buffer A, in combination with the coiled spring B and bolt C, passing through the head of both the buffer and the jaw, substantially as and for the purposes set forth.

2. In combination with the jaw B, the slide V, for the purpose set forth.

150,851.

150,851. WHIFFLETREE-HOOKS. Othniel J. Smith, Wauwatosa, Wis. [Filed Dec. 19, 1874.]

A whiffletree-hook, formed of the pivoted overlapping part C, combined with the stationary part B, having lug B', as shown and described.

150,852. MACHINES FOR MAKING SHOE-NAILS. Leander Soule, Taunton, Mass. [Filed Aug. 7, 1874.]

Brief.—A pair of narrow spring-dies, situated one at the side of both the griping-dies, leaving a space between, act in conjunction with the gripers to compress the metal blank, forming a shoulder or enlargement in the space between the spring-dies and the gripers, which is increased and finished by the action of the header in pressing the spring-dies toward the gripers.

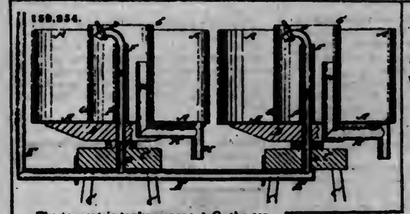
1. The auxiliary spring-dies i i, diverging from and in combination with the main dies s f, and constructed substantially as and for the purpose described.

2. In combination with the dies s f i i, having a space between them, the compressor p, for forcing one pair of dies laterally toward the other pair while the nail is griped between them, substantially as and for the purpose set forth.

150,852.

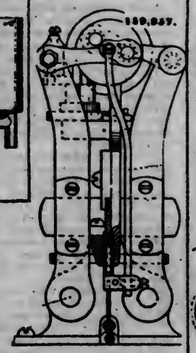
150,852. CRANBERRY-SEPARATORS. Danl. T. Staniford, New Egypt, N. J. [Filed Jan. 4, 1875.]

Brief.—The berries are caused to fall from a hopper upon a series of inclined planes. The sound berries rebound and alight upon a higher plane, and are conveyed to a receptacle. The soft berries pass on over a series of inclined planes, and are finally received with the refuse berries. In their descent the sound berries, one after another, rebound, and are thus separated from those that are soft.



The series of lower inclines C, the series of upper inclines D, the series of steps B, the corrugated feed-board G, and the series of flexible aprons F, in combination with each other and with the box A, substantially as herein shown and described.

150,854. MILK-COOLING APPARATUS. Orrin J. Stickles, Canton, N. Y. [Filed Jan. 18, 1875.]



Brief.—An outer tank contains milk, which is cooled by contact with an inner one filled with water. A waste-pipe prevents an overflow of water, and secures a constant flow through the vessel. The milk-tank is provided with a waste-pipe to draw off its contents, also to be used in cleansing. The apparatus is supported upon a bench by means of the pivoting inlet-pipe.

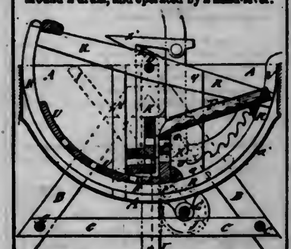
150,854.

The concentric tanks or pans A C, the central tube F, the waste-pipe H, the discharge-pipe I, the pivoted base B, and the pivoting-pipe D, in combination with each other, and with the water-pipe E and the bench or support C, substantially as herein shown and described.

150,857.

150,857. PEGGING-MACHINES. Benjamin F. Sturtevant, Boston, Mass. [Filed Feb. 8, 1875.]

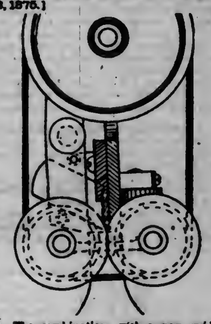
1. The combination, of a peg-guiding channel or way, with feeding mechanism constructed substantially as described, and adapted to move the strip in opposite directions, as and for the purpose set forth.



2. The combination, with a peg-guiding channel or way, of severing-cutters operating against the peg-strips from opposite sides, and arranged so that the path of each shall lap across that of the other, substantially as described.

3. The combination of the peg-guiding channel or way with the reciprocating plunger and the clearing-rod, substantially as set forth.

4. The combination of the peg-guiding channel or way with the pivoted holder connected with a stationary part of the frame, substantially as described.

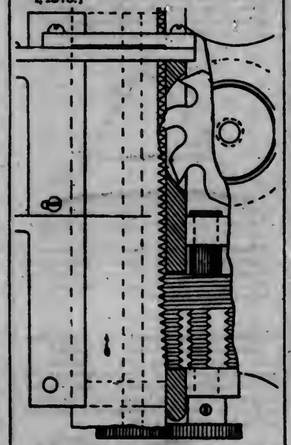


5. In the art or process of compressing points on pegs, moving the strips and pegs, substantially as described, so as to leave a space each side of the peg being pointed when the point-forming device acts thereon, substantially as and for the purpose described.

150,855.

The combination of the cords F I, the pulleys or drums G, the connecting-shaft H, and the lever J with the vertically-adjustable movable bars D and the oscillating presser or beater frame P, as and for the purpose described.

150,856. PEGGING-MACHINES. Benjamin F. Sturtevant, Boston, Mass. [Filed Feb. 3, 1875.]

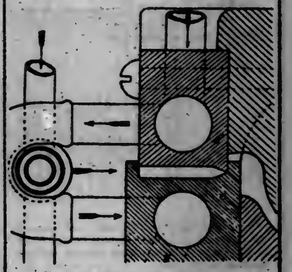


1. The combination, with a peg-guiding channel or way, of one or more rotary point-cutting devices, substantially as described, acting against the ends of the pegs to form peg-points, substantially as set forth.

2. The combination of a peg-wood guiding channel or way with a peg-severing cutter, and one or more rotating peg-pointing cutters acting against the pegs after they are cut from the peg-wood, substantially as described.

3. The combination of a peg-guiding channel or way with a feeding mechanism for feeding the peg-wood, and with rotating peg-point cutting mechanism moving within the lower portion of the channel and acting against the ends of the pegs, substantially as described.

150,858. PEGGING-MACHINES. Benjamin F. Sturtevant, Boston, Mass. [Filed Feb. 1, 1875.]



1. The combination, with a channel or way for guiding a peg-strip or peg, of a rotating cross-pointing mechanism, operating on the peg or peg-strip to form wedge-like bevel cross-points, substantially as described.

2. The combination, with a peg-guiding channel or way, of a cross-pointing and side-pointing mechanism adapted to point a peg or peg-strip, substantially as described.

3. The combination of a peg-guiding channel or way with a rotating toothed side pointing mechanism, substantially as described.

150,859. MACHINES FOR COMPRESSING SOLE-FASTENINGS. Benjamin F. Sturtevant, Boston, Mass. [Filed Dec. 17, 1874.]

1. The combination, with compressors for compressing ribbon peg-wood or a peg-strip, of apparatus for directing a flame in contact with the material forming the compressors, substantially as described.

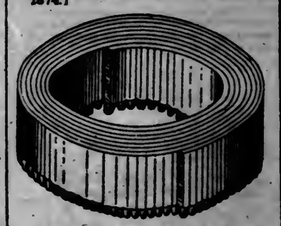
2. In combination, compressors for compressing peg-wood, heating apparatus for heating such compressors, and mechanism for presenting the material to such compressing mechanism, substantially as described.

3. The combination, with compressors for consolidating peg wood, of rotary presenting mechanism, for presenting such peg-wood to the jaws, substantially as described.

4. The combination, with compressors for consolidating peg-wood, of mechanism to take the peg-strip from the compressors, substantially as described.

5. The combination, with compressors for consolidating peg-strips, of mechanism to present the strip to and take it from the compressors, substantially as set forth.

6. The feeding-rollers to present the peg-strip to the compressors, when provided with flanges to receive and guide such strips, substantially as described.

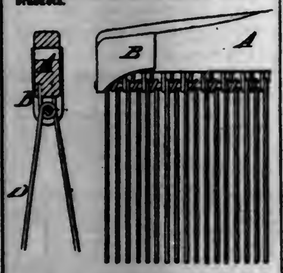


7. The combination, with compressors for consolidating peg-wood, of mechanism for moving the peg-strip and for winding it, substantially as set forth.

8. The compressors for consolidating the peg-strip, having their faces inclined with reference to each other in the direction of their length, substantially as set forth.

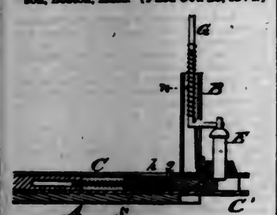
9. The compressors for consolidating the peg strip or ribbon, having their faces inclined with reference to their length, and beveled and provided with ledges, substantially as described.

10. The combination, with compressors for compressing the peg-ribbon, of means, substantially as described, for heating the strip previous to compression.



150,860. RIBBON PEG-WOOD. Benjamin F. Sturtevant, Boston, Mass. [Filed Dec. 29, 1874.]

A ribbon of peg-wood having plain sides and on one edge a series of compressed conical projections formed by compressing the wood in the direction of the length of its grain, substantially as described.



160,861. BROOMS. Geo. R. Swingle, Fredericktown, Ohio. (Filed Jan. 9, 1875.)

Brief.—The wires are wound on a rod, the short end projecting into the head, and the long end forming the broom proper. The rod is held to the hand at each end by suitable brackets.

The spring-wire teeth D, coiled and inserted into the head A, in combination with the rod C and caps B, substantially as and for the purpose described.

160,862. CAR-COUPLINGS. Geo. M. Thompson, Boston, Mass. (Filed Oct. 26, 1874.)

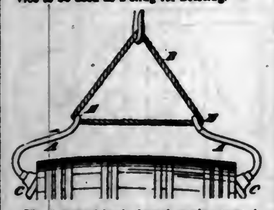
The vertical pull-rod G, working in guides on the dash-fender B, and held down by a spring, s, the flaring coupling-head O of the coupling-pin E, the sliding block D, pin p, slot h, and spring S, in combination with the draft-pole of a horse-car, substantially as described.

160,863. MACHINES FOR MAKING CUTTERS FOR GROOVING NEEDLES. E. Thompson, Bridgeport, Conn., assignor to Wheeler & Wilson Manufacturing Company, same place. (Filed Jan. 31, 1870.)

Brief.—Improvement on his Letters Patent No. 153,173, dated September 22, 1874; the improvement being the provision of automatic mechanism for the execution of several steps which, in the former machine, were performed by hand—viz imparting to the cutting-blank arbor a reciprocating semi-circular movement, to present the blank properly to the tool, and a vertical reciprocating movement, for releasing the blank from contact with the tool on the return movement, imparting, at the end of each cut, an intermittent rotary motion to the cutter-blank arbor, to present a new surface for the next tooth, and stopping the machine when a blank has been cut.

1. In combination with the cutter-blank arbor E and the herein-before-described mechanism to which the same is attached, the pulley N, elastic bands *p p'*, segmental lever L, connecting-bar M, lever G, horizontal lever J, spring *r*, cam H, cam K, shaft *d*, spur-gear V, pinion W, splined shaft *c*, shipper Y, and driving-pulley X, all constructed, arranged, and operated for the purpose of imparting a semicircular oscillating motion to said cutter-blank arbor and mechanism, substantially as and in the manner and for the object set forth.

2. In combination with the cutter-blank arbor R, oscillating mechanism connected therewith, and vertical sliding bearing I, to which said mechanism is attached, the horizontal lever J, adjustable spring *r*, and cam K, secured to the revolving shaft *d*, all constructed, arranged, and operated for the purpose of imparting a reciprocating motion to said arbor, oscillating mechanism, and sliding bearing, substantially as and in the manner and for the object set forth.



3. In combination with the oscillating cutter-blank arbor R and index S, the adjustable bar T and pawl U, constructed and arranged for the purpose of intermittently revolving said arbor and index, substantially as, and at the time, and in the manner, and for the object, set forth.

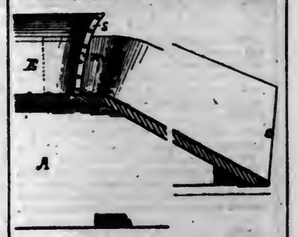
4. In combination with the oscillating cutter-blank arbor R and index S, the stud *n*, pivoted plate *o*, sliding rod *j*, catch *k*, vertical bearing F, latch *m*, shipper-lever Z, shipper Y, revolving shaft *c*, and driving-pulley X, all constructed, arranged, and operated for the purpose of stopping the movement of said oscillating cutter-blank arbor and index, substantially as, and at the time, and in the manner, and for the object, set forth.

5. The combination of the cutter-blank arbor R, bearing Q, index S, adjustable slide P, bearing O, protractor *w*, pointer *x*, vertical sliding bearing I, pulley N, elastic bands *p p'*, segmental lever L, connecting-bar M, lever G, horizontal lever J, spring *r*, cam H, cam K, shaft *d*, spur-gear V, pinion W, splined shaft *c*, shipper Y, driving-pulley X, shipper-lever Z, latch *m*, catch *k*, sliding rod *j*, pivoted plate *o*, stud *n*, adjustable bar T, and pawl U with the horizontally and vertically adjustable bearing D and milling-cutter spindle and cutter, all constructed, arranged, and operated substantially as and for the purpose specified.

160,864. RAISIN-ROLLERS. C. L. Topliff, Brooklyn, N. Y. (Filed Oct. 1, 1874.)

Brief.—Hook-shaped griping-arms having rollers at the ends, which rest under the chines of barrels, and serve as guides. At the other ends of the arms are eyes, through which passes the flexible loop which adapts the device to be used as a sling for hoisting.

The detached hook-shaped griping-arms A, constructed as described, with rollers U at one end and eyes at the other, in combination with a flexible loop, B, substantially as and for the purpose specified.



160,865. BLOCK-PLANES. J. A. Trant, New Britain, Conn. (Filed Nov. 13, 1874.)

Brief.—The cutting-iron is adjusted by means of an elongated perforated sliding plate and fastening-pin, operated by a screw-thumbnut at the rear end of the stock. The iron is secured in position by means of a pad-lever and intermediate set-screw.

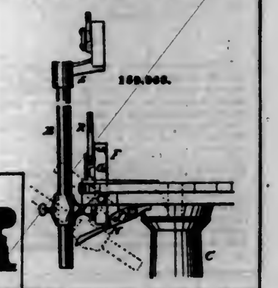
In a plane, substantially as herein described, the cutting-iron having a fixed fastening-pin, and the perforated sliding plate, with the thumb-screw and bar, by which the iron may be adjusted, and the thumb-screw and pad, by which it may be fastened in position, all combined and constructed to operate as set forth.

160,866. SNOW-PLOWS. Henry Twitchell and Geo. B. Parsons, Pulaski, N. Y. (Filed Mar. 12, 1873.)

The combination, in a snow-plow, of the inclined plane C, mold-boards E E, having dividing-cutter *e*, and vertical sides D D, provided with continuous inclined surfaces *m*, made in one piece, and vertical sides D D, and cutters *o o*, substantially as and for the purposes set forth.

160,867. WEATHER-STRIPS FOR WINDOWS. Samuel T. Varian, Plainfield, N. J. (Filed Jan. 23, 1875.)

The combined weather strip and slide for a sashing-frame or window-screen, made with the strip of india-rubber *b*, and the slide *a*, as set forth.



160,868. SHEEP-HOLDERS FOR SHEARING. Jos. B. Virgo, Texas Township, Kalamazoo County, Mich. (Filed Nov. 21, 1874.)

Brief.—A sheep is placed upon a revolving table. Its hind legs are thrust through openings in a perpendicular frame at the edge, its face outward, and by a single lever these openings are narrowed. Its fore-legs are in like manner placed in a lifting-block held by a staff, which, upon being inclined outwardly, brings both blocks to an inclined position.

1. A sheep-holder constructed substantially as described—that is, having a revolving table, A, holding-plates F F', and adjustable stand E, for the purposes set forth.

2. The holding-plates F F', with their sliding blocks P, V-shaped springs Q, and bent levers R, for the purposes described.

3. The combination of the shaft K, spring L, and locking-arm J, with the adjustable stand E and pivoted plate G, substantially as herein set forth, for the object stated.

160,869. VEGETABLE-SLICERS. A. Veillier, Newark, N. J. (Filed Oct. 17, 1874.)

Brief.—The central screw point feeds the vegetables forward through the material in a rotary manner. These wings, as they advance, cut out two spiral pieces of the material operated upon.

The rod B, having, at the lower end, a double-twist bit, D, provided with two spiral concavities, each leading to one of the ring-cutters E E, as and for the purpose specified.

160,870. DRAWING-BOARDS. J. B. Webb, Urbana, Ill. (Filed June 23, 1874.)

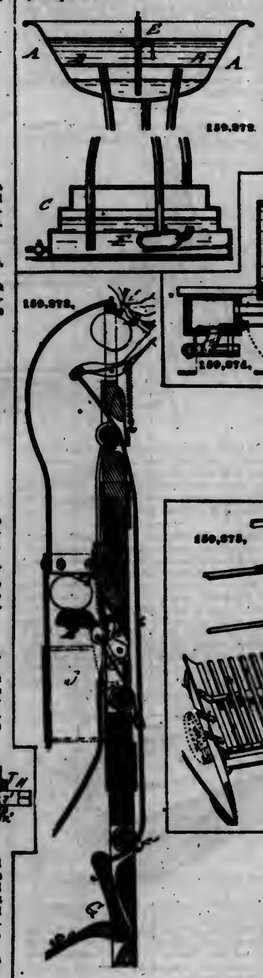
Brief.—L-shaped grooves in connection with cramping-pieces serve to hold the paper securely at the edges. Allowance is also made for shrinkage to prevent warping.

1. A drawing-board, provided upon its face with undercut grooves E, and with fastening-strips fitting therein, for securing the paper, substantially as described.

2. A drawing-board having supporting or strengthening cleats secured thereto by screws, and enlarged holes arranged in said cleats, in the manner and for the purpose specified.

160,871. GRATES. James C. Weightman, Malden, Mass. (Filed Dec. 12, 1874.)

Brief.—The fixed and movable rings are in different horizontal planes, to obviate the tendency of the latter to move the whole body of coal in the direction of their rotation. When the removable nut is in place it locks the grate, so that it cannot be tilted.



1. The combination of the rings D E, held rigidly in place by the engagement of the axis or shaft C in the bifurcation *b'* of arm B, and the movable rings F, G, and G', held against downward displacement relative to the fixed rings by bearers *a*, and guided in their vibration by means of the lugs *d d* resting upon the lugs *f f*, substantially as specified.

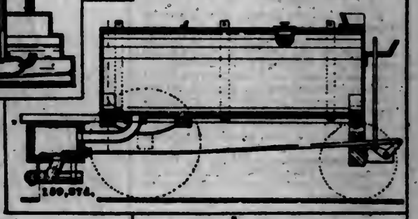
2. The combination of the stationary rings D and E and the movable rings F G G', all being serrated or saw-toothed, and the serrations of the latter above the horizontal plane of the former, substantially as specified.

3. The combination, with the slot *a*, of the bent A of a stationary furnace, and with the shaking and dumping rod H vibrating therein, of the detachable locking-nut J, having a rectangular end, *a*, substantially as and for the purpose set forth.

160,872. PUMPS. Charles A. Warden, Washington, Ill., assignor to himself and Wm. B. Warden, same place. (Filed Oct. 21, 1874.)

Brief.—A flexible tube extends from the jaws of the pitcher along the pole. A contained valve is placed within the tube to check the descent of the fruit. To prevent "begging" of the tube by the rising of the valve, a metallic or inflexible section is introduced around the valve.

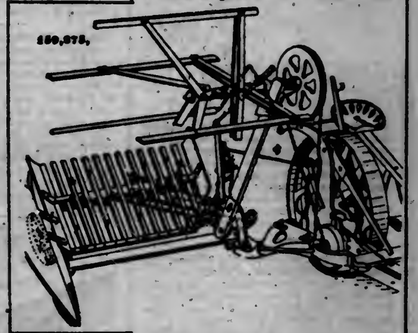
The combination, with the vertically-vibrating valve E and the flexible conducting-tube D, of the protecting shield or sleeve J, substantially as and for the purpose specified.



A pump, F, arranged in the base-chamber C, and connected by pipe D' with the lower chamber of the fountain A B, the latter being provided with the usual waste-pipe D, air-pipe D', and ejecting-nozzle E, as and for the purpose specified.

160,873. STREET-SPRINKLERS. Wm Westerfield, New York, N. Y. (Filed Nov. 14, 1874.)

Brief.—The valves are contained in a tank independent of the main tank, so as to afford convenient access to the valves. The valves being much nearer the sprinkling tubes than when placed in the main tank, the operator is enabled to stop and start the flow quicker.



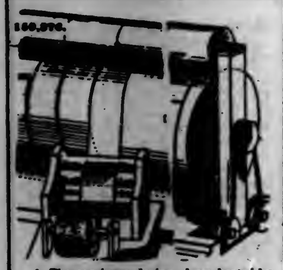
1. The combination of a valve-tank, B, containing the valves, with the principal tank A of a water-sprinkler, substantially as specified.

2. A water-sprinkler having a valve-tank independent of the main tank, and provided with sprinklers, as and for the purpose specified.

160,874. HARVESTER-DROPPERS. Cyprian Wheeler, Jr., Auburn, N. Y. (Filed May 8, 1869.)

Brief.—The swinging platform is supported upon parallel arms pivoted to the inner shoe, and by a single lever it is swung to the rear of the machine, dumped, and returned to receive the cut grain.

1. In combination with one of the pair of moving parallel bars and the dropper, a sliding or moving link and stop, or their mechanical equivalents, for tipping or dumping the dropper when it has arrived at the place where the grain is to be deposited, substantially as described.



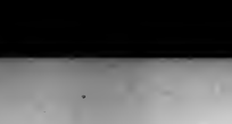
2. In combination with a swinging and hinged dropper, a bench, ledge, or support under its outer end, to prevent it from tipping forward while receiving its charge, substantially as described.

3. In combination with the hinged swinging and dumping dropper G, that carries around and delivers the grain in rear of the machine, as described, the single lever B, in close proximity to the driver's seat, which lever, by two motions—viz., a backward and forward one—through the bevels described, connections, will impart to the dropper four motions—viz., a rearward, a dumping, a righting-up, and a forward one—substantially as and for the purpose described.

160,875. APPARATUS FOR DRYING OIL-CLOTH, &c. Amos Wilder, Augusta, Me. (Filed Feb. 9, 1875.)

Brief.—The traveling carriage has a motion about its vertical axis, that the cloth may be properly delivered to the heating-roller.

160,876.



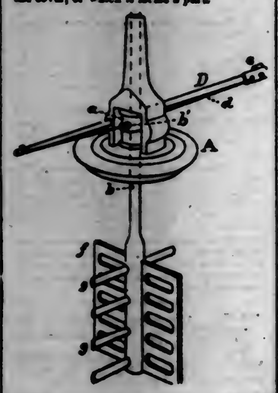
1. The revolving drying-drum heated by steam, in combination with a movable carriage or roll for delivering the fabric or cloth upon the drum for the purpose of wrapping the same thereon, substantially as described.

2. The drying-drum, in combination with a traveling carriage carrying the cloth roll and coating apparatus, and adapted to traverse in front of the drum at any desired angle therein, in order to wrap the fabric spirally or circularly around the same, substantially as described.

3. In combination with a drum for drying oil-cloth and other material, the rollers for smoothing and pressing the material upon the drum as the same is rotated, substantially as described.

160,877. MECHANICAL MOVEMENTS. David Williamson, Jr., Sewaville, N. J. [Filed Feb. 3, 1875.]

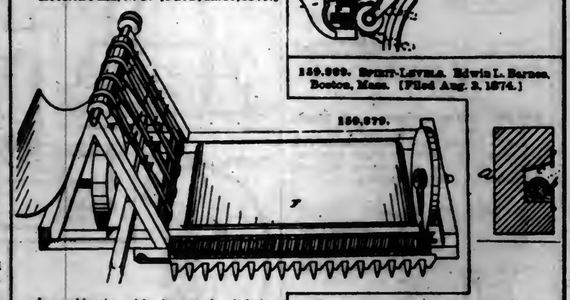
Brief.—The disk upon the shaft has one end of the link loosely outside of the center attached thereto. To the other end are pivoted two pitmen, so that power may be applied from opposite sides of the disk.



1. The disk upon shaft *a*, having a loose link, *d*, with one end attached loosely outside of the center of the shaft, and the pitmen B B applied to the opposite end of the loose link, combined substantially as and for the purpose herein set forth.

2. The pitmen B B, loose link *d*, pin *b*, and disk A, in combination with shaft *a*, substantially as and for the purpose specified.

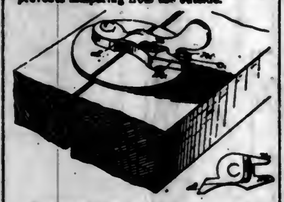
160,878. CHURNS. James L. Wilson, Calhoun, Ga. [Filed Oct. 5, 1874.]



Brief.—A dasher adjustably suspended from its handle, and reciprocally rotated by a bow, the handle narrowing in its ascent from the cover, of which it forms a part.

1. The lid A, surmounted by the standard B, forming the handle, as shown, and perforated for the reception of the pulley *a*, in combination with the dasher and spindle *f g* C, pulley *a*, vertically adjustable by means of the holes *b* and screw *b'*, bow D, passing through the standard, and thong *d*, all constructed and operating substantially as described.

2. The combination of the perforated plate *f*, rounds *g*, spindle C, having the adjusting-holes *b*, pulley *a*, and screw *b'*, all constructed and operating together substantially as specified, the dasher being thus adjustable to the desired depth in the tub, as set forth.

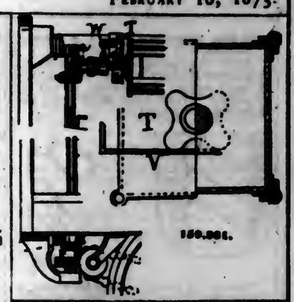


160,879. HARVESTERS. Walter A. Wood, Hoosick Falls, N. Y. [Filed Jan. 16, 1875.]

In combination with the carrying belts or aprons F, the screw-shaft I, for the double purpose of moving the cut grain backward onto the apron, and laterally in the direction in which the apron travels, substantially as described and represented.

160,880. FASTENERS FOR MEETING-RAILS OF SASHES. Geo. R. Adams, Newark, N. J., assignor of one-half his right to E. Putnam and J. J. Colwell. [Filed Dec. 11, 1874.]

Brief.—A safety-arm, having two prongs or actuating-arms, is pivoted by a single screw passing through the attaching-plate, in such relative position to a lever with downward-projecting catch that the safety-arm is thrown across the opening between the sash in the act of closing the lever, the catch engaging between the prongs to lock the device, while the projecting end of the safety-arm prevents tampering from the outside.



The pivoted safety-arm A, having prongs or actuating-arms *a a* and *a*, in combination with the lever L, having catch *c*, all constructed, arranged, and operating substantially as described and shown, for the purpose set forth.

160,881. ADVERTISING APPARATUS. T. B. Allison, Philadelphia, Pa. [Filed Apr. 11, 1874.]

Brief.—The cylinder receives an intermittent motion through the medium of a mutilated pinion mounted upon a shaft indirectly connected with the axle of the car. Its rotation may be caused to cease, while the car is in motion, by unscrewing either jam-nuts W.

The horizontal advertising-frame N, carrying the toothed disk T and the spring V, attached to the side of the car, in combination with the shafts K M, with screw-threads *c*, loose wheels *e*, with counterdisks *b*, and with the friction-sleeves W, having conical sides *b'*, internal threads *c'*, and holding-screws *d*, substantially as and for the purposes set forth.

160,881.

160,882. SPIRIT-LEVELS. Edwin L. Barnes, Boston, Mass. [Filed Aug. 3, 1874.]

The combination, with the level A, of the mirror *c*, both set into an opening in the piece *a* in the relative positions described above, and constructed and arranged substantially as herein specified, for the purpose of exhibiting the air-bubble or its reflection when the instrument is held above the head of the person using it.

160,883. MANUFACTURE OF METALLIC CARTRIDGE-CASES. Thos. H. Bayliss, Birmingham, England. [Filed Oct. 24, 1874.]

The method of thickening and strengthening the closed ends or heads of solid-head metallic cartridge-cases, by forcing the case mouth forward through a cylindrical die, by which the metal is forced or drawn to the closed end or head of the case, substantially as set forth.

160,884. QUILTING-MACHINES. A. Beck, New York, N. Y., assignor to L. Dryfoos, same place. [Filed Jan. 12, 1875.]

Brief.—The feed and tension rollers are hung in a frame which is capable of an adjustment on a vertical axis, whereby the rollers may be arranged any desired angle with respect to the stitching devices, which are mounted in a frame having a laterally-reciprocating motion. A mechanism on the feed-rollers automatically holds the same out of gear, at a state of rest, while the stitching devices traverse in one direction, but allows them to remain in gear and receive when such stitching devices move in the opposite direction.

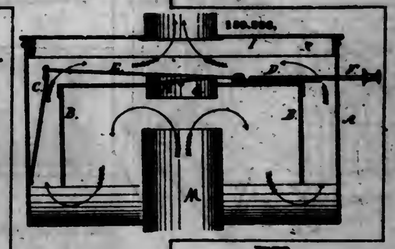
1. The laterally-reciprocating sewing-frame, carrying the stitch-forming mechanisms, in combination with an automatic independent feed, which operates when said frame moves in one direction, and is at rest when said frame moves in the opposite direction, substantially as set forth.

2. The combination, with the series of stitch-forming mechanisms, of feed-rolls not obliquely to the same, and operating to feed the cloth through the machine obliquely to the line of stitch-forming mechanisms, substantially as set forth.

3. The laterally-reciprocating sewing-frame in combination with an independent feed, placed at an angle oblique to the line of traverse of said frame, operating to feed the cloth when the frame moves in one direction, and remaining at rest when the frame moves in the opposite direction, substantially as set forth.

4. The combination of the laterally-to-and-fro moving sewing-frame, carrying the stitch-forming mechanisms, and the feed mechanism, adjustable to an angle more or less oblique to the line of traverse of the sewing-frame, substantially as shown and set forth.

5. The feed-rolls and tension-rolls, in combination with a supporting-frame adjustable upon a vertical axis to vary the angle of obliquity of said rolls, relatively to the sewing mechanism, substantially as set forth.



160,885. STOVE-DRUMS. Wm. Boehmer, Madison, Wis. [Filed Oct. 30, 1874.]

Brief.—The draft can be entirely cut off or allowed to pass directly or indirectly.

The combination, with the drum A having pipes E M, of the L-shaped partition B, having central open-end tube G with damper H, the hinged flap C, slide D with handle F, and the connecting-rod E, all constructed substantially as set forth.

160,886. BALLOT-BOXES. P. W. Bramhe, New York, N. Y., assignor to the National Ballot-Box Company, same place. [Filed Jan. 9, 1875.]

Brief.—A slide, at top of transparent hopper is drawn back to allow the deposit of ballot. This slide must be closed before the lower slide can open to drop the ballot into box. A ball ensues when either slide is opened, and both slides can be secured, so that neither can be opened without first opening the box.

160,886.

160,887. ROCK-DRILLS. Henry F. Bell, Philadelphia, Pa. [Filed May 26, 1873.]

160,887.

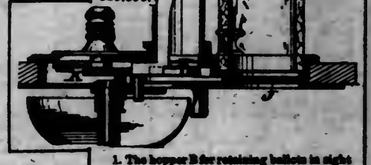
The rock-drill with the straight cutting-edge *b c c d* and the twisted cheeks B B, which are arranged diagonally on opposite faces, and terminate in said cutting-edge, substantially as and for the purpose set forth.

160,888. MOC-MEKING NIPPERS. William H. Bingham, Decatur, Ill. [Filed Jan. 26, 1875.]

160,888.

In combination with the jaw A, having side flanges *b b* and grooved lip *d*, the jaw B, made shorter than the jaw A, and having the upward-projecting points *f f*, formed with the jaw, and at the extreme end thereof, all substantially as set forth.

160,889. SUBSTRUCTURE PLATES FOR PHOTOGRAPHIC SUBSTRUCTURES. Jas. Bramble, Jr., Philadelphia, Pa., assignor to Wm. G. Bartram, same place. [Filed Feb. 3, 1874.]



Brief.—A hinged plate is provided with a transverse slot for the reception of a removable burnishing-tool.

160,889.

The plate A, provided with a recess, in combination with the removable burnisher *a*, substantially as described.

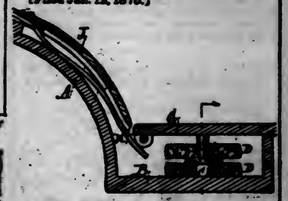
160,890. BALLOT-BOXES. P. W. Bramhe, New York, N. Y., assignor to the National Ballot-Box Company, same place. [Filed Jan. 9, 1875.]

160,890.

1. The hopper B for retaining ballots in sight until dropped, in combination with the slides H and J and locked locking-plate, constructed and arranged substantially as herein set forth, to prevent a simultaneous retraction of the said slides.

2. The combination, with the slides H and J, of the alarm-bell and hammer and the complate P, constructed and operating substantially as set forth, to sound an alarm prior to the opening of either slides protected by the said slides.

3. The spring-bolt U, catch V, and retracting-knobs *a a*, arranged and operating as herein set forth, to lock the hopper slide or slides at will, and prevent the unlocking thereof until the box has been opened.



160,891. KNITTED GARMENTS. N. H. Bruce, Clinton, Mass. [Filed Feb. 10, 1875.]

160,891.

A knitted shirt or other garment, the edges of which are united by means of a quadruple-edged tape, substantially as described and shown.

160,892. SHAWL-STRAP HANDLES. Wm. Bruen and Dwight Gridley, Newark, N. J. [Filed Jan. 12, 1875.]

160,892.

1. The combination, with the boxes B and straps D, of the studs C, having the flanges *c* and inclined upper portions or hooks *c'*, substantially as and for the purposes shown and described.

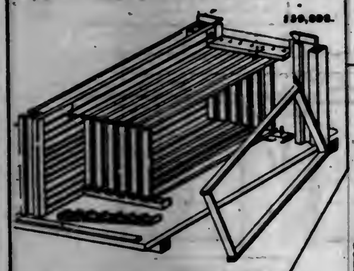
2. The combination, with the handle A and boxes M, of the lids or covers G and springs H, substantially as shown and described.

3. The cups J, in combination with the springs H and handle A, substantially as and for the purposes shown and described.

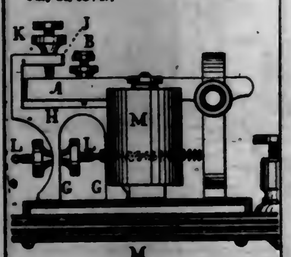
160,893. TREATING OILS. V. G. Blondo, Parkersburg, W. Va. [Filed Dec. 26, 1874.]

The process for reducing, distilling, or concentrating crude oils consisting of heating the oil from 212° to 800° Fahrenheit temperature, thoroughly agitating the same at such temperature, and injecting air or dry steam over the surface of the oil, substantially as set forth.

160,893.



160,893.



159,893. BEE-HIVES. John Sullock, Deep River, Mich. [Filed Apr 14, 1874.]

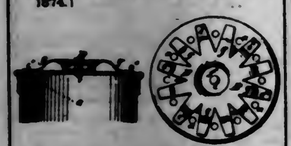
A bee-hive, one of the walls of which is secured to its floor, and the other three walls and the roof held in position by connection with the first, and separably removable, the two end-frames being held in position by attachment at one end to the fixed wall, the other end resting in notches or grooves in a transverse sill, as shown and described.

159,894.

159,895. TELEGRAPH-SOUNDERS. Jesse H. Bunnell, Philadelphia, Pa., assignor to Patrick, Bunnell & Co., same place. [Filed July 31, 1874.]

M

1. In combination with an armature-lever, a strobe-screw, located midway, or near midway, between the end thereof and the armature, substantially as and for the purpose set forth.



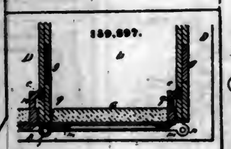
2. In a telegraph sounding apparatus, the arch located underneath the lever in the line of the direction of the swing of the lever, substantially as and for the purpose set forth.

3. The combination, with the sounder-lever A, of the arch O H, substantially as and for the purpose set forth.

4. The lever A, strobe-screw B, and arch G H, combined and operating substantially as and for the purpose set forth.

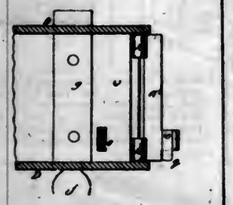
5. The lever A, carrying the strobe-screw B, the arch G G H, and below base C, constructed, combined, and operating substantially as and for the purpose set forth.

159,896. REGISTER PAPER-BOXES. T. W. Burger, Plainfield, N. J. [Filed Dec. 4, 1874.]



The centrally-pivoted crown-cap, and movable plate H, constructed with the radial strips g, having recesses or notches g' between, in combination with the top of a paper box formed with the annular series of perforations a, substantially as and for the purpose herein set forth.

159,897. NOZZLES FOR CANS. R. T. Bush, New York, N. Y. [Filed Jan. 22, 1875.]



The combination, with a screw-nozzle having an outwardly projecting flange, of a cap or plate provided with an annular shoulder and an outwardly-projecting flange, whereby the two are held together and simultaneously soldered to the can, substantially as set forth.

159,898.

159,899.

159,897. SAFE-DEPOSIT BOXES. Wm. H. Butler, Brooklyn, N. Y. [Filed July 28, 1874.]

1. In safe-deposit boxes, the combination of the horizontal plates with the vertical partitions, when held together by means of tie-bars fitted flush with the surface of the partition and passing through the horizontal plates, substantially as set forth.

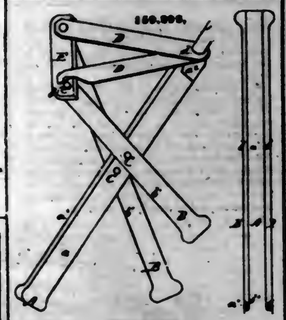
2. In safe-deposit boxes, the combination of the horizontal plates with the vertical partitions, when held together by means of the double-headed tie-bars fitted flush with the surface of the partitions, substantially as described.

3. In safe-deposit boxes, the construction and arrangement of the hinges and stop of each door, as described, whereby the door in closing is stopped by the vertical partition, the stop striking the partition between or outside the hinges of the adjoining door, and making a flush with them, as set forth.

4. A door for a safe-deposit box, consisting of the frame m, hinges l, dog n, and stop s, cast in one piece, and combined with the plate O, substantially as described.

5. A door for a safe-deposit box, provided with the dog a and spring g, the latter arranged in a recess in the former and not projecting beyond the side of the partition when the door is open, substantially as described.

6. In safe-deposit boxes, a partition provided with two mortises, the one above the other, and on opposite sides of the partition, for the reception of the dog and lock-bolt, substantially as described.



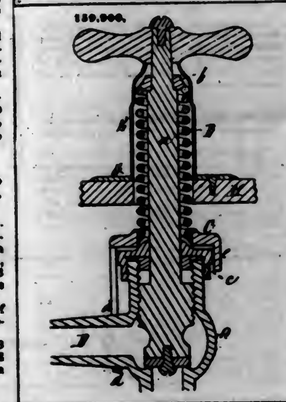
159,898. COMBINED CAMP-STOOLS AND CANES. Frank A. Byram, Philadelphia, Pa. [Filed Dec. 19, 1874.]

1. A combined camp-stool and cane, composed of the three legs A B B, pivoted together at C C, the leg A having the extension A', and being wedge-shaped in cross-section, so as to lie between and separate the legs B B when all three are folded to form a cane, as shown and described.

2. The removable folding seat, composed of the flexible parts D D and stiff piece E, substantially as shown and set forth.

3. The combination of the folding legs A B B, and the seat composed of the stiff front E and flexible side pieces, substantially as shown and described.

159,899.

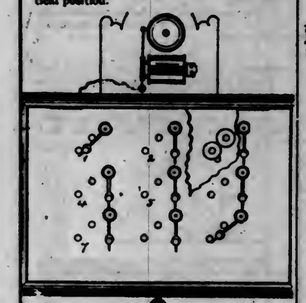


159,899. APPARATUS FOR SUGAR-COATING CONFECTIONERY, PILLS, &c. Wm. Cairns, Jersey City, N. J., assignor to himself and Thos. Burkhard, New York, N. Y. [Filed Dec. 30, 1874.]

Brief.—A pan is arranged to swivel, by means of a pivot upon an upright, back and forth above a fixed furnace, thus securing a varying temperature to the contents. The pan is rotated in all its positions by means of crank-shaft, universal joint, and suitable gear-wheel and pinion.

The combination, with the gears F G, of the operating-shaft I, the universal joint or coupling H, the swinging or swiveling rotating pan A, and the fixed or stationary furnace B, substantially as shown and described.

159,900.

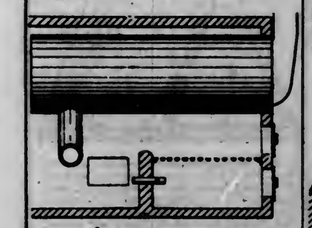


159,900. SELF-CLOSING HOPPER-COCKS. Henry Carruthers, Boston, Mass. [Filed Jan. 22, 1875.]

Brief.—The foot-piece in which the spring terminates surrounds the screw-cap, and is secured to the discharge-nozzle by an arm, thus preventing the cap from turning when the spring is wound to open the valve.

The foot-piece C, secured to the spring B, and provided with a hook, *d*, in combination with the spindle *a* and screw-cap *c* of an ordinary hopper-cock, A, substantially as described, for the purpose set forth.

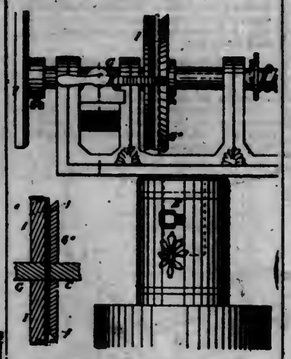
159,901. ELECTRIC ANNUNCIATORS. F. S. Carter and Chas. S. Hewitt, Burlington, N. J., assignors, by mesne assignments, to Patrick, Bunnell & Co., Philadelphia, Pa. [Filed July 31, 1874.]



Brief.—The various indicating-hands are pivoted to hang loosely on a hinged frame or door, through openings in which the poles of electro-magnets are arranged to project on one side of each of the pendent hands. Whenever either of the magnets is excited by the electric current, the corresponding hand or index is attracted thereto, and remains deflected until, by raising the hinged frame, the hand is released, dropping to its original vertical position.

1. The dial, with perforations, and the magnets with cores projecting through said perforations on the face thereof, in combination with pointer-needles, whose pivots are directly on the dial, forming together an improvement in electric annunciators, as set forth.

2. The tripping mechanism, consisting of the movable magnets or movable dial, operating to release the needle, substantially in the manner and for the purpose described.

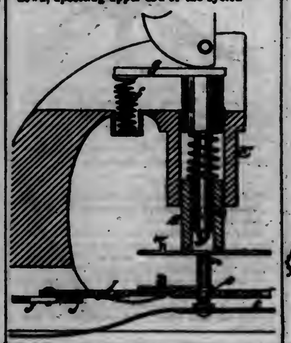


159,902. STEAM-BOILER FURNACES. H. R. Champion, Detroit, Mich. [Filed Feb. 16, 1874.]

In a steam-boiler furnace, the combination of a perforated grate, a tight ash-pit, a steam-pipe leading into the ash-pit, and a blower having a branch pipe leading into the ash-pit, and a branch pipe leading into the combustion-chamber back of the bridge-wall, all arranged and adapted to receive a continuous air-blast and an intermittent steam-blast in the closed ash-pit, and a second air-blast in the combustion-chamber back of the bridge-wall, substantially as and for the purpose set forth.

159,903. MACHINES FOR SOLDERING SHEET-METAL LIDS. Geo. E. Chinnock, Brooklyn, N. Y., assignor to Leonard Richardson, same place. [Filed Nov. 6, 1874.]

Brief.—The machine is designed for soldering a metal strip upon a flanged cover, by means of which the cover and body of the can are secured together. A spring is arranged to hold the strip in proper position while soldering it upon the flange of the lid, the lid being carried around by the revolving disks.



1. The combination of the disks G° I, arranged to clamp the flanged lid between them and the presser-spring K, arranged to press the strip upon or against the flange of the lid clamped as set forth during the rotation of the same and during the operation of soldering, substantially as and for the purpose specified.

2. The peripherical groove *e*, formed in the disk I, arranged to act in conjunction with the disk G° and presser-spring K, the whole combined for operation, substantially as and for the purpose set forth.

3. The groove *f*, arranged in the face of the disk G°, acting in conjunction with the disk I, the whole combined for operation, substantially as and for the purpose set forth.

159,904. EYELETING-MACHINES. John Coombs, San José, Cal. [Filed Sept. 16, 1874.]

Brief.—The eyelet is placed upon a stud rising from the lower horizontally-sliding plate. The article to receive the eyelet is placed upon an upper vertically-adjustable slotted plate, directly under the punch. After the hole is formed the punch is raised, when the sliding plate is brought forward by means of a lever, until the stud presents the eyelet underneath the hole, when the punch is again brought down, upsetting upper end of the eyelet.

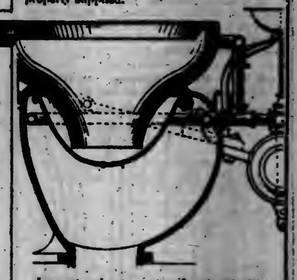
1. The cam-lever C, spring-punch *c*, adjustable presser-barrel H, in combination with the spring-plate I, and sliding die-plate I, with its hole *e* and spring-stud *p*, all constructed and operated as set forth.

2. In combination with the punch *c*, having the locking-barrel H attached to its lower end by means of a pin and slot, the horizontal spring-plate L and sliding die-plate I, substantially as and for the purpose described.

3. The sliding plate I, with its die-hole *e* and spring-stud or pin *p*, operated by a lever, J, in combination with the punch *c*, substantially as and for the purpose described.

4. The slotted horizontal plate I, with its stops W W, and having its supporting-rods *s* attached to the opposite ends of a cross-bar, *r*, below the beam *a*, the cross-bar and plate L operated by a spring, *s*, in combination with the cylinder H, with its flanges *d*, and the punch *c*, substantially as and for the purpose above described.

159,905. PLOWS. Cumberius G. Coz, Richmond, Va. [Filed Dec. 7, 1874.]



Brief.—Two series of holes in the upper branches of the land-side plate allow the beam to be raised or lowered.

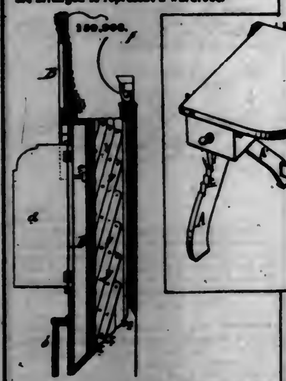
The land-side plow-plate A, provided with the arm B and stem D, and having a series of holes, *x* and *y*, made parallel with each other, in combination with the plow-beam C and bolts *a b*, arranged to allow the vertical adjustment of the plow-beam, as set forth.

159,906. WATER-CLOSETS. Wm. J. Crow, New York, N. Y., assignor of one-half his right to Joseph A. Macdonald, same place. [Filed Nov. 10, 1874.]

Brief.—A pipe is arranged under the bowl and around the exterior of the pan, for the purpose of washing the interior of the receiver and the exterior of the pan and bowl, and at the same time keeping the lower trap properly supplied.

In a water-closet, a water-pipe placed within the receiver and outside of the pan, substantially as and for the purpose shown and described.

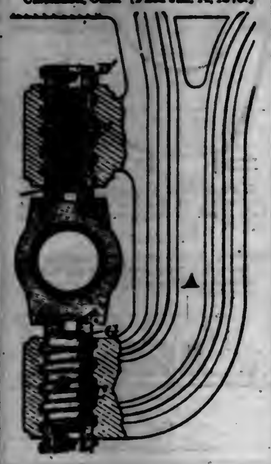
159,907. UNLOADING ATTACHMENTS FOR CARTS, &c. Thomas Crossley and Levi A. Bertolette, Wilmington, Del. [Filed Jan. 20, 1875.]



1. A cart or wagon having a bed that is narrower at its bottom than its top, in combination with an endless belt, D, that passes through the whole length of the bed, substantially as set forth.

2. The combination of the bed A, having sloping sides, so as to be narrower at the bottom than the top, with the endless belt D, rollers *e f*, chute *d*, and wheels *g f*, substantially as specified.

160,909. WARDROBE-BEDSTEAD. H. W. Curtis, Philadelphia, Pa., assignor to H. S. Hale, A. Kilburn, J. W. Hale, H. W. Curtis, C. Kilburn, and W. Hale, same place. [Filed Sept. 11, 1874.]

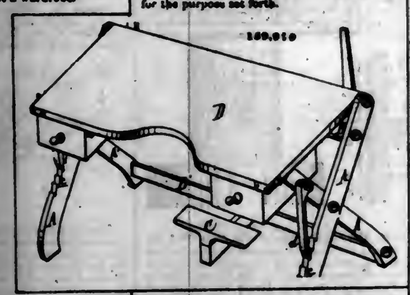


Brief.—The bed-frame is hinged to the stationary head-board in such manner that it can be placed in a vertical or horizontal position, and the foot-board is also hinged to the bed-frame, and forms an ornamental cap, and the slatted sides fold, as shown, when the parts are arranged to represent a wardrobe.

1. The combination of the frame and the adjustable head and foot boards of a wardrobe-crib, and slats consisting of ajoints jointed to each other and to the frame, all as set forth.

2. The combination, with a hinged bed-frame, D, of sides, composed of longitudinal slats and cross-bars, and a rail, *m*, arranged for attachment to the foot and head boards of the crib, as specified.

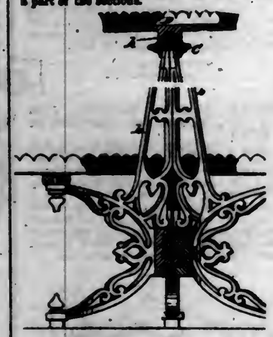
160,910. SHAFT-HANGERS. D. Dierker, Cincinnati, Ohio. [Filed Jan. 14, 1875.]



The combination of bracket A, having cast nuts, B B' C C', cast screws D D', having chambers G G' and sockets H H', as and for the purposes set forth.

160,911. LAP-TABLES FOR MILLINERS, &c. Jos. Dunean, Buchanan, Mich. [Filed Oct. 21, 1874.]

Brief.—The table-top is supported on two pairs of crossed legs. One of each pair slides under the table-top. The height of the top is adjusted by means of a pawl on the sliding leg engaging with a ratchet on the pivoted leg. A bracket foot-rest is attached to the back lower girt.

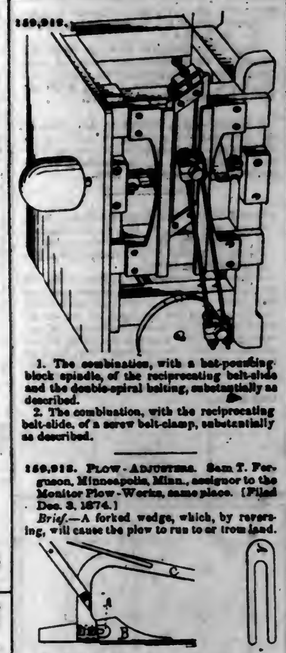


1. The combination, with the table D, adapted to be supported at any desired elevation, of the girt B', having the bracket foot-rest C, as and for the purpose set forth.

2. A lap-table composed of the table D, supported by the legs A A', ratchet *e*, pawl *d*, girts B B', and bracket foot-rest C, all as and for the purpose set forth.

160,912. STANDS FOR FLOWER-POTS AND VASES. Edwd. C. Durant, Kenosha, Wis. [Filed May 6, 1874.]

Brief.—The frame consists of three parts, cast thin, and held together by a central pin, the top being secured by a socket-cap. Circular disks are placed upon arms composing a part of the sections.



1. A stand for flower-pots, having its frame composed of a series of flat cast-iron sections or legs, A, having their inner edges provided with lugs, and all united rigidly by a central pin or its equivalent.

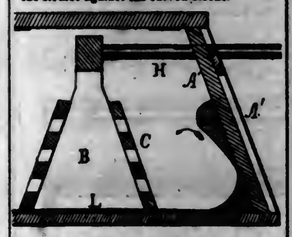
2. In combination with the sections A, having the upright arms *b*, the cap C.

160,913. MACHINES FOR POUNCING HATS. Rudolf Hahnemeyer, Yonkers, N. Y. [Filed Jan. 14, 1875.]

Brief.—The spindle upon which the hat-block is mounted has imparted to it a rotary reciprocating motion by means of a reciprocating slide, operated by a rotary crank-shaft and connecting-rod, and a belt attached to each end of said slide, passing beneath and spirally around the spindle in an opposite direction to each other, and attached to the spindle.

1. The combination, with a hat-pouncing block spindle, of the reciprocating belt-slide and the double-spiral belting, substantially as described.

2. The combination, with the reciprocating belt-slide, of a screw belt-clamp, substantially as described.



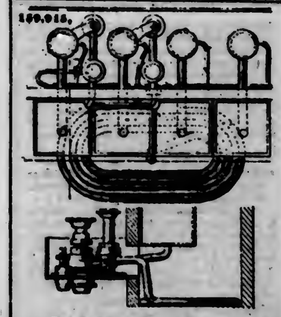
160,915. PLOW-ADJUSTERS. Sam T. Ferguson, Minneapolis, Minn., assignor to the Monitor Plow-Works, same place. [Filed Dec. 3, 1874.]

Brief.—A forked wedge, which, by reversing, will cause the plow to run to or from land.

The beam-adjuster A, in combination with land-side B and upright or metallic beam C, substantially as described, and for the purpose specified.

160,914. WASHING-MACHINES. Daniel A. Plummerfelt, Delaware Station, N. J., assignor to P. Lyons. [Filed Apr. 6, 1874.]

Brief.—Within the inclined ends of the suds-box are curved blocks. The double-inclined perforated beater slides on a flat metal spring in the bottom of the box, and forces the clothes against the curved blocks.



In a washing-machine provided with a reciprocating beater, the combination, with the sub A and beater B, of the spring L, interposed between the beater and the bottom of the tub, whereby the binding of the rods H and clogging between the beater and bottom of the tub are prevented, as set forth.

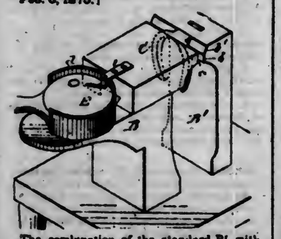
160,915. SODA-WATER DRAFT APPARATUS. Wm. Gee, New York, N. Y. [Filed Dec. 30, 1874.]

Brief.—A combined soda-water and syrup cock, which draws at one operation both soda-water and syrup, whereby soda-water syruped with any one of various kinds of syrups from different syrup-vessels may be drawn from a single fountain by the operation of a single cock.

160,916.

1. The combination of a single soda-water draft-pipe, two or more syrup-reservoirs, a corresponding number of combined soda-water and syrup cocks, and a corresponding number of branch pipes leading from the said draft-pipe to the said cocks, substantially as herein described, whereby soda-water syruped with either one of various syrups may be drawn from one fountain without a separate syruping operation.

2. The arrangement of the cut-off valve or cock, the combined soda-water and syrup cocks, and the plain-soda draft-cock, and the pipe leading from the fountain, whereby soda and syrup may be drawn separately when necessary, substantially as shown and described.

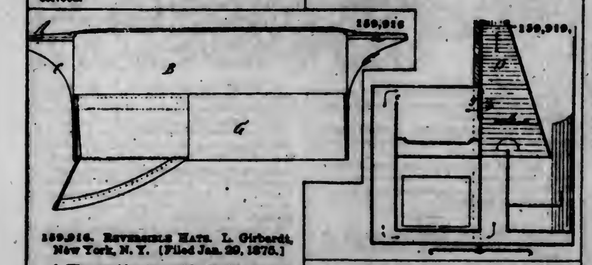


160,917. SPOKE-SOCKETS FOR VEHICLE-WHEELS. Myron Glassbrook, Batchellerville, N. Y., assignor of one-half his right to Jas. P. Parkhurst, same place. [Filed Jan. 28, 1875.]

1. The socket A, provided with the openings *a* and the wedge *c*, combined substantially as and for the purpose described.

2. The spoke-socket A, provided with openings *a*, base B, projecting lips *b*, dowel-pin *d*, combined with the wedge *c*, as specified.

160,918. MACHINES FOR SHARPENING HORSESHOE-CALKS. Brastus Gleason and Robt. Hamilton, Greenwich, N. Y. [Filed Feb. 6, 1875.]



The combination of the standard B', with bevel *b'* and face *b*, standard B, sliding die C, cam E, having flange or groove *d* and handle E', and the strap *e*, all constructed substantially as and for the purposes herein set forth.

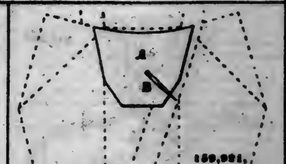
160,919. STOVES. Ernst W. Gram and J. Nelson, Jonestown, Miss. [Filed Jan. 13, 1875.]

Brief.—The draft may pass directly to the exit, or be sent around the oven and over the supplementary grate under the boiler-holes.

The heater A and cook-stove B, having a common exit-pipe, D, and adapted to be used separately or together, substantially as herein described.

160,920. GAME-COCKS. Ira S. Hamilton, Ossian, N. Y., assignor of one-half his right to Benj. M. Payne and D. W. Payne, same place. [Filed Dec. 1, 1874.]

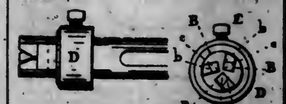
Brief.—The notch on the back of the cam may be brought in line with the slide-bolt, when the latter may be drawn outward until it engages with the notch, to admit of removing the packing.



The lever E, constructed with the cam *e* and notch or depression *i*, in combination with the slide-bolt J, having the spur *i* and movable valve *g*, substantially as and for the purpose described.

160,921. NECK-TIES. William H. Hart, Jr., Philadelphia, Pa. [Filed Oct. 17, 1874.]

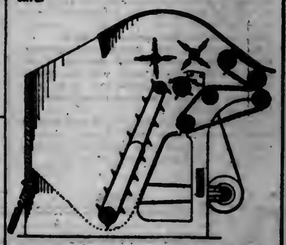
Brief.—The pin which secures the neck-band of the scarf is clinched to the shield by metal prongs struck up from the pin.



1. The pin B and neck-tie shield A, in combination with the metallic fastening C, substantially as and for the purpose set forth.

2. The pin B, formed with the punched-out fastening C, in combination with the neck-tie shield A, substantially as and for the purpose set forth.

160,922. TOOLS FOR POINTING BOLTS. P. Hartis and Wm. Cummins, Philadelphia, Pa., assignors to the M. J. Coleman Bolt and Nut Company, same place. [Filed Oct. 13, 1874.]



Brief.—Removable bits or cutters having chamfered ends and cutting edges, secured in grooves in a stock by means of a collar and set-screw.

The improved pointing-tool, herein described, consisting of the removable bits B, grooved stock A, sleeve D, and screw F, combined and operating substantially as and for the purpose set forth.

160,923. FEEDING MECHANISMS FOR CARDING-MACHINES. Geo. S. Harwood, Boston, Mass. [Filed Dec. 26, 1874.]

Brief.—Improvement upon the Estette patent, No. 43,959. The dust and foreign substances fall through the gauze bottom of the receiving-box, and can be removed through the open door. The slotted shield clears the teeth of the worker, and prevents short fibers falling down between the two aprons, and the size of the packing-chamber is adjustable, to regulate the quantity of material fed to the card.

1. The receiving-box, having a wire-gauze or other perforate bottom, in combination with the case and door in the same, substantially as and for the purposes set forth.

2. In machinery of the kind herein referred to, the combination of a spiked worker and a slotted shield applied to said worker, in the position and to operate substantially as shown and described.

3. The packing-chamber, having its top and bottom formed of moving surfaces, which are adjustable to regulate the size of chamber, substantially as set forth.

160,924. COCKS OR VALVES. Henry W. Henle and Emilius D. Gowan, Holloway, England. [Filed Nov. 7, 1874.]

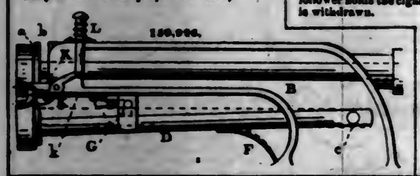
Brief.—On the spindle is formed a screw-recess, and a corresponding recess is formed in the bush, in which is inserted a key, which protrudes into the recess in the spindle. The bush is prevented from revolving by keying it to the barrel.

In cocks or valves for retaining steam, gas, or fluids under pressure, the combination of the valve-spindle *d*, provided with a screw-recess, *f*, with the bush *e*, having a corresponding screw-recess, and actuating the shut-off, the key-piece *g*, and the key *q*, arranged and operating substantially as described.

189,924.

189,925. CANOPY-FRAMES. R. F. S. Heath, Philadelphia, Pa. (Filed Apr. 11, 1874.)

1. The cast metallic bracket, consisting of the body C, with ears B B, constructed in pairs, with supporting-bars D, and independent of each other, in combination with the upwardly-folding arms G jointed to the ears B, with pivots F, independent of each other, all constructed, arranged, and operating substantially as herein set forth.



2. The cast metallic body C, having ears B with supporting-bars D at their forward lower ends, in combination with the upwardly-folding arms G, pivoted to the ears and having vertical pins J behind the pivots F of the arms, all constructed, arranged, and operating, substantially as and for the purposes set forth.

189,926. BINDING AND WIRING HAT-FRAMES. R. F. S. Heath, Camden, N. J. (Filed Jan. 6, 1875.)

1. The operating-arm G and elevating-spring F, in combination with the non-rotating arm D, having an axis, *c*, journaled roller E, rotary shaft B, and the roller C, substantially as and for the purposes set forth.

2. The roller C with flange *b* and groove *c*, rotary shaft B, roller E with shoulder *f*, and axial arm D, in combination with the elevating-spring F and depressing-arm G, all constructed, arranged, and operating substantially as set forth.

3. The cutting-blades J K, in combination with the pressing-rollers C E, and binding-guide H, arranged and operating substantially as and for the purposes set forth.

189,927. HARROWS. George W. Hoover, Kutztown, Pa. (Filed Jan. 20, 1875.)

1. The spring-cushion A A, in combination with the bars G G and cords *c c*, substantially as described.

2. The combination, with the bars G G, of the spring buckles A A, cords *c c*, and buckle-straps H H, substantially as described.

3. The unhitching-strap F and spring buckle B of the draft-strap, in combination with the bars G G, substantially as described.

4. In combination with the bars G G, the unhitching-strap F and spring buckle C of the girt, substantially as described.

5. The combination, with the bars G G and unhitching-straps E F, of the flanges H and rings I, substantially as described.

6. In combination with the spring buckles A, bars G G, and check-reins L, a saddle having the top part arranged to be displaced by the lines, substantially as described.

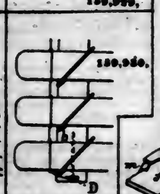
189,928. TOYS. A. E. Hotchkiss, Cheshire, assignor to Friend W. Smith and F. Eggo, Bridgeport, Conn. (Filed Dec. 28, 1874.)

Brief.—Slight pressure upon the outside of the case causes the mouse to leap out and run a distance over the floor.

189,928.

1. In the artificial mouse *c*, the tail A and spring *f*, as described.

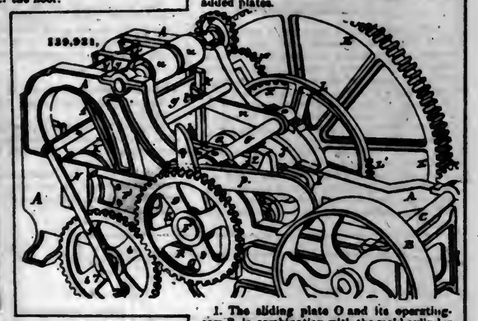
2. The tail A and spring *f*, in combination with the axle-trees *d* and *e*, with wheels, substantially as described.



3. The tail A, spring *f*, axle-trees *d* and *e*, with wheels, and notch *k*, in combination with box *b* and trigger *l*, substantially as described and set forth herein.

189,929. CIGAR-PACKING IMPLEMENTS. S. Jacoby, New York, N. Y. (Filed Dec. 17, 1874.)

Brief.—The cigars are packed in a frame resting on a table, so that they will not fall out. The frame passes into the cigar-box. A follower holds the cigars down while the frame is withdrawn.



189,929.

189,930.

The implement described for packing cigars in boxes, the same consisting of a rectangular frame constructed to fit within a cigar-box, said frame, being open at top and bottom, whereby the cigars may be introduced at the top and compressed in place, preferably by a follower, within the cigar-box, substantially as described, for the purposes specified.

189,931.

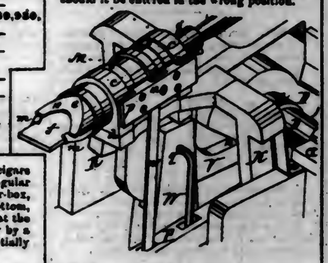
1. The sliding plate O and its operating-cam S, in combination with the mold-cylinder K, having a square portion, N, to receive the impact of the plate, substantially as set forth.

2. The reciprocating plunger or feeder I, with its operating crank-disk and wheel S and S, in combination with the hopper *p*, mold K, and mold-plunger, substantially as set forth.

3. The plunger I, when provided with skid flanges 2, for attachment of re-enforce plates, in combination with the clay-hopper *p*, substantially as set forth.

4. The plunger I and vertically-adjustable plate *p'*, in combination with the taxel part of the clay-hopper *p*, substantially as set forth.

5. The knife A, cam-arm *a p*, and cams *q r*, in combination with the mold-plunger, substantially as set forth.



6. The knife-frame T and operating-cams Z Z', lever *a a' c*, and pitmen *d d*, combined with the molds K', substantially as set forth.

7. The knife-frame T U, having brick-apertures T, to raise the bricks above the level of the table, substantially as and for the purpose set forth.

189,932. NAIL-PLATE FEEDERS. David W. Keith, West Wareham, Mass. (Filed Sept. 1, 1874.)

Brief.—A lever actuated by two cam-pins operates against the jaw N, closing it on the rod while the rod is fed forward as the proper time by the jaws N N', operated by the cam D and its counterpart E. The nose-piece has interior inclined shoulders, to guide the plate should it be entered in the wrong position.

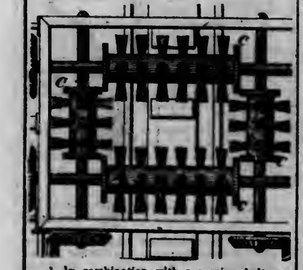
189,933.

1. The jaws N N', for seizing the sleeve *s*, surrounding the rod h, in combination with the lever *s*, cams H I, shaft B, and cams D E, substantially as and for the purpose set forth.

2. The nose-piece *s* with its shoulder or shoulders 14, inclined at *w*, in combination with the spring-guides *m*, substantially as described, for the purpose set forth.

189,934. SHIPS' LANTERNS. F. J. Kenny, Boston, Mass. (Filed Jan. 30, 1874.)

Brief.—The lens is packed in the frame by a rubber or elastic strip, and the door secured in place by wedging projections upon the bolt, which moves in a socket attached to the lantern.



1. The combination of the segmental lens A with the recess, having beveled sides E, and with the curved rods *c* and nuts *d*, as and for the purposes set forth.

2. In a lantern, the combination of the door *f*, the staples *n*, and the bolt, with hook *n* and bolt *n'*, bent at an angle, to constantly draw, wedge, and hold the door, when shut into the staples *n*, for the purpose set forth, substantially as described.

189,934. MACHINES FOR DUSTING BRICKS. J. N. Kerper, Washington, D. C. (Filed Jan. 7, 1875.)

Brief.—A reciprocating screen under a hopper agitates the sand, which, falling on revolving brushes, is thrown on all the exposed surface of the bricks that are being drawn through on an endless belt

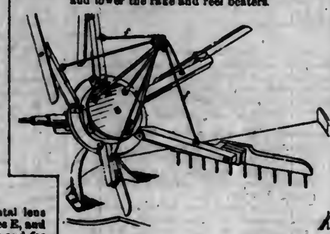
1. In combination with a moving belt or carrier, B, one or more revolving brushes, C, for throwing or depositing dust upon subarat bricks, substantially as and for the purpose described.

2. The combination of the moving or endless belt B, one or more brushes, C, and hopper D, for feeding dust and sand to said brushes C.

3. The combination of the frame A, belt B, one or more brushes, C, hopper D, shaking or reciprocating screen E, and sieve F, with suitable gearing for operating, substantially as and for the purposes set forth

189,935. METALLIC LIPS FOR WOODEN PAILS, &c. St. Clair D. Kirtley, Philadelphia, Pa. (Filed May 1, 1874.)

Brief.—The metal lip is formed with a downward-projecting flange, for attachment to the bucket, and side flange and central channel projecting above the bucket, for guiding the fluid in its discharge.

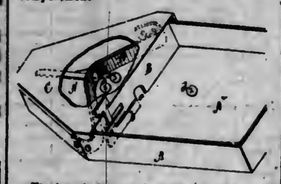


189,935.

The lip A, bent to form the horizontal portion a, flanges *b b*, and central channel *d*, as set forth

189,936. HARVESTER-RAKES. J. H. Kirton, Rockford, Ill. (Filed July 9, 1874.)

Brief.—A pivoted rocking plate above the rake and reel carrying head serves to raise and lower the rake and reel beaters.



1. The pivoted rocking plate or disk E, in combination with the pivoted rake and reel arms, whereby the rising and falling movements are imparted to said arms, substantially as described.

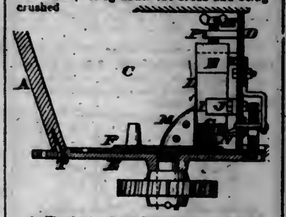
2. The combination of the bevel-wheel C, pivoted disk or table E, standard E', rotating disk F, and pivoted links *f* with the arms of the reel and rake, substantially as and for the purpose set forth.

3. The plates connecting the reel-beaters and rake-head with their carrying-arms, made one concave the other convex on their adjacent faces for permitting the adjustment of the beaters and rake-head, as described.

189,937. GAME APPARATUS. V. Klobasse, Washington, D. C. (Filed Feb. 4, 1875.)

Brief.—A box having two compartments, from the inner one of which balls are propelled by a spring-plunger (through a hole in the dividing-partition) into view in the outer compartment.

The box A, having the interior partition B, with one or more openings, *a*, the cover C, spring D, and operating device E, to be used with balls *d*, or their equivalents, substantially as and for the purposes herein set forth.



189,938. BIRD HOUSES. E. A. La Bar, Philadelphia, Pa. (Filed Jan 8, 1875.)

As a new article of manufacture, the metallic frames C, herein set forth, the same constructed to surround and finish the entrance-openings of a bird-house, substantially as and for the purpose described

189,939. CORN-PLANTERS. L. L. Lawrence and G. S. Thomas, Dublin, Ind assignors to Wayne Agricultural Company, same place. (Filed Jan. 2, 1875.)

Brief.—In one corner of the seed-box is removably secured a square cut-off brush, with one half resting on the revolving cell plate, while the other half rests on the hopper-bottom The brush is secured in an upright position by a vertical bolt and an adjustable side clamp. In contact with the two exposed sides are placed a fender and an ear, to prevent the seed from passing under the brush and being crushed

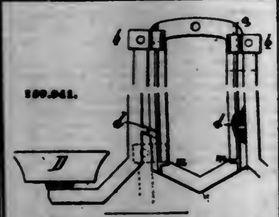
1. The fender M, in combination with the revolving cell-plate F and square cut-off brush G H.

2. In the described combination with cut-off brush G H and set-screw P, the revolving cell-plate F and the hopper-bottom E, each occupying half the area of the brush point, as and for the purpose set forth.

3. The combination, with cut-off brush G H, of clamp I J K, fender M, and ear N, substantially as set forth.

189,940. WHEELS FOR VEHICLES. Gabriel Leverich, Brooklyn, assignor to John B. Sammis, New York, N. Y. (Filed Jan. 16, 1875.)

1. The recessed or slotted annulus C' and the radial spur *c* of the box or bearing D, in combination with the hub A and a cushion or cushions, the whole to operate substantially as and for the purpose set forth.

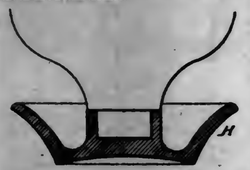


2. In an elastic hub, the combination of the lateral sleeve G, to permit radial play of the box or bearing D, with the said bearing, and one or more elastic cushions, B or C, the said sleeve to close the inner ends of the spoke-mortises, all substantially as and for the purpose set forth.

3. The elastic hub comprising the box or bearing D, with one or more circumferential shoulders, provided with the nut F at its outer end, and having the radial spur *b*, one or more elastic cushions, B C, the annuline C', and the sleeve G, to permit radial play of the box D, all combined for operation substantially as and for the purpose set forth

189,941. DROP-LIGHTS. John C. Love, Philadelphia, Pa. (Filed Dec. 26, 1874.)

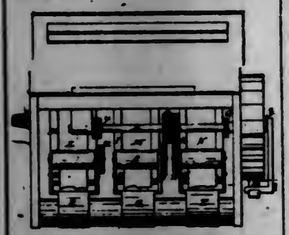
Brief.—A lamp-supporting arm hinged to a slide adapted to the guide upon the fixed frame, and having a pin to fit into a notch upon said frame for holding the arm in place.



A lamp-chandelier in which are combined a fixed frame having a guide or guides with one or more lamp-supporting arms, each hinged to a slide adapted to the guide, and having a retaining-pin adapted to a notch or notches on the said fixed frame, all substantially as set forth, for the purpose specified

150,941.

150,941. LAMP-HOLDERS. John C. Love, Philadelphia, Pa. [Filed Jan. 4, 1875.]



Brief.—The metal base receives drip, and it fits in the metal holder.

The combination of the cup-shaped metal base H of the lamp, with a metal holder, B, of a form adapted to the said base and carried by the arm of a chandelier or bracket, all as set forth.

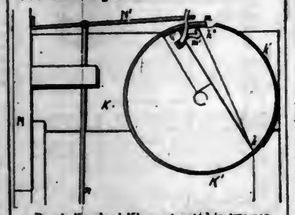
150,942. TICKET-REELS. Levi J. Masterson, Philadelphia, Pa., assignor of one-third his right to J. Kilpatrick, same place. [Filed Dec. 29, 1874.]

Brief.—By decreasing springs which carry the feeding-cylinders, these latter are geared with a revolving segment, which gives an intermitting feed to strips of paper wound upon the spools.

1. The springs R S T, provided with their rollers and pinions, in combination with the shaft X and its pinions, and the segment-gear Y, for unrolling the coils of paper L M N, substantially as set forth.

2. The shaft H, having ratchet-wheel R and its pawl D, and segment-gear F, in combination with the shaft X and its attachments, to give an intermitting feed to the strips of paper or tickets on spools H I K, substantially as set forth.

150,943. CURTAIN-FIXTURES. G. C. Mathews, Louisville, Ky. [Filed Dec. 10, 1874.]

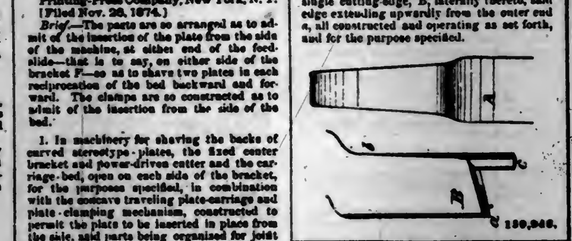


The combination, with a notched disk journaled in a slotted bearing, of a stationary detent, an oscillous cord, I, and the friction-wheels H H, the said wheels being arranged to one side of the disk, and the said cord passing around the same in such a manner as to form a laterally-drawing loop, which, when a traction is exerted upon the cord, brings the disk away from the detent, and the journal of the disk in a portion of the slotted bearing when it is free to revolve, substantially as described.

150,944.

150,944. MANUFACTURE OF NAIL-RODS. Saml. P. Maxwell, Clifton, W. Va. [Filed Jan. 16, 1875.]

Brief.—The material is coiled around a divided former, and the two ends held in position while being nailed.

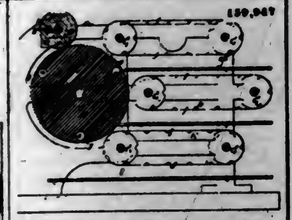


Bench K, wheel K', constructed in two sections, as described, eccentric m^1, crank-arm m^2, spring-arm N^1, rod a, and treadle N^2, the whole constructed and arranged to operate substantially as described.

150,946. MACHINES FOR SHAVING THE BACKS OF CURVED STEREOTYPE-PLATES. Thos. J. Mayall and Richard W. Hartnett, Boston, Mass., assignors to Mayall Power Printing-Press Company, New York, N. Y. [Filed Nov. 23, 1874.]

Brief.—The parts are so arranged as to admit of the insertion of the plate from the side of the machine, at either end of the feed-slide—that is to say, on either side of the bracket F—so as to shave two plates in each reciprocation of the bed backward and forward. The clamps are so constructed as to admit of the insertion from the side of the bed.

1. In machinery for shaving the backs of curved stereotype-plates, the fixed center bracket and power-driven cutter and the carriage-bed, open on each side of the bracket, for the purposes specified, in combination with the concave traveling plate-carriage and plate-clamping mechanism, constructed to permit the plate to be inserted in place from the side, said parts being organized for joint operation, as shown and set forth, so that the plate may be placed in the carriage on either side of the center bracket, and from the side of the machine.



150,946.

2. In combination with the concave stereotype-plate carriage, provided on one side with a shoulder or projection, up against which one of the edges of the plate bears, the clamps, having a combined up-and-down and to-and-fro horizontal motion, substantially as shown and set forth.

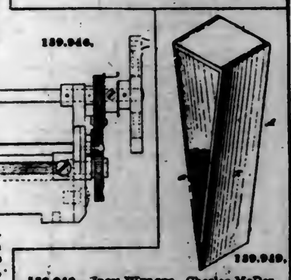
150,947. DELIVERING APPARATUS FOR PRINTING-PRESSES. Thos. J. Mayall and Richard W. Hartnett, Boston, Mass., assignors to the Mayall Power Printing-Press Company, New York, N. Y. [Filed Dec. 12, 1874.]

Brief.—The female cylinder, in rear of the slot for the knife, has a series of pins, on which the end of the web is pressed. Endless delivery-bands carry a rock-shaft, on which are mounted sharp hooks, which penetrate the paper held on the pins on the cylinder and draw it off, carrying the severed sheet over the delivery-board, when a weighted arm on the hook-shaft meets a projection on the frame, by which the shaft is rocked and the hooks withdrawn from the sheet.

150,947.

In combination with the female cylinder, provided with pins, or the equivalents specified, arranged to operate, as described, one or more deliveries, armed with stripping-hooks, for operation in connection with said pins, substantially in the manner and for the purposes set forth

150,948. BITS FOR BORING METALS. Wm. McCrosson, Philadelphia, Pa., assignor to S. C. Beckman, same place. [Filed Dec. 24, 1874.]

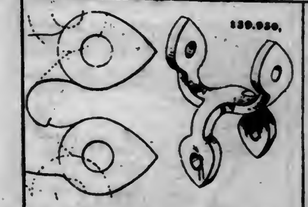


The improved drilling-tool herein described, the same consisting of the body A, with lateral extension *b*, the guiding-point C at one side of the lower portion of the body, and a single cutting-edge, B, laterally thereto, said edge extending upwardly from the outer end *a*, all constructed and operating as set forth, and for the purpose specified.

150,948.

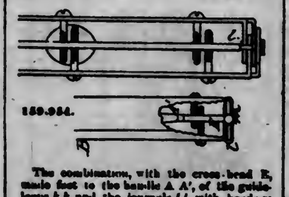
150,949. IRON WEDGES. Charles McDermott, Oakland Station, Ark. [Filed Jan. 6, 1875.]

Brief.—The head and inclined sides of the wedge are made from a single plate of iron, which is welded to the triangular side plates, forming a closed chamber.



As a new article of manufacture, the wedge formed of plates *b c*, welded together at their contiguous or meeting edges, thus forming a closed chamber, *a*, as shown and described.

150,949.

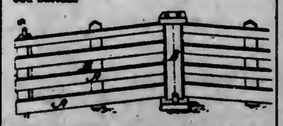


150,950. METHODS OF MANUFACTURING CARRIAGE-SHACKLES. Alex. McKee, Philadelphia, Pa., assignor of one-half his right to W. Barp, same place. [Filed Oct. 19, 1874.]

As an improvement in the manufacture of carriage-shackles, the mode herein described of first stamping the plain bar to the form shown in Fig. 3 of the drawing by means of dies, then removing the burrs, then bending the arms to form a cross, and finally bending the said arms to form the shackle, all as set forth.

150,950.

150,951. MECHANISMS FOR TRIMMING SHIPS. Jas. McNabb, Widder Station, Canada, assignor to himself, J. Blakeley, and S. Corsell, same place. [Filed May 22, 1874.]



150,951.

In devices for trimming ships, the combination of the weighted pendulum I, the overhang H, frame G, and the bell-crank F, for the purpose of controlling the movements of a longitudinal shaft, A, substantially as described and shown.

150,952. PORTABLE FENCES. Thomas McQuary, Daviess County, Ky., assignor of one-half his right to S. J. Harris. [Filed Nov. 6, 1874.]

Brief.—The beveled ends of the adjacent panels are clamped together by removable cap and sill pieces, which receive the ends of the end battens

The combination of the horizontal boards A A, end posts B B, beveled as described, and provided with tenons *a a*, foot-pieces *c c*, and top caps D D, all substantially as and for the purposes herein set forth.

150,953. SANDPAPERING-MACHINES. E. W. Merrill, Lynn, Mass. [Filed Jan. 30, 1875.]

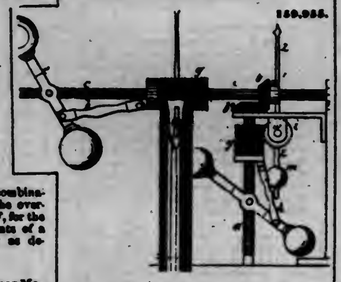
Brief.—The sand-paper rollers are first covered with a layer of felt, outside of which is secured an abrading covering, thus forming an elastic surface.

1. The spring D, constructed as and for the purposes specified.

2. The clamp *b*, provided at one end with jaws for clamping the material, as described, and at the other with the spring *d*, all as and for the purposes set forth.

3. The hinged plates E, in combination with the roll A and elastic covering B, substantially as and for the purposes specified.

4. The abrading-rolls, constructed as herein described and shown, and for the purposes set forth.



150,954. BROOM-HEADS. E. J. Merrick, Rochester, N. Y. [Filed June 30, 1874.]

Brief.—The sides are hinged to the main head, and are, by means of the loops, limited in their outer movements. The central partition serves to hold the sides in place.

150,954.

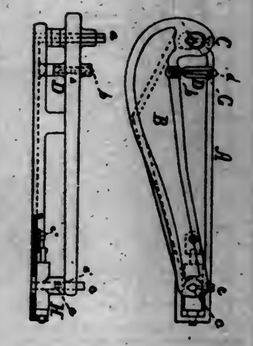
The combination, with the cross-head E, cam-le feet to the handle A A', of the guide-loops *b b* and the journals *l l*, with heads *n n*, arranged to operate in connection with the jaws B B, in the manner and for the purpose specified.

150,955. STEAM-GOVERNORS. M. Muchin, Riga, Russia. [Filed Dec. 24, 1874.]

150,955.

In a governor for steam-engines, the combination of the shaft *a*, toothed sleeve *g*, mounted on said shaft *a*, with capability of sliding to and fro, the lever *h*, and the lever *e*, provided with a ball at both ends, with the toothed segment *i*, shaft *w*, index-hand *z*, the weight *u*, and a valve, substantially as and for the purposes shown and described.

150,956. CONSTRUCTION OF JETTIES FOR IMPROVING RIVER-CHANNELS. Alfred B. Mullett and Frank Schumann, Washington, D. C. [Filed Jan. 6, 1875.]

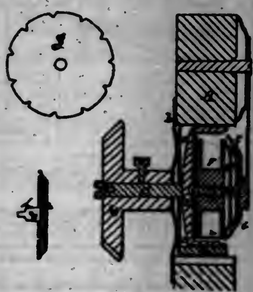


Brief.—Jetties for deepening the channels of rivers are formed of buoyant metallic caissons floated to place and linked together, after which they are sunk by the admission of water, and braced and held in position by a series of piles, vertical or inclined.

The process and apparatus herein described for forming bars or jetties in rivers and other running water by the submersion of connected buoyant caissons A, constructed as specified, and sustained by struts or supports I I', all as herein described.

150,957. CASTING SCALE-LEVERS. Titus Olmes, Philadelphia, Pa. [Filed Mar. 28, 1874.]

Brief.—In order to unite steel knife-edges with cast scale-beams, the steels are held in proper position by a frame placed in the mold; the supports for the steels being arranged on the frame, so as to yield and compensate the shrinkage of the metal on cooling.

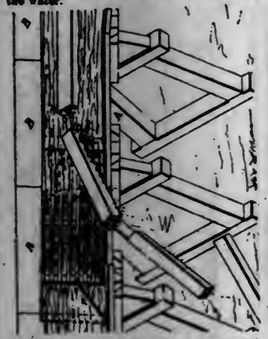


1. The stand D, projecting right-angularly from the board A, in combination with the wire G and set-screw *d*, substantially as and for the purpose set forth.

2. The combination, with the board A, of the block H, with opening *c'* and set-screw *c*, and with the rod H', car J', removable car J, and set-screw *c''*, substantially as and for the purpose set forth.

150,958. SEWING-MACHINES. John O'Neil, New York, N. Y., assignor of one-half his right to Theron D. Fuller and Julius Wood, same place. [Filed Sept. 15, 1874.]

Brief.—The pivot on which the bobbin revolves is a screw connecting two disks on either side of the bobbin. The lower disk is notched. A finger on the upper one fits into the notches, and the tension is regulated by turning the lower disk. A spring-catch fits into the slotted head of the screw, and prevents its revolving with the shuttle, and the thread is prevented from twisting as the bobbin is stationary with respect to the motion of the shuttle. The catch yields to allow the thread to pass over the bobbin.



1. The combination of the revolving shuttle E, the bobbin F, provided with a slotted-headed screw and a catch, *i*, whereby the bobbin is prevented from revolving with the shuttle, substantially as described.

2. The combination of the bobbin F, the screw *j*, and the notched disk *g* and plate *h*, having on its edge the finger *h'*, as and for the purposes specified.

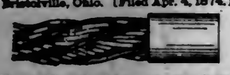
3. The combination of the bobbin F, the finger *h'* and the disk *a*, having on its edge the groove *r*, as and for the purposes specified.

159,959. FLUMES FOR CONVEYING TIMBER. H. G. Parker, Carson City, Nev. [Filed Jan. 30, 1875.]

Brief.—The V-shaped chutes, through which timber is conveyed to the valleys, are provided with removable side boards, and in connection with these a reversible inclined shoe is placed in the chute, to deflect the logs out of the same at the desired point. The shoe is a skeleton frame, to permit the free passage of the water.

1. The reversible incline-shoe C, constructed substantially as herein shown and described, and for the purpose set forth.

2. The flume A, provided with sectional side-boards B, as and for the purpose specified.

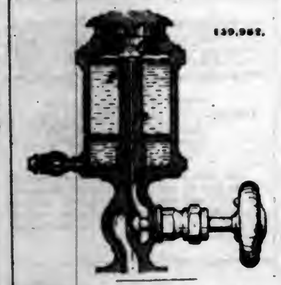


3. The incline-shoe C, in combination with the flume A, provided with the shifting side-boards B, as and for the purpose set forth.

159,960. FAUCETS. Anthony Pfund, New York, N. Y. [Filed Apr. 22, 1874.]

A faucet provided with two channels, *a b*, both extending parallel with each other through the spout B, the plug C, and body A, substantially as herein shown, for the purpose specified.

159,961. LIGHTNING-RODS. M. D. Phelps, Bristolville, Ohio. [Filed Apr. 4, 1874.]



The combination of three or more clusters of wires, each cluster composed of a copper center, *a*, covered with wires *b b*, and the clusters thus formed twisted together, and the wires *d d* twisted around between the clusters on the exterior, all substantially as set forth.

159,962. LUBRICATORS FOR STEAM-ENGINES. James Purcell, Cincinnati, Ohio. [Filed Oct. 21, 1874.]

Brief.—The discharge-tube is countersunk and flaring on its upper end, and has thereon a sleeve-valve, upon the top and outer edge of which are openings, to permit the oil to pass through, and down the tube when the valve is raised.

1. The retaining-ring C, in combination with a screw-cap, for oil-cups or other purposes, substantially as herein described.

2. The combination of the discharge-tube *c*, constructed with a countersunk or flaring upper end, forming the valve-seat at its outer edge, and the regulating-valve F, forming a sleeve, and constructed with lateral perforations at its upper end for the admission of steam to the cistern, and for the escape of the lubricant as floated up by the water of condensation, substantially as herein shown and described, for the purposes set forth.

159,962.

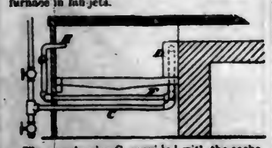
159,963. RUFFLERS. Edward Powell, New York, N. Y., assignor to Domestic Sewing-Machine Company. [Filed Dec. 23, 1874.]

Brief.—The upper ruffling-blade is attached to a rocking arm on the blade-carrier. The adjusting-screw on the operative lever, striking this arm, tilts it as it moves it backward, causing the blade to rise and pass freely over the cloth. The curved heel of the lever which moves the carrier forward tilts the arm back, causing the blade to close on the cloth and carry it forward. The operative lever is fastened to the needle-arm by hinged jaws that wedge between the screw-head and needle-arm, obviating the necessity of removing the screw.

1. In a ruffling attachment, the combination, with the socket A, of the base-plate B, lever D, the centrally-pivoted lever F, and nippers G and H, substantially as and for the purposes set forth.

2. The automatic grasping and carrying nippers G and H, in combination with frame H' and levers D and F, substantially as and for the purposes set forth.

3. The combination of the socket A, with its base-plate B, projection or post C, lever D, with its curved arm D', rocking lever F, and frame H', for operating and carrying the nippers, substantially as and for the purposes set forth.

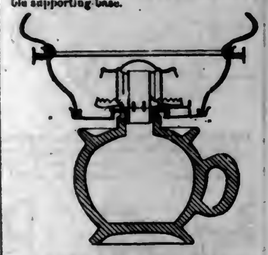


4. In a ruffling or gathering attachment, the hinged locking device, consisting of jaws *a a'*, for connecting the lever D with the needle-bar of a sewing-machine, substantially as set forth.

5. In a ruffling attachment, the combination of lever D, with its curved heel D', adjusting-screw K, rocking lever F, and nippers G H, substantially as and for the purposes set forth.

6. In a ruffling attachment for sewing-machines, the combination of the socket A, lever D, provided with a curved heel-carrying frame, H', cap M, and nippers G H, substantially as and for the purposes set forth.

159,964. SMOKE-CONSUMING FURNACES. William L. Powlesson, San Francisco, Cal. [Filed July 27, 1874.]

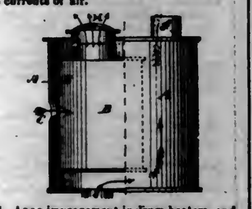


Brief.—A superheater forms a front lining for the bridge-wall, in which the steam is superheated before being introduced to the furnace in fan-jets.

The supply-pipe C, provided with the cocks I and I', in combination with the superheating-pipe *c*, embedded in the superheater D, forming a lining for the bridge-wall, the conducting-pipes F and G, and the fan-jet nozzles H, all these devices being arranged in relation to each other, with the fire-chamber, and combined to operate substantially as and for the purposes set forth.

159,965. SHADE-SUPPORTS FOR LAMPS. S. A. Prescott, Sutton, assignor to himself and J. M. Barker, Worcester, Mass. [Filed Jan. 4, 1875.]

Brief.—The shade and shade holder proper are made easily removable from the detachable supporting-base.



1. In combination with the shade-supporting base, adapted to be attached to the lamp, the removable ring resting on said base, the elevated shade-holder proper, and the arms or supports intermediate between and connecting said removable ring and shade-holder, substantially as set forth.

2. The combination, with the shade-holder, of one or more supporting spring-hooks, which bear outwardly against the inner side or face of the shade, as and for the purposes set forth.

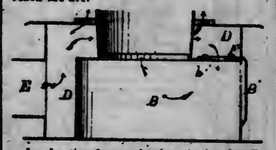
159,966. HEATING-DRUMS. F. Proudfoot, Toronto, Canada. [Filed Dec. 18, 1874.]

Brief.—The inner drum is made tight at the bottom, to contain water for moistening the currents of air.

1. As an improvement in drum-heaters, and in combination with a smoke-pipe, F, the outer drum A and inner drum B, having perforations C at the rear and front sides of said drums for the passage of air wholly through, the inner drum B, said drum B having a water-tight bottom for the reception of water, and attached contiguously to opposite sides of the outer drum A, the smoke-space of the outer drum extending over the ends of the inner drum, as and for the purpose set forth.

2. In combination with smoke-pipe F, and outer drum A, and inner drum B, having water-tight bottom and perforations C, the perforated capped passage H, extending upwardly from the inner drum through the outer drum, for the passage of air solely within the inner drum, as and for the purpose set forth.

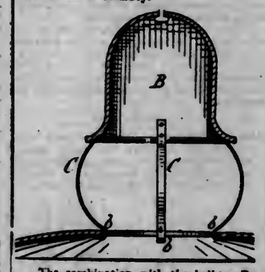
159,967. PLOWS. Artemas Rigby, Upper Stillwater, Mo. [Filed Dec. 21, 1874.]



Brief.—A low share having its outer edge provided with a sole running parallel with the land-side, and with cutters projecting from its top

The swivel-plow having the standard C, land-side E, and share G, the share having cutters *d d*, with a shoe, *f'*, upon its outer side, parallel with and upon the same plane as the land-side, substantially as and for the purpose set forth.

159,968. HEATING-STOVES. J. H. Robinson, Washington, D. C. [Filed Oct. 31, 1874.]



Brief.—The draft being sufficiently strong, a portion of the air will be drawn through the openings *b* to the ash-pit, and will then reach the fire.

In a heating-furnace having air-chamber D, surrounding the fire-pot and furnace proper, the combination of the air-tight door, B', a single cold-air duct, E, and a perforated ash-pit, B, with damper F, all substantially as set forth.

159,969. REFLECTORS. Gustav Rosenthal, Rochester, N. Y. [Filed Jan. 26, 1875.]

Brief.—The springs can be compressed and the reflector removed without removal of the smoke-bell or chimney.

The combination, with the bell-top B and reflector A, of the spring-arms C C, fastened at one end to the bell-top, and provided at the other end with the hooks *b b*, which enter the central opening *c* of the reflector, as and for the purpose specified.

159,970. WASHING-MACHINES. Peter A. Shipley and Abraham Wheeler, Woodberry, Md. [Filed Oct. 9, 1874.]

Brief.—The roller is formed of strips of wool, the ends being secured between rings and projections on metal disks at the two ends.

The strip *c*, in combination with the toothed disks *f* and the plain rings *d*, forming a support for said strips, and triangular projections *c'*, the whole forming the roller D, substantially as specified.

159,971.

159,972. HOOF-TRIMMERS. Andrew Shirran and William J. Givens, Pacheco, Cal. [Filed Apr. 11, 1874.]

Brief.—The body of the instrument bears against the outside of the hoof. The knife is attached to a sliding handle, and is operated by a disk-lever and flexible band.

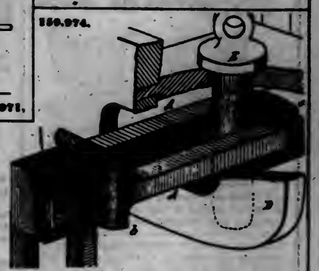
A machine for trimming hoofs, constructed substantially as shown and described—that is, having a working lever, A, and disk B, (connected with the knife-handle by a flexible connection,) knife K, handle E, and bar F, arranged as and for the purpose described.

159,973. SICKLE-HEADS FOR HARVESTERS. Michael M. Shelleberger, Hamilton, Mo. [Filed Nov. 19, 1874.]

Brief.—Adjustable guides upon the shoe support the sickle-head.

1. The adjustable lower race B, in combination with the coupling-shoe A, as shown and described, for the purpose specified.

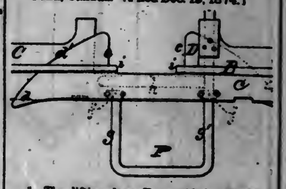
2. The combination of the shoe A, the separately-adjustable lower and upper races B and H, and the yoke F, substantially as and for the purpose shown and described.



3. The combination, with the cutter-bar Q, formed with the screw-threaded shank *q*, of the nut R and the yoke P, having the tubular elongation *p*, substantially as and for the purpose shown and described.

4. The combination of the yoke P, the boring Y' Y', and journal *r*, the nut R, the screw-thread *s* on the exterior of the nut R, and screw-threaded shank *q*, substantially as and for the purpose shown and described.

5. The combination of the shoe A, bolts *b*, brackets *m*, set-screws *n*, and upper race H, substantially as and for the purpose shown and described.

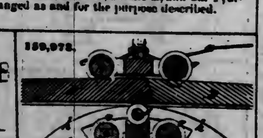


159,974. CAR-COUPLINGS. J. B. Stanwood, Philadelphia, Pa., assignor of one-half his right to J. Bilbrough, same place. [Filed Jan. 26, 1875.]

The combination of the link-retaining bar A, having a box or eye-shaped prolongation, B, and top and bottom stops *a b*, with the loose coupling-link C, substantially as set forth.

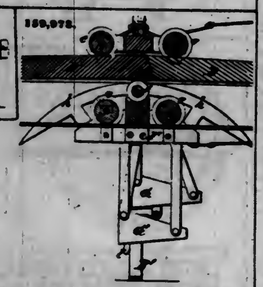
159,974.

159,975. CAR-COUPLINGS. W. F. Starr, St. John, Canada. [Filed Dec. 19, 1874.]



1. The lifting-loop F, provided with the cross-bar *h*, and operating in guides *f*, all combined substantially as and for the purpose specified.

2. In a car-coupler, the vertically-vibrating coupling-link B, and the rigid barbed and notched coupling-arms C, in combination with the lifting-loop F, provided with cross-bars *h*, so that both links may be uncoupled at one and the same operation, substantially as described.



159,976. CHILDREN'S WALKING-CHAIRS. Geo. P. Steinbeck, Baltimore, Md. [Filed Dec. 31, 1874.]

159,977.

159,978.

159,978. WIREWAYS. A. A. Smith, Georgetown, Colo. [Filed Dec. 30, 1874.]

Brief.—A is elevated wire cable, over which two cars travel in opposite directions at the same time without interference, by means of a hinged riding-track located at center of length of cable. One car rides upon said track, while the other remains upon the cable while passing each other. The cable is secured in sections by means of serrated clamps on top of supporting-posts. The cars are propelled by an endless rope in the usual manner.

1. A combined child's walking, playing, and commode chair, provided with the height-adjusting, locking, and traveling devices *b*, *b'*, and *c*, substantially as herein specified.

2. In a child's chair, the combination of the body A, seat C, having grooved ways, removable vessel *d*, and lid *g*, substantially as and for the purposes herein set forth.

3. The sliding piece *e*, fitted with the belt *a*, in combination with the slotted body A, provided with the toothed rack *f*, substantially as and for the purpose specified.

160,977. PEGS OR SOLE-FASTENINGS. B. F. Sturtevant, Boston, Mass. [Filed Dec. 17, 1874.]

1. That improvement in the art or process of manufacturing a peg or peg-ribbon consisting in first bringing the part intended to form the point to a blunt medium edge by cutting, and then, by compression, forming an acute bevel, including a portion of the body of the blank, and the point of which is the point of the previously-cut edge, substantially as described.

2. A compressed wooden peg-strip, the point of which has the characteristics essentially as set forth.

160,978. ROLLS FOR ROLLING ANGLE-IRON. A. Swift, Cincinnati, Ohio, and J. B. York, Newport, Ky. [Filed Jan. 13, 1875.]

A pair of rolls for making angle-iron, whose several grooves are so formed as to successively impart to the pile or bar the forms, first, of an obtuse or flattened V, having rounded apex; second, the same, with outerward offset; and, third, provision for excess of metal at the corners of the curves, as shown in fourth, fifth, and sixth passes, the passes being alternately inverted and consecutively less obtuse, terminating with the finishing-pass 7, substantially as and for the purpose set forth.

160,979. SAW-SETS. Josiah B. Titus, New York, N. Y., assignor to himself and J. McLean, same place. [Filed Jan. 18, 1875.]

The combination, with the plate or frame A, having interior openings B D E, lateral opening F, and bridge C, of the slide F, having jaw K and the screw I, all constructed substantially as and for the purpose set forth.

160,980. PROPELLING DEVICES FOR STREET-CARS AND THE LIKE. H. Tribble and N. A. Davis, Rusk, Tex. [Filed July 10, 1874.]

Brief.—For propelling street-cars and the like.

160,980.

In combination with the truck A, having bearings *b*, the drums C C and slatted belt D, substantially as and for the purpose set forth.

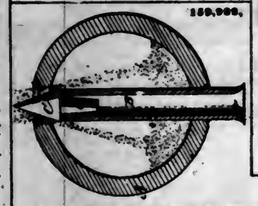
160,981. FAUCETS. Thomas Tully, Springfield, Ill., assignor of one-half his right to W. H. Doan, Cleveland, Ohio. [Filed Jan. 9, 1875.]

1. A valve formed by casting it into its valve-seat, substantially as and for the purpose described.

2. The combination, with a regular or irregular valve-seat, of a valve of soft metal, formed by casting it into the said valve-seat, substantially as and for the purpose described.

3. The combination, with a valve, formed by casting it into its valve-seat, of a suitable guide, consisting of the flattened top end *c* of the valve-stem and square hole *c'* in the top of the faucet A, whereby the said valve is made always to take the same seat, substantially as and for the purposes described.

4. The combination, with the valve-stem C, of a valve of soft fusible metal E, formed by casting the said valve over a head or crossbar, C', substantially as and for the purpose described.

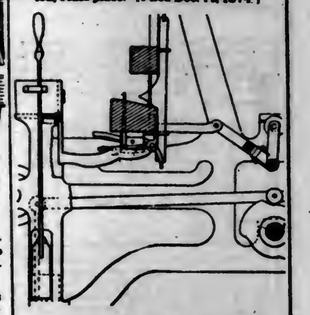


5. The combination, with the valve-seat B and the valve E cast therein, of the flattened stem C and a corresponding square orifice in top of the faucet A, whereby the valve is guided always to the same seat, substantially as and for the purpose described.

6. The combination of the valve-seat B, the valve E cast therein, the flattened stem C, and nut *c*, substantially as and for the purpose described.

7. The combination, with a faucet, of a valve-seat, B, and valve E cast therein, stem C, spiral spring D, and nut *c*, substantially as and for the purpose described.

160,982.

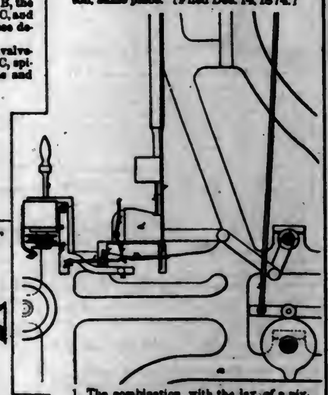


160,982. EXPLOSIVE SHELLS. Hiram Tyler Gemmeo, N. Y., assignor of two-thirds his right to J. Warren and N. H. Goerhart, same place. [Filed Feb. 8, 1875.]

1. A shell consisting of the soft-metal tube B, provided with a rest, and the outer shell A, these parts being connected together and combined for operation substantially as and for the purposes herein set forth.

2. The method of loading the shell A by first inserting the central soft-metal tube B into the case, and, by means of the cone C, causing the distribution of the charge, after which the tube is fully inserted and upset, substantially as herein set forth.

160,983. STOPPING MECHANISMS FOR LOOMS. J. A. Ware, Worcester, Mass., administrator of Jas. Bullough, deceased; said administrator assignor to G. Crompton, same place. [Filed Dec. 14, 1874.]

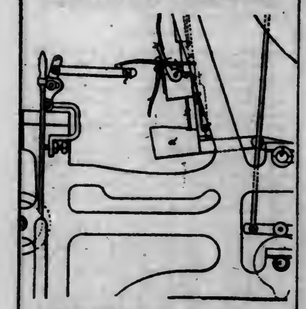


1. The combination, with the lay, of movable pins attached thereto, and adapted to be projected within the shed, and to retain or place the weft in the path of the weft-feeler, substantially as described.

2. The combination, with the lay and movable pins adapted to be projected within the shed and above the race of the lay, of a weft-feeler, substantially as described.

3. In combination, the lay, an arm or lever attached thereto, a pin or slide adapted to be moved above the race bottom and within the shed, and a projection attached to a stationary part of the loom, for operating the arm or lever, and pin or slide, substantially as described.

160,984. STOPPING MECHANISMS FOR LOOMS. J. A. Ware, Worcester, Mass., administrator of Jas. Bullough, deceased; said administrator assignor to G. Crompton, same place. [Filed Dec. 14, 1874.]

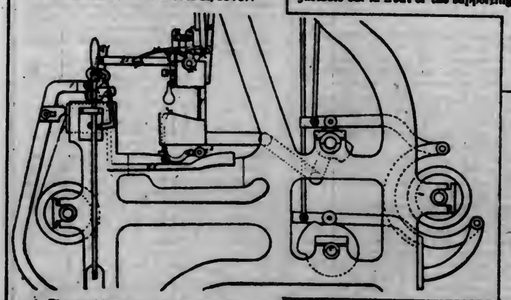


1. The combination, with the lay, of a pivoted lever or pin, projecting therefrom above the race-board, and adapted or arranged to be turned by the weft to prevent the stopping of the loom, substantially as described.

2. The combination, with the lay and its attached lever for actuating the shipping or stopping mechanism, of a rest and lever to move such lever for actuating the shipping mechanism, substantially as described.

3. The combination, with the lay and its attached lever *i*, adapted to be tilted by the weft, of a lever pivoted to the lay, and adapted to operate the belt-shipping mechanism when the weft fails, substantially as described.

4. In combination, the lever *p*, chains or cords *q*, pulley *r*, lever *r'*, and setting-on rod *s*, substantially as described.



160,985. STOPPING MECHANISMS FOR LOOMS. J. A. Ware, Worcester, Mass., administrator of Jas. Bullough, deceased; said administrator assignor to G. Crompton, same place. [Filed Jan. 11, 1875.]

1. The combination, with the movable bracket *a'*, of a pivoted fork or prong, which is raised or lowered to meet the weft and prevent the stopping of the loom, substantially as described.

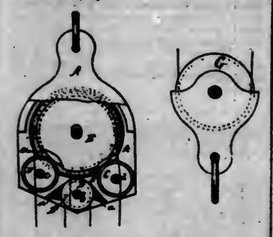
2. The combination, with a pivoted weft-fork or prong arranged upon the lay and operated by the weft, of a lever, also on the lay, operated by the weft fork, and adapted to engage and actuate the shipping mechanism when the weft is absent or broken, substantially as described.

160,986. STOPPING MECHANISMS FOR LOOMS. J. A. Ware, Worcester, Mass., administrator of Jas. Bullough, deceased; said administrator assignor to G. Crompton, same place. [Filed Jan. 11, 1875.]

1. The combination, with the lay, of a weft-feeling device composed of two movable parts adapted to operate within the shed, one part serving to place or hold the weft in position while the other part feels for the weft, substantially as described.

2. A weft-feeling device composed of two movable parts, and working within the shed between the selvages, combined with mechanism to withdraw the feelers from the shed when the lay beats up, substantially as described.

3. The combination, with the lay, of a weft-supporting fork, adapted to be projected above the lay and among the warps, and to support the weft, against the action of a feeler, adapted to feel for the weft, substantially as described.



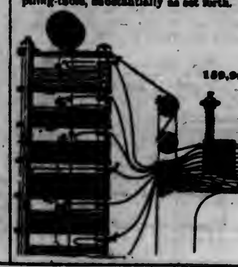
4. The combination, with the lay, of weft-feeling devices, adapted to be projected into the shed and bear on opposite sides of the weft, substantially as described.

5. The combination, with the lay, of the movable weft-forks, pivoted and adapted to be projected within the shed and to support the weft, substantially as described.

6. In combination, the lay, the two movable weft-feeling devices, adapted to be projected within the shed, and a lever for moving the shipping mechanism to stop the loom, the arm being moved by the weft-feeler when the weft is absent, substantially as described.

160,987. DIFFERENTIAL PULLEY-BLOCKS. Benj. F. Warren, Fishkill, N. Y., assignor of one-half his right to Danl. W. Warren, Newark, N. J. [Filed Aug. 4, 1874.]

Brief.—A double-grooved sheave is supported by two friction-pulleys. Between the latter there are two guiding-sheaves for the rope, all in a case, wherein is a vertical slot for the center-pin of the main sheave, to prevent lateral play.



In combination with the sheaves or wheels C D, case A, and guiding sheaves or wheels B and B', the loose sheave or pulley E, with grooves *e e'*, substantially as and for the purposes set forth and described.

160,988. MACHINES FOR FILING TEXTILE MATERIALS. Alma Warth, Stapleton, N. Y. [Filed Jan. 20, 1875.]

Brief.—To facilitate the piling of cloth upon a table preparatory to marking and cutting, the packages are placed in a vertical frame provided with shelves or with bearings, and the several ends of the layers or pieces being placed in a clamp, they are drawn upon the table by a windlass. To guide and smooth the fabrics they are passed through a series of separating-plates arranged upon an adjustable bar in front of the supporting-frame.

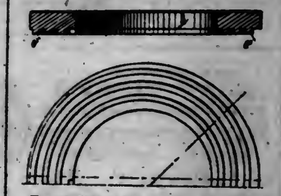
1. The combination, with a piling-table, of a package-supporting frame containing two or more supports for packages, and with guide rods or rollers for guiding the layers to the piling-table, substantially as set forth.

160,988.

2. The combination, with a piling-table, of a package-supporting frame containing two or more supports for packages, and with guide rods or rollers for guiding the layers to the piling-table, substantially as set forth.

3. In combination with a series of shelves for supporting the packages of the material to be piled, the rods *b*, extending through the shelves on one side, and the cords *c*, rising from each shelf on the opposite side, substantially as and for the purpose set forth.

4. In combination with the package-supporting frame and with the piling-table, two or more separators, extending across the piling-table for guiding the layers and removing the wrinkles, substantially as shown and described.

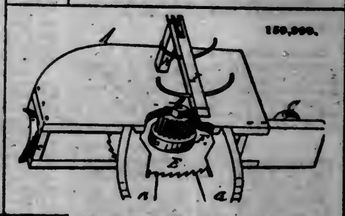


5. In combination with the separators, a supporting-bar which swings on a pivot fastened to the side of the piling-table, and which allows of adjusting the separators in the required position, substantially as set forth.

6. In combination with the piling-table and the separators, the clamp D, which serves to draw the layers through the separators, substantially as shown and described.

7. In combination with the package-supporting frame, the piling table, the separators, and the clamp for drawing the layers through the separators, a windlass for drawing the clamp over the piling-table, substantially as set forth.

160,989. SCROLL-CHUCKS. J. E. WARREN, Oneida, N. Y. [Filed Dec. 10, 1874.]



Brief.—The ends of the threads of the scroll-plate are cut square, or at right angles across. The first and last threads of the dogs are similarly formed, and tend, by reason of such formation, to push the dirt in front of them, and thereby prevent clogging.

The scroll or face-plate A, and boxes B, each having their threads *a* and *b'* *b'* constructed with their ends square, or at right angles to the length of the thread, as herein shown and described.

160,990. CORN-HARVESTERS. W. N. West, Milford, Mich. [Filed Dec. 11, 1874.]

Brief.—The corn that is cut by the saw falls upon arms in a bar which is pivoted, so as to be turned for the purpose of delivering the sheaf after being bound.

160,990.

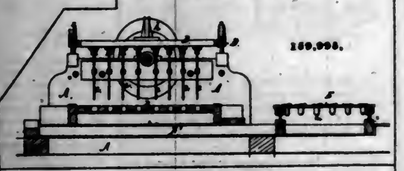
1. The combination of the revolving post H and bar I, provided with curved fingers, with the frame A, when the parts are arranged to operate substantially as and for the purpose described.

2. The combination, with the frame A, of the arbor D, saw E, guides G, revolving post H, bar I, provided with curved fingers, and wheel R, all constructed and arranged substantially as described and shown, for the purpose set forth.

169,991. SHOE-TIPS. Hugh White, Chicago, Ill., assignor of two-thirds his right to C. H. Fargo & Co., same place, and John Mundell & Co., Philadelphia, Pa. (Filed Sept. 19, 1874.)

Brief.—The wings of the blank are turned over to form the tip, and thus dispense with the usual seam across the toe of the shoe.

The leather-blank having tip-forming prolongations *a* and wings *b* in one piece therewith, substantially as and for the purpose specified.



169,992.

1. The combination of the plate D and its square projection *a* with the arm H, having a hub with a square recess adapted to the said square projection, and with the set-screw *d* and spring, all substantially as set forth.

2. The combination of the plate D, its square projection, and stop *e* with the arm H, its square recess, and stops *f f*.

169,993. TORPEDO-FILLING MACHINES. D. J. Wolfe and G. A. Lillendahl, Jersey City, N. J. (Filed Aug. 19, 1874.)

169,994.

169,995.

169,992. JOINTS FOR STEAM-GENERATORS. H. Whittingham, Brooklyn, N. Y. (Filed Dec. 23, 1874.)

Brief.—Tapering tube ends fit into corresponding sockets, and are secured together by tapering nuts screwed on the ends of the smoke-tube, thus allowing for contraction and expansion.

The combination of the return-line C, having screw-threads at its ends, exterior water-tube B, having plain tapering ends, the heads A A, having plain tapering seats *c*, and the tapering nuts D and E, applied to the screw-threaded ends of the return-line for clamping the parts in place, substantially as described.

169,993. FORMER FOR FORMING WATCH-CASE BACKS. Fritz H. Wilby, Philadelphia, Pa. (Filed Jan. 6, 1875.)

Brief.—The back C is clamped upon the form by the nut B. Then a burnisher is used for pressing down the back until it fits the form.

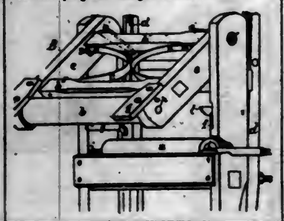
The chuck A, in combination with the clamping-ring B, for making the finished back, substantially as described.

169,994. FASTENERS FOR THE MUSTING-BALLS OF SAMPLES. Jos. M. Withers, Philadelphia, Pa. (Filed Sept. 3, 1874.)

Brief.—The novelty consists in a square projection on the plate, or on an upwardly-projecting tube, and a square recess within the lower part of the bolt, so arranged that by the action of a spring and set-screw from either top, the swinging arm, when in position over both sockets, is depressed or lowered till it receives and fits over the square projection of the plate, thus firmly locking the device, an opposite movement of the set-screw being necessary to release it.

1. The priming-rod C, provided with a notch at or near its lower end, for the purpose of holding or carrying the proper quantity or charge of detonating compound, substantially as and for the purpose herein set forth.

2. The safety fulminate-tray D, having small chambers or compartments, the bottom of which are made of thin paper-cloth or other suitable material, substantially as and for the purposes herein specified.



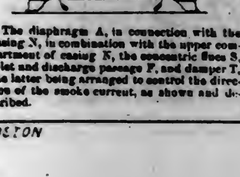
3. The plate E having rollers or wheels, in combination with the trim-way *c* and the sliding frame F, substantially as and for the purpose herein specified.

4. In combination with a machine for priming torpedoes, the sliding frame F, arranged so as to carry the fulminate-tray D into the machine when the plate E is withdrawn from the machine, and to carry out from the machine the tray D when the plate E is inserted, substantially as and for the purpose set forth.

5. The spurs *i* and *f* on the cam A, in combination with the frame F, arranged and operating substantially as and for the purpose herein specified.

169,996. CLOTHES-WRINGERS. Philip N. Wolfston, Springfield, Ohio, assignor of one-half his right to B. C. Converse. (Filed Oct. 21, 1874.)

Brief.—Two frames are pivoted together at their upper ends, a roller being journaled in each of these frames, which are held in contact by latches. Another frame is connected for clamping the wringer to a tub



1. In a clothes-wringer, the frame B, having the springs *c*, the roll *b*, guards *g*, latch *l*, pin *p*, and the arms *c'*, in combination with the uprights *d'* and roll *a*, as described.

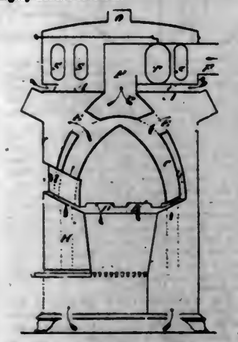
2. The uprights *d*, in combination with the uprights *d'* and screw-bolts *c''*, and arms *c'*, substantially as described.

169,997. PROCESSES AND APPARATUS FOR COOLING LIQUIDS. Lucien B. Woolfolk, Lexington, Ky. (Filed Nov. 7, 1874.)

Brief.—The refrigerator proper has two compartments bounded by a perforated partition—one to hold ice, the other salt. Surrounding this refrigerator is a jacket holding water. Outside thereof is another receptacle holding water, surrounding the pipes containing the liquid to be cooled. Thus salt is kept in contact with upper portion of the ice, and the severest cold being confined within the jacket next to the refrigerator, the liquid in the pipes is cooled, but not frozen.

1. The process of cooling liquids by the use of ice and salt placed in separate receptacles in a refrigerating-vessel, and imparting their cooling effect through the medium of water in contact with pipes or vessels containing the liquid to be cooled.

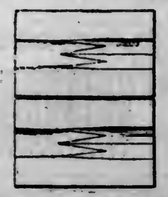
2. The combination, with the pipe D, of the refrigerator E, the salt-receptacle *a*, the ice-compartment *b*, the waste-pipe G, and the casing-vessel F, in the manner and for the purpose set forth.



3. In combination with the refrigerating-vessel E, the salt-receptacle *a*, for the purpose of causing the salt to remain in contact with the top of the brine, and keep it so far saturated as to melt ice at a very low temperature, substantially as described.

4. In combination with the refrigerating-vessel E and the cooling-pipe D, the casing-vessel F, for the purpose mentioned.

REISSUES.

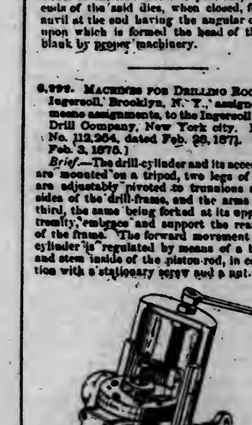


6,990. HOT-AIR FURNACES. David Boyd, New York, N. Y. Patent No. 153,926, dated Aug. 11, 1874. (Filed Jan. 26, 1875.)

Brief.—The air entering the bottom of the furnace is discharged below the diaphragm. The fresh air, entering just above the diaphragm, does not come in contact with very highly-heated surfaces.

The diaphragm A, in connection with the casing N, in combination with the upper compartment of casing N, the eccentric flues S, inlet and discharge passage F, and damper T, the latter being arranged to control the direction of the smoke current, as shown and described.

6,991. MANUFACTURE OF BOLTS. Wm. J. Clark, Milldale, Conn. Patent No. 43,669, dated Aug. 2, 1864; antedated Feb. 2, 1864; reissue No. 1,016, dated Mar. 26, 1866. (Filed Oct. 31, 1873.)



1. The process, substantially as hereinbefore set forth, of forming, from a round piece of metal, a headed bolt-blank, having an angular neck and a round stem, which process consists in subjecting a portion of the length of the round piece of metal to lateral swaging or compression on all sides simultaneously to form the angular neck, and, while the piece is firmly held with the neck portion inclosed at all sides, upsetting the projecting end of the swaged piece of metal to form the head of the bolt-blank.

2. The process, substantially as hereinbefore set forth, of forming the angular neck and protuberant head of a bolt, which consists in subjecting a round piece of metal to lateral swaging between angular-grooved dies, the end surfaces of which dies, when closed, form the anvil against which the projecting end of the swaged piece of metal is upset and formed into a head by proper machinery.

3. The swaging-dies, made substantially as hereinbefore set forth, so that one portion of the cavity inclosed by them is round, and another portion of said cavity is angular, and the said two portions are connected by an interrening portion of less transverse area than either of the said first two portions, and the ends of the said dies, when closed, form an anvil at the end having the angular opening upon which is formed the head of the bolt-blank by proper machinery.

6,992. ROCK-DRILLS. S. Ingersoll, Brooklyn, N. Y., assignor, by mesne assignments, to the Ingersoll Rock-Drill Company, New York city. Patent No. 115,476, dated May 30, 1871. (Filed Feb. 3, 1875.)

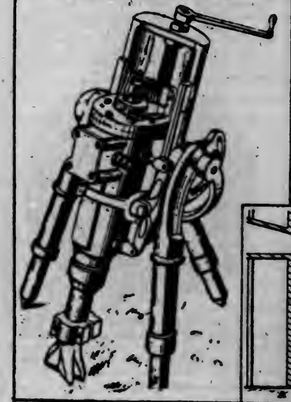
In organized machinery for drilling rock, &c., the combination, with the steam-cylinder, steam-valve, and valve-operating tappets projecting laterally into the interior of the cylinder, of the steam-piston, arranged to operate said tappets, and to continue its stroke without being restrained by the same, the drill-carrying rod fixed to said piston and working through one head of the cylinder, and mechanism arranged to rotate said piston and drill-carrying rod within the cylinder, substantially as shown and set forth.

6,993. MACHINES FOR DRILLING ROCK. S. Ingersoll, Brooklyn, N. Y., assignor, by mesne assignments, to the Ingersoll Rock-Drill Company, New York city. Patent No. 112,204, dated Feb. 28, 1871. (Filed Feb. 3, 1875.)

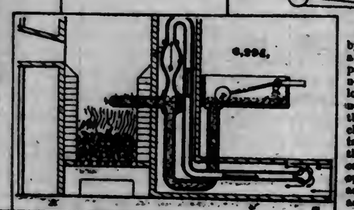
Brief.—The drill-cylinder and its accessories are mounted on a tripod, two legs of which are adjustably pivoted to trunnions at the sides of the drill-frame, and the arms of the third, the same being forked at its upper extremity, embrace and support the rear part of the frame. The forward movement of the cylinder is regulated by means of a button and stem inside of the piston-rod, in connection with a stationary screw and a nut.

1. A tripod composed of two ordinary legs and one forked leg, substantially as described, whereon a drill may be mounted and tilted, as specified.

2. A tripod with telescopic legs having adjustable bearings at their upper ends, one of said legs being forked, substantially as specified, whereby greater facility is afforded in tilting a drill and supporting the same on uneven ground.

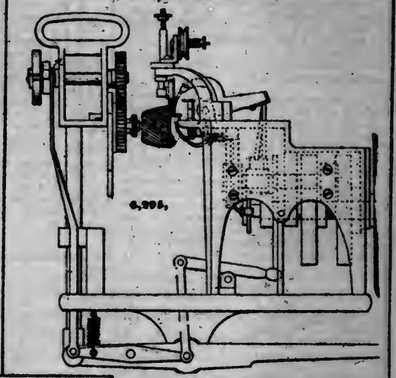


3. A tripod with telescopic legs, substantially such as are described, said legs having slots of varying depth formed in them in the manner and for the purpose specified.



4. A tripod composed of two ordinary legs and one forked leg, a slotted sector making part of each of the ordinary legs, as described, in combination with a drill-frame and its trunnions and clamp-screws, whereby the drill-frame can be held firmly tilted, if required, and held in any desired position when tilted, the combination being substantially such as specified.

5. A button and its stem arranged inside of the piston-rod, in combination with a screw and nut, whereby the cylinder is permitted to move forward, substantially in the manner and for the purpose specified.



6,993.

6,994.

6,995.

6,994. HOT-AIR FURNACES. J. C. Weldon, Pittsburg, Pa. Patent No. 119,965, dated Oct. 17, 1870. (Filed Nov. 30, 1874.)

Brief.—Designed to thoroughly moisten the whole body of air which is to be conducted to the apartments.

The method of generating steam and introducing it into the air-passages of an air-heating apparatus, by passing the water for the production of such steam into a hollow arm, F, so extending through the walls of the furnace and into the fire-box, as to be acted upon by direct heat, and conveying the steam so generated, by means of suitable pipes H, into the air-passages E, leading to and around the outside of said furnace, in the manner shown and set forth.

2. The combination, with a hot-air furnace having a steam-generator, of an ejection-pipe leading downward from said generator, and having open communication with the air-inlet of the air-heating chamber, substantially as shown and described, so as to moisten the whole body of incoming air.

6,995. MACHINES FOR SEWING BOOTS AND SHOES. Henry Dunham, Jr., Abington, assignor, by mesne assignments, to Gordon McKay, trustee of the McKay Sewing-Machine Association, Boston, Mass. Patent No. 26,396, dated Sept. 9, 1859; reissue No. 1,363, dated Dec. 16, 1862; reissue No. 3,366, dated Apr. 20, 1869; reissue No. 6,061, dated Oct. 13, 1874. (Filed Feb. 6, 1875.)

Brief.—Adapted to sew shoes known as "turns." The upper and sole, wrong side out, are supported on a carrier, so moved as to present the edges of the shoe to the action of the needle, the latter entering the channeled portion of the sole near its edge, but on the same side or face, and then through the upper. In this position the needle is supplied with thread by means of a thread-carrier, and the thread is drawn through the upper and sole, and enchained in the manner of the common chain-stitch. One guide enters the channel portion of the sole, and the other bears on the upper, the latter resting about the edge of the sole. The last has a ridge near its edge, and forms a support for the sole between the channel and the edge of the sole, and through the action of the guides and ridge the sole-edge is bent so as to determine the depth of the stitch in the body of the sole, and the exit of needle with reference to the edge of the sole.

1. In a machine for sewing soles to uppers by a line of stitches, one face of which lies in a channel cut in the sole, and which stitches pass into, but not entirely through the thickness of the sole, the combination of the following instrumentalities, viz., a guide or channel-opener adapted to enter and bear against the two inner faces or the inner angle of the channel, a guide or guiding or resisting surface, against which the upper at the edge of the last rests, or is borne, and a movable lock or last-carrier for supporting the shoe, all operating to hold and present the shoe to the action of the sewing mechanism, substantially as shown and described.

2. In a machine for sewing boots and shoes known as turns, and operating to connect a sole and upper, mounted on a last, a guide, or channel-opener, (that enters the channel in and bears against the inner face of the sole or channel,) combined with a guide or surface against which the upper at the edge of the sole rests, and with a needle and thread-guide operating to connect such sole and upper by stitches which pass into the sole.

3. In a machine for sewing turned shoes, the combination with the guide made to enter in and bear against the inner face of the sole or channel, of the guide or surface constructed to hold and bear the outer edge of the sole toward the face of the last, whereby the needle may enter and pass from the same side of the sole.

4. The last, having the ledge or edge *a*, adapted to bear on the sole between the channel and edge of the sole, in combination with guides or gages H and I, the combination operating to bend the sole about such ledge or ridge for the passage of the needle.

5. In combination with a last-carrier, supported substantially as described, whereby its distance from the sewing mechanism may be varied, a feed-movement, acting through the said last-carrier, as set forth.

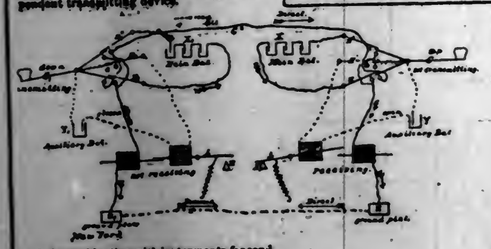
6. The combination of the guides or gages H and I bearing against the same side or face of the work, for the purpose of regulating the entrance and exit of the needle or other piercing instrument and the distance of the stitches from the edge of the sole.

7. The guide or bearing H, constructed with two bearing faces or surfaces adapted to bear on or hold the upper around the edge of the sole, substantially as described.

8. The guide I, combined with the needle, and rendered adjustable with reference to the path in which the needle moves, as and for the purpose set forth.

9. The curved needle N, when constructed with a hook upon its side or flank, substantially as described.

10. The combination of the curved needle N and the awl-tip P, constructed and operating substantially as and for the purposes stated.



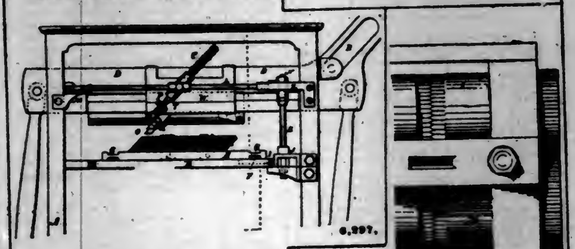
11. The combination of the curved awl O and curved hooked needle N, substantially as described.

6,296. METHODS OF SENDING AND RECEIVING MESSAGES SIMULTANEOUSLY OVER THE SAME TELEGRAPH-WIRE. M. G. FARMER, Salem, Mass. Patent No. 21,326, dated Aug. 31, 1858; extended seven years. [Filed Feb. 19, 1873.]

Brief.—Combines with duplex telegraph a continuity-preserving key.

1. The combination, with a double transmitter, of a device which shall preserve the continuity of the main circuit, by closing one branch or path thereof, which was previously open, at the same time or slightly before that it opens another branch or path that was previously closed.

2. The combination of such a continuity-preserving device with an equating circuit which shall hinder the armature relay or other receiving-instrument from responding to the action of this transmitting key or device, unless assisted by the action of some other independent transmitting device.



6,296.

3. In combination with instruments for sending and receiving messages simultaneously upon one wire, a key or device, arranged to transmit signals by reversing the direction of the main battery current, without interrupting the continuity of the main circuit.

4. The combination of a continuity-preserving key with a battery for transmitting signals to a distant station, and a relay or receiving instrument for receiving signals at the same time, from a distant station.

5. In instruments for the simultaneous transmission and reception of messages over one wire, the combination, at each station, of an accessory magnet or coil, an accessory battery, the accessory main-circuit magnets, and batteries with the means of reversing the direction of the current of each of the main batteries, substantially as set forth.

6,297. FLOWER-MAKERS' GRASS-CUTTING MACHINES. T. Millot and James Millot, New York, N. Y. Patent No. 144,016, dated Nov. 25, 1873. [Filed Jan. 26, 1874.]

6,297.

1. The combination of a cutting-board, E, and a clamp for holding the pack of material to be cut on said board, with a paper-cutting machine, the said board being arranged on a feed-guide having adjustability laterally to the feed, for shifting the pack to the position for cutting the slits, and also to the position for cutting off the bunches, substantially as specified.

2. The cutter C, made with the beveled end and a lower cutting-edge, in combination with the mechanism for clamping and moving the pack of sheets in cutting the slits of artificial grasses, as set forth, so that the material at the end of the slit is not injured, as specified.

3. The combination of a point-cutter, Q, with the cutter C and cutting-board, substantially as specified.

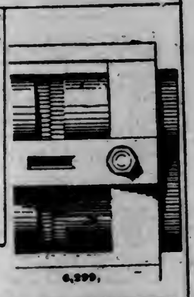
4. The said point-cutter connected with the shifting cutter-board guide H, to be shifted with the board, substantially as specified.

5. The cutter Q, arranged on a movable support, in combination with an incline on the cutter C, that moves it out of the way of said cutter C when the latter descends, substantially as specified.

6. The combination of the paper or cloth guide b with the cutting-board, substantially as specified.

7. The arrangement of shifting angle-bar H, standard K, swinging rod L, adjustable cutter-supports O, and spring Z with the cutter C and table B, substantially as specified.

8. The point-cutter Q, arranged to work in an inclined plane coinciding with the shearing inclination of the cutter C, substantially as specified.



6,298. PEGS OR SOLE-FASTENINGS. Chas. Rowland and J. G. Rowland, Quincy, Ill., assignors, by mesne assignments, to Benj. F. Sturtevant, Boston, Mass. Patent No. 68,006, dated Aug. 20, 1867. [Filed Feb. 10, 1875.]

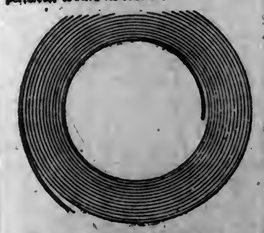
A strip of sole-fastenings united together by thin films of the substance forming the substances of the fastenings, substantially as described.

6,298.

6,299. MACHINES FOR MAKING COMPRESSED PEG-STRIPS. Charles Rowland and Jos. G. Rowland, Quincy, Ill., assignors, by mesne assignments, to Benj. F. Sturtevant, Boston, Mass. Patent No. 68,006, dated Aug. 20, 1867. [Filed Feb. 10, 1875.]

6,299.

1. Compressors for compressing a peg-strip, having recesses or dies, and adapted to compress or consolidate the peg-strip, substantially as described.



2. That improvement in the art or process of manufacturing pegs or ribbon peg-strips consisting of compressing the peg-strip between heated compressors, thereby condensing the pegs or peg-strip, substantially as described.

3. As a new article of manufacture, a compressed ribbon peg-strip, of leather or its described equivalent.

4. Grooved heated compressors, combined and acting to compress a peg or peg-strip, substantially as described.

6,300. BLANKS FOR SHOE-PEGS. Benjamin F. Sturtevant, Boston, Mass. Patent No. 25,149, dated Aug. 16, 1859; reissue No. 2,366, dated June 12, 1866; extended seven years. [Filed Feb. 8, 1875.]

Brief.—The peg blank or ribbon is unwound or produced from a log or cylindrical block of wood by a prolonged spiral cut, tending constantly, by the desired thickness of the ribbon for each revolution of the block, from its perimeter toward its center.

1. A peg-blank consisting of a ribbon of wood made and constituted substantially as described.

2. The described ribbon peg-blank, having one of its edges sharpened, substantially as and for the purpose set forth.

OFFICIAL GAZETTE

OF THE

United States Patent Office.

VOL. 7.—NO. 8. TUESDAY, FEBRUARY 23, 1875. PRICE { $6,00 per year—single. $5,00 per year in clubs.

The OFFICIAL GAZETTE is published on Tuesday of each week, from the United States Patent Office. The subscription price for 1875 is six dollars per year for single subscribers; five dollars per year to clubs of not less than five sent at one time, and which will be mailed free of postage to separate addresses if desired. Subscriptions will commence and terminate with the year. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

FOREIGN PATENT LAW.

JAPAN.

TRANSLATION OF THE LAW OF MAY 25, 1871, REGULATING GRANTS OF EXCLUSIVE PRIVILEGES TO INVENTORS.

May 25, 1871.

Henceforward exclusive permission to trade in newly-invented articles of all kinds whatsoever will be granted to the inventors; in consequence whereof, should any person residing in any part of the country be desirous of obtaining such exclusive permission, the application shall for the present be made to the Home Office in accordance with the regulations which follow.

Patents shall be granted for a term of years to all persons who increase the conveniences of life, who newly invent any chemical apparatus, machinery, utensile, or furniture, weapons, woven fabrics, &c., or who improve existing furniture or utensils.

The term of years shall be fifteen years, ten years, or seven years, according to the value of the invention.

Any person desirous of obtaining a patent shall send in his application to the local authorities of the district in which he resides, accompanied by a description, drawings, &c., which shall be forwarded to the Home Office, and the Home Office shall issue the patent.

The objects of the invention or the improvement shall be carefully drawn in cross-section and plan, and in the case of machinery the parts must be numbered or lettered in accordance with the description, so that everything may be clearly comprehensible at a single glance; and the seals of the inventor and of his surety must be attached to the drawings. Models may be furnished of articles of which drawings cannot easily be made.

When the document containing the patent is issued by the Home Office the local authorities shall deliver it after having obtained a receipt from the inventor and his surety.

A duty of five riô (1*l.* 1*s.* 3*d.*) shall be paid annually in advance during the period for which the patent is granted into the hands of the local authorities.

The duty may be increased or diminished, according to the nature of the invention. The amount shall be forwarded to the Home Department as soon as it is collected.

No duty shall be paid until six months have elapsed from the granting of the patent, that period being allowed for the inventor to try whether the sale be remunerative, and when he has ascertained that it is remunerative he will pay in one year's duty to the local authorities.

If, from the trial made during the first six months the sale turns out to be unremunerative, the application may be withdrawn at the option of the patentee; but in case such application be made after the expiration of the six months, the duty for one year already paid in advance will not be returned.

The applications sent into the Home Office will receive consideration according to priority of arrival.

Where the invention of another has simply been improved, the application must distinctly state the name of the original inventor, and the nature of the improvement. Where the invention in respect of which an application is made resembles a prior invention by another individual, but actually differs in construction or use, the points of difference must be clearly laid down in the application.

No patent will be granted for articles of general convenience, though the inventor be known beyond the possibility of mistake, and be yet alive, if the invention has been in general use for several years previous to the application.

Separate patents will not be given to each individual who may have combined with others to produce an invention, but a single patent will be issued in the name of all the partners of the company.

The owner of a patent may freely dispose of it for such sum as seems fit, during the period for which it has been granted; and both parties shall make application to have the fact endorsed upon the patent.

The patentee is at liberty to establish branch shops in his own name, or to teach others how to make the articles patented by him.

Should the patentee die before the patent expires, he may leave the patent to a relation; but application must be made to have the transfer endorsed thereon.

The Home Office shall publicly notify in each case that a patent has been granted to such and such a person, of such and such a place, giving also the names of the department, province, and the seat of the local authority, in consequence of his having invented such and such an article.

Should the patentee incur such losses during the term of years as he is unable to make good, if the article after due inquiry is found to be of indispensable public necessity, an extension may be granted.

Each separate article must bear the words "by Government sanction," together with the name of the inventor.

Fines shall be imposed on persons who fraudulently make use of a patentee's name, or who, not being in the enjoyment of a patent, make use of the term "by Government sanction."

COMMISSIONER'S DECISIONS.

MCBRIDE *vs.* HENDERSON.—*Appeal.—Interference.*

[*Appeal from the decision of the Board of Examiners-in-Chief in the matter of the interference between the applications of Thomas McBride and William M. Henderson, for letters patent for an* "IMPROVEMENT IN HYDRAULIC CAR-BRAKES."—*Decided January* 25, 1875.]

THACHER, *Commissioner:*

This case is a continuation of a bitter contest between parties who mutually charge each other with theft and perjury.

On April 4, 1873, Henderson filed an application for a patent for a car-brake controlled from the engine, and operated by hydraulic pressure, the first claim of which was for—

A three-branched cock or valve combined with a water-tank, a steam-boiler, and hydraulic brake-operating cylinders, so that in one adjustment of the cock the brake-cylinders may fill or empty from the tank, and in the other adjustment of said cock the pressure within the boiler is transmitted to the fluid operating the brake-pistons, substantially in the manner set forth and described.

The patent was granted on the 12th of the following August.

Previous to the granting of this patent, however, and on July 1, McBride had filed an application embracing the same subject-matter as above set forth in Henderson's patent, and, in addition thereto, an arrangement of devices for the employment of glycerine, or other non-freezing liquid, during cold weather.

On September 16 an interference was declared between McBride and Henderson in the matter of the first claim of Henderson, above granted.

September 22, 1873, Henderson also filed an application for a patent embracing an arrangement of devices for the employment of glycerine in a car-brake, which arrangement constitutes the subject-matter of the present interference.

October 13, 1873, McBride withdrew from his original application all matter in reference to the glycerine attachment therein described, and made it the subject of a new application, which was filed on the same day.

October 24, a second interference was declared between this last application of McBride for the glycerine device and the application of Henderson filed September 22.

McBride, in his applications of July 1 and October 13, 1873, described and claimed an arrangement for the employment of glycerine, or other non-freezing liquid, with water, by the use of a tank containing the liquid from which the conveying-tube was supplied, in combination with a check-valve controlling the supply, and a three-way cock controlling the communication between the boiler and the said conveying-tube.

Upon a disclaimer by Henderson of the above combination of a glycerine-tank, and tubes leading to the boiler, whereby the two fluids could be commingled, accompanied by a motion on his part to dissolve the interference, the interference was finally dissolved by the primary examiner, and McBride's device allowed to go to patent.

On January 23, 1874, however, McBride returned to the Office with another application, covering, unmistakably, the devices of Henderson as set forth in his application of September 22, 1873, and on February 18, 1874, the present interference was declared.

The claims of McBride comprehend the particular devices now in dispute, and are as follows:

The cylinder G, containing the diaphragm *g*, in combination with the pipes E E', leading from the boiler to the brake-cylinders, the pipe H, provided with the check-valve h, pipes I K, cock *c'*, and a cock or cocks for regulating the boiler pressure and relieving the brakes, substantially as described.

In combination with the cylinders G and pipes E, E', I, and K, the stop-cocks *c'*, *i'*, and *k*, and a cock or cocks for regulating the boiler pressure and relieving the brakes, arranged, as described, for the purpose set forth.

This arrangement of devices for the employment of non-freezing liquids is widely different from that set forth by McBride in his first application of July 1, 1873. The latter application, it is alleged, was made for the ostensible purpose of protecting his rights to the invention of which he claims Henderson had in the previous spring attempted to defraud him. It is therefore very natural to suppose that he would have included therein the particular devices which he felt he was in danger of losing, especially as McBride knew, as the testimony on both sides now shows, that several months before he filed his July application, Henderson had made a drawing of a glycerine attachment, which he claimed in public and in private, and before McBride, as his own invention. Notwithstanding this fact, McBride proceeded to set forth in his application a very different arrangement.

In this state of the case, the inference would at once arise that the device for the employment of glycerine described by McBride in his July application was the precise and only invention of the kind which he had then made. This inference has become an established conviction in my mind, after a careful consideration of all the testimony adduced in both the former and the present interference. In the former case, although the glycerine attachment was not a part of the subject-matter in dispute, Henderson asserted his claim to the particular device now in controversy, in connection with the idea of the brake, yet McBride neither in his preliminary statement nor in his deposition alluded to the matter, nor did he attempt by way of rebuttal to correct the statements of Henderson and his witnesses. Douglass, the only witness on the part of McBride in that interference whose character for veracity was not sought to be impeached, testified that when McBride

described to him, some time before Christmas, 1872, his proposed brake apparatus he also understood him to say that he had a *small tank* for the use of glycerine, which, as the witness testifies further, McBride intended to employ in the particular arrangement of pipes, &c., constituting his brake apparatus. Three other witnesses of McBride testified that, as early at least as November, 1872, he informed them of his idea of using glycerine with his brake. They gave no description of any arrangement proposed by McBride for that purpose, but convey the impression, by their statements, that the glycerine was to be used in the particular brake apparatus then in dispute.

Thomas, a witness on the part of Henderson, and to whom Henderson showed the drawing of the device now in dispute, in the presence of McBride, testified that at that interview McBride only claimed that he *suggested* the application of glycerine to prevent freezing, and that he urged his claim to co-ownership with Henderson to the brake and glycerine attachment on the strength of having made that suggestion.

Jenks, another witness on the part of Henderson, and who witnessed, by his signature, Henderson's drawing of the brake with the present glycerine arrangement attached, in the presence of McBride, testified that McBride then gave him to distinctly understand that Henderson was the inventor of the entire device. Thomas and Jenks appear to be entirely disinterested witnesses.

So far, then, as the testimony in the former interference relates to the *devices* for the employment of non-freezing liquids, it clearly indicates that, whatever else McBride may have originated in that direction, the arrangement now in controversy was not among his plans.

Adhering to the plan set forth by him in his first and a subsequent application, and ignoring the arrangement claimed by Henderson, it was not until he found, by the action of the Patent Office, that his claims would not cover those of Henderson that he incorporated Henderson's invention in an application of his own.

In this interference McBride adds to his previous charges the accusation that Henderson has attempted to defraud him of this invention also.

This is a grave charge, and, as the presumption of law is in favor of Henderson's innocence, the charge, to stand, should be supported by clear, consistent, and abundant proof. In my opinion, the proof advanced lacks all of these qualities.

McBride, in his deposition, sets forth that he conceived the invention in dispute in December, 1872, or January, 1873, and at that time communicated the same to Henderson by means of rough sketches, and urged Henderson to make a drawing of it. This device, he says, was his *first* idea, and he insists that he "*subsequently discovered that he could do without a cylinder in which was the piston, and use simply the supply tank.*"

As has already been stated, the witness Douglass, on whom the most reliance was placed in the former interference, then testified to the effect that McBride communicated to him the idea of "simply the supply-tank" some time, he positively asserts, before Christmas, 1872.

McBride relies now for support chiefly upon the testimony of a Mr. Harwood, in whose presence, he alleges, he made his rough sketches and explained them to Henderson. Harwood testified in the former interference, but at that time made no allusion to a glycerine arrangement as the invention of McBride. He now admits that his conclusion, that the invention which McBride described to Henderson in his presence, as above set forth, was the precise one now in controversy, has been arrived at from *having seen Henderson's preliminary statement*, filed in this case, in which Henderson clearly describes the invention, and illustrates it by a drawing. Harwood's testimony, perused in the light of Henderson's preliminary statement, to which he appears so much indebted, affords very meager support to McBride's claims.

Harlan, the next witness, testifies that McBride described to him this invention about the middle of January, 1873, but all that he can remember about it now is that McBride told him "that he used a cylinder or tank, or something of the kind, I think a cylinder. I think he said he had a piston he put on top of the glycerine, and put the pressure of the water on this piston, which forced the glycerine through the pipes."

In view of the fact that Harlan was a witness for McBride in the former interference, and was fully conversant with all the matters in dispute between the parties from the beginning, his vague and uncertain testimony creates no impression, except that of suspicion as to its truthfulness.

Grady, an attorney for McBride, has a long story to tell, some of which would have been relevant in the former interference, but not one word of which is pertinent to the present issue.

Young, who in the previous interference simply testified that in November, 1872, McBride had consulted him in regard to the qualities of glycerine, and in February, 1873, described to him a hydraulic car-brake, now alleges that, in that same interview in February, 1873, McBride described several ways of connecting a tank of glycerine with the brake, one of which arrangements, from Young's description, possessed some features in common with the device in controversy. His description, however, is very brief and imperfect. He is not corroborated, as to the interview he describes, by Henderson, or any one else, and his statements are inconsistent with the general history of the case, and the balance of the testimony adduced.

Tufts, the only remaining witness in behalf of McBride, except Cramer, whose testimony is irrelevant to this issue, testifies that McBride showed him a drawing, in November or December, 1872, of a hydraulic brake, and explained to him how it was proposed to apply water from a tank to the pipes by means of pressure from the boiler, and that he offered no explanation about the use of glycerine, except to say "*that he applied it with water* to keep it from freezing." In the fall of 1873 he heard Henderson describe a brake to a meeting of engineers, which he thought was the same thing McBride had described to him in the previous fall.

Leaving out of the case the *idea* of using glycerine, and confining the issue to the precise devices set forth in the conflicting claims of the respective parties, the testimony in behalf of McBride relating thereto, outside of his own deposition, is comprised in a very few sentences. Even this slender supply of evidence consists entirely of fragments of conversation had with McBride, and is not the result of inspection of anything which he had produced.

The evidence in behalf of Henderson is to the effect,

substantially, that he conceived this invention, and made the drawing of it, which accompanied his application for a patent, in March or April, 1873; that on the first day of May following this drawing was witnessed by B. H. Jenks and F. J. Lovegrove, who now affirm that fact; and that on the same day he made oath to his application. The first-named witness, Jenks, reiterates the statement made in the former interference, and which McBride has not denied, that McBride gave him to understand distinctly that the *devices* represented by the above-mentioned drawing were the invention of Wm. M. Henderson. This certainly is the conclusion at which I have arrived.

The decision of the Examiners-in-Chief is affirmed.

DECISIONS OF THE COURTS.

U. S. CIRCUIT COURT, DISTRICT OF MASSACHUSETTS.

THOMAS E. MURPHY *et al. vs.* LAURENT KISSLING *et al.*

[*In equity.—Before* SHEPLEY, *J.—October*, 1874.]

The invention of Francis McLaughlin, of a brush-head, provided with an angular groove and a rubber ring fitted therein, (patented January 11, 1870,) is not anticipated by a door stop provided with a rubber fitted in an angular groove.

The device adopted by defendants is none the less an infringement, because of the added feature of a flange, which extends in between the two parts of the brush-head and serves to pack the joint.

[*J. L. Newton*, for complainants.
J. T. Wilson, for defendants.]

[This was a suit under letters patent for an improved brush, granted to Francis McLaughlin January 11, 1870, being the same patent that was involved in the suit of *Murphy* et al. vs. *Eastham* et al., reported in OFFICIAL GAZETTE, vol. II, p. 61. The object of the McLaughlin invention was to obviate the danger of breaking glass and injuring the surface of wood or other substances to be washed or dusted by contact with the brush-head. To this end the patentee proposed to form a groove in the brush-head or stock near the bristles, and in this groove to insert a rubber band, one edge or angle of which should project outward and prevent injurious contact between the brush-head and the surface to be cleaned. The novelty of the invention and the scope of the patent were fully discussed in the case above referred to.]

SHEPLEY, *J.*:

This bill in equity is brought for an alleged infringement of the letters patent granted for the invention, by Francis McLaughlin, of an improved brush. So far as the defense set up, of want of novelty in the invention, relates to the evidence introduced by defendants of the Monzani patent and the rejected applications of Williams and Crittenden, it has been fully considered in the case of these same complainants against Eastham *et al.*, Massachusetts district, May term, 1871.

The defendants also set up, as anticipating the invention of McLaughlin, a door-stop made and used and sold by D. C. Smart. Smart's door-stop had an angular groove in it, with a rubber fitting therein, in the same manner as in the brush-head in the McLaughlin invention. It was not new, at the date of the McLaughlin invention, to put a rubber ring into an angular groove. What was new was his combination of a brush-head with an angular groove and a rubber ring fitting therein, whereby the elements of the combination operated together and jointly in the function of the brush.

The infringement in this case is clear—defendants use a rubber ring fitting into an angular groove in the brush-head in the same manner as in the McLaughlin patent. They claim that their rubber ring performs another function also—that, as they extend their rubber ring by a flange between the two surfaces of the two parts of the brush-head where they unite at the bottom of the groove as their brush is constructed, the rubber forms a packing, which makes the joint tight. This would be only an improvement, at best, upon the McLaughlin invention. But if the groove in the McLaughlin brush be made square, and an elastic band be used fitting this square groove, it would act in the same way as a packing to exclude the water from the joint, if the joint were at the bottom of the groove. This is one of the forms of McLaughlin's invention, and it is shown in Exhibit G.

This is a clear case of an attempt to evade infringement by a change of form merely.

Decree for injunction and account as prayed for in the bill.

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date February 23, 1875.]

8,070 and 8,071.—Writing-Paper.—HENRY D. CONE, Stockbridge, Mass.—Cases A and B. Applications filed February 5, 1875. Term of patents 14 years.

8,072.—Carpet.—JOHN H. SMITH, Enfield, assignor to HARTFORD CARPET COMPANY, Hartford, Conn. Application filed February 15, 1875. Term of patent 3½ years.

8,073 to 8,106, inclusive.—Carpets.—OTTO HEINICKE, New Utrecht, N. Y., assignor to HARTFORD CARPET COMPANY, Hartford, Conn. Applications filed February 9, 1875. Term of patents 3½ years.

8,107 to 8,125, inclusive.—Carpets.—HENRY HORAN, East Orange, N. J., assignor to HARTFORD CARPET COMPANY, Hartford, Conn. Applications filed February 9, 1875. Term of patents 3½ years.

8,126 to 8,131, inclusive.—Carpets.—LEVI G. MALKIN, New York, N. Y., assignor to HARTFORD CARPET COMPANY, Hartford, Conn. Applications filed February 9, 1875. Term of patents 3½ years.

8,132 to 8,151, inclusive.—Carpets.—ELMER J. NEY, Dracut, Mass., assignor to HARTFORD CARPET COMPANY, Hartford, Conn. Applications filed February 9, 1875. Term of patents 3½ years.

8,152 to 8,159, inclusive.—Carpets.—HENRY NORDMANN, New York, N. Y., assignor to HARTFORD CARPET COMPANY, Hartford, Conn. Applications filed February 9, 1875. Term of patents 3½ years.

8,160.—Carpets.—GEORGE W. PIGGOTT, New York, N. Y., assignor to HARTFORD CARPET COMPANY, Hartford, Conn. Application filed February 9, 1875. Term of patent 3½ years.

8,161.—Work-Stand.—MATTHEW S. DUNN, Rochester, N. Y. Application filed January 25, 1875. Term of patent 7 years.

8,162.—Carpets.—HEINRICH F. GOETZE, Boston, Mass., assignor to THE ROXBURY CARPET COMPANY, same place. Application filed February 10, 1875. Term of patent 3½ years.

8,163.—Rocking-Chair.—GROVE M. HARWOOD, Troy, and ROBERT WOOD, West Troy, N. Y. Application filed October 15, 1874. Term of patent 14 years.

8,164 and 8,165.—Glass Dishes.—GEORGE W. LOWNY, East Cambridge, Mass.—Cases B and A. Applications filed December 21, 1874. Term of patents 3½ years.

8,166.—Fork and Spoon Handles.—CHARLES OSBORNE, North Attleborough, Mass., assignor to THE WHITING MANUFACTURING COMPANY, New York city.—Case C. Application filed February 9, 1875. Term of patent 7 years.

8,167 to 8,171, inclusive.—Carpet.—JOHN H. SMITH, Enfield, assignor to HARTFORD CARPET COMPANY, Hartford, Conn. Applications filed February 15, 1875. Term of patents 3½ years.

8,172.—Carpets.—FREDERICK W. GREEN, Orange, N. J., assignor to HARTFORD CARPET COMPANY, Hartford, Conn. Application filed February 9, 1875. Term of patent 3½ years.

8,173 to 8,176, inclusive.—Carpet.—JOHN H. SMITH, Enfield, assignor to HARTFORD CARPET COMPANY, Hartford, Conn. Applications filed February 15, 1875. Term of patents 3½ years.

8,177 to 8,179, inclusive.—Carpet.—WILLIAM H. SMITH, Enfield, assignor to HARTFORD CARPET COMPANY, Hartford, Conn. Applications filed February 15, 1875. Term of patents 3½ years.

TRADE-MARKS REGISTERED DURING THE WEEK.

[Each certificate bearing date February 23, 1875.]

2,247.—Silver-Polish.—WILLIAM E. DURHAM, Fall River, Mass. Application filed January 14, 1875.

"'W. E. D.,' made in a monogram, with the word 'Trade' above and 'Mark' below, the whole inclosed by lines in the form of a shield."

2,248.—Shafts, Spokes, &c., for Vehicles.—JACOB A. LEIPPE, Lancaster, Pa. Application filed January 27, 1875.

"a plain anchor with the word 'Trade-Mark.'"

2,249.—Cigars.—S. LOWENTHAL & Co., Cincinnati, Ohio. Application filed February 8, 1875.

"'PEDRO,' and the representation of six playing-cards."

2,250.—Washing-Blue.—SIMON S. MYERS, Philadelphia, Pa. Application filed February 9, 1875.

"the representation of a bottle having its mouth stopped by a cork having a tube with its closed end projecting above said cork on a blue ground surrounded by the words 'Manufactured and put up only by S. S. Myers, Philad'a,' and the said words and bottle inclosed by a flat ring or circular band, having upon its face the words, 'Myers' Sprinkling Washing-Blue.'"

2,251.—Baking-Powder.—E. PLUMB SONS & Co., Grand Rapids, Mich. Application filed November 20, 1875.

"'Triumph' before the words 'Baking-Powder.'"

2,252.—Knitted Hosiery.—WILLIAM F. SALMON, Lowell, Mass. Application filed December 11, 1874.

"the representation of the banner suspended from a cross-bar, and this connected to a staff having cords to hold the cross-bar and the connected banner in position, with the words 'Trade Mark' above or below the banner."

2,253.—Teas.—WILLIAMS, BLANCHARD & Co., San Francisco, Cal. Application filed February 10, 1875.

"'Japan Tea,' 'Buddha Chop,' arranged above and below a figure representing Buddha—a heathen divinity—in the posture in which he is generally shown by them.

2,254.—Cosmetic.—ANNIE DELAND, New York, N. Y. Application filed February 13, 1875.

"'Eau Merveilleuse.'"

2,255.—Cigars.—ARTHUR W. FOOTE, Brooklyn, N. Y. Application filed February 5, 1875.

"'La Doncella de Orleans.'"

2,256.—Tooth-Paste.—FORSTER & STOWALL, Philadelphia, Pa. Application filed February 6, 1875.

"'Sphynx.'"

2,257.—Cigars.—GOLDSMITH & NEWBURGH, Cincinnati, Ohio. Application filed February 18, 1875.

"'EXPOSITION.'"

2,258.—Pocket Spirit-Stoves.—GEORGE P. HOUSTON, Washington, D. C. Application filed February 16, 1875.

"two cannons crossed, an anchor placed thereon in a central vertical position, and the whole inclosed by a single coil of rope, the ends of which are passed through and held by the cable-ring of the anchor."

2,259.—Steam-Engines and Machinery Relating to the Treatment of Paper.—VICTOR E. MAUGER, New York, N. Y. Application filed February 13, 1875.

"the representation of an arrow."

2,260.—Cotton-Presses.—Mrs. THOMAS C. NISBET, Macon, Ga. Application filed February 15, 1875.

"the representation of the nut or trap used in screw cotton-presses, and the words 'T. C. Nisbet. Cotton-Press.'"

2,261.—Paint or Cement.—EWING W. TIBBELS, Chester, Pa. Application filed December 2, 1874.

"'Tibbel's Indestructible Compound and Super-Marine Cement,' surrounding a representation of a ship at sea."

EXTENSIONS GRANTED.

31,252.—Improvement in Iron Ties for Cotton-Bales. Granted to J. J. MCCOMB, January 29, 1861.

Claim.—Forming the link or tie with an oblong aperture, one end of which is arrow shaped, or, rather, presents two sides of an equilateral triangle—the design of this arrow-shaped end being not only to force the hoop or bend of the hoop over the slot, which it does with unerring precision when the bale expands after being released from the press, but also to secure an equal bearing upon the separate parts of the slotted side of the tie.

31,315.—Improvement in Machinery for Grinding the Card-Teeth of Carding-Cylinders.—Granted to CHARLES HARDY, February 5, 1861.

Claim.—Extending and adjusting the shafts G and E in the manner represented, whereby I am enabled to cause the grinder D to traverse and retraverse all of the teeth of the cards with its entire breadth, substantially as specified.

31,324.—Improvement in Looms.—Granted to JNO. DAVIS, administrator of WM. MURKLAND, deceased, February 5, 1861.

Claim.—1. The combination of the reverse shuttle-boxes with the active shuttle-boxes, by attaching and detaching the several reverse shuttle-boxes to and from the active shuttle-boxes, under a construction and mode of operation substantially as set forth.

2. I also claim the adjustment of the reverse shuttle-boxes with the active shuttle-boxes so as to allow the use of one or more of the active series, substantially as described.

3. I also claim the construction and use of the annular disk, for the purpose of keeping the shuttles in place, and for passing the ends of the yarns around the axis of the polygonal shuttle-box frame.

4. I also claim the manner of holding the boxes of the polygonal frame in their position, by means of a segment of a circle or its equivalent.

31,330.—Improved Collar for Ornamental Carriage Work.—Granted to MOSES SEWARD, February 5, 1861.

Claim.—As an article of manufacture, an upset planished collar for ornamental carriage work formed without welding or turning.

INDEX OF INVENTIONS PATENTED FEBRUARY 23, 1875.

Animal hopple, J. D. Wilson	144	160,134
Battery, earth, J. C. Bryan	50	160,152
Battery for boilers, anti incrustation, J. F. Donoghue	50	160,009
Bed bottom, H. S. Hale	62	160,185
Bells to shafts, device for attaching, A. A. Bevin	14	160,146
Blanket and pantaloons combined, horse, C. Franke	144	160,012
Blind stop, W. A. Clark	24	160,051
Boiler, wash, J. B. Camyre	91	160,158
Boilers, anti-incrustation battery for, J. F. Donoghue	50	160,009
Boilers, compound for the prevention of scales in steam, J. H. Pitts	148	160,030
Book holder, A. L. Wilson	146	160,044
Boom, sheer, H. Anderson	13	160,070
Boot and shoe sole, H. E. Van Benshoten	16	160,042
Box machine and box, J. W. and C. M. Hyatt	30	160,199
Box, spice, J. E. Camp	88	160,157
Braiding machine, F. W. Huppelsberg	17	160,198
Brake machinery, C. Kahler	117	160,242
Breweries, cooling floor for, A. Brandt	58	160,077
Brush attachment, fly, G. S. Beekman	165	160,141
Brush for grain cleaners, G. E. Throop	57	160,243
Brush, shoe, I. and J. A. Joseph	22	160,104
Bustle, R. Biering	80	160,048
Butter worker, J. L. Englehart	45	160,089
Buttons, &c., setting instrument for attaching, D. Heaton	23	160,056
Caoutchouc, mold for the manufacture of screws from hard, G. H. Roberts	84	160,235
Car axle, railway, S. L. Harrison	122	160,095
Car brake, C. C. Clark	122	160,063
Car brake, Hiner and Fessler	122	160,190
Car coupling, A. H. Clark	122	160,062
Car coupling, J. M. Clem	122	160,164
Car coupling, W. Cline, Jr	122	160,165
Car coupling, H. T. Lovell	122	160,157
Car coupling, H. Merlam	122	160,025
Car coupling, J. West	122	160,133
Car, dumping, R. Roberts	121	160,122
Car lamp, Hicks and Smith	90	160,097
Car, passenger, I. Bridgman	121	160,059
Carriages, jump seat for, N. Starkey	31	160,036
Cartridge loading implement, B. Burton	55	160,049
Casting bobbins, machine for, M. Dimock	31	160,008
Chain link and chain, S. D. Locke	60	160,107
Chair, tilting, D. E. Teal, (reissue)	62	6,309
Chimney top, H. Becker	4	160,014
Churn, D. C. Bailey	45	160,139
Clock operated horse crib, automatic, Gribbin and McMillan	36	160,092
Clothes frame, P. Cameron	91	160,156
Clothes frame, J. H. Chadwick	91	160,160
Clothes frame, A. Wright	91	160,246
Coal hod, G. Seyfang	154	160,035
Coat shaper, E. B. Viets	38	160,246
Cooking vessels, portable stirrer for, F. M. Roush	154	160,033
Cores, clamp for anchoring, L. E. Roberts	33	160,062

	Class No.	No. of Patent.
Corn cutter, green, W. J. Potter	88	160,119
Corn sheller, T. J. Hoover	59	160,193
Corpse preserving casket, B. Hartwell	39	160,186
Cotton scraper and chopper, W. H. McClaugherty	43	160,111
Cultivator, J. Bebel	43	160,142
Cultivator, Lawrence and Thomas	43	160,210
Cutlery, die for making handles of pocket, W. H. Miller	44	160,039
Dasher flap fastener, J. A. Kincaid	31	160,020
Dish drainer, J. A. Fox	68	160,176
Elevator, C. H. Gulles	79	160,183
Elevator, ice, X. Wittmer	79	160,250
Elevators, dumping cage for, J. McCulloch	79	160,112
Embroidery patterns, apparatus for stamping, J. McGavin	38	160,113
Engine, steam, J. W. Middleton	150	160,218
Engines, frame for portable steam, J. W. Hill	150	160,189
Faucet, beer, M. J. Sullivan	167	160,242
Faucet, measuring, L. L. Dennick	132	160,085
Fertilizing compound, C. H. Hoffmann	96	160,191
Fire arm, revolving, F. W. Hood	55	160,192
Fire escape for safes, Hackett and Crounse	128	160,184
Fire extinguisher, G. E. Barker	118	160,072
Fire kindler, B. S. Harrington	154	160,054
Flat iron heater, E. D. Dudley	91	160,011
Floors for the passage of pipes, construction of, W. H. Gedney	30	160 014
Floral decorations, body for, C. A. Warren	63	160,247
Flue cleaner or scraper, Kees and Schmid	148	160,203
Fuel, compound for gas, C. Jenty	66	160,201
Funnel, measuring, I. W. Hoagland	112	160,017
Furnace, hydrocarbon, H. Napier	149	160,027
Furnace, metallurgic, B. Bayliss	99	160,140
Furnaces, fire chamber for puddling and other, H. H. Gilmore	85	160 180
Game board, M. Riedinger	143	160,234
Garden sprinkler, P. Muller	63	160,220
Gas engine, P. Vera	2	160,130
Gas from liquid hydrocarbon, apparatus for manufacturing illuminating, H. S. Maxim	66	160,216
Gas fuel, compound for, C. Jenty	66	160,201
Gas in water, absorbing ammonia, J. M. Beath	83	159,998
Gas lighting apparatus, Potter and Thomas	64	160,228
Gas meter, J. Radston	64	160,031
Gearing, H. L. Gordon	67	160,181
Generator for cooking, &c., steam, W. Cooper	148	160,165
Grain cleaners, brush for, G. E. Throop	57	160,243
Grain drier, J. B. Wheeler, (reissue)	48	6,307
Gun carriage, N. E. Johnsen	105	160 100
Gunpowder, manufacture of, E. Greene	71	160 053
Harvester reel, G. G. Read	74	160,061
Hat brim, curling, A. Freshfield	76	160 091
Hay loader, F. Marion	77	160,023
Heater, feed water, H. S. Maxim	148	160,215
Hoist, hydraulic, H. Richmann	79	160 232
Hoisting machine, H. Richmann	79	160 233
Horse blanket and pantaloons, combined, C. Franke	144	160,012
Horse crib, automatic clock operated, Gribbin and McMillan	36	160,092
Horse power, E. J. and J. W. Hoyle	150	160,098
Horses, device for hitching, E. Obin	144	160,223
Horses, interfering boot for, A. D. Westbrook	144	160,248
Horseshoe, S. B. Henry	60	160,188
Horseshoe magneta, machine for bending, J. C. Bryan	125	160,153
Horseshoes, die for making, W. Horsfall	60	160,195
Hose, engine, T. L. Pierce	81	160 226
Hubs to axles, device for attaching, D. Dalzell	31	160,007
Indexing books, machine for, F. R. Alderman	15	160,137
Inkstand, S. Darling	146	160,171
Kiln and furnace, drying, Cawthon and Conner	48	160,004
Ladder, firemen's, P. P. Carnes	30	160 081
Lamp, A. Albertson	90	160 069
Lamp, car, Hicks and Smith	90	160,097
Lamp extinguisher, J. W. Waterman	90	160,067
Land pulverizer, A. Underwood	114	160,129
Landau, C. Thomas	31	160,039
Leather straps, machine for creasing and finishing, S. B. Randall	93	160,231
Lightning rod, J. C. Bryan	50	160,151
Lightning rod, J. C. Bryan	50	160,154
Loom, Davis and Stone	95	160,084
Loom, W. V. Gee, (reissue)	95	6,301
Loom shuttle, F. Blanding	95	160 001
Lounge, adjustable reclining, E. Bartels	62	160,073
Lumber carrier, Pinney and Hasty	130	160,092
Magnet, electro, M. A. Rice	50	160,120
Magneta, machine for bending horseshoe, J. C. Bryan	125	160,153
Main springs to arbors, attachment of, W. C. Maynard	36	160,109
Meat and vegetable slicer, J. W. Murkland	59	160,221
Meat chopper, J. Perkins	25	160 225
Metal plates, apparatus for pickling, Gething, Jenkins, and Gardner	113	160,178
Metal, turning tool for, W. Clay	100	160,161
Milk safe, J. F. Pool	45	160,227
Miter machine, D. A. Fisher	29	160 090
Molding machine, A. Miller	173	160,114
Mower, lawn, E. G. Passmore, (reissue)	75	6,305
Musical instruments, mouth piece for, C. G. Conn	102	160,164
Musical instruments, string for, Farmer and Baillie	142	160,173
Neck tie shield, R. R. Parker	38	160,117
Needle blanks, device for turning machine, E. Sauter	104	160,238
Nut lock, B. B. Snyder, Jr	14	160,241
Nut machine, W. Horsfall	14	160,194
Ordnance, breech loading, N. E. Johnsen	105	160 101
Ordnance, projectile for, C. Arrick	105	160,071
Ore separator, B. Tyson	3	160,041
Organ case, J. R. Lomas	106	160 213
Organ, reed, L. K. Fuller	106	160,052
Paints, gloss compound for, J. B. Tascott	107	160,038
Paper box, E. D. F. Shelton	109	160,239
Paper, &c., device for protecting the ends of rolls of, J. L. Firm	108	160,175
Paper perforating machine, R. Hemingray	109	160,016
Pavement, Filbert and Hoffman	110	160,174
Peg float, D. Lynahan	16	160 108
Pin, safety, Furness and Wales	104	160,013
Pisciculture, apparatus for, A Bond	29	160,132
Plane, G. L. Weaver	133	160,055
Planters, check rower for corn, G. D. Haworth	133	160,035
Plow, Dugdale and Breed	114	160 086
Plow, A. Hampe	114	160,094
Plow carriage, D. W. Ralston	114	160,230
Plow, gang, J. B. Hunter	114	160,099
Pocket book, G. Strauss	146	160 126
Poker and tongs, combined, I. J. Conklin	154	160,006
Pot lid, A. E. Colgrove	88	160 163
Press, T. J. Jenne	7	160,200
Press, horizontal hay and cotton, Bennett and Rancier	7	160,143
Press, lever, W. O. Watson	7	160,131
Printing surface, Friedlaender and Moeller	117	160,177
Propellers, blade for screw, J. H. Loftus	139	160 212
Pruning implement, W. H. Johnson	63	160,103
Pruning shears, W. H. Johnson	63	160,102
Pump, double acting submerged, Hartwick and Marx	118	160 096
Pump, force, L. J. Knowles	118	160,207
Pump sucker, J. M. Springer	118	160,065
Pumps, &c., air chamber for steam, L. J. Knowles	118	160,206
Pumps, bucket for chain, D. F. Stow	118	160,125
Purifier, flour and middlings, G. W. Brown	57	160,080
Railway crossings, gate for, S Cox	120	160,166
Railway, elevated, F. A. Williams	150	160,249
Railway rail joint, R. Pickel	120	160,118
Railway rail joint, D. K. Reeder	120	160 032
Railway switch, P. C. Bragg	120	160,076
Railway switch, C. D. Tisdale	120	160,040
Railway switch, G. J. Woodruff	120	160,135
Railway tracks, repairing, J. Houston	120	160,197
Rake, horse hay, B. Owen, (reissue)	77	6,304
Refrigerator, J. C. Clark	58	160,050
Rein holder, C. Osgood	31	160 028
Relishing machine, W. G. Caldwell	173	160,003
Roll for straightening and finishing tubes, G. Matheson	125	160,024
Roller, land, P. Bilyen, Sr	73	160,147
Roof, slate, L. Brandt	126	160,078
Roving frame, T. Mayor, (reissue)	142	6,302
Ruffles, apparatus for making fluted, T. Robjohn, (reissue)	38	6,308
Sad iron, J. M. Whiting	91	160,068
Saddle tree, P. B. Horton	72	160,196
Safes, fire escape for, Hackett and Crounse	128	160 184
Sash balance, J. Berndt	24	160,145
Sash holder, F. A. Battey	24	160,047
Saw grinding machine, D. M. Mefford, (reissue)	131	6,303
Saw, jig, E. J. Wescott	131	160,043
Saw mill, G. F. Bellows	130	159,999
Saw mill head block, J. Osgood	130	160,116
Saw, scroll, J. M. Bengler	130	160,144
Sawing machine, scroll, R. McConnell	130	160,217
Screw blanks, mechanism for shaving, nicking, and reshaving wood, Bidwell and Jaquith	171	160,000
Screws, cap for wood, H. T. Blake	171	160,148
Screws from hard caoutchouc, mold for the manufacture of, G. H. Roberts	64	160,235
Separator, grain, W. M. Koppes	159	160,105
Separator, grain, J. H. Locke	159	160,022
Sewing machine attachments, clamp for, J. G. Powell, (reissue)	134	6,306
Shirt, J. Twamley	38	160,245
Shoe brush, I. and J. A. Joseph	22	160,104
Shovel, P. B. Cunningham	141	160,170
Skate, R. H. Earle	143	160,087
Spindle bearing and its lubrication, J. M. Stone	87	160,124
Spirits, apparatus for flavoring, M. Grube	47	160,093
Spool holder, F. J. Taylor	38	160,127
Spooling machine, T. A. Mathewson	142	160,058
Spring for seats, &c., J. A. Stevenson	24	160,123
Square and bevel, combined try, Larrison and Leigh	97	160,106
Steel, reworking, J. N. Lauth	70	160,209
Stove, heating, C. Noble	154	160,222
Sugar cane cutting machine, J. Robert	75	160,121
Sulky, P. Soule	31	160,064
Surgical instrument, H. L. Stillman	156	160,037
Table, extension, A. S. Bowen	62	160,149
Table, folding, P. Cameron	62	160,155
Table, ironing, E. B. Lake	91	160,308
Table, ironing, T. R. Roland	91	160,236
Table slide, extension, D. C. Sivey	62	160,063

	Class No.	No. of Patent.
Teeth, securing pins to artificial, O. S. Bixby	46	160,075
Thrashing machine stacker attachment, Kittinger and Kurtz	159	160,204
Tin from tin scrap, removing, Holliday and Baker	99	160,018
Tobacco, machine for packing, H. Winterwerber	160	160,045
Tobacco, treating chewing, S. V. Appleby	160	160,138
Tool, fitting, T. S. Carroll	100	160,159
Toy automaton, D. K. Hatfield	143	160,187
Toy trundle, W. E. Leonard	143	160,021
Toy wind wheel, J. Jamouneau	143	160,019
Transfer sheet, ornamental, O. J. E. Palm	54	160 224
Transplanting box, P. Eby	63	160,088
Trap, animal, I. V. Newsom	143	160,115
Trap, fly, J. C. Sellers	143	160,034
Tubes, roll for straightening and finishing, G. Matheson	125	160,024
Umbrella, H. Martin	165	160,214
Umbrella ribs, softening, J. McAuliffe	165	160,110
Valises, &c., corner cap for, G. Crouch	162	160,168
Valve, safety, G. H. Crosby	148	160,167
Valve, steam, J. J. Grant	152	160,182
Vane and pointer, weather, J. C. Bryan	101	160,150
Vehicle spring, J. M. Pressey	31	160,229
Vehicle spring side bar, J. Tilton	31	160,244
Vehicle wheel, A. A. Smith	31	160,240
Ventilator for windows, G. Wagner	166	160,066
Violins, chin rest for, C. F. Albert	102	160,136
Wagon brake, R. J. Knapp	31	160,205
Washers, device for cutting out sheet metal, D. Goodnow, Jr	14	160,015
Washing machine, W. D. and D. M. Croy	91	160,169
Washing machine, F. M. Lechner	91	160,211
Washing machine, Minderle and Maschmeyer	91	160,026
Water wheel, W. J. Thompson	168	160,128
Weather vane and pointer, J. C. Bryan	101	160,158
Windmill, A. and G. Raymond	118	160,066
Windmill, G. F. Rounds	118	160,237
Wind wheel, Mix and Jacobs	118	160,219
Wood filling compound, Dorr and Seyfert	107	160,010
Wooden pins, machine for making, S. S. Eskey	173	160,172
Wrench, pipe, D. Gilbert	100	160,179

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED FEBRUARY 23, 1875.

	Patent No.
Albert, C. F., Chin rest for violins	160,136
Albertson, A., Lamp	160,069
Alderman, F. R., Machine for indexing books	160,137
Althouse, M. J., assignee	160,060
American Invention Company, assignee, (reissue)	6,303
Anderson, H., Sheer boom	160,070
Appleby, S. V., Treating chewing tobacco	160,138
Arrick, C., Projectile for ordnance	160,071
Bailey, D. C., Churn	160,139
Baillie and Farmer	160,173
Baker and Holliday	160,018
Barker, G. E., Fire extinguisher	160,072
Bartels, R., Adjustable reclining lounge	160,073
Battey, F. A., Sash holder	160,047
Bayliss, B., Metallurgic furnace	160,140
Beath, J. M., Absorbing ammonia gas in water	159,998
Becker, H., Chimney top	160,074
Beekman, G. S., Fly brush attachment	160,141
Behel, J., Cultivator	160,142
Bellows, G. F., Saw mill	159,999
Bengler, J. M., Scroll saw	160,144
Bennett, T. B., and E. J. Rancier, Horizontal hay and cotton press	160,143
Berndt, J., Sash balance	160,145
Bevin, A. A., Device for attaching bells to shafts	160,146
Bevin Brothers Manufacturing Company, assignee	160,146
Bidwell, J. A., and J. N. B. Jaquith, Mechanism for shaving, nicking, and reshaving wood screw blanks	160,000
Biering, R., Bustle	160,048
Bilyen, P., Sr., Land roller	160,147
Bixby, O. S., Securing pins to artificial teeth	160,075
Blake, H. T., Cap for wood screws	160,148
Blanding, F., Loom shuttle	160,001
Bond, A., Apparatus for pisciculture	160,002
Bowen, A. S., Extension table	160,149
Bragg, P. C., Railway switch	160,076
Brandt, A., Cooling floor for breweries	160,077
Brandt, L., Slate roof	160,078
Breed and Dugdale	160,086
Bridgman, L., Passenger car	160,079
Brown, G. W., Flour and middlings purifier	160,080
Brown, H. W., assignee	160,237
Bryan, J. C., Weather vane and pointer	160,150
Bryan, J. C., Lightning rod	160,151
Bryan, J. C., Earth battery	160,152
Bryan, J. C., Machine for bending horseshoe magnets	160,153
Bryan, J. C., Lightning rod	160,154
Burton, R., Cartridge loading implement	160,049
Butcher, T. P., assignee	160,172
Calder, F. R., assignee	160,190
Caldwell, W. G., Relishing machine	160,003
Cameron, P., Folding table	160,155
Cameron, P., Clothes frame	160,156
Camp, J. E., Spice box	160,157
Camyré, J. B., Wash boiler	160,158
Carnes, P. P., Fireman's ladder	160,081
Carroll, T. S., Fitting tool	160,159
Cawthon, B. F., and A. J. Conner, Drying kiln and furnace	160,004
Chadwick, J. H., Clothes frame	160,160
Chambers, O., assignee	160,090
Champion, S. T., assignee	160 208
Clark, A. H., Car coupling	160,082
Clark, C. C., Car brake	160,083
Clark, J. C., Refrigerator	160,050
Clark Thread Company, assignee	160,008
Clark, W. A., Blind Stop	160 051
Clay, W., Turning tool for metal	160,161
Clem, J. M., Car coupling	160,162
Cline, W., Jr., Car coupling	160,005
Coffman, W. H., assignee	160,169
Colgrove, A. E., Pot lid	160,163
Conklin, I. J., Combined poker and tongs	160,006
Conn, C. G., Mouth piece for musical instruments	160,164
Conner and Cawthon	160,004
Cooper, W., Steam generator for cooking, &c	160,165
Corrigan, P., assignee	160,009
Cox, S., Gate for railway crossings	160,166
Crosby, G. H., Safety valve	160,167
Crouch, G., Corner cap for valises, &c	160,168
Crounse and Hackett	160,184
Croy, W. D. and D. M., Washing machine	160,169
Cunningham, P. B., Shovel	160,170
Dalzell, D., Device for attaching hubs to axles	160,007
Darling, S., Inkstand	160,171
Davis, H. D., and J. M. Stone, Loom	160,084
Dennick, L. L., Measuring faucet	160,085
Dimock, M., Machine for casting bobbins	160,008
Donoghue, J. F., Anti-incrustation battery for boilers	160,009
Dorr, H. L., and H. Seyfert, Wood filling compound	160,010
Dudley, E. D., Flat iron heater	160,011
Dugdale, C. R., and D. Breed, Plow	160,085
Eames, M. C., assignee	160 202
Earle, R. H., Skate	160,087
Eby, P., Transplanting box	160,088
Emerson, R., assignee	160,142
Englehart, J. L., Batter worker	160,089
Eskey, S. S., Machine for making wooden pins	160,172
Estey, J., & Co., assignees	160,052
Farmer, J., and J. Baillie, String for musical instruments	160,173
Fessler and Hiner	160,190
Filbert, L. S., and L. M. Hoffman, Pavement	160,174
Firm, J. L., Device for protecting the ends of rolls of paper, &c	160,175
Fisher, D. A., Miter machine	160 090
Fox, J. A., Dish drainer	160,176
Fralick, F. G., assignee	160,108
Franke, C., Horse blanket and pantaloons combined	160,012
Freidlaender, J., and P. K. Moeller, Printing surface	160,177
Freshfield, A., Curling hat brim	160,091
Fuller, L. K., Reed organ	160,052
Furness, N. H., and S. Wales, Safety pin	160,013
Gardner, Gething, and Jenkins	160,178
Gedney, W. H., Construction of floors for the passage of pipes	160,014
Gee, W. V., Loom, (reissue)	6,301
Gething, W., D. Jenkins, and S. Gardner, Apparatus for pickling metal plates	160,178
Gilbert, D., Pipe wrench	160,179
Gilmore, H. H., Fire chamber for puddling and other furnaces	160,180
Goodnow, D., Jr., Device for cutting out sheet metal washers	160,015
Gordon, H. L., Gearing	160,181
Grant, J. J., Steam valve	160,182
Greene, E., Manufacture of gunpowder	160,053
Gribbin, W. R., and A. McMillan, Automatic clock operated horse crib	160,092
Grube, M., Apparatus for flavoring spirits	160,093
Gullee, C. H., Elevator	160,183
Hackett, F., and J. C. Crounse, Fire escape for safes	160,184
Hale, H. S., Bed bottom	160,185
Hampe, A., Plow	160 094
Harrington, B. S., Fire kindler	160,054
Harrison, S. L., Railway car axle	160,095
Hartwell, B., Corpse preserving casket	160,186
Hartwick, G. G., and E. Marx, Double acting submerged pump	160,096
Hasty and Pinney	160,029
Hatfield, D. K., Toy automaton	160,187
Haworth, G. D., Check rower for corn planters	160,035
Heaton, D., Setting instrument for attaching buttons, &c	160,056
Hemingray, R., Paper perforating machine	160,016
Henry, S. B., Horseshoe	160,188
Herchelrode, C., assignee	160,189
Heywood Brothers & Co., assignees, (reissue)	6,309
Hicks, M., and T. Smith, Car lamp	160 097
Hill, J. W., Frame for portable steam engines	160,189
Hiner, M. M., and J. M. Fessler, Car brake	160,190
Hoagland, I. W., Measuring funnel	160,017
Hoffman and Filbert	160,174
Hoffmann, C. H., Fertilizing compound	160,191
Holliday, J., and H. M. Baker, Removing tin from tin scrap	160,018
Hood Fire Arms Company, assignee	160,192

	Patent No.
Hood, F. W., Revolving fire arm	160,192
Hoover, T. J., Corn sheller	160,193
Horsfall, W., Nut machine	160,194
Horsfall, W., Die for making horseshoes	160,195
Horton, P. B., Saddle tree	160,196
Houston, J., Repairing railroad tracks	160,197
Hoyle, E. J. and J. W., Horse power	160,098
Hunter, J. B., Gang plow	160,099
Huppelsberg, F. W., Braiding machine	160,198
Hyatt, J. W. and C. M., Box machine and box	160,199
Ilsley, S. A., & Co., assignees	160,157
Jacobs and Mix	160,219
Jamousseau, J., Toy wind wheel	160,019
Jeqnith and Bidwell	160,000
Jenkins, Gardner, and Gething	160,178
Jesse, T. J., Press	160,200
Jenty, C., Compound for gas fuel	160,201
Johnsen, N. E., Gun carriage	160,100
Johnsen, N. E., Breech loading ordnance	160,101
Johnson, W. H., Pruning shears	160,102
Johnson, W. H., Pruning implement	160,103
Joseph, I. and J. A., Shoe brush	160,104
Kahler, C., Brake machinery	160,202
Kees, W. H., and L. Schmid, Fine cleaner or scraper	160,203
Kincaid, J. A., Dasher flap fastener	160,020
Kingsley, D., assignee	160,118
Kinsey, W. B., assignee	160,006
Kittinger, L., and J. K. Kurtz, Stacker attachment for thrashing machines	160,204
Kline, J. J., assignee	160,123
Knapp, R. J., Wagon brake	160,205
Knowles, L. J., Air chamber for steam pumps, &c	160,206
Knowles, L. J., Force pump	160,207
Koppes, W. M., Grain separator	160,105
Kratz, O., assignee	160,121
Kurtz and Kittinger	160,204
Lake, E. B., Ironing table	160,208
Larrison, J. L., and H. Leigh, Combined try square and bevel	160,106
Lauth, J. N., reworking steel	160,209
Lawrence, L. A., and G. S. Thomas, Cultivator	160,210
Lechner, F. M., Washing machine	160,211
Leigh and Larrison	160 106
Leonard, W. E., Toy trundle	160,021
Locke, J. H., Grain separator	160,022
Locke, S. D., Chain link and chain	160,107
Loftus, J. H., Blade for screw propellers	160,212
Lomas, J. R., Organ case	160,213
Lovell, H. T., Car coupling	160,057
Lynahan, D., Peg float	160,108
Maloney, J. A., assignee, (reissue)	6,307
Marion, F., Hay loader	160,023
Marley, H. A., assignee	160,005
Martin, H., Umbrella	160,214
Marx and Hartwick	160,096
Maschmeyer and Minderle	160,026
Matheson, G., Roll for straightening and finishing tubes	160,024
Mathewson, T. A., Spooling machine	160,058
Maxim Gas Machine Company, assignee	160,216
Maxim, H. S., Feed water heater	160,215
Maxim, H. S., Apparatus for illuminating gas from liquid hydrocarbons	160,216
Maynard, W. C., Attachment of mainsprings to arbors	160,109
Mayor, T., Roving frame, (reissue)	6,302
McAuliffe, J., Softening umbrella ribs	160,110
McClaugherty, W. H., Cotton scraper and chopper	160,111
McConnell, R., Scroll sawing machine	160 217
McCulloch, J., Dumping cage for elevators	160,112
McGavin, J., Apparatus for stamping embroidery patterns	160,113
McMillan and Gribbin	160,092
Mefford, D. M., Saw grinding machine, (reissue)	6,303
Meriam, H., Car coupling	160,025
Middleton, J. W., Steam engine	160,218
Miller, A., Molding machine	160,114
Miller, W. H., Die for making handles of pocket cutlery	160 059
Minderle, D., and G. Maschmeyer, Washing machine	160 026
Mix, N. P., and W. E. Jacobs, Wind wheel	160,219
Moeller and Friedlaender	160,177
Muller, P., Garden sprinkler	160,220
Murkland, J. W., Meat and vegetable slicer	160,221
Napier, H., Hydrocarbon furnace	160,027
National Tube Works Company, assignee	160,094
Newsom, I. V., Animal trap	160,115
Nicholson, F. P., assignee	160,222
Noble, C., Heating stove	160,222
Ogden, W. L., assignee	160,202
Ohm, E., Device for hitching horses	160,223
Osgood, C., Rein holder	160,028
Osgood, J., Saw mill head block	160,116
Owen, R., Horse hay rake, (reissue)	6,304
Palm, O. J. E., Ornamental transfer sheet	160,224
Parker, R. R., Neck tie shield	160 117
Passmore, K. G., Lawn mower, (reissue)	6,305
Paxson, D. L. and J. S., assignees	160,095
Perkins, F. B., assignee	160,137
Perkins, J., Meat chopper	160,225
Pickel, R., Railway rail joint	160,118
Pierce, T. L., Engine hose	160,226
Pinney, F. L., and R. H. Hasty, Lumber carrier	160,029
Pitts, J. H., Compound for the prevention of scales in steam boilers	160,030
Pool, J. F., Milk safe	160,227
Potter, R. M., and W. W. Thomas, Gas lighting apparatus	160,228
Potter, W. J., Green corn cutter	160,119
Powell, J. G., Clamp for sewing machine attachments, (reissue)	6,306
Pressey, J. M., Vehicle spring	160,229
Radston, J., Gas meter	160,031
Ralston, D. W., Plow carriage	160,230
Rancier and Bennett	160,143
Randall, S. B., Machine for creasing and finishing leather straps	160,231
Rasin, R. W. L., assignee	160,241
Raymond, A. and G., Windmill	160 060
Read, G. G., Harvester reel	160,061
Reeder, D. K., Railway rail joint	160,032
Rice, M. A., Electro magnet	160,120
Richmann, H., Hydraulic hoist	160,232
Richmann, H., Hoisting machine	160 233
Riedinger, M., Game board	160,234
Robert, J., Sugar cane cutting machine	160,121
Roberts, G. H., Mold for the manufacture of screws from hard caoutchouc	160,235
Roberts, L. E., Clamp for anchoring cores	160,062
Roberts, R., Dumping car	160,122
Robjohn, T., Apparatus for making fluted ruffles, (reissue)	6,308
Roland, T. R., Ironing table	160,236
Rounds, G. F., Windmill	160,237
Rouach, F. M., Portable stirrer for cooking vessels	160 033
Sauter, E., Device for turning machine needle blanks	160,238
Sawyer, J. G., assignee	160,118
Schmid and Kees	160,203
Segur, J. M., assignee	160 226
Sellers, J. C., Fly trap	160 034
Seyfang, G., Coal hod	160,035
Seyfert and Dorr	160,010
Shelton, E. D. F., Paper box	160,239
Sherman, D. B., assignee	160,108
Shoninger, B., assignee	160,213
Sieg, R., assignee	160,191
Sivey, D. C., Extension table slide	160 063
Smith and Hicks	160,097
Smith, J. A., Vehicle wheel	160,240
Snyder, B. B., Jr., Nut lock	160,241
Soule, P., Sulky	160 064
Springer, J. M., Pump sucker	160,065
Springfield Iron Works, assignee	160,128
Starkey, N., Carriage jump seat	160,036
Stevenson, J. A., Spring for seats, &c	160,123
Stillman, H. L., Surgical instrument	160,037
Stone and Davis	160,064
Stone, J. M., Spindle bearing and its lubrication	160 124
Stone, L. D., assignee	160,072
Stow, D. F., Bucket for chain pumps	160,125
Strauss, G., Pocket book	160 126
Sullivan, M. J., Beer faucet	160,242
Taber, W., assignee	160 062
Tascott, J. B., Gloss compound for paints	160,039
Taylor, F. J., Spool holder	160,127
Teal, D. E., Tilting chair, (reissue)	6,309
Thomas, C., Landau	160,039
Thomas and Lawrence	160,210
Thomas and Potter	160,228
Thompson, W. J., Water wheel	160,128
Throop, G. E., Brush for grain cleaners	160,243
Tilton, J., Vehicle spring side bar	160,244
Tisdale, C. D., Railway switch	160 040
Tripp, P. R., assignee	160,043
Twamley, J., Shirt	160,245
Tyson, B., Ore separator	160,041
Underwood, A., Land pulverizer	160,129
Union Steel Screw Company, assignee	160,000
Van Benschoten, H. E., Boot and shoe sole	160,042
Van Deusen, I. S., assignee	160,113
Vera, P., Gas engine	160,130
Vieta, E. B., Coat shaper	160,246
Wagen, R. M., assignee	160 119
Wagner, G., Ventilator for windows	160,066
Wales and Furness	160,013
Warren, C. A., Body for floral decorations	160 247
Washburn, O. F., assignee	160 039
Waterman, J. W., Lamp extinguisher	160,067
Watson, W. O., Lever press	160,131
Wattles, T. B., assignee	160,001
Wayne Agricultural Company, assignee	160 210
Weaver, G. L., Plane	160,132
Weiss, T., assignee	160 170
Wescott, E. J., Jig saw	160,043
West, J., Car coupling	160,133
Westbrook, A. D., Interfering boot for horses	160,248

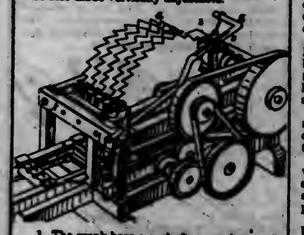
TITLES. DRAWINGS, AND CLAIMS

OF

PATENTS GRANTED FEBRUARY 23, 1875.

159,998. ABSORBING AMMONIA GAS IN WATER. John M. Booth, San Francisco, Cal. [Filed Apr. 21, 1874.]

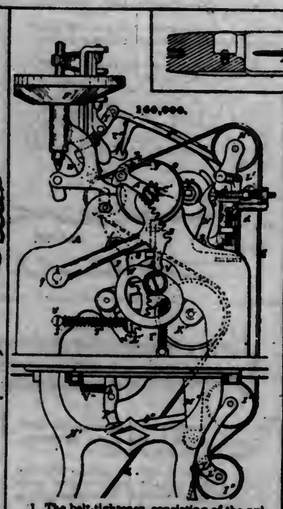


Brief.—Mixer while in motion, and maintains uniformity of temperature and pressure while mixing.

The process of absorbing ammonia gas in water by mingling them in due proportions while in transit, and then passing the mixture in streams through conduits exposed to a cooling agent, substantially as specified.

159,999. SAW-MILLS. George F. Bellows, Menomonee, Wis. [Filed Jan. 7, 1875.]

Brief.—The log carriage is provided with spurs, upon which the log rests while passing the gang of circular saws, which convert it into lumber. The guides and spreading-disks are also made vertically adjustable.



1. The crank-bars *a c*, shaft *g*, crank *g'*, and cams *g' g''*, in combination with the carriage of a saw-mill, substantially as and for the purpose set forth.

2. The guides T, in combination with the swinging frame *t* and the saws G, substantially as and for the purpose set forth.

3. The pinion E, in combination with the side arms *r r*, the arms *s s*, and lever S, substantially as and for the purpose set forth.

160,000. MACHINES FOR SHAPING, NICKING, AND REMOVING WOOD-SCREW BLANKS. Jason A. Metcalf and Joseph M. B. Fogwill, Cleveland, Ohio, assignors to the Union Steel-Screw Company, same place. [Filed Nov. 28, 1874.]

Brief.—The oscillating cradle, by which the lowest blank in the conductor V' is carried under the nicking-fingers, has a notched wheel, that is turned one notch at each oscillation, to remove any imperfect blank that the fingers fail to seize. There are two mandrels, carried in a yoke that is intermittingly rotated on a central axis, so that the blank is seen in acted upon by the shaving-tool while the other is being nicked. The several separate improvements enumerated in the claims apply to separate parts of the same machine.

160,000.

1. The belt-tightener, consisting of the pulleys I'' I'', as arranged in relation to each other in the arms of the vibratory frame I', and spring G'', in combination with the belt G, drums J'' and K'', pulley H'', and yoke, consisting of the shaft C, arms D D, and clamps E E, substantially in the manner as described, and for the purpose set forth.

2. The arm I, lever M, rod N, and springs L and L', as arranged to co-operate, in combination with the flange H of the clamps E of the yoke, consisting of the shaft C and arms D D, substantially in the manner as described, and for the purpose set forth.

3. The brake F', spring *r''*, and pin *r'''*, arranged to operate, in combination with the clamps E, in the manner as described, and for the purpose set forth.

4. The shaft *a*, notched wheel *c'*, ratchet-wheel *d'*, pawl *f'*, and vibrating cradle W, in combination with the stationary conductor V', substantially as described, and for the purpose specified.

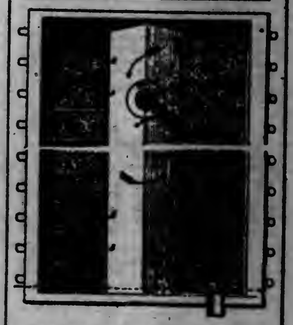
5. The improved fork A', consisting of bars F' F'' and adjusting-ties S', as arranged that said bars may be adapted to different sizes of screw-blanks, in combination with the adjustable conductor V' and revolving hopper F'', substantially as and for the purpose set forth.

6. The segment-gear E, cam V, lever R, spring T, and rod S', in combination with the pin P for operating the cams, in the manner as described, and for the purpose specified.

7. The cam W and segment-gear S', in combination with the pinion O', pawl *f*, wheels X O, and yoke, consisting of the shaft C, arms D D, and spindles or clamps E E, substantially in the manner as described, and for the purpose set forth.

160,001. LOOM-SHUTTLES. Francis Blanding, Canton, Mass., assignor to himself and Thos. B. Wattles, same place. [Filed Nov. 26, 1874.]

Brief.—The spindle is recessed to receive a rotating tongue or shaft, supported in bearings on the spindle, and provided with eccentric bearings, and an arm arranged to come in contact with a fixed stud on the spindle is turned down into the shuttle. By this means the spindle presses on the interior of the cop and holds it in place.



160,001.

In a loom-shuttle, the rotary tongue B, its eccentric journals *d d*, and arm *c*, in combination with and applied to the recessed spindle A, in manner as described, so as to operate, as explained, with a stud or projection, *g*, extended from the shuttle-body, all being essentially and for the purpose as specified

160,002. APPARATUS FOR PISCICULTURE. Amos Bond, Vernon, Conn. [Filed May 26, 1874.]

Brief.—The exit-pipe is placed centrally to give, in connection with the shelving centerpiece, a gentle and equable flow to the water, and thus fertilize the spawn placed thereon. A frame is substituted for the hatching-boxes when the tank is to be flushed. The exit-pipe is adjustable as to height to regulate the flow and pressure.

1. In combination with sieves *b*, the receptacles B, formed substantially as shown and described, to collect and hold together the salt and spawn, for the purposes set forth.

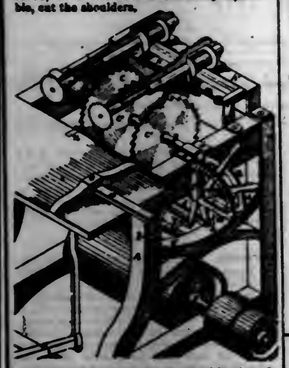
2. In a fish tank or vat, provided with the spawn-receptacles B *b*, the tubes E, combined and arranged substantially as and for the purpose set forth.

3. In combination with a fish-vat, the overflow-pipe C, made adjustable as to height, to regulate the level of the water within the vat, substantially as shown and described.

4. In combination with a fish-vat, constructed substantially as described, the adjustable overflow-pipe C, arranged at or near the center thereof, for the purpose set forth.

5. In combination with a fish-vat, provided with the gravel-sieves *b b*, the removable shed, substantially as shown, and for the purpose described.

6. A fish-vat, provided with the zinc or other metal lining, which is covered with gun-tar, substantially in the manner and for the purpose shown and described.

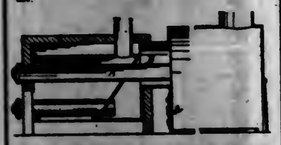


7. In combination with a fish-vat, the series of partitions *f f f* &c., constructed and arranged substantially as shown and described.

8. In combination with the series of partitions *f f f*, &c., the flow W, with its gate *p* and part *w'*, in the manner and for the purpose shown and described.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON

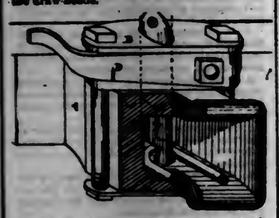
160,003. RELISHING-MACHINES. Wm. O. Caldwell, Three Rivers, Mich. (Filed May 6, 1874.)



Brief.—A series of circular saws, adjustable upon their arbor, cut the sides of the tenon, while a second series, similarly adjustable, cut the shoulders.

In a relishing-machine, the combination of the mandrel B, saw C, sliding collar *c'*, arm D, with sleeve *k*, rod *d*, connecting-rod *f*, lever E, and measuring device G *h i*, substantially as shown and described, for the purpose specified.

160,004. DRYING-KILNS AND FURNACES. Benj. F. Cawthon, Jefferson County, and Andrew J. Conner, Louisville, Ky. (Filed Dec. 15, 1874.)



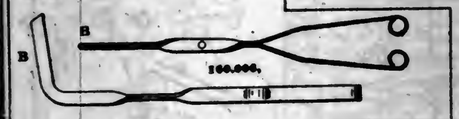
Brief.—Hot air is supplied to the drying-chamber from space inclosed by the two side walls of the furnace, and also by pipe passing through combustion-chamber. The several registers afford means of regulating supply of air.

In a drying apparatus consisting of a furnace and kiln, the combination of one or more calidncts passing from said furnace through the drum B with a kiln having registers *e e'*, substantially as described.

160,005. CAR-COUPLINGS. Wm. Cline, Jr., Clayton, Ind., assignor to H. A. Marley, same place. (Filed Nov. 27, 1874.)

Brief.—The pin is supported when raised by the bar D, and released by the meeting of the draw-heads.

1. In combination with the coupling-pin F, the yielding pressure or spring plate D, substantially as described.



2. The cross piece or plate B, and guide-bar G, in combination with the yielding pressure or spring plate D and coupling-link F, as set forth.

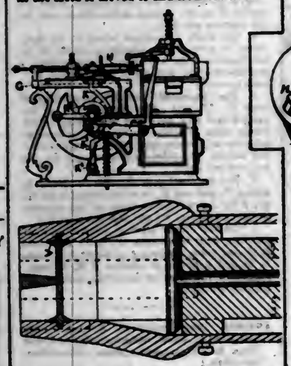
3. The cross piece or plate B, guide-bar G, yielding pressure or spring plate D, bolt M, and spring E, bolts I I, clamping-plate J, and coupling pin F, all combined to operate as specified.

160,006. COMBINED POKER AND TONGS. Ira J Conklin, Philadelphia, Pa., assignor to Wm. B. Kinsey, same place. (Filed Jan. 5, 1875.)

Brief.—Tongs with elastic handles and turned-up ends, which, closed, form a poker.

The combination of two pokers jointed to each other, each having a turned-up end, B, and an elastic handle, C, the two ends, when the pokers are folded, coming together and forming a single prong, the handles coming together closely after closing of the ends B, and two complete long jaws being provided when the pokers are opened, all as set forth and shown.

160,006.



160,007.

160,007. DEVICES FOR ATTACHING HUBS TO AXLES. David Dalzell, South Egremont, Mass. (Filed Nov. 30, 1874.)

In combination with a carriage-axle and axle-box, of a suitable elastic washer and a spring or pressure washer, D, substantially as and for the purpose set forth.

160,008. MACHINES FOR CASTING BOBBINS. Martial Dimock, Newark, N. J., assignor to the Clark Thread Company, same place. (Filed Nov. 26, 1873.)

Brief.—The mold is constructed of four pivoted parts, and attached to a cross-head, and moved to and from the tank by means of a lever and cam. The mold-sections are held together by entering a socket attached to the tank. The lower section of the mold is opened and closed by means of a lever and incline as the mold is moved to and from the tank.

1. The frame G, provided with the horizontal mold H, constructed of four pivoted parts, as described, the shank of which is fitted into a socket in the cross-head I, in combination with the reciprocating lever K and the cam K² on the main shaft for moving the mold from and toward the tank, substantially as and for the purposes described.

2. In combination with the mold H, tank B, and injector C, the socket N, attached to the tank for receiving and holding the four parts of the mold together while the mold is being filled, substantially as and for the purposes described.

3. The combination, with the mold H, arranged in the frame G, of the stop or check lever U and incline U', constructed to lift the lower member of the mold, as and for the purposes described.

160,009. ANTI-INCRUSTATION BATTERIES FOR BOILERS. John F. Donoghue, Springfield, Mass. (Filed July 6, 1874.)

The battery for use in boilers, consisting of a spiral of copper wire partially incased or embedded longitudinally in a base of zinc, substantially as and for the purpose shown and described.

160,009.

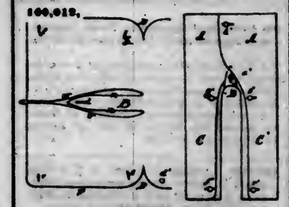
160,010. WOOD-FILLING COMPOUNDS. E. L. Derr, Dayton, and Henry Seyfert, Cincinnati, Ohio. (Filed Jan. 18, 1875.)

The compound herein described, consisting of collodion, gum-sholine, and gum-sandarach, for the purpose herein set forth.

160,011. FLAT-IRON HEATERS. E. D. Dudley, Galesburg, Ill. (Filed Jan. 2, 1875.)

Brief.—The gravitating-slide automatically closes the slot, in the lower end of which is the front arm of the flat-iron handle. The compartment in the lid may be filled with water or non-conducting substances.

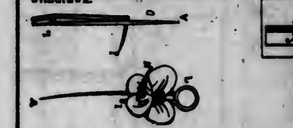
1. The lids D D', having recesses *c c'* and lips *a a*, hinged to the pan A, and arranged to operate in combination therewith, and with the iron G and handle B, substantially as described, and for the purpose specified.



2. The lids D D, provided with non-conductor-of heat compartment, and arranged to operate in combination with the pan A and iron G, substantially as and for the purpose specified.

3. The gravitating slide H, arranged to operate in combination with the iron G and pan A, substantially as described, and for the purpose specified.

160,012. HORSE BLANKETS AND PANTALOONS COMBINED. Charles Franke, New York, N. Y. (Filed Jan. 15, 1875.)



As a new article of manufacture, a horse-blanket consisting of the blanket A, cut open at one end and with a tongue, B, in combination with yokes C C', attached to the same, in the manner described, and provided with suitable fastenings, arranged substantially as and for the purpose herein specified.

160,013.

160,013. SAFETY-PINS. Nathaniel H. Furness, Tarrytown, and Sigourney Wales, New York, N. Y. (Filed Apr. 20, 1874.)

Brief.—The two pins, being at right angles to each other, are prevented from being easily withdrawn.

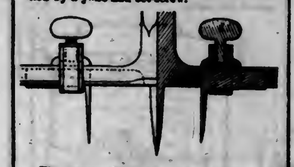
1. A safety-pin composed of two pointed arms, one of which is bent at right angles at or near the center thereof, substantially as and for the purpose hereinbefore set forth.

2. The combination of the hinged ornament, or its equivalent N, with the arms A and I, and with or without the coil L, substantially as and for the purpose hereinbefore set forth.

3. The combination of the coil L, with the arm I, having a right-angle bend at or near its center, and the arm A, substantially as and for the purpose hereinbefore set forth.

160,014. CONSTRUCTION OF FLOORS FOR THE PASSAGE OF PIPES. Wm. H. Gedney, New York, N. Y. (Filed Oct. 2, 1874.)

Brief.—The joists are cut on the upper side for the passage of gas or water pipes, and a metallic key is fitted tightly into the opening, so as to cover and protect the pipe, and be flush with the upper surface of the beam. The beam is not weakened by this arrangement.

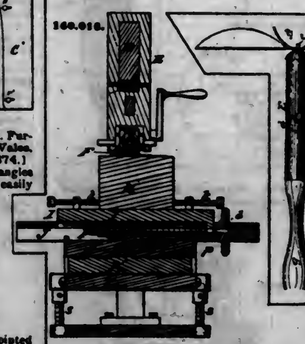


1. The beam-key D, having slightly-inclined faces D' D', and a hollowed body, adapted to serve as and for the purposes herein specified.

2. The combination of the beam A, notched as shown, and having plates abutting from A' A', with the inclined pipe or crossing-piece B and beam-key D D' D', as herein specified.

160,015. DEVICES FOR CUTTING OUT SHEET-METAL WASHERS. Daniel Goodnow, Jr., Boston, Mass. (Filed Jan. 26, 1875.)

Brief.—The manner of attaching the cutter to the stock constitutes the invention. The body of the cutter from which the cutting-blade projects at right angles is of triangular section, and rests in a V-groove in the arm of the stock, and is clamped in position by a yoke and set-screw.



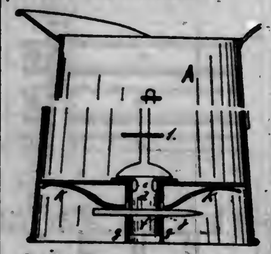
The cutters with wedge-shaped shanks, and the beam formed with corresponding gly-shaped grooves to receive said shanks, in combination with the encompassing clamping-yokes, substantially as and for the purposes shown and set forth.

160,016. PAPER-PERFORATING MACHINES. Robt. Hemingray, Covington, Ky. (Filed Aug. 28, 1874.)

Brief.—An ornamental perforating or cutting cylinder moves over a level bed, which carries the paper.

160,016.

1. The combination of roller F, sliding carriage E, roller *t*, bar B, ratchet-shaft G, and pinion *g*, substantially as set forth.



2. The combination of the block H and roller F, sliding carriage E, roller *t*, bar B, ratchet-shaft G, and pinion *g*, substantially as and for the purposes set forth.

3. The device for supporting, holding, and adjusting the block H, consisting of the jack-screws *s*, table I, table K, table J, table I, screws *p*, and set-screws *k*, substantially as set forth.

4. The combination of roller F, sliding carriage E, bar B, ratchet-shaft G, and pinion *g*, substantially as set forth.

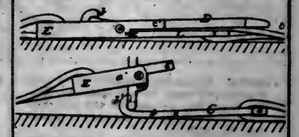
160,017. MEASURING-FUNNELS. Isaac W. Hoagland, Newark, N. J. (Filed Jan. 27, 1875.)

Brief.—The neck of a bottle being inserted in the outer tube presses against the inner tube, thereby raising the valve and allowing the liquid to escape into the bottle.

In a liquid-measure, the combination of the post A, having the gage-strips 1, the pipe *d*, having the perforations *e* and *f*, and the slotted pipe *g*, when operating substantially as and for the purposes set forth and shown.

160,018. PROCESSES FOR REMOVING TIN FROM TIN-SCRAP. John Holliday and H. M. Baker, Brooklyn, N. Y. (Filed Aug. 11, 1874.)

Brief.—Dips the scrap into a bath of fused alkaline nitrate; then plunges them, after draining, into water in a suitable tank. The tin separates and collects at the bottom. Any residual tin is removed by heating the plates, and fusing the alkaline nitrate upon them, forming stannate of soda, which is utilized.



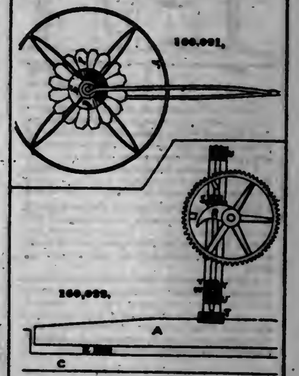
The process of separating the metallic tin from the iron of tin-scrap by heating the said scrap in a bath of fused alkaline nitrate, and then plunging it into water, substantially as described.

160,019. TOY WIND-WHEELS. Joshua Jamouneau, Newark, N. J. (Filed Sept. 15, 1874.)

A toy composed of the wheel A, journal *c*, bearings *d*, pipe E, and handle *g*, when constructed and arranged to operate substantially as and for the purposes set forth.

160,019.

160,020. DASHER-FLAP FASTENERS. John A. Kincaid, Boston, Mass. (Filed Mar. 28, 1874.)



The lever-buckle consisting of the U-shaped bar K, its offsets *c'*, the hook-plate C, its tongue *b*, and lateral shoulders *a*, the open loop-lever D, its guard-lugs *m*, shoulders *n*, and the pivots *o*, substantially as specified.

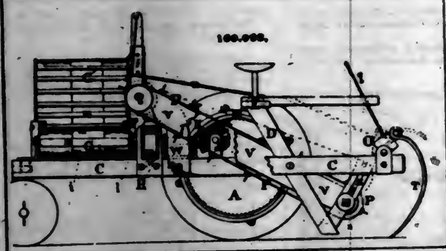
160,021. TOY TRUMBLES. Wm. H. Leonard, Chelsea, Mass., assignor of one-half his right to William Leonard, same place. (Filed Nov. 2, 1874.)

Brief.—Within the frame of the treadle is arranged a vaned wind-wheel, the vanes being colored, if desired.

The toy wheel described, the same consisting of the wheel A, having the elliptical braces *c c* and handle B, and provided with the central fan-wheel E, constructed and arranged to operate substantially in the manner and for the purpose specified.

160,021.

160,022. GRAIN-SEPARATORS. J. H. Loehr, San Francisco, Cal. (Filed Dec. 20, 1874.)



1. The loose screen-frame A, resting on the rubber springs B B within the outer frame C, in combination with the drop-shaft N, substantially as and for the purpose herein before set forth.

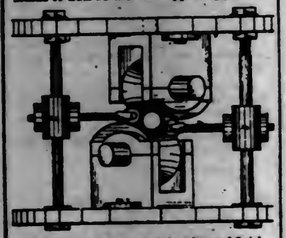
2. The rubber springs W W, supporting the strip of wood Y, in combination with the collar on the drop-shaft, substantially as and for the purpose herein before set forth.

160,023. HAY-LOADERS. Frank Marion, Tremont, Ill. (Filed Aug. 24, 1874.)

The construction and arrangement of the frame C C, draper and adjustable elevator or loader G G, draper-supports W W, spindle *a*, rollers Q Q, side pieces V V, draper F F' F', rollers *y y*, adjustable nut *x* for raising or lowering the draper at this end within the segmental guides Z Z, guides *s s*, bars D D, and rake O P, as described.

160,023.

160,023.



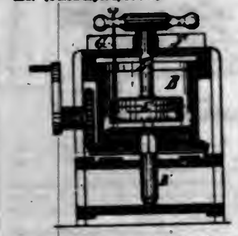
160,023. REIN-HOLDER. Carmi Osgood, East Hardwick, Vt. [Filed Dec. 31, 1874.]

1. The rein-holder, consisting of a case or frame, *r c*, with its stationary inclines *h h'*, the openings *i i'*, and the tips or projections *k k'*, all combined as and for the purpose set forth.

2. In combination with the case or frame *r c*, the movable wedges or rods *g g'*, as and for the purpose set forth.

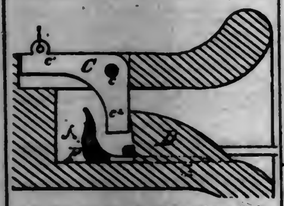
160,024. ROLLS FOR STRAIGHTENING AND FINISHING TUBES. George Matheson, McKeesport, Pa., assignor to the National Tube-Works Company, same place. [Filed Jan. 28, 1875.]

Brief.—The rolls have a bearing upon the article throughout their whole length in virtue of their concave surfaces, and the relative angular positions of their axes. The bearings of each roll are adjustable about a central pivot, and their distance apart can be changed by raising or lowering the plate to which the bearings of the upper roll are fastened by means of nuts on the four supporting-pillars.



1. In a machine for straightening and finishing pipe or other cylindrical articles, a pair of rolls, the rolling-surfaces of which are concave, having their axes arranged at different angles and upon different planes and in pivoted adjustable bearings, substantially as herein described, and for the purpose set forth.

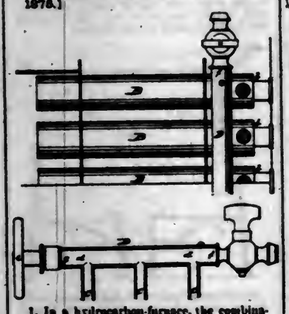
2. In a machine for straightening and finishing pipe or other cylindrical articles, a pair of rolls, the rolling-surfaces of which are concave, having their axes arranged at different angles and upon different planes, in combination with the guide-arms *n*, having friction-rollers *o*, supported in adjustable bearings *m*, substantially as herein described, and for the purpose set forth.



3. In a machine for straightening and finishing pipe and other cylindrical articles, a pair of rolls, the rolling-surfaces of which are concave, having their axes arranged at different angles and upon different planes, in combination with the adjustable plate D, substantially as herein described, and for the purpose set forth.

160,025. WASHING-MACHINE. Damian Minderle and Geo. Maschmeyer, St. Louis, Mo. [Filed Apr. 1, 1874.]

The combination, with tab B, adapted to be oscillated as described, of the pressure-head E, provided with the shaft and handle E' and the rod C, whereby the said tab and pressure-head may be operated simultaneously in opposite directions, or the head locked in a stationary position while the tab is being oscillated, as and for the purpose specified.

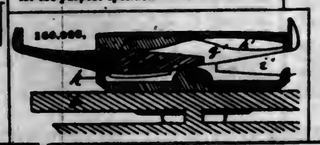


160,026. CAR-COUPLINGS. Horace Meriam, Berlin, Wis. [Filed Aug. 26, 1874.]

1. The elbow F, with bifurcated arm G, in combination with lever C and link H, as shown and specified.

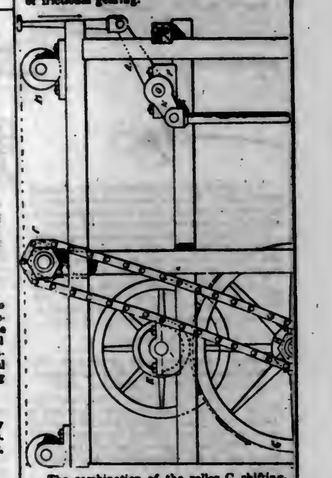
2. The combination of the lever C, elbow F, having bifurcated arm G, link H, and plate D, as shown and specified.

160,027. HYDROCARBON-FURNACES. Henry Napier, New York, N. Y., assignor to Jas. Napier, East Orange, N. J. [Filed Jan. 12, 1875.]



1. In a hydrocarbon-furnace, the combination of the tubes A, having spiral flanges *a*, with the tubes B, substantially as and for the purpose set forth.

2. The combination of the tube D, having its regulating-tube *d*, with tubes C and B, the tube C forming a steam and oil tight connection between tubes D and B, substantially as shown and described.

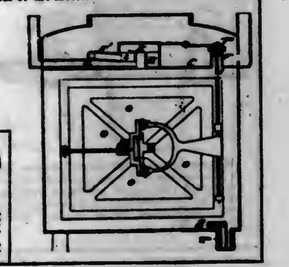


3. The combination of the tube B with tubes C, E, and A, the latter provided with spiral flanges *a* and damper F, substantially as and for the purpose specified.

160,028.

160,029. LUMBER-CARRIERS. F. L. Pinney and R. H. Hasty, Anoka, assignors of one-third their right to C. F. Washburn, Minneapolis, Minn. [Filed Sept. 12, 1874.]

Brief.—Fluted carrying-rolls are made vertically adjustable, and are driven by a system of frictional gearing.



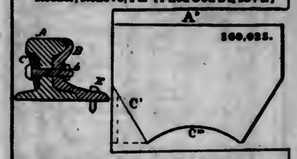
The combination of the roller C, shifting-frame E, driving-wheel G, and friction-wheel K, arranged to operate as herein described.

160,030. COMPOUNDS FOR THE PREVENTION OF SCALES IN STEAM-BOILERS. J. H. Pitts, Oakland, Cal. [Filed Apr. 26, 1874.]

The compound described, consisting of a solution formed by the boiling together of leather scraps, caustic soda or hydrated oxide of sodium, gelatine, and water, in or about the proportions named, substantially as and for the purposes herein set forth and specified.

160,031. GAS-METERS. Jacob Badstue, San Francisco, Cal. [Filed July 10, 1874.]

Brief.—To avoid making separate holes for the shafts, they are passed through the pipes, which are provided with extensions at the top for the stuffing-boxes. To draw off the liquid which accumulates in gas-meters, the feet are made hollow and are divided into two chambers, one of which communicates with the exterior and the other with the interior chamber of the meter.

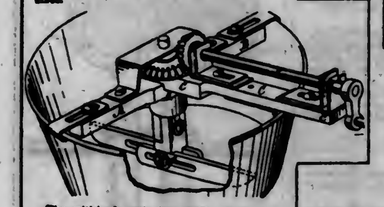


1. The pipes F F, provided with the extension-pipes F'', the ends closed with stuffing-boxes, in combination with the internally-arranged shafts L and diaphragms O, for operating the valves, as set forth.

2. The loops P, adjustably secured in the holders *r*, in combination with the diaphragms O, links N, yokes M, and operating-levers, substantially as and for the purpose herein described.

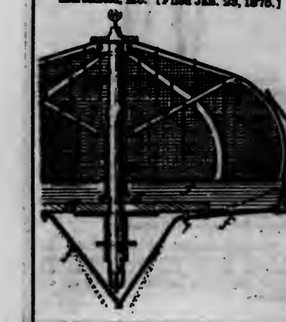
3. The divided foot T, having one half connecting with the chamber exterior to the diaphragm, and the other half connected with the interior chamber by the pipe S, the foot being provided with a screw-cap, Z, the whole operating substantially as and for the purpose herein described.

160,032. RAILWAY-RAIL JOINTS. Daniel K. Reeder, Renovo, Pa. [Filed Oct. 24, 1874.]



160,032.

The combination of the stay-plate B, made to conform to the outside of the rail and embrace the same closely, with the spring-plate C on the inside of the rail, its lower edge resting against the lower flange and web of the rail, and its upper edge extending away from the web and resting against the edge of the upper flange, in order to support the same, as and for the purposes herein set forth.



160,033. PORTABLE STIRRERS FOR COOKING-VESSELS. Francis M. Roush, Massillon, Ohio. [Filed Feb. 2, 1875.]

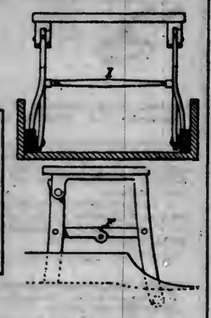
Brief.—Adaptable to vessels of various sizes.

The within-described portable stirring apparatus, consisting of the combination of the radial arms A B C, having adjustable holders *a e*, the stirrer-shaft and stirrers adjustable to and on said shaft, and the driving mechanism, all supported and sustained on said radial arms, as and for the purpose described and represented.

160,034. FLY-TRAPS. Jacob C. Sellers, Marshfield, Mo. [Filed Jan. 28, 1875.]

1. A fly-trap consisting of an umbrella-shaped frame covered with netting, and an adjustable apron attached around the same to the ends of the ribs, as herein set forth.

2. The combination, with an umbrella-shaped frame covered with netting, of the apron J, elastic springs or bands A, draw-strings *f*, and bait-board O, substantially as and for the purposes herein set forth.



160,035. COAL-HODS. George Seyfang, Buffalo, N. Y. [Filed Jan. 9, 1875.]

Brief.—The apron of a hod made of one piece with little waste of metal.

The blank A, consisting of a single piece of metal, and having the linear front A'', right-angled corners B' B'', converging sides C' C'', and curved back C''', adapted to form the funnel or front part of a coal-hod, substantially in the manner shown, and for the purpose set forth.

160,036. JUMP-SEATS FOR CARRIAGES. N. Starkey, Amesbury, Mass. [Filed Jan. 12, 1875.]

1. In combination with the movable seat of a carriage, a leg hinged to the hind part of the seat, to operate substantially as described.

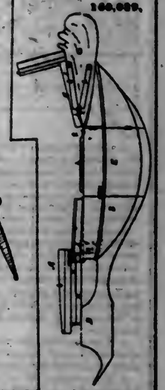
2. In combination with a fixed forward leg and a jointed hind leg, a jointed or stiff brace to connect the front and hind leg, substantially as described.

3. In combination with the braces F, which support the hind legs, the rod I, to support the braces when the seat is put forward or back, as set forth.

160,037. SURGICAL INSTRUMENTS. Herbert L. Stillman, Richmond, R. I. [Filed June 10, 1874.]

Brief.—An elastic cup is connected at one end with an air-pump. Dilators are arranged along its shank and the lower end of the barrel of the air-pump. In difficult parturition the cup embraces the head of the child, and when a vacuum is produced in it the head may be drawn down by applying force to the barrel of the pump.

The compound instrument composed of the oval elastic cup, communicating with the air-pump, and of the side dilators, all arranged in the manner and for the purposes shown.



160,038. GLOBE COMPOUNDS FOR PAINTS. James B. Tarbett, Chicago, Ill. [Filed Dec. 30, 1874.]

A glass or enamel for paint, composed of resin, sugar of lead, and drying-oil, combined substantially in the manner as described.

160,039.

160,039.

160,039. LANDAUS. Chauncey Thomas, Boston, Mass. [Filed Nov. 4, 1874.]

1. The combination of the counter-balance, consisting of the spring C, the connections *d d*, and the arms *e e*, with the body B and the front head A, as described.

2. The post H, separate from the door E, and grooved and hinged to the head G, in combination with the window F, provided with the headed stud *i*, to operate in the groove of the post, all as set forth.

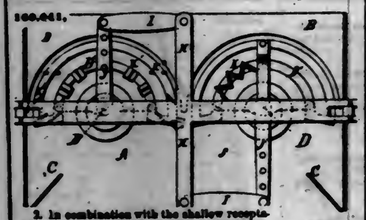
3. The combination of the ledge *h* with the rabbet *g* of the door and the grooved post H and stud *i*, applied to the window and back hood, as specified.

4. The combination of the mortised plate *p* and the tenon *q* with the door and the grooved post H, separate from each door and hinged to the back hood G, all substantially as set forth.

5. The combination of the spring-stop *a o* with the grooved post H, hinged to the back hood, and the window provided with the headed stud *i*, all to operate as set forth.

160,040. RAILWAY-SWITCHES. Charles D. Tisdale, Boston, Mass. [Filed Dec. 10, 1874.]

Brief.—A railroad-switch in which a stationary grooved plate is employed in combination with a movable grooved point-rail, which is held clear of the main line by a weighted lever; said groove in movable point permitting the passage of a train from the siding onto the main line when the latter is open.



In combination with the grooved guide-plate C and the frog D, arranged, as described, at the junction of a main track and siding or turn-out track, mechanism, substantially as explained, for operating the frog after closing of it by an attendant, such mechanism consisting of the elbow-lever *g* and its weight *i*, applied to said frog as set forth.

160,041. CAR-SEPARATORS. Bryan Tyree, Washington, D. C. [Filed Nov. 20, 1874.]

Brief.—A plate just above the agitators; feeders projecting from the inside of the box; circular agitators mounted on posts rising above the box, and operated reciprocally by a sliding bar and pivoted levers. The ores and kept from splashing over or gathering at the sides of the box, the posts of the vertical axles cannot be clogged with seed.

1. The shallow receptacle or receiving-box A, constructed with the plate B and feeders C C, in combination with the rotary oscillating or reciprocating agitating arms or wheels D E, as and for the purposes described.

160,041.

2. In combination with the shallow receptacle or receiving-box A, constructed with the plate B and fenders C, the shafts D D, stepped in posts E secured in the box A, and extending above the agitators, said shaft carrying the arms or circular frames D' and agitators K, as and for the purposes described.

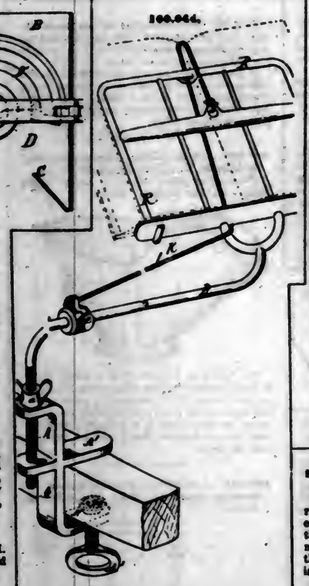
3. In combination with the box A, constructed with the plate B and fenders C, the agitators D' K, placed in the box in front of and below the plate B secured to the shaft D that is supported or stepped in a post, E, which extends above the plate B, said agitators receiving, through said shaft D, a rotary oscillating or reciprocating motion, as and for the purposes described.

4. The combination of the sliding bar F, crown-bar H, and connecting-rods I, substantially as and for the purposes set forth.

5. The combination and arrangement, in an ore separator or washer, of the shallow box A B C, posts E, and agitating devices D D' K, said agitators receiving, through a sliding bar, F, crown-bar H, and connecting-arms I J, a rotary oscillating or reciprocating agitation or motion, as and for the purposes described.

160,042. SOLES FOR BOOTS AND SHOES. H. B. Van Benschoten, Ghent, N. Y. (Filed June 10, 1872.)

Soles of boots and shoes armed with the metal wear plates or protectors B B, inserted in countersunk depressions, so as to be flush with the outer surface of the sole, such plates or protectors being provided with and attached by means of the sharpened shanks or prongs C D, of sufficient length to penetrate and bind together the pieces composing the bottom, substantially as and for the purposes described.



160,043. JIG-SAWS. Edwin J. Wescott, Hyde Park, assignor to F. B. Tripp, Boston, Mass. (Filed Sept. 9, 1874.)

Brief.—The saw is secured to the arch-heads of two levers by metallic bands, and is retained in the proper position while at work by means of flanges upon the arch-heads and a supporting-roll.

The guide-rings or arms a a' on the arms of the levers, combined with the bands a a' on the springs, and with the guide-roller o for the back edge of the saw, substantially as shown and described.

160,044.

160,044. BOOT-HOLDERS. A. L. Wilson, Broadway, N. J. (Filed Oct. 12, 1874.)

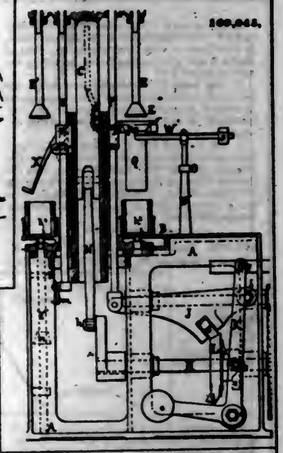
1. The combination of the boot-rack R, supported upon the arm B, with the adjustable copy-guide V, cord K, guiding-collar m, and nut-screw *n*, substantially as and for the purpose described.

2. The combination of the adjustable swinging arm B, threaded on the lower end, jam-nut *o'*, and clamp A A', substantially as and for the purpose described.

160,045. MACHINES FOR PACKING TOBACCO. H. Winterwerber, Offenbach, Germany. (Filed Mar. 20, 1873.)

Brief.—The molds turn horizontally in succession under a hinged hopper, which, as it is raised and made to enter the usual funnel, throws the packing devices in and out of gear. The funnel is automatically taken from the molds after the packer has operated, and swung to one side. The completed packet is finally raised from the mold by an ascending plunger, and thrown from the machine by a vibrating lever.

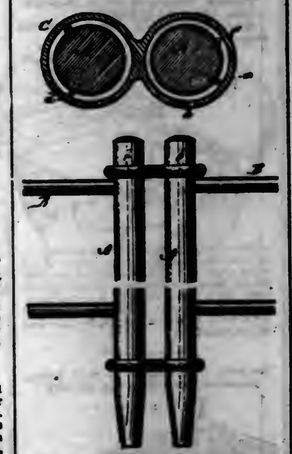
1. The combination of the hopper S, arm U rod R, lever V, disengaging-bar T, and weighted arm K, arranged and operating in the manner and for the purpose substantially as set forth.



2. The sliding rod C, with groove r in its surface, in combination with the sleeve F, with internal projecting pin q, the spring-hook *d*, fast to the lower part of the sleeve F, and the projections a a a a, fast to the table B, arranged and operating together substantially in the manner described.

3. The combination of the lever W, with counter-weight 3 at one end and hook p at its other end, the inclined supporting-pin *s*, and the filling-tube Q, rod P, and arm I, substantially as and for the purpose described.

4. The combination of the sliding rod O, with hook m, the rod Y, with projection a, the bottom plates 4, and the projection 13, fast to the frame, arranged and operating together substantially in the manner and for the purpose described.

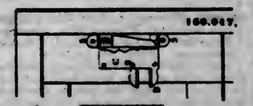


5. The combination of the lever X, roller *o'*, and sliding rod O, arranged and operating in the manner and for the purpose substantially as specified.

160,046.

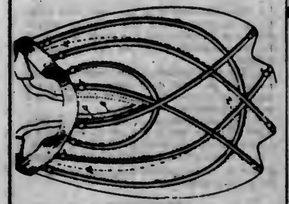
160,046. CLOTHES-FRAMES. Allen Wright, Westfield, N. Y. (Filed July 6, 1874.)

Brief.—A clothes-frame constructed in upright sections, held together by double rings constructed with an inner groove, having through the rings an opening, by which a pin may be introduced into the upright within the groove, which serves as a guide for opening and closing the sections.



The rigid rings C C, constructed with interior circumferential grooves a a, extending but partially through the rings, and with openings b, in combination with pins *d* and posts A A, all as and for the purpose specified.

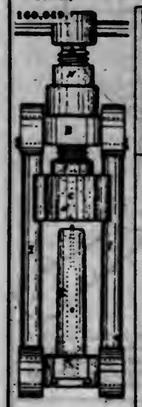
160,047. SASH-HOLDERS. Frederick A. Batley, Chicago, Ill. (Filed Oct. 20, 1874.)



Brief.—The claim clearly sets forth the device, the introduction of the spring into the wedge-shaped bar being the element of novelty in the improved combination.

The wedge-shaped bar F, provided with legs b a, and tapered lever arm in combination with the roller F, spring E, lever E, and case C, C', and C'', as and for the purposes described.

160,047.



160,048. BUSTLES. Robert Bierng, New York, N. Y. (Filed Oct. 9, 1874.)

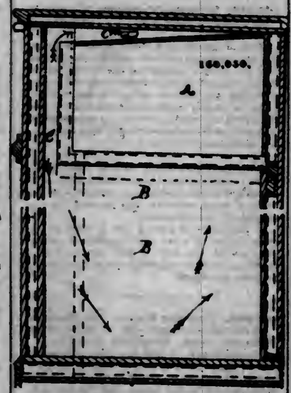
1. A bustle constructed of a layer of cloth, to which springs are secured, and formed into the desired shape by a double gore, *c c*, substantially as set forth.

2. In a bustle the web of cloth *a*, stretched across the inner or concave side of the bustle, and secured thereto at its side and bottom edges, its upper edge being left free, substantially as and for the purposes herein set forth.

160,049. CARTRIDGE-LOADING IMPLEMENTS. B. Burton, Brooklyn, N. Y. (Filed Sept. 4, 1874.)

1. In a cartridge-loading implement, the rotating head and spindle D E, substantially as described.

2. The sliding crimper C and punch F, operated by a screw or press, guided in a direct line with the cartridge by means of the slings or ways I.



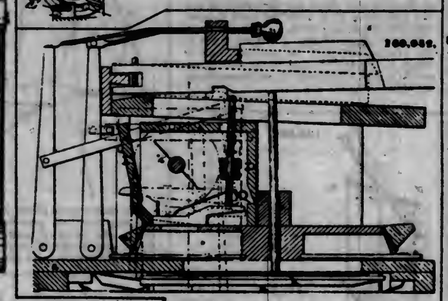
3. The combination of the revolving head, crimper, punch, screw, and frame, constituting a machine or tool, substantially as set forth and described.

160,050. REFRIGERATORS. Jas. C. Clark, South Bend, Ind. (Filed Dec. 14, 1874.)

Brief.—The warm air passes up in the rear flue, over and not entering the ice-box, onto a condenser affixed to the cover of the refrigerator. The bottom of the ice-box rises from the sides toward the center, and in grooves from the front center to the rear center.

The ice-box A, having its bottom arranged in inclined planes, and provided with a condenser, c, and flues D, in combination with the preserving-chambers B and warm-air flue C, as shown and described, for the purposes specified.

160,051.

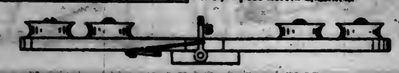


160,051. BLIND-STOPS. William A. Clark, New Haven, Conn. (Filed Jan. 4, 1875.)

Brief.—A segmental friction-plate is secured in slightly-inclined position to the inner face of the lower slat of the blind. A spring-bolt is so arranged as to press laterally on the surface of the plate, the weight of the bar on connecting-rod tending to make the slats turn automatically, while the inclined position of the plate tends to crowd back the bolt, thereby increasing the friction. There is also in the plate, near its lower edge, a hole, with which the bolt engages to lock the device.

A blind-stop, consisting of the inclined friction-plate D and the spring-bolt E, both constructed and arranged to operate substantially as shown and described.

160,052.



160,052. REED-ORGANS. Levi K. Fuller, Brattleborough, Vt., assignor to J. Estey & Co., same place. (Filed Dec. 15, 1874.)

Brief.—An inclosed tremolo-face is arranged above and in connection with supplemental valves, one for each reed-cell. These valves are operated by further depression of their respective keys than is necessary to sound the usual valves, so that sole effects in tremolo, which do not affect the harmonic accompaniment, are readily attainable.

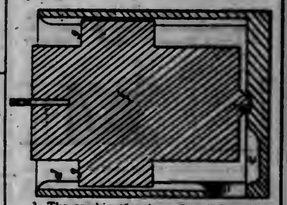
1. A tremolo attachment for reed-organs, consisting of a rotating fan, h, inclosed within a box or casing, D, distinct from the casing of the instrument itself, said box being located over the reed-cells and outside of the air-chamber, and provided with a damper or valve, E, operated by a step or lever, when all arranged substantially in the manner shown, and for the purposes set forth.

160,053.

2. In a reed instrument, in combination with a tremolo-fan, a series of air-orifices arranged in proximity thereto, communicating with the reed-cells, and controlled by valves, each governed by a separate key, which acts upon the valve only when fully or nearly fully depressed, so that the tremolo effect may be confined to any particular note or notes desired, substantially as herein set forth.

3. In a reed instrument, the combination of the supplementary valves A, arranged on the top of the reed-board, the reed-cells *r r* having orifices B B in their roofs, and the supplementary tracker-pins C C, which act upon the said valves only when the keys are partially or fully depressed, (the pins not being in contact with the keys when the latter are at rest,) substantially in the manner and for the purposes set forth.

4. In combination with the pins C C, and valves A A, the rock-shaft F, connected with the bar *u*, substantially as and for the purposes set forth.



5. In a reed instrument, the combination of the pins C C, and valves A A, with the box D, and fan *h*, as shown and described.

160,054. MANUFACTURE OF GUNPOWDER. Edward Greene, New York, N. Y. (Filed Jan. 25, 1875.)

In the manufacture of gunpowder, the process herein described of incorporating together the ingredients, consisting in dissolving the saltpeter or nitrate of soda in hot water, and mixing the other ingredients with the heated solution, the heat being maintained during the operation in a complete or partial vacuum, substantially as and for the purpose set forth.

160,055. FIRE-KINDLERS. B. S. Harrington, China, Me. (Filed Jan. 18, 1875.)

Brief.—The bucket being placed beneath the grate, a match is applied at the draft-opening.

1. The combination, in a fire-kindler, of a bucket-shaped receptacle having a draft-opening and a drip-cup, and a removable porous absorbent core, substantially as described.

2. The combination, in a fire-kindler, of a bucket-shaped receptacle, *a*, having the draft-opening *b*, drip-cup *c*, and grooves *d*, and a removable porous absorbent core, *f*, having the flanges *g* and point *h*, substantially as described.

3. Igniting coal and other fuel from below the grate by means of a fire-kindler, consisting of a bucket-shaped receptacle provided with a draft-opening, and carrying within it a porous absorbent core, substantially as herein described.

160,056. CHECK-ROWERS FOR CORN-PLANTERS. Geo. D. Haworth, Decatur, Ill. (Filed Oct. 17, 1874.)

Brief.—Upon a beam for transverse attachment to the planter-frame is pivoted a series of pulleys for the reception of the knotted cord, which passes through the double-slotted rock-plate, pivoted about midway of the beam, for communicating motion to the seed-slide through the medium of the connecting-rod and elbow-lever.

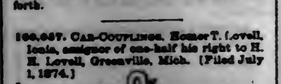
1. A vibrating tappet, B, pivoted on a check-row bar, or otherwise attached to a corn-planter, and provided with two crotches, arranged as described, so that the check-row cord, in passing through a slit crotches, will produce a reciprocating motion, substantially as and for the purpose herein specified.

2. Pulleys *a a a' a'*, arranged as described, so that a check row cord will be received by an outside pulley, *a*, and discharged by an inside pulley, *a'*, and when the planter is reversed will be in a correct position to receive the cord on the opposite side of the planter, substantially as and for the purpose herein specified.

3. Cord D, arranged as described, with pulleys *a a a' a'*, so that every stop will operate rocker-plate B in either slot alternately, thereby producing a reciprocating motion by the use of one rocker-plate, substantially as and for the purpose set forth.

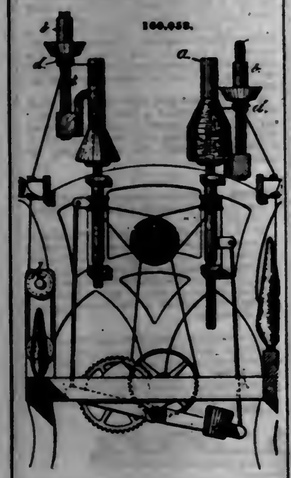
4. Pulleys *a a a' a'*, rocker-plate B, lever C, rod *b*, and cord D, all constructed and arranged to operate as a check-rower, substantially in the manner and for the purpose set forth.

160,056. SETTING-INSTRUMENTS FOR ATTACHING BUTTONS, &c. David Heston, Providence, R. I. [Filed Dec. 10, 1874.]



Brief.—The ends of the fastening-prongs are curved and concealed within the fabric by means of cavities and grooves in the lower jaw of the instrument.

1. The die B, constructed with circular cavities *d' d'* and concave grooves *f' f' f'* in the face of the jaw, constituting the clinching mechanism, substantially as specified.



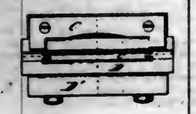
2. The combination of the die B, constructed as described, with the platform-spring *n* and jaw A, provided with the arched groove or slot R, all substantially as and for the purpose set forth.

160,057. CAR-COUPLINGS. Homer T. Lovell, Lonia, assignor of one-half his right to H. H. Lovell, Greenville, Mich. [Filed July 1, 1874.]

The combination of the head *a*, having an opening through its top, and hole *b*, the plate *c*, having weight *d* and projections *e*, pin *f*, and the guides *g*, substantially as set forth.

160,058.

160,059. SPOOLING-MACHINES. Thomas A. Matherson, Pawtucket, R. I. [Filed Nov. 11, 1874.]

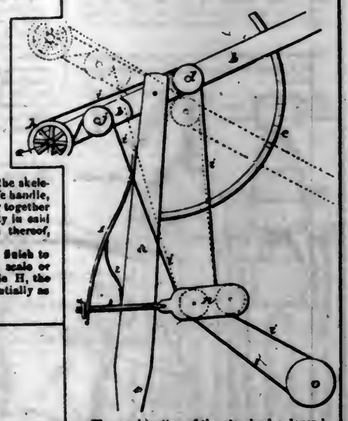


Brief.—The threads of the screw that carries the cone are of saw-toothed section, so that the cone, if placed too low on the screw, will be caused to slide readily upward when it strikes the bobbin being wound, and assume its proper position automatically. On the sleeve that carries the cone is a loose guide or carrier, that travels vertically with the cone, but does not revolve with it.

1. In combination with the cone C and sleeve *b*, the thread-carrier *d*, supported loosely upon the sleeve *b*, for guiding the thread onto the vertical spool, substantially as and for the purpose herein described.

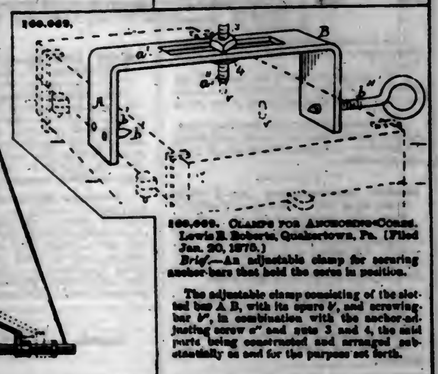
2. The screw S, having the threads on the same formed of a saw tooth section, in combination with the cone C and carrier *d*, in a spooling-machine, substantially as and for the purpose described.

160,060. DIES FOR MAKING THE HANDLES OF POCKET-CUTLERY. W. H. Miller, West Meriden, Conn. [Filed Oct. 27, 1874.]



Brief.—Blank is first cut from a sheet of metal; then by a series of dies is roughly formed into the scales and back; a former is then inserted in the blank, and the two subjected to the action of the finishing-dies, whereby the blank is completed and its corners left sharp and angular.

1. As a means of giving form to the skeleton scale or frame B of a pocket-knife handle, the die D and the punch F, operating together to force the said blank into the cavity in said die, and cause it to take the form thereof, substantially as described.

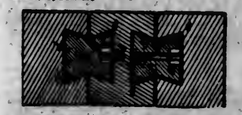


2. As a means of giving a sharp finish to the exterior angles of the skeleton scale or frame B, the combination of the die H, the punch *k*, and the former L, substantially as set forth.

160,061. HARVESTER-RIBBLE. Geo. G. Read, Russellville, Ky. [Filed Dec. 2, 1874.]

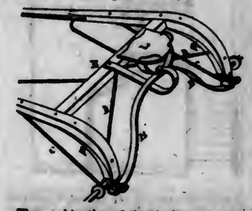
The combination of the standard *a*, lever *b*, carrying the three pulleys *h i l*, and holding device, the pulleys *j l* being arranged on different sides of the fulcrum of the lever, substantially as shown and described.

160,062.



160,063. CLAMPS FOR ANCHORING-CORDS. Lewis H. Roberts, Quakertown, Pa. [Filed Jan. 20, 1875.]

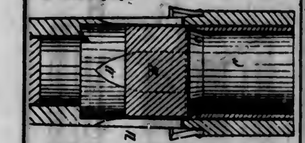
Brief.—An adjustable clamp for securing anchor-bars that hold the cords in position.



The adjustable clamp consisting of the slotted bar A B, with its spurs *b'*, and screwing-bar *b''*, in combination with the anchor-adjusting screw *a''* and nuts 3 and 4, the said parts being constructed and arranged substantially as and for the purpose set forth.

160,063. EXTENSION-TABLE SLIDES. De Witt Clinton Silver, Greenfield, Ind. [Filed Nov. 4, 1874.]

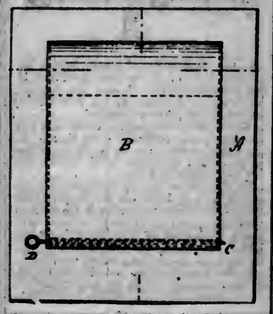
The double-dovetailed groove-tongue B, provided with grooves *d* upon opposite sides and at opposite ends, in combination with the double-dovetailed grooved slides A, provided with the pins or stops *b*, all constructed as and for the purpose herein specified.



160,064. SULKIES. Peter Soule, Colesville, N. Y. [Filed Aug. 18, 1873.]

The combination of the shafts A A, bar E, braces C C and D D, pivots B B, spring H, and seat L, substantially as and for the purpose set forth.

160,065. PUMP-SUCKERS. J. M. Springer, Indianapolis, Ind. [Filed Jan. 18, 1875.]

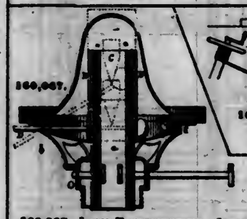


Brief.—The valve is a block of wood made in the form of a solid cylinder of size sufficient to nearly fill the bore of the cylinder in which it plays.

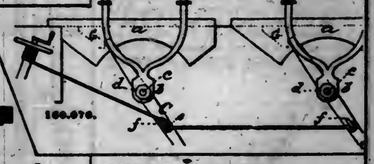
A pump sucker or plunger consisting of the cylinder A; provided with suitable openings D, the valve-seat C, and valve E, substantially as described.

160,066. VENTILATORS FOR WINDOWS. Geo. Wagner, Washington, D. C. [Filed Feb. 6, 1875.]

Brief.—A pane of glass is provided with a transparent box-flue on its inside. The box-flue communicates with the outside of the window, and has a damper arranged in it at its lower end.



1. A ventilator for windows, consisting of the pane of glass A, having on its outside the transparent box-flue B, provided with the damper C D, substantially as and for the purpose set forth.



2. A ventilator for windows, consisting of the transparent box-flue F, provided with the damper G, and forming a part of the pane E, substantially as and for the purposes set forth.

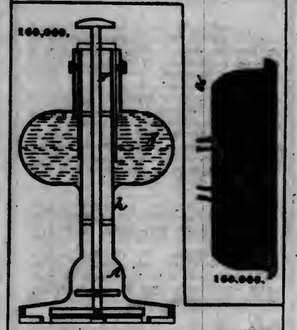
3. A window provided with the ventilating-pane A, having the box-flue B, controlled by the damper C, and the pane E, having the box-flue F, controlled by the damper G, substantially as and for the purposes set forth.

160,067.

160,068.

160,067. LAMP-EXTINGUISHERS. Jonathan Wesley Waterman, Oregon, Wis. [Filed Sept. 21, 1874.]

Brief.—The inclined side of the wedge-shaped projection upon the sliding tube limits the upward motion of the weighted levers.



In a lamp-burner, O, the combination of the sliding sleeve B with the weighting wedge-shaped legs C, having their projecting edges, *e*, inclining each toward a downward point, *d*, and the bent, twisted, forked, and bevel-weighted lever D, substantially as and for the purposes specified.

160,068. SAD-IRONS. James M. Whiting, Providence, R. I., assignor of one-half his right to Walter Taber, Acushnet, Mass. [Filed Dec. 4, 1874.]

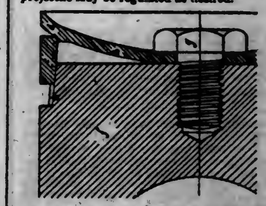
Brief.—The iron to be heated is made in two parts, with a spring-handle that clamps the center-piece of a detachable shoe.

The iron *a a*, divided in two parts horizontally, from heel to point, the steel springs *b b b b*, and the handle *c*, the horizontal center-piece D, formed on the shoe E, combined substantially as and for the purposes described.

160,069.

160,069. LAMPS. Albert Albertson, Jersey City, N. J., assignor to P. Corrigan, New York city. [Filed Feb. 8, 1875.]

Brief.—A hollow tube surmounted by cap and having lateral arms, all filled with mercury or other desirable fluid, for conducting heat to the lamp-bottom to induce circulation of air.

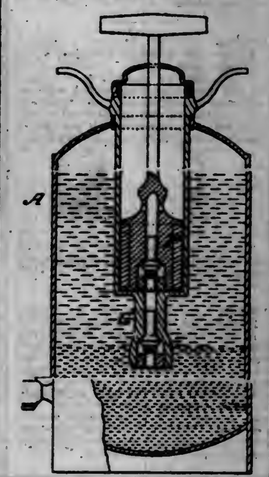


The hollow tube F with hollow cap G and branches I, in combination with a lamp with cylindrical wick-tube and cylinder *h*, substantially as described, and for the purpose set forth.

160,070. SHEER-BOOMS. Hector Anderson, Durand, Wis. [Filed Jan. 9, 1875.]

The fin C, pivoted near its center to the brace B, in combination with the sheer-boom A and stop G, substantially as and for the purpose set forth.

160,071. PROJECTILES FOR ORDNANCE. C. Arrick, Washington, D. C. [Filed Jan. 13, 1875.]



Brief.—The construction of parts is such that the escape of air between the sabot and projectile may be regulated as desired.

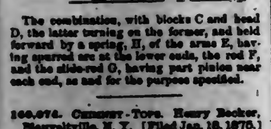
The projectile provided with a tapering groove, *h*, and sabot or cup *b*, provided with tapering block *c'*, when combined and adapted for operation as shown and described.

160,072. FIRE-EXTINGUISHERS. George H. Barker, Waverly, N. Y., assignor of one-half his right to L. D. Stone, same place. [Filed Jan. 21, 1874.]

Brief.—An air-forcing pump is so arranged within a reservoir for containing a fire-extinguishing mixture that the incoming air will stir up the precipitated salts.

The fire-extinguishing apparatus, consisting of the reservoir A, hose and nozzle and the air-pump terminating in a jet, O', within said reservoir, above and near the bottom thereof on which the salt lies, thereby serving actively to form the solution and to discharge the same, substantially as specified.

160,072. ADJUSTABLE RECLINING-LOUNGE. Emil Bartels, New York, N. Y. [Filed June 6, 1874.]



Brief.—To the upper end is pivoted the head or arm-piece, secured to blocks upon which are formed jointed connections with the upper section or arm-piece, the lower end of which is fitted with ratchets and pinions attached to a cross-shaft, the position of which is governed by a spiral spring, for raising and lowering the arm-piece or head, and its position governed by an upright spring attached to the frame.

The combination, with blocks C and head D, the latter turning on the former, and held forward by a spring, H, of the arms E, having quarred arc at the lower ends, the rod F, and the slide-rod G, having part pinion near each end, as and for the purpose specified.

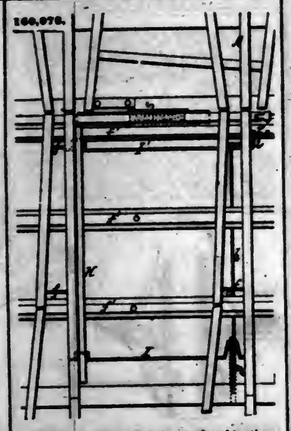
160,074. CEMENT-TOPS. Henry Becker, Maysville, N. Y. [Filed Jan. 18, 1875.]

Brief.—The lugs are passed through the rectangular opening in the coping-plate at the corners, and they catch under the edge of the plate when turned so as to be opposite the sides of the rectangle, and thereby hold the top in place.

The chimney-top A, having base B and subjacent lugs C, constructed and arranged substantially as shown and described, to enable it to be attached to coping-plate A', in the manner set forth.

160,075. SECURING PINS TO ARTIFICIAL TEETH. Orin S. Bixby, Syracuse, N. Y. [Filed Jan. 26, 1875.]

Brief.—Holes are baked in the teeth, and the pins then inserted and packed with material more fusible than porcelain. The teeth, with pins inserted and packed with this material, are then subjected to heat sufficient to melt the material and securely fasten the pins.

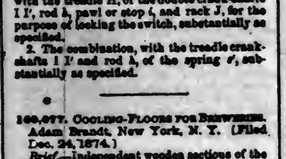


The above-described method of inserting and fusing metallic pins in artificial teeth, substantially as specified.

160,076. RAILWAY-SWITCHES. P. C. BYRD, Mayfield, Ky. [Filed Nov. 14, 1874.]

Brief.—The movable rails of the switch are locked in position by means of a longitudinal traverse acted upon by the flange of the wheels, said traverse being mounted upon double crank-shafts, which are connected by a longitudinal rod. The front crank-shaft carries a projection or stop, which engages with notches in a plate, thereby locking switch-rails. The stop is withdrawn from the notch by a spring at rear end of longitudinal rod, connected to rear crank-shaft.

160,076.

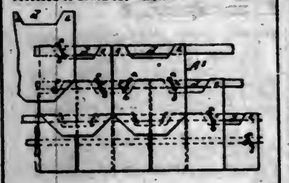


In a railroad-switch, the combination, with the treadle H, of the double crank-shafts I I', rod K, pawl or stop *i*, and rack J, for the purpose of locking the switch, substantially as specified.

2. The combination, with the treadle crank-shafts I I' and rod K, of the spring *s'*, substantially as specified.

160,077. COOLING-FLOORS FOR BREWERIES. Adam Brandt, New York, N. Y. [Filed Dec. 24, 1874.]

Brief.—Independent wooden sections of the floor ride on balls. Each is covered by a metal sheet, fastened to it only at the top of the depending side flanges. The metal flanges of adjacent sections interlock, and are soldered together. Result: a water-tight metal floor, each sheet of which can expand and contract without throwing itself or its wooden support out of a horizontal plane.

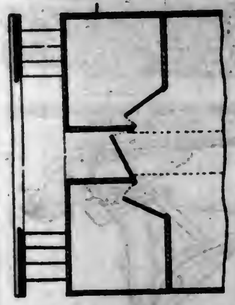


1. The cooling-floor, composed of sheet-metal sections *a a* that are respectively fastened to, and combined with, movable sections B B of flooring, substantially in the manner herein shown and described.

2. The sheet-metal sectional plate *a* of the cooling-floor, made with pendent flanges *g g*, of which two are formed into troughs *f*, substantially as herein shown and described.

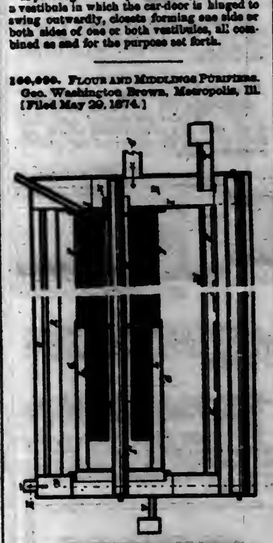
3. The flooring B, constructed in movable sections to constitute a sectional support for a metallic cooling-floor, with which it is combined, substantially as specified.

160,078. SLATE ROOFS. Louis Brandt, New York, N. Y., assignor of one-half his right to Adam Brandt, same place. [Filed Jan. 30, 1875.]



Brief.—A roofing-slate with two perforations near each of its opposite sides, to receive the wires by which the slate is fastened to the iron purlins. The upper edge is also recessed to avoid the wires.

1. A slate perforated at *a b* near its opposite sides to receive wires *c*, whereby it is secured to the beam B, substantially as specified.

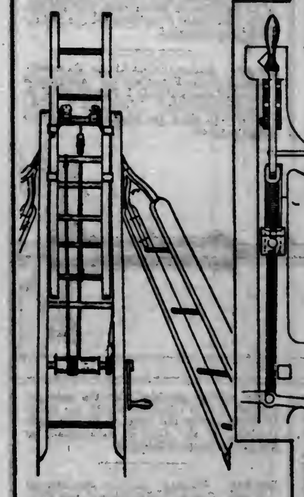


2. The slate A, having the holes *a b* for receiving fastening-wires *c*, and made with the recess *d* and ears *e e* at its upper end, substantially as set forth.

160,079. PASSENGER-CARS. I. Bridgman, Toronto, Canada. [Filed Apr. 28, 1874.]

A passenger railway-car having in each end a vestibule in which the car-door is hinged to swing outwardly, closets forming one side or both sides of one or both vestibules, all combined as and for the purpose set forth.

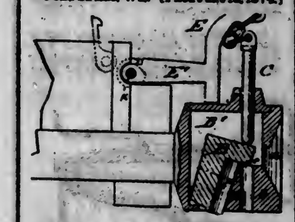
160,080. FLOUR AND MIDDLINGS PURIFIERS. Geo. Washington Brown, Metropolis, Ill. [Filed May 20, 1874.]



1. The combination of the perforated air-passages O P R S M, the perforated tube H, the pressure-chamber B, and the exhaust-chamber D with the bolting-reel, substantially as and for the purpose described.

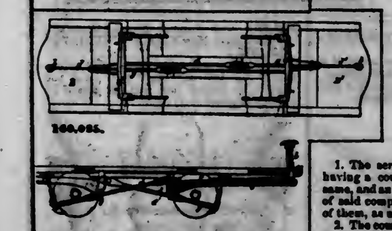
2. The combination of the exterior bolt F G, interior bolt L, perforated tube H, and the perforated radial partitions K, all constructed and arranged to operate in the manner and for the purpose set forth.

3. The combination of the perforated air-passages O, P, R, S, and M, the perforated tube H, the pressure-chamber B, the exhaust-chamber D, the exterior bolts F G and interior bolt L, the perforated radial partitions K, the shaft I, and the perforated partition J, substantially as and for the purpose specified.



4. The perforated top and side conductors O and P, combined with the bolting-reel and the blast-chamber, substantially as specified.

160,081. FIREMEN'S LADDERS. P. P. Carnes, Cleveland, Ohio. [Filed Jan. 11, 1875.]

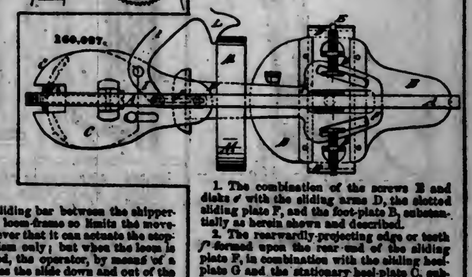


In a tripod ladder having its sections secured together at the top, the removable yokes O C, as shown and described, and for the purpose set forth.

160,082. CAR-COUPLINGS. Alex. H. Clark, Fond du Lac, Wis. [Filed June 13, 1874.]

The combination, with pins C, of the curved and chain-connected lifter E, having a right-angled arm, E', pivoted at its rear end, as shown and described.

160,083. CAR-BRAKES. Charles C. Clark, Boston, Mass. [Filed Jan. 22, 1875.]



1. The combination of the twin levers J J', provided with the foot-rest *l*, and pivoted to the car-floor, with the rods *d* and *g*, attached to opposite brakes, substantially as and for the purpose set forth.

2. In combination with the notched foot-rest *l* and platform B, the sliding dog *n*, substantially as and for the purpose stated.

160,084. LOOMS. Elias D. Davis and Jos. M. Stone, North Andover, Mass., assignors to G. L. Davis, J. A. Wiley, J. M. Stone, G. G. Davis, J. H. Stone, and J. H. Davis, same place. [Filed Oct. 21, 1874.]

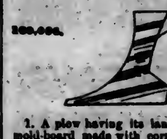
160,084.

Brief.—A sliding bar between the shipper-lever and the loom-frame so limits the movement of the lever that it can actuate the stopping mechanism only; but when the loom is to be reversed, the operator, by means of a treadle, presses the slide down and out of the path of the lever, thereby giving room for the lever to be shifted to its extreme outer position, which puts in gear the reversing mechanism.

The combination, with the shipper which operates the reversing mechanism of the loom, of a latch or detent, which prevents the reversing mechanism from being put into engagement with the loom until said latch or detent is withdrawn, substantially as described.

160,085. MEASURING-FAUCETS. Lyman L. Dennick, Syracuse, N. Y. [Filed Nov. 16, 1874.]

Brief.—Measuring-compartments arranged about a many-way cock, so that one, two, or more compartments may be emptied at once. A stop-cock is arranged between the compartments and the vessel containing the liquid to be measured.



1. The series of measuring-compartments having a common inlet-faucet for filling the same, and an outlet-faucet that opens into each of said compartments and stops off one or all of them, as and for the purposes specified.

2. The combination of the faucet *f* and stop-cock *c* with the measuring-chamber *a*, as herein specified, opening and closing a series of measuring-compartments, as and for the above-described purpose.

160,086. PLOWS. Chas. R. Dugdale, Mason and Dixon, Pa., and Daniel Breed, Washington, D. C. [Filed Sept. 22, 1874.]

Brief.—The wearing-surfaces are corrugated and afterward enameled.

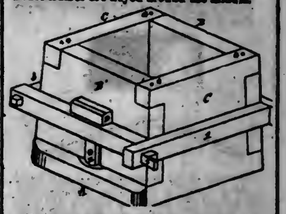
160,086.

1. A plow having its land-side, point, and mold-board made with corrugated or waved surfaces, and covered with enamel or porcelain, substantially as set forth.

2. A plow made with corrugated or waved surfaces, for the purpose of applying enamel, substantially as set forth.

160,087. SKATES. R. H. Earle, St. John, Newfoundland. [Filed Dec. 28, 1874.]

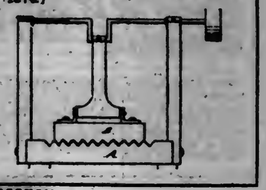
160,087.



1. The combination of the screws B and disks *a'* with the sliding arms D, the slotted sliding plate F, and the fore-plate E, substantially as herein shown and described.

2. The rearwardly-projecting edge or teeth *f'* formed upon the rear end of the sliding plate F, in combination with the sliding heel-plate G and the stationary heel-plate C, substantially as herein shown and described.

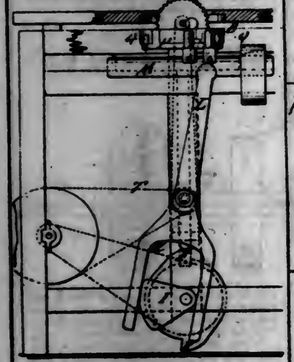
3. The combination of the arm L with the lever I, that operates the clamps, and with the instep-strap M, substantially as herein shown and described.



160,088. TRANSPLANTING-BOXES. Peter Eby, Salisbury Township, (near Kinzer's P. O.,) Lancaster County, Pa. [Filed July 9, 1874.]

Brief.—The sides of the box are notched together and secured with pins, which may act as hinges. The box is square in form, and a trifle smaller at the top than at the bottom. The bottom is provided with a slide, which can be removed, leaving the whole space clear. Brace-frames are keyed around the middle.

The construction of the sides C, having projecting tongues to enter notches in the sides B B', forming framed corners, in combination with a sliding bottom, A, brace-framing 1, 2, 3, and 4, the whole substantially as and for the purpose specified.



160,089. BUTTER-WORKERS. Jacob L. Englehart, New York, N. Y. [Filed Nov. 7, 1874.]

The combination of crusher B, flexibly pendent, and inclined table A, both correspondingly corrugated, as and for the purpose described.

160,090. MINING-MACHINERY. D. A. Fisher, Allegheny, Pa., assignor to himself and O. Chambers, same place. [Filed June 20, 1874.]

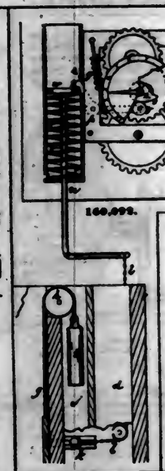
Brief.—The saw has an oscillatory motion parallel with the plane of the table, and is mounted in a frame which moves up and down, thus cutting misers on each side of a guide.

1. The combination, with a sawing-bench or table, of a circular saw, having a vertical movement up through the table and below it alternately, with an oscillatory movement in a plane parallel with the table, substantially as specified.

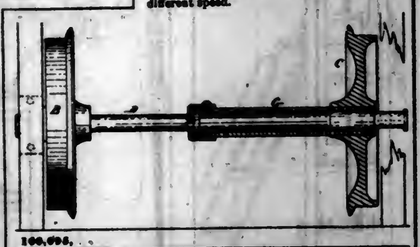
2. The cam I, rock-lever L, sliding bar M, studs N, and arm O, combined with the oscillatory ring R and ring-support C, to oscillate a o w, in the manner described.

3. The combination of the protracter P, and adjusting-pins Q, with the arm O of the oscillating ring-support R, and the adjustable studs N of the sliding bars M, substantially as specified.

160,091. CURLING HAT-BRIMS. Abraham Freudsdahl, New York, N. Y., assignor to himself and Henry Sax, same place. [Filed Feb. 5, 1875.]



The curl B for a hat-brim, said curl being made of rattan or equivalent material, thinner toward the front and back of the brim, and higher at the sides, and perforated to admit the thread whereby it is fastened to the brim, substantially as herein shown and described.

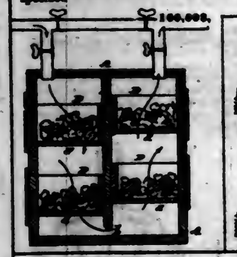


160,092. AUTOMATIC CLOCK-OPERATED BOXING-CHIRK. W. R. Gribbin and Angus McMillan, Portland, Me. [Filed Nov. 12, 1874.]

Brief.—An automatic boxing-cock operated by an ordinary alarm-clock mechanism, so that at a fixed time a catch will be released, and by the action of certain mechanical devices the fowl is exposed.

The crib A, having the compartments d d, the slide f, cord g, pulley h, weight i, catch k, and cord l, in combination with the piston w, lever p, spring q, and cam s, the whole being arranged to operate by mechanism similar to that of an ordinary alarm-clock, as and for the purposes set forth.

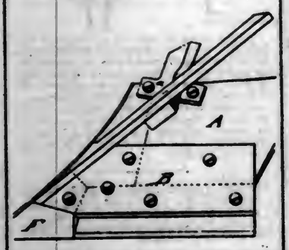
160,092.



160,096.

160,093. APPARATUS FOR FLAVORING SPIRITS. Martin Grube, Lancaster, Pa. [Filed Jan. 6, 1875.]

Brief.—The boxes for flavoring material are arranged in two vertical tiers, and are clamped tightly in the frame. The liquor to be flavored is passed downward through one tier, and upward through the other.



A series of two or more removable drawers, D, one over the other, in separate chambers made by a vertical partition, B, in a case, A, said drawers being provided with perforated bottoms d and overlapping flanges F, in combination with the clamps C and binding-screw s, the whole constructed, arranged, and operating substantially as and for the purpose specified.

160,093.

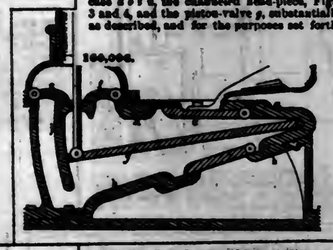
160,094. PLOWS. Alfred Hampe, Staunton, Ill. [Filed Aug. 4, 1873.]

Brief.—The point is one of the parts of a sectional mold-board. Its base runs horizontally to the rear, which, with dovetailed and angular joints, produces great strength.

1. The plow-point F, having an angular share-edge, a horizontal base, and a dovetailed recess to receive the land-side and plate B, as shown and described.

2. The sectional share and point, constructed as described, in combination with the sectional mold-board A and land-side, as and for the purpose specified.

160,095. RAILWAY-CAR AXLES. Samuel L. Harrison, San Francisco, Cal., assignor of one-half his right to D. L. Pennon and J. S. Pennon, same place. [Filed Aug. 7, 1874.]

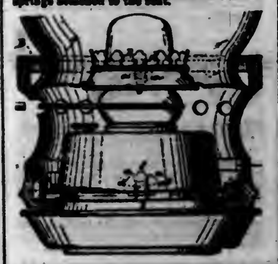


Brief.—To allow the wheels to rotate at a different speed.

The axle D, provided with the enlarged journals E F, in combination with the sleeve G, which carries the wheel C, to turn independently of the wheel B, substantially as and for the purpose described.

160,096. DOUBLE-ACTING SUBMERGED PUMPS. George G. Hartwick, Jersey City, N. J., and Ernest Metz, New York, N. Y. [Filed July 11, 1874.]

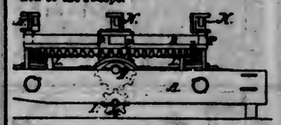
Brief.—A piston-valve hinged to the outer end of an angular casing is given a vertical reciprocating motion by a connecting-rod. The water is taken alternately through inlet-valves on either side of the piston-valve, and discharged through outlet-valves in the lower end of the pump-tube.



In combination with the angular box or case a b i c, the channeled head-piece, Figs. 3 and 4, and the piston-valve p, substantially as described, and for the purposes set forth.

160,096.

160,097. CAR-LAMPS. Michael Hicks and Thos. Smith, New York, N. Y. [Filed Feb. 12, 1873.]

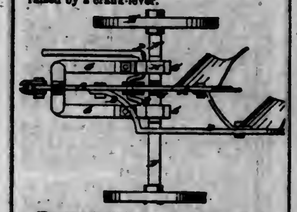


Brief.—Two curved arms hinged at one end to the seat, the other ends loose and opened by button and key, or closed by springs attached to the seat.

The combination of the curved arms B B, hinged at one end, and provided with legs a at the other ends, the springs U C, cord b, and handle or key B, substantially as and for the purposes herein set forth.

160,098. HORSE-POWERS. Ellis J. Hoyle and John W. Hoyle, Martin's Ferry, Ohio. [Filed Sept. 21, 1874.]

Brief.—The master-wheel is held in position by the flanges upon the pinion-rollers, and dogs upon the frame within the inner periphery of said wheel. It has near its outer periphery an upwardly-projecting rim, and strengthening-blocks at intervals cast therewith, which latter form sockets for the insertion of the sweeps.



1. The combination of the flanged pinion-rollers L and L', and dogs T for supporting and holding in place the master-wheel B, substantially as set forth.

2. The combination of the master-wheel B, the flanged pinion-rollers L and L', shafts O and O', gear-wheels D and D', shaft P, pinion R, gear-wheel G, and shaft L, all of these devices being constructed and arranged in relation to each other to operate together substantially in the manner and for the purposes set forth.

3. The master-wheel B, cast with the high vertical flange b and strengthening-posts P thereon, in combination with the lever-lugs H fastened to said posts, substantially in the manner and for the purposes specified.

160,099. GANG-PLOWS. James R. Hunter, Ashley, Ill. [Filed Oct. 24, 1874.]

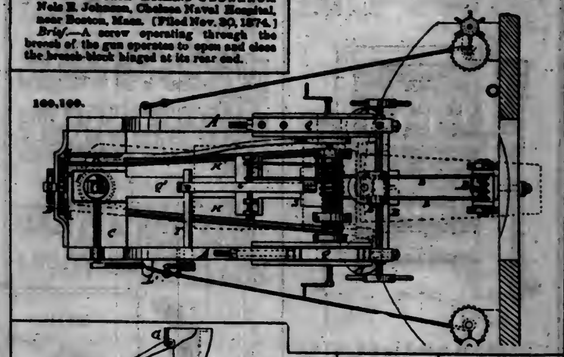
Brief.—Frame composed of two arms of U shape, rigid to the axle and projecting forward. From these rise two slotted posts, which support the elevated tongue and seat, and serve as guides for the beams, which are raised by a crank-lever.

The combination of the fixed U-bar G, the slotted vertically-adjustable forward standard K, and slotted rear standard J, with the axle F, the plow-beams A B, and the tongue J, as herein shown and described.

160,100. GUN-CARRIAGES. Nels E. Johnson, Chelsea Naval Hospital, near Boston, Mass. [Filed Nov. 20, 1874.]

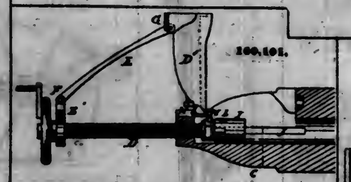
Brief.—The carriage is brought to and from port by means of a rope and windlass; said rope being attached to the side of the port, thence around the windlass, and attached to the opposite end of the compressor-bar. The compressor-bar is provided with a slot, into which a locking-bolt drops, to hold the carriage stationary while not in operation. The pressor or friction screw is operated by means of a worm-wheel and a corresponding worm-shaft.

1. The combination, with a sliding gun-carriage, of a fixed compressor or friction bar Q, guide-bar Q'', the pressure-screw F', worm-wheel O', and worm-shaft H'', all constructed and relatively arranged as herein set forth.



2. The combination of the locking-bolt V, arm U, and rock-shaft T, with the compressor-bar Q and gun-carriage A, as and for the purpose set forth.

3. The combination of the windlass Y and rope Z with the gun-carriage and compressor-bar, for bringing the gun to and from port, as and for the purpose specified.



160,101. BREECH-LOADING ORDNANCE. Nels E. Johnson, Chelsea Naval Hospital, near Boston, Mass. [Filed Nov. 20, 1874.]

Brief.—A screw operating through the breech of the gun operates to open and close the breech-block hinged at its rear end.

160,100.

160,101.

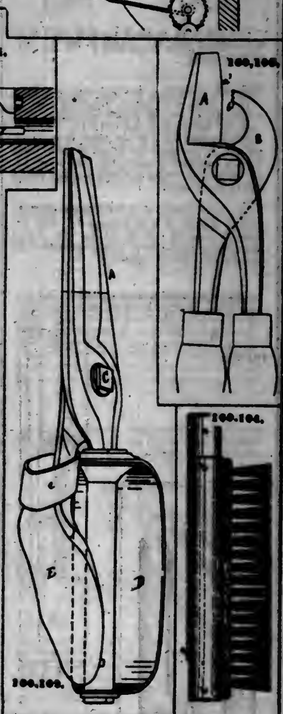
1. The joint-bar E, breech-block D', and screw D, combined substantially as described, for the purpose set forth.

2. The combination of the sliding breech-ring I, screw D, swiveled therein, the hinged breech-block D', and the jointed bar E, connected with the block and screw, as herein shown and described.

160,102. PRUNING-SHEARS. Willis H. Johnson, Springfield, Ill. [Filed July 15, 1874.]

Brief.—One handle of a pair of pruning-shears is flattened out, and shaped to conform to the thumb and a part of the palm of the hand, a small flexible strap being attached to pass over the end of the thumb. The other handle is formed by prolonging the blade, and shaping it into a loose revolving bit or cylinder, to which a suitable leather guard is firmly attached; the construction giving a powerful leverage, while the revolving handle readily adapts itself to the varying motion of the blades. Both blades are conveyed upon a circle which, if continued, will pass through the center of the pivot.

1. The combination of the handle E of a blade, A, fitted to conform to the hand, and provided with a strap, c, and stud d', as described, with the handle of a blade, B, provided with a loose revolving bit or cylinder, F, and guard D, said handles being joined, as described, and the several parts operating substantially as set forth.



2. Pruning-shears having two blades, (one a thin cutting-blade, and the other a thick non-cutting blade,) with the edges of both blades conveyed upon a circle, which, if continued, would pass through or slightly behind the center of the fulcrum or pivot, substantially as shown and described.

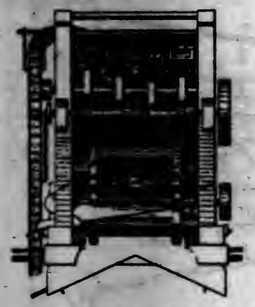
160,103. PRUNING IMPLEMENTS. Willis H. Johnson, Springfield, Ill. [Filed July 15, 1874.]

Brief.—The novel feature is the blunt, corrugated end of the hook-shaped jaw, the use of which prevents undue injury to the bark of the tree in the process of lopping or laying down, or in hedge-work, &c.

The cutting-instrument described, wherein a short, sharp, convex-shaped blade, A, adapted for cutting, is combined with a curved jaw, B, having a blunt roughened end, b, terminating at a point nearly opposite the center of the cutting-blade, and adapted to seize the tree near the center thereof, substantially as and for the purposes set forth.

160,102.

160,103.



160,104. SHOE-BRUSHES. Israel Joseph and J. Albert Joseph, New York, N. Y. [Filed Jan. 11, 1875.]

Brief.—The ordinary back of a brush is provided with a tin receptacle for little brushes and a blacking-box, which is covered by a sliding tin cover.

1. The box C, made with rounded sides, and open at the top and one end, and the cover D, made with rounded sides and open at one end, in combination with the block or back of the brush A B, substantially as herein shown and described.

2. The brushes F G, having their backs and handles formed to fit upon each other and the blacking-box E, and into the cavity of the box C D, substantially as herein shown and described.

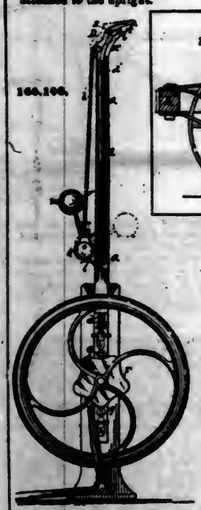
160,100. GRAIN-SEPARATORS. William M. Koppes, Seville, Ohio. [Filed Nov. 9, 1874.]

The upwardly-inclined bearing-rods d^1 in combination with the shaker d, for the purpose set forth.

160,106. COMBINED TRY-SQUARES AND BEVELS. John L. Larrison, Schooley's Mountain, N. J., and H. Leigh, Wurtsboro, N. Y. [Filed Nov. 20, 1874.]

Brief.—One piece of the bevel is made adjustable to the other by means of a lever-bar having a pointer in connection with the scale, to indicate the angle at which the two pieces are to one another.

The combination of pointed main piece A, having foot-pin a' and recesses b c, with adjustable notched rule B, having slot e, and the sliding lever-rod e, having pointer f, as and for the purpose specified.



160,107. CHAIN-LINKS AND CHAINS. S. D. Locke, Hoosick Falls, N. Y. [Filed Dec. 12, 1874.]

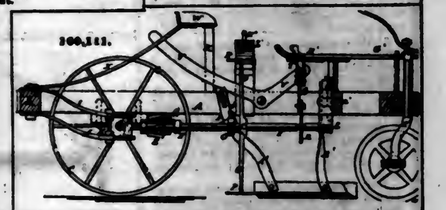
1. A chain link, having its end bars eccentric to the side bars reversely to each other, one of said end bars being provided with a hook, substantially as and for the purpose specified.

2. A chain-link composed of the side bars a a, the bar b' at one end, and the bar b, having the hook c, at the other, the bar b being below, and the bar b' above, the plane of the side bars, substantially as and for the purpose specified.

160,108. PEG-FLOATS. Daniel Lydahan, Buffalo, N. Y., assignor of two-thirds his right to F. G. Fralick and D. B. Sherman, same place. [Filed Dec. 5, 1874.]

Brief.—The angle of the cutter-head is varied by means of an eccentric and bell lever attached to the upright.

160,109. ATTACHMENT OF MAINSPRINGS TO ARBORS. William O. Maynard, Binghamton, N. Y. [Filed Jan. 15, 1875.]



In combination, a watch-barrel arbor provided with a notch or recess which presents a holding-shoulder, and a mainspring having a hook upon its inner end arranged to engage with said holding-shoulder, substantially as and for the purpose described.

160,110. METHODS OF SOFTENING UMBRELLA-RIBS. John McAuliffe, New York, N. Y. [Filed Dec. 28, 1874.]

Brief.—The ends of the ribs are inserted in a shallow bath of melted lead, and allowed to cool with the lead, to remove the temper and render them soft and capable of being easily punched. When cold a gentle heat is applied to loosen the ribs from the solidified lead.

The process of softening umbrella-ribs of tempered steel preparatory to punching holes therein by standing the ends that are to be punched in molten lead brought to a red heat, then allowing both lead and rib ends to cool off together, and finally separating the surrounding lead from the ribs by a gentle heat, all substantially as set forth.

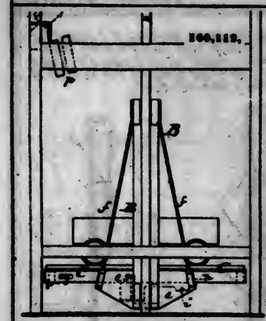
160,111. COTTON SCRAPERS AND CHOPPERS. William H. McClaugherty, Seguin, Tex. [Filed Nov. 14, 1874.]

Brief.—Devices for allowing one end of the chopper-shaft to be raised or lowered without releasing the gear-wheels from each other, and to allow the pinion-wheel to turn slightly on the shaft. A chopper-arm in two sections, hinged. Steering-wheels with cutting-flanges turned by a rudder, and having a standard upon which the frame is raised by a lever.

1. The combination of the clamp G with the slotted or grooved end of the small gear-wheel E, and with the polygonal section of the chopper-shaft F, substantially as herein shown and described.

2. The combination of the pivoted bearing-block H, and the vertically-adjustable U-shaped bar or slotted bearing I, with the adjustable chopper-shaft F and frame A, as and for the purpose described.

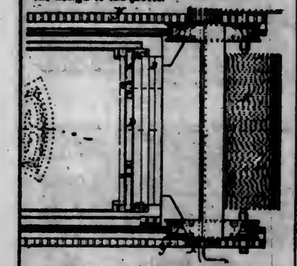
3. The arm of one of the cross-bars O that carry the chopper-knives F, made in two parts, hinged to each other, and provided with an adjusting swiveled screw, Q, substantially as herein shown and described.



4. The combination of the two wheels B', short axle D', pivoted and sliding bent standard B', and foot-lever G' H', with the forward part of the frame A, that carries the scrapers and choppers, substantially as herein shown and described.

160,112. DUMPING-CARS FOR ELEVATORS. James McCollum, Kingston, Pa. [Filed Jan. 23, 1875.]

Brief.—The platform, with its ear, rests on a swinging bar pivoted to the frame, and is locked thereto by levers and side bolts. On reaching the top it is unlocked by a protruding lever passing into a diagonal groove at the mouth of the mine, where there is also a hook, which catches a projecting pin to tilt the platform.



1. The combination of the hoisting-frame B, having the side plates a a, with the crank-shaft f, which supports the platform C, and with the dumping-cage r and s, all arranged to render the platform self-dumping without changing the location of the frame and cage r, substantially as herein shown and described.

2. In combination with the dumping-platform C of a hoisting-cage, the bolts j, levers n o, and inclined stationary guide p, all arranged to automatically unlock the pivoted platform during the ascent, and relock it during the descent, of the cage, substantially as specified.

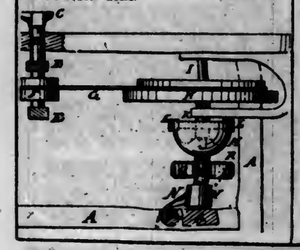
160,113. APPARATUS FOR STAMPING EMBROIDERY PATTERNS. John McGavin, New York, N. Y., assignor to I. S. Van Deusen, Passaic, N. J. [Filed Dec. 12, 1874.]

Brief.—The rotating traversing brush passes over a perforated pattern, thereby transferring the design to the fabric.

1. The combination of a revolving and traversing brush with the pattern sheet or plate, and a table for holding the cloth to be printed, substantially as specified.

2. The revolving brush on a traversing table, geared with a crank-shaft, itself geared with the rack on table, to impart both the rotary and the traversing motion to the brush, substantially as specified.

3. The combination of the fastening-bars D with the pattern-sheet and the pattern-frame, the latter having grooves to receive said bars to fasten the pattern-sheet, substantially as specified.



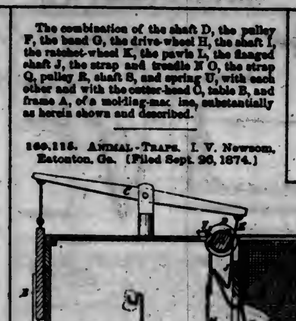
4. The sliding bar E and spring-fasteners G, in combination with the pattern-frame and rack-bars H on the latter, substantially as specified.

5. The cams Q on the pattern-frame, combined with the cloth-table I, substantially as specified.

6. The cloth-table I, arranged adjustably toward and from the pattern-frame, substantially as specified.

160,114. MOLDING-MACHINES. A. Miller, Ringtown, Pa. [Filed Jan. 25, 1875.]

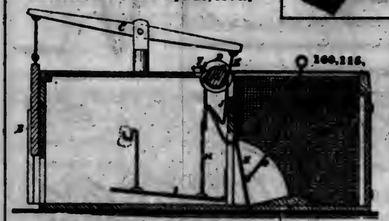
Brief.—The molding-cutter is put in motion by the foot of the operator acting upon a treadle through a system of belts, pulleys, and ratchet-wheels.



1. The combination of the lever H, carrying the dogs E, and having the rotary handle J journaled in its upper end, with the cranks P I, cord T, cam G, and spindle X, substantially as set forth.

2. The combination of the lever D, pawls F, and cam G, substantially as shown.

3. The lever H, dog S, cam-spindle X, and stop W, combined to operate as specified.



160,115. HEAD-BLOCKS FOR SAW-MILLS. John Osgood, Fort Edward, N. Y. [Filed Aug. 22, 1874.]

Brief.—The setting-jack of the head-block is moved forward by a setting-lever and pawls of peculiar construction acting upon a ratchet-wheel.

The combination of the shaft D, the pulley F, the band G, the drive-wheel H, the shaft I, the ratchet-wheel K, the pawls L, the flanged shaft J, the strap and treadle N O, the strap Q, pulley R, shaft S, and spring U, with each other and with the cutter-head C, table B, and frame A, of a molding-machine, substantially as herein shown and described.

160,116. ANIMAL-TRAPS. I. V. Newsom, Eatonton, Ga. [Filed Sept. 26, 1874.]

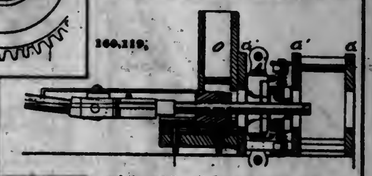
1. The combination, with door-lever C, having cord E, and door-arm having cord J, with the notched drum D, held by a spring-latch, F, and the treadle-arm H, as shown and described, for the purpose specified.

2. The door K, provided with handle O, and arm having cord J, combined with the lever-cord E and drum D, as shown and described, so that the trap may be opened by hand, as set forth.

160,117. NECK-TIE SHIELDS. R. R. Parker, Indianapolis, Ind. [Filed Oct. 3, 1874.]

Brief.—A neck-tie may be slipped through the loop, and adjusted upon the shield in any desired style of tie.

As a new article of manufacture, a neck-tie shield provided with elastic strap-loop a and button-loop b, when combined and arranged substantially as shown and described.



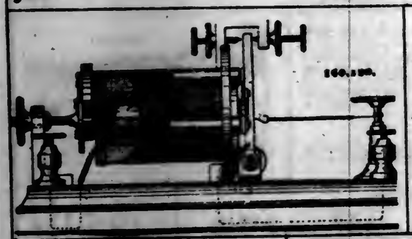
160,118. RAILWAY-RAIL JOINTS. Reuel Pickel, Keesville, N. Y., assignor to himself, J. G. Sawyer, and D. Kingsley, same place. [Filed Sept. 26, 1874.]

The joint described, consisting of the rails A A', having the extensions a a', vertical projections a^2 a^2, having the inner inclined faces a^3 a^3, as described.

160,119. GREEN-CORN CUTTERS. Wm. J. Potter, Mount Lebanon, N. Y., assignor to himself and Robt. M. Wagen, same place. [Filed Jan. 18, 1875.]

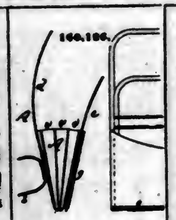
Brief.—A hollow plunger is concave in front to fit the ear and carry it as far as the knives. When the ear reaches the knives, the rod which is attached to the plunger is automatically released, and then passes through the center of the plunger, and carries the ear past the knives. The ears are fed from a hopper, the bottom of which is automatically withdrawn by a lever operated by a pin on the reciprocating cross-head of the plunger-rod.

1. The combination, with hopper O, of the hollow plunger J, concaved in front to center the ear, and carrying it forward to the knives, and the rod I moving therethrough and pushing the cob completely past the knives, as and for the purpose specified.



2. The combination, with hollow plunger J and rod I, having groove N, of the lever K, arranged to operate as and for the purpose specified.

3. The combination, with hopper O, of an intermittently-moving bottom, P, that feeds the ear, in the manner described.



4. The lever S, having one end, V, operated by a pin, U, on the reciprocating cross-head H, and the other attached to the shank of spring-pressed plate P, as and for the purpose specified.

160,120. ELECTRO-MAGNETS. M. A. Rice, Pent Water, Mich. [Filed Dec. 28, 1874.]

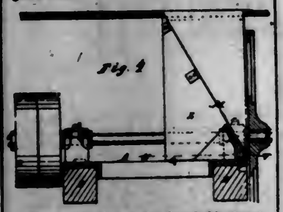
The combination of two or more bars and an insulated coil, one leg or arm of each bar being arranged within the coil, and one exterior to it, in such manner as to make two or more magnets in one coil, substantially as specified.

160,120.

160,120.

160,121. SUGAR-CANE-CUTTING MACHINES. Julius Robert, Gross-Seelowitz, Austria, assignor to Dr. Otto Kratz and R. Sieg, New Orleans, La. [Filed Aug. 1, 1874.]

Brief.—The cutters are fastened to plates that can be removed from the wheel that carries them, in order to adjust the cutters and grind them.



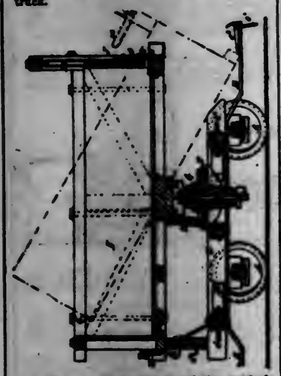


Fig. 1.

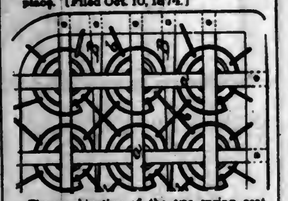
The combination of the detachable throat-plates C, cutters H, and fastening-bolts J with the revolving wheel E, having radial openings F for the reception of the throat-plates, substantially as set forth.

160,122. DUMPING-CARS. Robt. Roberts, Pattenburg, assignor of one-half his right to N. S. Wyckoff, Clinton, N. J. [Filed May 30, 1874.]

Brief.—The body is hinged to a cross-head belt turning within a cross plate upon the truck.

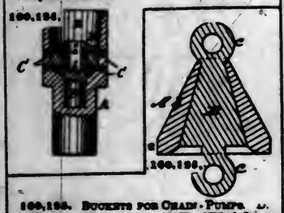


1. The cross-head belt L and the notched washer G, in combination with the plate F, attached to the car-frame C, and the plate H, attached to the car-body I, substantially as shown and described.

2. The guard-block M, in combination with the plates F H, cross-head belt L, notched washer G, frame C, and body I, substantially as shown and described.

3. The combination of the U straps M, with the tail-board J and the upper rear cross-bar of the body I, substantially as shown and described.

4. The combination of the drop-bolt N and lever O with the tail-board J of the car-body I, substantially as herein shown and described.



160,123. SPRINGS FOR SEATS, &c. John A. Stevenson, Belvidere, N. J., assignor of one-half his right to John J. Kline, same place. [Filed Oct. 10, 1874.]

The combination of the two spring-seat frames A A', tied together by interior oblique spring-braces B B, and exterior semi-elliptical spring-braces at the front and rear sides and at the ends of the frames, whereby all longitudinal and lateral movement of the seat-frames is prevented.

160,124. SPINDLE-BEARINGS AND THEIR LUBRICATION. Jos. M. Stone, North Andover, Mass. [Filed Oct. 21, 1874.]

The combination, with the bushing of a spindle-bearing, of the porous wooden plugs set radially around the same, and the porous wooden conducting-pieces to supply the oil thereto, and a reservoir to contain a supply of oil, substantially as described.

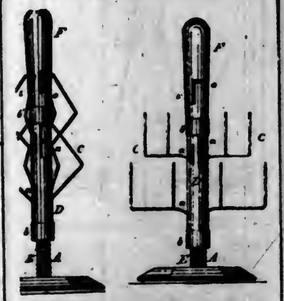
160,124. 160,125.

160,125. BUCKETS FOR CHAIN-PUMPS. A. F. Stow, Horseheads, N. Y. [Filed June 6, 1874.]

Brief.—Upon the conical core is fitted a shell or jacket of rubber, having the form of the core, except at its base, which is made cylindrical to fit the pump-tube.

The chain-pump bucket herein described, having the cylindro-conical elastic shell A, fitted to the solid core B, substantially as and for the purpose set forth.

160,126. POCKET-BOOKS. Gabriel Strauss, New York, N. Y. [Filed Jan. 27, 1875.]



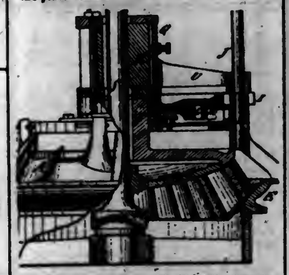
Brief.—The bill-wallet is constructed so as to be detachable from the specie-holding or body part of the book, it having an elongated flap, which passes through a loop formed upon the outer pocket of the book proper, and which is provided with a suitable fastening device.

1. A pocket-book composed of two parts, A and B, which may be separated to constitute, each, a distinct pocket-book, substantially as herein shown and described.

2. The book B, having the flap c, combined with the book A, having a slit or loop for the reception of the flap c, substantially as herein shown and described.

160,127. SPOOL-HOLDERS. F. J. Taylor, La-porte City, Iowa. [Filed Dec. 30, 1874.]

Brief.—Spools are held upon the pivoted arms, which are depressed and unlocked by lowering the slotted sleeve.



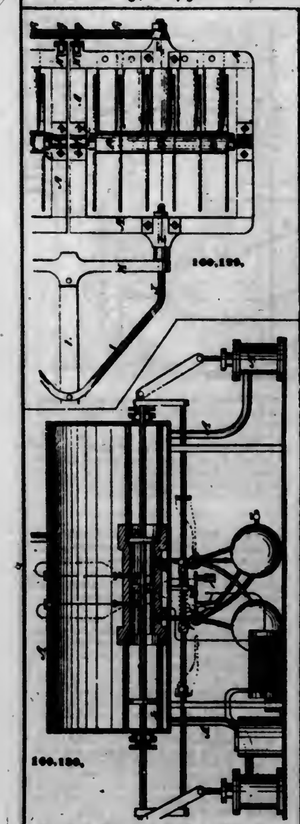
1. In combination with the shaft A, the arms C, sleeve D, and spring E, as and for the purpose specified.

2. The spool-holder, consisting of the shaft A, handle F, slotted sleeve D, pivoted arms C, and spring E, when constructed and arranged to operate substantially in the manner and for the purpose specified.

160,128. WATER-WHEELS. William J. Thompson, Springfield, Mo., assignor of one-half his right to Springfield Iron-Works. [Filed Oct. 31, 1874.]

Brief.—The gates are operated by a spring for each gate, to insure the simultaneous closing thereof; also, a three-chambered box around the main shaft, having an arm which extends over the sector-gears and supports the pinion-shaft.

1. The combination, with wheel C, of mechanism G I and L M, arranged to increase the leverage on the gates, and thus allow the application of a governor.



2. In combination with the arms B of the gates A, the springs N, as and for the purposes described.

160,129. LAND-PULVERIZERS. Augustus Underwood, Carrollton, Ill. [Filed Nov 30, 1874.]

Brief.—The pulverizing devices consist of a series of disks placed upon a shaft near to gether, and having cleaning-fingers between them. Two of these are mounted in rectangular frames, and placed end to end, each being journaled upon the end of a bent rod, which constitutes the bounds of the tongue.

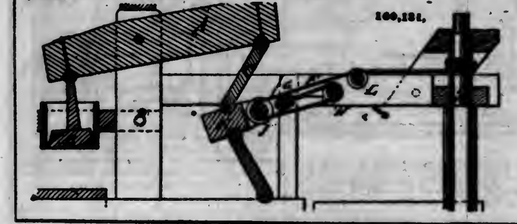
1. In a land-pulverizing machine, the combination, with the pivoted oscillating frames A A, having friction-rollers H, of the bar C, having bearing-plates g', as and for the purpose specified.

2. The bent or V-shaped rods J, connected to the pole L and bar K to form bounds or braces, and extended rearwardly through the castings I and front bar of the oscillating frames A to form the pivots or journals thereof, as shown and described.

160,129.

160,130. GAS-ENGINES. Pedro Vera, Bogota, United States of Colombia. [Filed Mar. 20, 1873.]

Brief.—Hydrogen and oxygen gases alternately exploded within a double cylinder by means of an electric spark.



1. The combination of the gas-cylinder A, flexible hydrogen and oxygen gas holders, valve mechanisms, electrical-engine wires X Y Y', and the device for alternately connecting said wires, substantially as specified.

2. The combination of the air-pumps with the cylinder A and the gas-exploding mechanism, substantially as specified.

160,131. LEVER-PRESSES. Wm. O. Watson, Albany, Ga. [Filed Jan. 11, 1875.]

Brief.—The main lever is operated by toggle-levers connected to the capstan by a rope passing over intermediate pulley-blocks.

The combination of the block E, pulley J, and the pulley H with the rope F, capstan K, and the press-lever A, substantially as specified.

160,131.

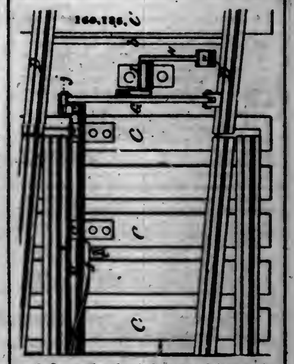
160,132. PLANES. Geo. L. Weaver, Hartford, Conn. [Filed May 23, 1874.]

Brief.—An inclined wedge-shaped bed is adjusted by a screw, to enlarge or close the throat.

The hand-plane herein described, having the stationary inclined bed F d, the adjustable wedge-shaped bed D, having an angle coincident with that of the bed F, and a bevel surface parallel with the cutting-iron C, and affording, with the bed d, a rigid support for the same, and the clamp G, with its set-screw g', all combined for the purpose set forth

160,133. CAR-COUPLINGS. John West, Minneapolis, Minn. [Filed Dec. 10, 1874.]

The independently-acting piece e, in combination with the clevis-link b, uncoupling devices g e, and trips h, substantially as and for the purpose specified.



160,134. ANIMAL-HOPPLES. J. D. Wilson, Round Grove, Kans. [Filed June 27, 1874.]

A hopple for animals, consisting of the slide-piece C, cross-bar D, with forwardly-bent ends, rod E, having upwardly-inclined ends, and the flexible connection F, as and for the purpose specified.

160,135. RAILWAY-SWITCHES. George J. Woodruff, Norristown, Pa. [Filed Jan. 20, 1875.]

Brief.—A railroad-switch operated by flange of wheel upon a winding vane on a cylinder, the curvature of said vane being gradual at each end, and having a gain twist toward the center, to obviate sudden jars at the commencement of the movement of the switch-rails. A weighted locking-lever is combined with the shifting mechanism, to secure the switch-rails against accidental shifting.

160,135.

1. In a railroad-switch operated by a rock-shaft actuated by the wheel-flange, the lengthwise-curved flange d, extending partly around the shaft, and having a very slight curvature at each end, gradually becoming more marked in the center of its length, for the purpose of gradually overcoming the inertia of the switch-rails, giving them a rapid intermediate movement, and then gradually overcoming their momentum, substantially as specified.

2. The combination, with the flanged rotating rod E, crank-arm F, and pitman G, pivoted to the switch-rails, and having pin p, of the vertically-vibrating locking-lever H and slotted plate i, receiving pin p, substantially as specified.

3. The combination, with the flanged rotating shaft E, of the check-plate I, substantially as specified.

4. The combination, with the plate I, of lug P on rotating shaft E, for the purpose of preventing endwise displacement of the said rod, substantially as specified.

160,136. CHIN-RESTS FOR VIOLINS. Chas. F. Albert, Philadelphia, Pa. [Filed Jan. 12, 1875.]

Brief.—The rest is attached to the upper side of the upper holding-lip of the adjustable clamp.

1. A chin-rest for violins, in which are combined the rest proper A and the perforated plate B, with the bar D and its pin c, as set forth.

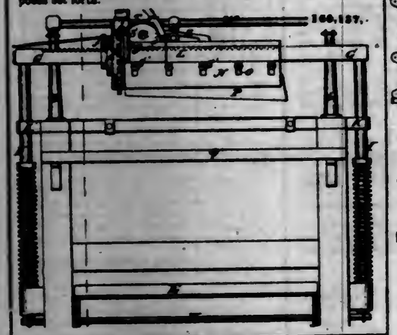
2. The plate B, provided at the top with a lip, e, which extends over the edge of the violin, and to which the rest A is attached, and between which and a lip, f, at the lower end of the plate B, the violin is clamped, all as and for the purpose set forth.

160,137. MACHINES FOR INDEXING BOOKS. Frank R. Alderman, Grand Rapids, Mich., assignor of one-half his right to F. B. Perkins, same place. [Filed Sept. 8, 1874.]

Brief.—Cuts the sheet and prints the letters at the same operation.

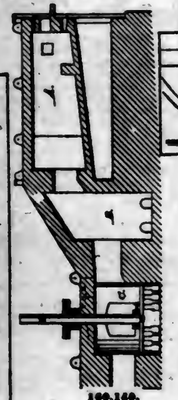
1. In a machine for indexing books, a slide provided with an adjustable knife, having a square projecting cutter at one end, to which a horizontal motion is imparted, the slide also carrying a type-wheel, to which a rotary motion is imparted, substantially as described, and for the purpose set forth.

2. The frame G, having a reciprocating vertical movement, and provided with the horizontal rock-bar J, in combination with the slide L, pinions T U, slotted arm Z, eye-bolt X, sliding on the horizontal rod W, and pawls e e, substantially as described, and for the purpose set forth.



3. The slide L, having a slot, as set forth, and provided with a knife, P, in combination with the frame G, having rods I I', forming its sides, by means of which the knife can be operated when it projects beyond one of the side rods of the frame, substantially as described, and for the purpose set forth.

4. The slotted arm Z, journaled on the shaft R of the pinion U, and provided with the hinged pawls a a, in combination with the double eyebolt X, rod W, and spring-pawls b b, substantially as described, and for the purpose set forth.

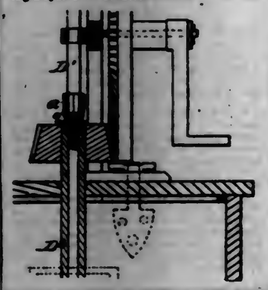


5. The type-wheel c, hung on a sleeve on the slide, provided with ratchet-teeth on its outer face, and slots on its periphery for the reception of the type, held in place by the cap, substantially as specified.

6. The type-wheel c, constructed as set forth, in combination with the slide L, slotted arm Z, rod W, eccentric-rod n, and pawls n n, substantially as described, and for the purposes set forth.

160,137.

160,138.



160,139. TREATING CHEWING-TOBACCO. S. V. Appleby, Spotswood, N. J. [Filed Oct. 6, 1874.]

1. The process of preparing chewing-tobacco by dampening, boxing, and treating the same with a compound consisting of gum arabic, slippery-elm, and flavoring and sweetening ingredients, and afterward drying and cutting, substantially as described.

2. As a new article of manufacture, chewing-tobacco prepared by dampening, boxing, and treated with a compound consisting of gum-arabic, slippery-elm, and flavoring and sweetening ingredients, and afterward drying and cutting, substantially as described.

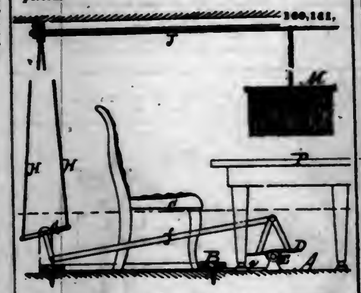
160,140. CHURN. David C. Bailey, South Salem, Ohio. [Filed May 16, 1874.]

Brief.—Concentric vertical shafts are revolved in different directions, the top of the outer passing through a lever gear-pinion, and terminating at the top thereof, where it receives a hollow screw-nut, the head of which expands and becomes the bearing of an enlargement upon the inner shaft, the inner dash being then pendent, each shaft revolving a system of dashers.

The shafts D D', in combination with the enlarged socket a, having a shoulder, a', and the metallic bearing s, let into the upper end of the shaft D', substantially as and for the purpose set forth.

160,142. METALLURGIC FURNACES. E. Bayliss, Pittsburg, Pa. [Filed Nov. 6, 1874.]

Brief.—The iron is melted in chamber and carried by the conduit to the refining-chamber, and is thence run into the puddling-chamber, and puddled by the mechanical tool. The products of combustion pass from the fire-place f through all the chambers to the stack, and supply the requisite heat.

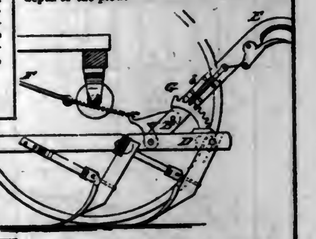


1. The combination of the melting-furnace A, refining-furnace B, and puddling-furnace C, said furnaces communicating and operating with relation to each other substantially in the manner herein described, and for the purpose set forth.

2. A puddling-furnace, provided with a rotary puddling-tool, in combination with a refining and melting furnace, arranged and operating with relation to each other substantially as herein described, and for the purpose set forth.

160,141. FLY-BRUSH ATTACHMENTS. Geo. S. Beekman, Tallula, Ill. [Filed July 30, 1874.]

Brief.—A foot-treadle being depressed vibrates a fan or fly-brush above the table or person.



160,141.

The combination of the board B, treadle D, connecting-rod f, lever G, cord or band H, rock-shaft J, and fan or fly-brush M, substantially as shown and described.

160,143. CULTIVATORS. Jacob Bebel, Rockford, Ill., assignor of one-half his right to Ralph Emerson, same place. [Filed Jan. 26, 1875.]

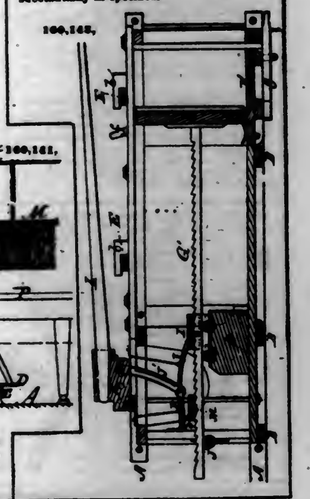
Brief.—A rod or chain from the hanger to the handle suspends the plow-beam. A notched segment secured to the beam, and held by a spring-pawl upon the handle, adjusts the latter at any height, or limits the depth of the plow.

1. The handle E, pivoted to the beam or drag-bar D, in combination with the rod or connection F, substantially as and for the purpose specified.

2. The combination of the beam or drag-bar D, handle E, and rod or connection F with the ratchet-segment G and pawl or catch b, for changing and holding the beams in different positions, substantially as described.

160,144. HORSE-HAY AND COTTON PRESSES. T. B. Bennett and E. J. Beasley, Belton, Tex. [Filed Nov. 26, 1874.]

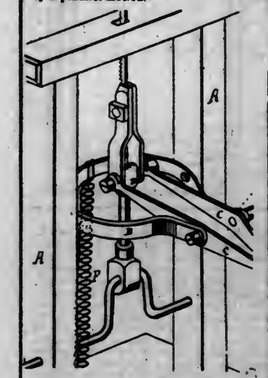
Brief.—A rock-bar carrying a follower is operated by a lever through the medium of two pivoted arms and a pair of pawl-blocks.



1. The combination, with the vertically-vibrating hinged doors O O and the sides of the press-box, having hooks b, of the transverse bars E, having upon their ends hooked plates c, substantially as specified.

2. The combination, with the doors F at the sides of the press-box, having vertical brace-bars d, of the bar G, endwise movable in the staples e, and having notches i, substantially as specified.

3. The combination of the vibrating catch g of the bottom door B' of the press-box with the hook h', substantially as specified.

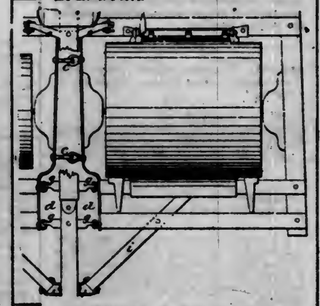


4. The combination, with the vertically-vibrating socket K and rack-bar G', of the pawl-block I, arms J J', plate P, and pawl-block M, substantially as specified.

160,145.

160,146. SCROLL-SAWS. Jas. M. Beagler, Williamsport, Pa. [Filed Feb. 4, 1875.]

Brief.—The saw receives its motion from a crank, and is made to reciprocate vertically by a parallel motion.



1. The combination of the yoke B, pivoted as described, rocking lever C, and crank-rod D, substantially as and for the purpose set forth.

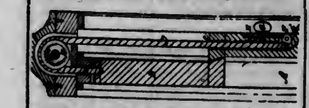
2. The combination of the yoke B, rocking beam C, crank-rod D, treadle E, and rod d, substantially as and for the purpose set forth.

3. The combination of the yoke B, rocking beam C, crank-rod D, and spring F, substantially as and for the purpose set forth

160,147. LAND-ROLLERS. Peter Bilyeu, Sr., Mowequa, Ill. [Filed Oct. 12, 1874.]

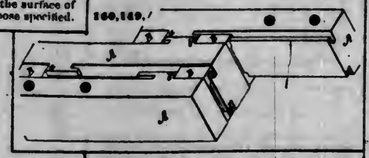
Brief.—Each roller-frame is complete in itself, and is provided with stationary journal-boxes for the roller-shafts. The inner ends of the frames are hinged together by link-joints, and the tongue and braces are attached by like means. The seat is mounted upon the inner end of the frames. Each roller is provided with a scraper, which is operated by the driver's foot.

In a land-roller, the separate roller-frames, each carrying its roller-bearings, jointed together at e e, with the tongue jointed to and between the front portions of said frames by the double joints g g, in the space d, and the diagonal draft-braces i i, all arranged substantially as herein set forth.



160,148. CAPS FOR WOOD-SCREWS. Henry T. Blake, New Haven, Conn. [Filed Feb. 6, 1875.]

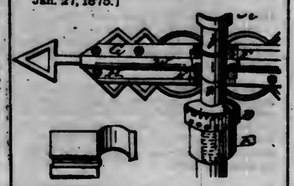
A cover for screw-heads, consisting of the collar A, constructed with one or more spurs, a, combined with the disk B, substantially as described.



160,145. SASH-BALANCES. John Berndt, Denver, Colo. [Filed Dec. 28, 1874.]

Brief.—The two sashes are connected by flexible wire-rope passing over a pulley at the top, and brought down through a vertical hole in the meeting-rail of the inner sash, into and about half-way down the center of the mullion, and thence out through a horizontal hole, there being also a friction-pulley arranged within a slot, and a set-screw on the face of the mullion, for locking the device.

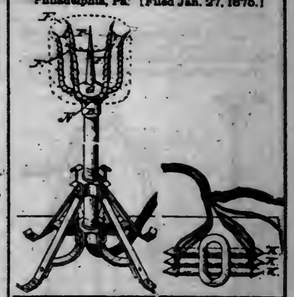
The combination, with sashes B C, of the cord D, pulley F, and clamp G, the first being brought down through a vertical hole in the top of lower sash, and partly through the mullion thereof, the second arranged within a slot, and the third attached to the surface of said mullion, as and for the purpose specified.



160,149.

160,146.

160,150. WEATHER-VANES AND POINTERS. James C. Bryan, Philadelphia, Pa. [Filed Jan. 27, 1875.]



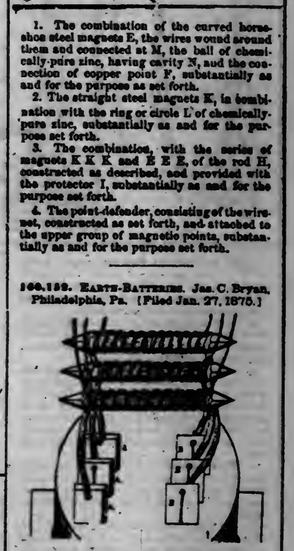
1. The improved weather-vane, consisting of four sheets, G, H, I, and J, with metal cap F on each side of center, riveted together to form V and W of the vane, as herein described.

2. The support E, having a circular groove provided with metal balls, in combination with the washer and bearing of weather-vane C, constructed of the four pieces of sheet metal, as herein described.

3. The combination of the staff provided with cap A, extending over the upper bearing of the vane, and the vane provided with cap D, extending over its lower bearing on the staff, as herein described.

4. The block M, consisting of the four pieces S S T T, each having attached a bracket to indicate one of the cardinal points of the compass, held in position and close contact with staff B by the bolts and nuts K K and dovetailing, substantially as and for the purpose herein set forth.

160,151. LIGHTNING-RODS. Jas. C. Bryan, Philadelphia, Pa. [Filed Jan. 27, 1875.]



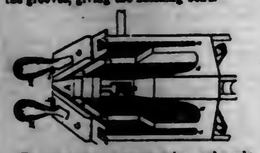
1. The combination of the curved horse-shoe steel magnets E, the wires wound around them and connected at M, the ball of chemically-pure zinc, having cavity N, and the connection of copper point F, substantially as and for the purpose as set forth.

2. The straight steel magnets K, in combination with the ring or circle L of chemically-pure zinc, substantially as and for the purpose set forth.

3. The combination, with the series of magnets K K K and E E E, of the rod H, constructed as described, and provided with the protector I, substantially as and for the purpose set forth.

4. The point-defender, consisting of the wire-net, constructed as set forth, and attached to the upper group of magnetic points, substantially as and for the purpose set forth.

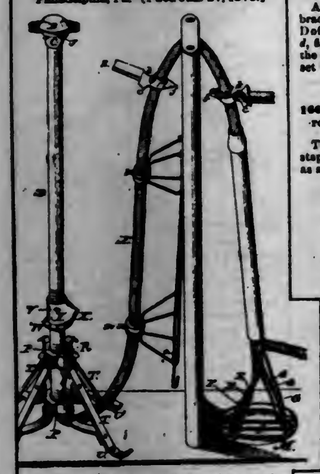
160,152. EARTH-BATTERIES. Jas. C. Bryan, Philadelphia, Pa. [Filed Jan. 27, 1875.]



1. The improved voltaic earth-battery, consisting of the metals A B, partially embedded in the sulphur C, as herein set forth.

2. The combination, with the voltaic earth-battery and primary coil, of the series of magnets forming the magneto electric battery, substantially as herein described.

3. The combination, with the voltaic earth-battery, magneto-electric battery and primary coil, and the secondary coil F, substantially as herein set forth.



160,153. MACHINERY FOR PRINTING HOSIERY-MARKETS. Jas. C. Bryan, Philadelphia, Pa. [Filed Sept. 9, 1874.]

Brief.—The rod is entered, (gaged by R,) and the lever bends into staple-shape; the levers are then brought down, carrying the ends into the grooves, giving the finishing bend.

The arrangement, construction, and combination of the upper centering traveling lever A, the rear lever B, the carriage C, roadway D, front levers G G, with their flanges J J, grooves K K, guides N N, and centering gage X, as herein described, and for the purposes set forth.

160,154. LIGHTNING-RODS. Jas. C. Bryan, Philadelphia, Pa. [Filed Jan. 27, 1875.]

1. The combination, with the upper terminal of a lightning-rod, of the series of steel magnets A and the ball of zinc partially inclosing the magnets and extending over socket C, substantially as herein set forth.

2. The rod composed of the series of insulated wires F, F, F, G, G, G, and H, wound as described, and wrapped with a protector, substantially as herein set forth.

3. The combination, with a lightning-rod composed of the series of wires, as described, of the terminal magnets, batteries L and M, each single magnet of either battery being connected to one magnet of the other battery by insulated wires connecting their opposite poles, substantially as and for the purpose set forth.

4. The combination, with a lightning-rod, of the series of magnets placed at the lower end thereof, and forming a magnetic earth-battery, substantially as and for the purpose herein set forth.

5. The supporting-standard N, consisting of the central portion O and lead P, provided with cavities Q, bolts S, and grooves, constructed as shown, the parts being arranged and combined substantially as and for the purpose herein set forth.

6. The spiral protector, consisting of the tube provided with flange W, orifice X, and fastening-screw Y, substantially as and for the purpose herein set forth.

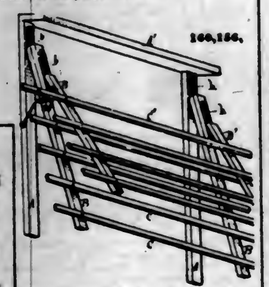
7. The inclined shoulder b, dip c, tapering points f of the metallic fastening Z, as herein set forth.

8. The roof-fastening, consisting of the frame and tie-wire i, secured together by the lead fillet or head h i, cast thereon, and extensions a e, substantially as and for the purpose herein set forth.

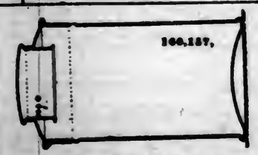
9. The insulating strip d, and having a groove along its center to fit within the arms f of support Z, and the side flanges for extension over the arms f, substantially as and for the purpose herein set forth.

10. The combination, with the rod and the protecting-tube t, of the lead socket or protector s, extending over the top of the tube and grasping the rod, substantially as and for the purpose specified.

160,155. FOLDING TABLES. Peter Cameron, Salford, Great Britain. [Filed Nov. 6, 1874.]



A table or bench having hinged legs, hinged braces extending through turning cross-pieces D of the legs, and combined with thumb-screws d, fitting openings in said cross-pieces, and in the top or frame of the table or bench, all as set forth.



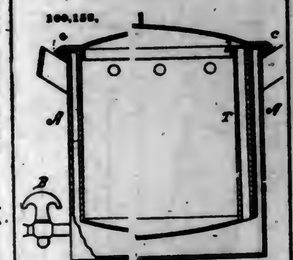
160,156. CLOTHES-FRAMES. Peter Cameron, Oshkosh, Wis. [Filed Jan. 19, 1875.]

The combination of the bars A B B' C C', staples a, loops b, and links c c', substantially as and for the purpose set forth.

160,156.

160,157.

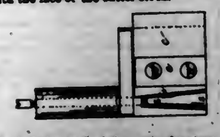
160,157. SPICE-BOXES. Joseph B. Camp, Brooklyn, N. Y., assignor to S. A. Ilsley & Co., New York city. [Filed Dec. 22, 1874.]



The spice-box having a removable ring-shaped cover and a perforated cylindrical cap sliding through the opening of the cover, as and for the purposes specified.

160,158. WASH-BOILERS. Jean B. Camyré, Montreal, Canada. [Filed Aug. 20, 1874.]

Brief.—A passage is provided through the clothes-chamber for introducing water to the lower chamber.

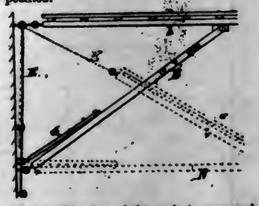


The outer vessel A, having a stop-cock, B, and lid h, the flange m of which is provided with an inward bead, l, in combination with the inner perforated vessel C, provided with the flange e and supply-pipe T, the whole constructed, arranged, and operated in the manner herein set forth.

160,159.

160,159. FITTING-TOOLS. T. S. Carroll, Winsted, Conn. [Filed Nov. 27, 1874.]

Brief.—The conical socket is in the axial line of the mandrel, which latter, for solidity and convenience, is, at its outer end, enlarged to a half-cylinder of the diameter indicated at b. This enlargement is planed down on one side until its plane cuts the socket, parallel to its axis, at a point that reduces the area of the socket by about one-fourth, and onto this plane surface is secured the cutter by the clamp plate and screws. The cutting-edge of the cutter is slightly beveled, and that surface which is terminated by the salient angle of the cutting-edge is placed downward in contact with the face of the cutter-stock.



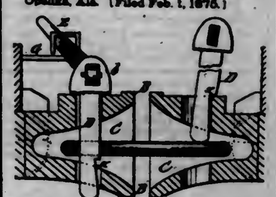
1. A fitting-tool of the general nature set forth, having a pattern-socket, s, greater than a half-circle, and a chisel, c, tizable at both ends to the stock, with its bevel c' to d on that side of the edge opposite to the chisel-seat, substantially as shown and described, and for the purpose set forth.

2. The mandrel a, having at one end the part-circular pattern-socket s, combined with the chisel c and screw t, substantially as shown and described.

160,160. CLOTHES-FRAMES. Jos. H. Chadwick, Wheaton, Ill. [Filed Jan. 23, 1874.]

Brief.—A flexible rack or grating is supported at the center by a diagonal hinged strut from a wall, and capable of being lowered by a cord, or raised into a horizontal position.

The combination of the rack A, composed of bars a, center bar b, and stringer c, the strut B, hinged to the rack and to the wall, the arm G, cord E, and pulley or eye f, substantially as specified and shown.



160,161. TURNING-TOOLS FOR METAL. Wm. Clay, Birkenhead, England. [Filed May 12, 1874.]

A tool for cutting or shaping metals, constructed substantially as described and represented, with a hole or passage through it for conducting water or other cooling fluid, gas, or vapor to the edge and beneath the shaving or cutting, substantially as specified.

160,161.

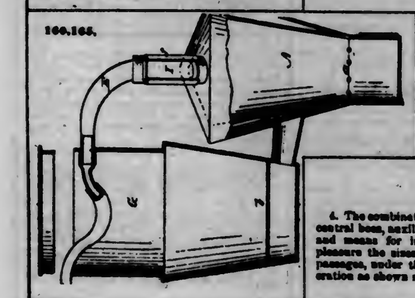
160,162. CAR-COUPLINGS. Jas. M. Clem, Opelika, Ala. [Filed Feb. 1, 1875.]

The re-enforced and slotted draw-head A, having V-shaped channel C, in combination with pin D, having slotted head b and notch a, bearing G, and loosely-working lever E, as and for the purpose specified.

160,163. POT-LIDS. Austin E. Colgrove, Attica, Ind., assignor of one-half his right to Elijah Young, same place. [Filed Sept. 8, 1874.]

Brief.—Upon the edge of the cover are projecting ears, to which are pivoted cams, which bear upon or under the flange of the pot.

The combination of the ears C C and cams D D with the cover B and the flanged pot A, all substantially as and for the purposes herein set forth.



160,164. MOUTH-PIECES FOR MUSICAL INSTRUMENTS. Chas. G. Conn, Elkhart, Ind. [Filed Dec. 5, 1874.]

Brief.—The mouth-piece, where it comes in contact with the lip of the performer, is faced with india-rubber or other elastic covering.

The annular cushion C, of elastic material, applied to the face of a mouth-piece, B, of common form, in the manner specified.

160,165.

160,166. STEAM-GENERATORS FOR COOKING, &c. William Cooper, Tpsilanti, Mich. [Filed Jan. 9, 1875.]

Brief.—The slide governs the feed-opening. Steam is carried to any ordinary cooking or washing apparatus.

The combination of the fire-box or heater A, having grate a, and made flaring from bottom to top, as shown, the flaring chamber D, pipe J, with slide I, and the pipe E, all substantially as set forth.

160,166.

160,167. SAFETY-VALVES. Geo. H. Crosby, Somerville, Mass. [Filed Feb. 2, 1875.]

Brief.—The central portion of the valve rests upon a boss, from which auxiliary passages lead through the valve-casing. When the valve is lifted, steam issues through the auxiliary passages, the exit of steam being controlled by an adjustable collar.

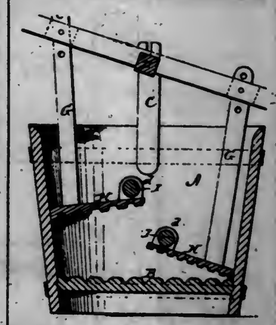
1. The boss for auxiliary steam-escape, in combination with the main valve, which, when in position on its seat, rests on top of, and in contact with, the upper face of said boss, and covers the steam-inlet therein, substantially as shown and set forth.

2. In combination with the auxiliary steam-escape passages opening out from the side of the valve-shell, the adjustable sleeve encompassing said shell, and operating to regulate the size of the outlets, substantially as shown and described.

3. The sleeve encompassing and adjustable upon the valve-shell, and provided with an apturned flange or rim, which directs upward the steam escaping from the lateral openings in the shell, substantially as shown and set forth.

160,167.

4. The combination of the valve-shell, valve, central boss, auxiliary steam-escape passages, and means for increasing or decreasing at pleasure the sizes of the outlet ends of said passages, under the arrangement and for operation as shown and set forth.



160,168. CORNER-CAPS FOR VALISES, &c. Geo. Crouch, New York, N. Y. [Filed Dec. 5, 1874.]

A leather corner-cap for trunks, valises, and bags, made of a single piece without seam, and molded or pressed into form, substantially as shown and described.

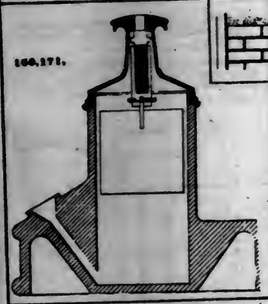
160,168.

160,169. WASHING-MACHINES. William D. Croy and David M. Croy, Blacksburg, assignors of one-third their right to William H. Coffman, Dayton, Va. [Filed Jan. 19, 1875.]

The combination, with the tub A B, of the corrugated pressers H H, rigidly attached to the arms G G in an inclined position, cars d d, and rollers I I, all constructed and operated substantially as and for the purposes herein set forth.

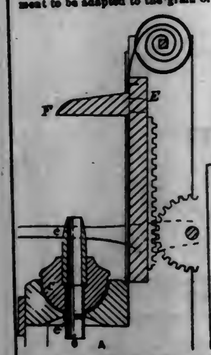
160,170. SHOVELS. Peter B. Cunningham, Freehold, assignor to Thos. Winn, Bethlehem, Pa. [Filed Feb. 6, 1875.]

Brief.—A socket is formed in the shovel-blade, and a metal tang attached to a wooden handle, fitted into the socket and secured by a pin or rivet.



A shovel in which are combined a metal tongue, A, secured to the handle, with a socket, c, formed for its reception in the blade, as set forth.

160,171. INSTRUMENTS. Shmi. Darling, Providence, R. I. [Filed Nov. 6, 1874.]



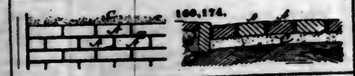
An instrument having a loose plunger, a dipping-cup, the lower diameter of which is less than the width of an ordinary pen, with proper steering-space below for the point of a pen, and a provision for the free passage of air from the reservoir, substantially as and for the purposes described.

160,171.

160,172. MACHINES FOR MAKING WOODEN PINS. Samuel S. Baker, Parkersburg, W. Va., assignor to Thomas P. Butcher, same place. [Filed Jan. 13, 1875.]

Brief.—The cutting-tool is suspended in a ball-and-socket joint, to permit a slight movement to be adapted to the grain of the wood.

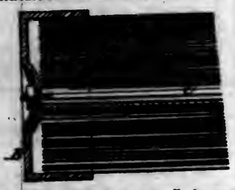
1. The ball C, provided with the cutter *c* and regulating-tube *e* and the socket, for the purpose set forth.



2. In combination with the stand A and slide E, having the projection F, the ball having the cutter *c* and weighted tube *e*, and the socket, as shown.

160,173. STRINGS FOR MUSICAL INSTRUMENTS. John Farmer, Harrow, and Jas. Ballie Hamilton, University College, Oxford, England. [Filed June 26, 1872.]

Brief.—The string is secured, at the ordinary hitch-pin end, to the vibrating end of a musical reed. The string may be also secured to the same by a rod touching the string between the hitch and tuning pins.



The combination, in a musical instrument, of a free reed-tongue, and a string connected with the vibrating end of the reed and to a tuning-pin, all substantially as herein shown and described.

160,174.

160,175. DEVICES FOR PROTECTING THE ENDS OF ROLLS OF PAPER, &c. Joseph L. Fitzi, New York, N. Y. [Filed Mar. 10, 1874.]

Brief.—Each end of the roll of paper or other fabric is protected by a metallic cap, perforated to receive the ends of a screw-rod passing through a sleeve or tube in the center of the roll, and countersunk in its center, so that the roll may be placed on end without interference from the nut on the screw-rod.

The combination of the tube F, the caps B D, countersunk in the center, and the screw-rod C, substantially as and for the purpose shown and described.

160,176. DISH-DRAINERS. Jane Ann Fox, Stamford, N. Y. [Filed Dec. 18, 1874.]

Brief.—The large dishes are placed in the rigid central receptacle, while the knives and forks and smaller articles are placed upon the sloping removable shelves, or either, and hot water poured over them, which drains through minute perforations into the pan beneath.

160,176.

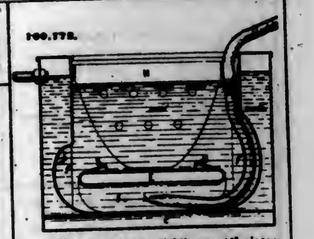
1. The combination of the pan A, provided with ears *a*, and the drainer B, having concave bottom with perforations *c x*, substantially as and for the purposes herein set forth.

2. The combination of the pan A, with ears *a*, the drainer B, with perforated concave bottom, and the inclined plates C C, provided with perforations *y y*, substantially as and for the purposes herein set forth.

160,177. PRINTING-SURFACES. Julius Friedlaender, Berlin, Prussia, and F. H. Moeller, Leipsic, Saxony. [Filed Feb. 9, 1874.]

Brief.—Prepares plates or rollers by electro-deposit, from which to print in the manner of lithography.

A printing plate or roller having the within-described unpolished electro or chemically deposited metallic surface, on which the picture is drawn, or to which it is transferred, as set forth.



160,178.

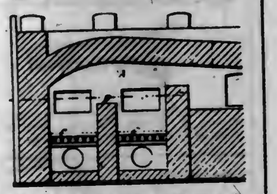
160,178. APPARATUS FOR PICKLING METAL PLATES. William Gething, David Jenkins, and Sankey Gardner, Neath, South Wales. [Filed Sept. 22, 1874.]

Brief.—Water circulates through the outer vessel around the acid-bath, the temperature of which is thus regulated. The bath is separated into several compartments by partitions, and contains a shelf to support the plates. Steam is introduced beneath this shelf, and, aided by the peculiar form of the vessel, creates a circulation of acid among the plates on the shelf above.

160,179.

1. The acid-bath for pickling metal plates, consisting of an inner vessel with supports for the plates, an outer vessel containing water for regulating the temperature of the bath, and pipes for introducing steam into the acid, substantially as set forth.

2. The shelf E and frames H, between which the plates to be pickled are placed, in combination with the steam-pipes F, with their open ends beneath the shelf E, and arranged as specified, to produce a circulation of the acid in the bath, as set forth.

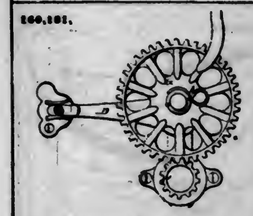


160,179. PIPE-WRENCHES. Daniel Gilbert, Waynesborough, Pa. [Filed Jan. 8, 1875.]

Brief.—The point of the lever bears in notches arranged on the outer edge of the links and opposite the teeth. The free end of the chain is passed through the first link.

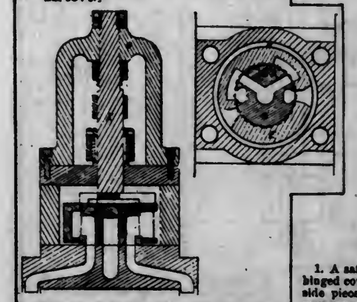
In combination with the lever A, bent at the point, the chain formed of a series of links, B C D E, &c., constructed to receive the point of the lever on their outer edges to compress the chain against the pipe, the link B being open so as to permit the free end of the chain to pass through it, substantially as set forth.

160,180. FIRE-CHAMBERS FOR PUDDLING AND OTHER FURNACES. Henry H. Gilmore, Cambridgeport, Mass. [Filed Apr. 26, 1874.]



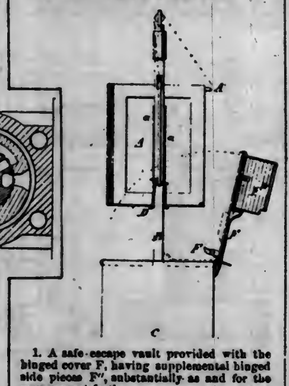
The firing-chamber A of a reverberatory furnace, divided by walls D into a series of connected sections, provided with stoke-holes C, as specified, to enable the sections to be fired successively, and the unconsumed products of combustion, that are always wasted for some time after a furnace-fire is started, to be thus burned and utilized.

160,181. GEARING. Horace L. Gordon, West Garland, Me. [Filed Dec. 7, 1874.]



Brief.—A pinion on a churn-spindle is geared into by either of two wheels on the same center, having different diameters, and revolving as one piece on a pin standing on the short arm of a bell-crank lever. The change is made by unshipping and reversing the piece, and, giving a half-revolution to the lever.

160,181.



The combination, with a pinion, C, of the pivoted elbow-lever D D' with stud E, and the double cog-wheel G G' placed on said stud, substantially as and for the purposes herein set forth.

160,182. STEAM-VALVES. John J. Grant, Greenfield, Mass., assignor to himself and Solon L. Wiley, same place. [Filed July 22, 1874.]

The conical frustum arranged within the valve-jacket, and provided with two ports, opening into the cylinder, and two openings connecting with the exhaust-channel, in combination with the cylindrical slide, having two ports, through which steam is admitted, and cavities arranged to embrace the exhaust-passages and passages leading to the cylinder, as and for the purposes described.

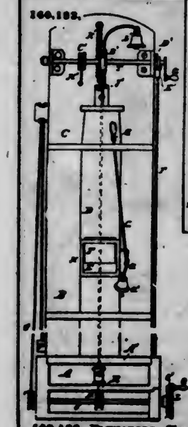
160,183. SAFE-ESCAPE VAULTS. D. K. Hatfield, Pottstown, Pa. [Filed Oct. 16, 1874.]

1. A safe-escape vault provided with the hinged cover F, having supplemental hinged side pieces F'', substantially as and for the purposes set forth.

2. The combination of safe A, having boss A', with hinged cover F, having projection F', substantially as and for the purposes set forth.

3. The combination of vault C, having a hinged cover, F F' F'', and standards B, with the safe A A', provided with lateral flanges *a a*, the whole constructed substantially as described, and adapted to operate in manner set forth.

160,184. FIRE-ESCAPES FOR SAFES. F. Hackett and John C. Crounse, Hale's Corners, Wis. [Filed Dec. 12, 1874.]

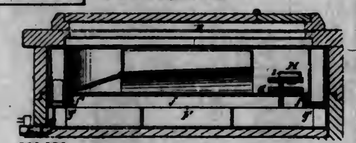


160,185. BED-BOTTOMS. Henry S. Hale, Philadelphia, Pa. [Filed Dec. 21, 1874.]

A bed-bottom consisting of a frame, A, metal springs B, and a covering composed of slats cemented to a suitable fabric, all being combined substantially as and for the purpose herein set forth.

160,186. CORPSE-PRESERVING CASKETS. Bartholomew Hartwell, Baltimore, Md. [Filed Aug. 22, 1874.]

Brief.—The ice-boxes are removable, and are set in a gutter formed by the upper edge of the lower section of the casket and an upward-turned flange of the raised table upon which the corpse is laid.



160,182.

160,185.

160,186.

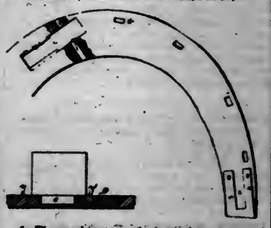
160,182. ELEVATORS. Chas. H. Gullen, Chicago, Ill. [Filed Feb. 3, 1875.]

Brief.—A crank-shaft at top and bottom of a spout, with counterbalance rope-pulleys on each, for transmission either way, or to an intermediate floor, of parcels, bells announcing the operation.

1. The combination of stand F and cooling-board G, having, respectively, the flanges *f f'*, as and for the purpose described.

2. The clamps I I, swiveled and movable toward each other in a slot of head-rest, as and for the purpose specified.

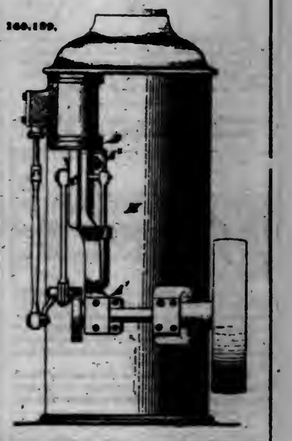
3. The described combination with edges of lower section of casket-case, of the stand F, and raised cooling-board G, forming a gutter or groove to hold the sections of ice-chamber until the top section is put in place.



160,187. TOY AUTOMATONS. D. K. Hatfield, Pottstown, Pa. [Filed Oct. 16, 1874.]

Brief.—A toy figure seems to strike a bell. The operative lever is rendered automatic by attachment to the works of a clock.

As an improvement in toy automatons, the head and shoulders A secured upon the block B and pivoted within the post C, the rod D provided with the arms D' and D'', and the hammer E', in combination with the operating-cord G, the stop H, the wire loop I, and the spring K, substantially as and for the purpose specified.

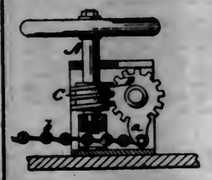


160,188. HORSESHOES. Samuel B. Henry, Farmwell, Va. [Filed Jan. 21, 1875.]

1. The combination of a horseshoe, A, having a recess, *c*, and transverse opening *i*, a calk, B, provided with a dovetailed projection adapted to said recess, and extending over the bearing on the face of the shoe, a block, D, fitting the recess *c*, overlapped by the calk, and retained by a transverse pin, *i*, all as set forth.

2. A shoe, A, having recesses *c c*, adapted to receive dovetailed projections of detachable calks, in combination with blocks of rubber fitted to and secured in said recesses, all as set forth.

160,189.



160,189. FRAMES FOR PORTABLE STEAM-ENGINES. J. W. Hill, Dayton, Ohio, assignor of one-half to Christian Horstkroede, same place. [Filed July 2, 1874.]

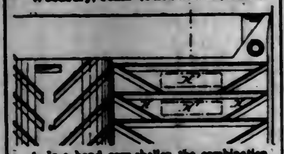
The combination of the upright cylindrical boiler H and the bercis described composed casting of the engine, having flanges A' A', standing in position oblique transversely to the plane of the guides C C', substantially as and for the purpose specified.

160,190. CAR-BRAKES. Martin M. Hiew and J. M. Fussler, Harrisburg, assignors of one-third their right to F. B. Calder, State College, Pa. [Filed Feb. 10, 1875.]

Brief.—The spindle on which the brake-chain is wound is revolved by a toothed disk engaging with a worm-gear. The chain is secured to the end of an arm formed upon the disk, and its slack is thus taken up by a partial revolution only of the spindle.

The segmental wheel D, provided with a downward-projecting arm, *a*, and the chain *b*, connected to said arm, in combination with the worm-wheel C on the brake-shaft A, all constructed to operate substantially as and for the purposes set forth.

160,191. FERTILIZING COMPOUNDS. Chas. H. Hoffmann, San Francisco, Cal. [Filed Sept. 22, 1874.]



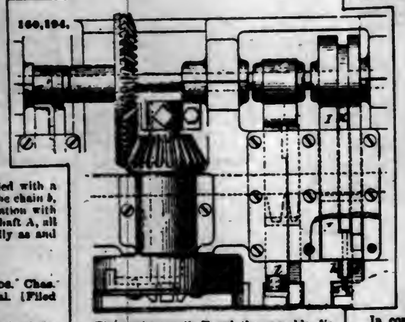
As improved fertilizer, composed of the common liquid manure, salt, saltpeter, lime, stone-oil, and sulphur-balsam, in the proportions substantially as herein set forth.

160,192. REVOLVING FIRE-ARMS. Freeman W. Hood, Norwich, Conn., assignor to the Hood Fire-Arms Company, same place. [Filed Dec. 9, 1874.]

In combination with the rotary magazine and its pivot-pin *a* of a revolver, a mechanism or latch, E, substantially as described, to hold the pin in place and operate as a friction-brake to the magazine, all as specified.

160,193. CORN-SHELLERS. T. J. Hoover, Woodbury, Tenn. [Filed Jan. 23, 1875.]

1. In a hand corn-sheller, the combination of the board or plate A and the oblique shelling-ribs D, having their adjacent ends terminating at a sufficient distance from each other to form an escape space or channel for the corn lodged in rear of the ribs, substantially as and for the purposes described.



2. In a hand corn-sheller, the combination of the plate or board A, the oblique ribs H, and the straight ribs G, substantially as and for the purposes described.

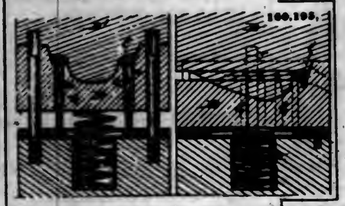
3. The hand corn-sheller herein described, comprising the frame A, the board or plate B, having lateral flanges I, the double series of oblique ribs D, the straight ribs G, and the oblique ribs H, all constructed and relatively arranged substantially as herein described.

160,194. NUT-MACHINES. Wm. Horsfall, Armley, Leeds, England. [Filed Oct. 2, 1874.]

Brief.—The device claimed is one of several associated together, and is designed to compress the two edges of the bar, to partly form and sever a blank therefrom, which is at the same time subjected to the action of a presser, through which works the punch. The punched and partly-severed blank is removed on a mandrel by the attendant, and placed over a slide, which rises and holds the mandrel while a crowner operates. The nut is next subjected to the action of four radial hammers, and finally to a flattener, which partly removes the mandrel.

160,194.

The stationary die F and the movable die E, each constructed with the separate formers or dies *a b* and *c d*, in combination with the reciprocating slide K, having the punch *i*, and the slide I having the tool A, substantially as and for the object specified.



160,195. DIES FOR MAKING HORSESHOES. Wm. Horsfall, Armley, Leeds, England. [Filed Oct. 2, 1874.]

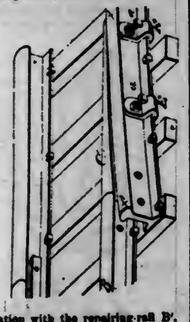
Brief.—The primary die B is a fac-simile of the section D', and the primary die B of the section D, except that it is not pierced to admit of the passage of the nail-punches.

1. The one primary die A, provided with a recess, *k*, for the toe-calk *l*, and, together with its fellow die B, constructed to form one or more lips, *i*, for clips, essentially as herein described.

2. The combination of the primary dies A B, constructed to unite the toe-calk with the shoe, and to form lips for clips on the latter, and the nail-hole-punching die-sections D D' D' and punches G, constructed to operate substantially as described.

160,195.

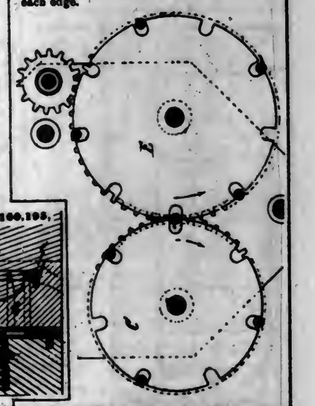
160,196. SADDLE-TREES. P. B. Horton, San Francisco, Cal. [Filed Oct. 31, 1874.]



A saddle-tree, formed of saw-dust and glue or other agglutinating agent compressed to the desired shape in a mold, as a new article of manufacture.

160,196.

160,197. REPAIRING RAILROAD-TRACKS. J. Houston, Woodbura, Iowa. [Filed Dec. 14, 1874.]



Brief.—A repairing-rail applied by means of clamp-plates extending beneath the rails, and combined in place by screw-bolts.

In combination with the repairing-rail B', the tapering rail C, having rib D secured to the repairing-rail by the clamps E and bolts *a a'*, substantially as set forth.

160,198. BRAIDING-MACHINES. Friedrich Wilhelm Huppelsberg, Brooklyn, E. D., N. Y. [Filed Dec. 5, 1874.]

Brief.—To enable a flat braid to be produced of two different colors, and of the same thickness and same amount of material on each edge.

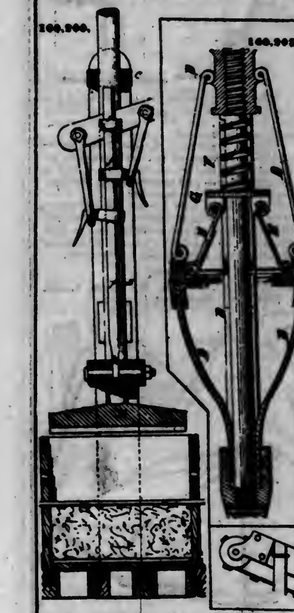
In a braiding-machine, the combination, with an even number of jacks or bobbins, of two disks, F C, of unequal diameter, each disk being provided with an uneven number of notches, the number of notches in the large disk being two more than that in the small disk, said disks being made to revolve at the same circumferential velocity with or without intermediate disks, substantially as and for the purpose shown and described.

160,199. BOX-MACHINES AND BOXES. John W. Hyatt and C. M. Hyatt, Newark, N. J. [Filed Dec. 9, 1874.]

Brief.—The vertically-reciprocating cutters cut the stuff to the required bevel, and stationary cutters form the groove for the box which unites the different parts.

1. The punches K, in combination with the mitering-knives C C, carriage H, stationary cutters D D, and platform E, substantially as set forth.

2. The curved toes *s*, in combination with the mitering-knives C C, carriage B, stationary cutters D D, and platform E, substantially as set forth.



3. The clamp F, in combination with the mitering-knives C C, carriage B, stationary cutters D D, and platform E, substantially as described.

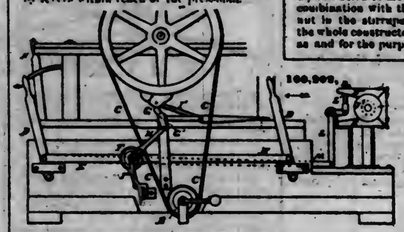
4. The slide G and wedges *f*, in combination with the clamp F, mitering-knives C C, carriage B, stationary cutters D D, and platform E, substantially as set forth.

160,200. PRESSES. Thos. J. Jenne, Gouverneur, N. Y. [Filed Feb. 8, 1875.]

Brief.—The pivoted lever-arm is attached to the stem of the follower, and connected with the standard on which the griping-pawls operate, in such manner that when the lever arm is depressed it will, through the medium of the alternating friction-pawls connected with the lever on opposite sides of its pivot, carry the stem of the follower downwardly.

160,200.

160,200.



The combination, with the platen or follower D and stem E of a cotton or other press, of a pivoted lever, G, connected with said stem, and griping-pawls arranged upon a standard, F, parallel with the stem of the platen, and connected with the lever on opposite sides of its pivot, the whole being constructed and arranged to operate substantially as and for the purpose described.

160,201. COMPOUNDS FOR GAS-FUEL. C. Jouty, Paris, France. [Filed Aug. 28, 1874.]

The combination of peat which has been carbureted by immersion in prepared naphthaline with coal, lime, and tar, in the proportions described, the tar serving to bind the other powdered ingredients, as specified.

160,202. BRAKE MACHINERY. C. Kahler, Chicago, Ill., assignor of one-half his right to M. C. Barnes and Wm. L. Ogden, same place. [Filed Oct. 31, 1874.]

Brief.—The action of the cylinder of the printing-cylinder and the tension of the reel on which the paper is wound are controlled by levers within reach of the pressman.

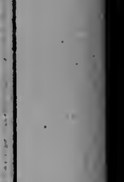
1. The combination, substantially as described, of a brake with the cylinder and an adjustable belt-wheel, for the purposes set forth.

2. The combination of one or more pivoted levers, D D, pivoted bar E, adjustable wheel F, and yielding shoe I, resting on a rocker connected to said wheel for actuation, substantially as and for the purposes specified.

3. The lever N arranged at the foot of a printing-press, in combination with a tension mechanism of the paper-reel, for the purpose of enabling the attendant at the foot of the press to control the said tension through the instrumentality of the said lever, and thereby regulate the width of the margin on the printed sheets, substantially as specified.

4. The combination of the paper-reel, the hinged friction-blocks, the bell-crank, the connecting-rods L' and M, and the lever N, arranged at that end of the press opposite the tension, substantially as and for the purposes specified.

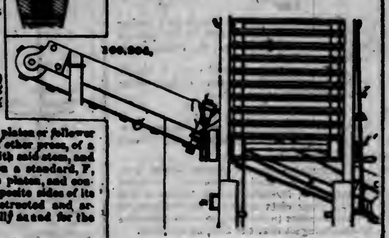
160,202.



160,203. BRAKE-BEAMS. Robt. I. Knapp, Half Moon Bay, Cal. [Filed Aug. 18, 1874.]

Brief.—A brake-bar held in a stirrup in the draw bar, and adjusted by means of a screw to take up wear of the brake-shoes.

The brake-bar A, provided with the plate D, and fitted to move within the stirrup C, in combination with the screw E, to turn in the nut in the stirrups, and having the head *a*, the whole constructed to operate substantially as and for the purpose described.



160,203.

160,204. STACKERS' ATTACHMENTS FOR THRASHING-MACHINES. Levi Kissinger and J. K. Kurtz, Massillon, Ohio. [Filed Jan. 19, 1875.]

Brief.—Adjustably-inclined stacker with deeply-adjustable band-tightening pulleys, over which passes the driving-belt from thresher.

160,204.

160,205. AIR-CHAMBERS FOR STEAM-PUMPS, &c. Lucius J. Knowles, Worcester, Mass. [Filed Jan. 26, 1875.]

Brief.—The cast-iron shell is of such form that the sheet-metal covering is easily removable; yet every part of it fits snugly upon the iron backing, and is able to resist inflatation.

A combined cast-iron and sheet-metal air-chamber for steam-pumps and other similar machines, composed of the cast-iron part A and sheet-metal part E, constructed and combined together substantially as and for the purposes set forth.

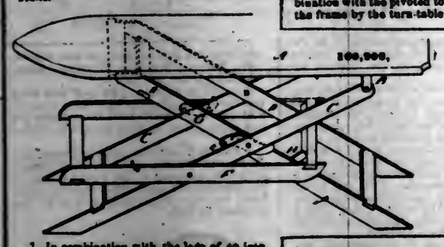
160,205.

160,206.

160,207. FORCE-PUMPS. Lucius J. Knowles, Worcester, Mass. [Filed Jan. 26, 1875.]

Brief.—Inlet and outlet valves—two or more of each for each cylinder, to relieve the impact of the plunger and liquid—are arranged on diametral levers, to carry any air or gases lodged in the column of liquid through the pump. Rail-valves operate in circular cages, secured in place by screw-plugs, which are covered by screw-caps, packed or nicely fitted to their seats, to prevent leakage of the liquid.

1. The combination with the central parts A A', cast in one piece and relatively arranged, one part partially above the other, as shown and described, and having cylinders C C projecting from the ends thereof, of two series of valves, a b, relatively arranged in respect to each other substantially as and for the purposes set forth.



2. The combination, with valve frame or frames I, of the screw holding plug or plugs k, substantially as and for the purposes set forth.

3. The combination, with valve-frame I and the body of the pump that supports it, of screw-plug k and clamping and packing cap m, substantially as and for the purposes set forth.

4. A force-pump consisting of the central parts A A', projecting cylinders C C, separate pistons D, working in separate chambers d, cross-heads E, connecting-bars F, with two series of valves, a and b, and their respective liquid passage-ways, arranged as described, for the admission and outlet of the liquid to and from the pump, substantially as and for the purposes set forth.

160,908. IRONING-TABLES. Ezra B. Lake, Tom's River, assignor to S. T. Champion, Pleasantville, N. J. (Filed Jan. 11, 1875.)

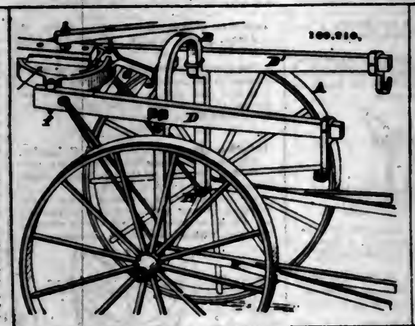
Brief.—A folding skirt-frame in connection with the folding-legs of an ironing-board, which are held by locking-plates and pivotal steels.

160,908.

1. In combination with the legs of an ironing-table, a folding skirt-supporter, F, arranged above the lower ends of the intersecting pivoted legs, and secured or pivoted at its middle part only to the frame of the table, substantially as shown and described.

2. In combination with an ironing-table having intersecting pivoted legs, the locking-plate L or its equivalent, having locking pins at opposite ends on different sides, and pivotal stud projecting from both sides, said plate being cast or formed in one piece with its studs, and arranged between the legs or bars which it connects, substantially as described and shown.

3. The combination, with the board A, of the legs C O D D, frame F, and locks E, G, and H, substantially as shown and described.



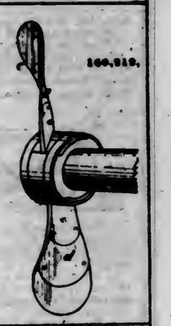
160,909. REVIVING STEEL. J. N. Leath, Pittsburg, Pa. (Filed Dec. 24, 1874.)

Brief.—Files or fagots the steel and covers with iron in the usual way; then raises the temperature to about a red heat, not to a welding heat, and compresses the iron and steel together, after which the mass is raised to a full welding heat and rolled into the desired shape.

In the reworking of steel when piled or fagoted exteriorly with iron, the step set forth, which step consists in arresting the heat at a point a little short of that at which the steel employed would be destroyed or materially injured by the action of air or other gases thereon, and then subjecting the pile or fagot to compression before bringing it to the usual working-heat, substantially as described.

160,910. CULTIVATORS. L. L. Lawrence and O. S. Thomas, Dublin, Ind., assignors to Wayne Agricultural Company, same place. (Filed Jan. 2, 1875.)

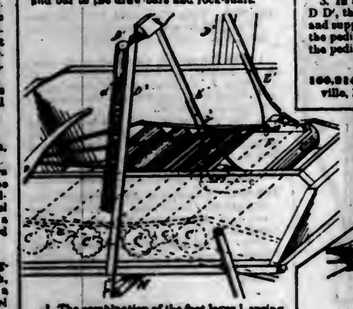
Brief.—The revolving plate of a turn-table rigidly secured to the tongue. A drop-catch actuated by a lever, when raised, permits the tongue to swing horizontally. When the tongue remains in longitudinal position, the catch drops into place, and the tongue is rigid with the frame.



160,910.

1. The described combination of bed-plate E, turn-table G, tongue H, bolt K, lever M, and catch O, for the purpose herein designated.

2. The tongue H, rigidly secured to the circular turn-table G, in combination with the drop catch O and lever M.

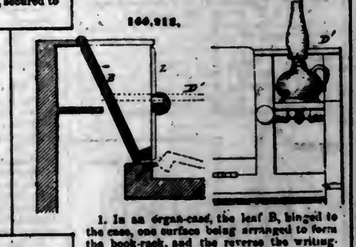


3. In a wheel-cultivator, the arched axle B, with the offsets b and the frame D D', in combination with the pivoted tongue H, secured to the frame by the turn-table E G.

160,911.

160,911. WASHING-MACHINES. Frances M. Lechner, Waynesburg, Ohio. (Filed Nov. 26, 1874.)

Brief.—The rubber is adjustable on the arms by slots and screw-bolts, and pressure is applied by a foot-lever with an elliptic spring and bar to the draw-bars and rock-shaft.



1. The combination of the foot-lever I, spring I', link i, cross-bar H, draw-rods D', and springs d' with the posts D and rock-shaft E, substantially as set forth.

2. The adjustable arms or bars a', in combination with the pendulum-arms E' and rubber F, substantially as set forth.

160,912. BLADES FOR SCREW-PROPELLERS. James Hart Loftus, Oakland, Cal. (Filed Nov. 21, 1874.)

A removable screw-propeller blade, constructed of a series of gradually-reduced plates, a b c, fastened rigidly together, and having their ends turned at right angles to fit the recesses in the hub, so as to make the blade strongest near the hub, as set forth.

160,912.

1. In an organ-case, the leaf B, hinged to the case, one surface being arranged to form the book-rack, and the reverse the writing-desk top, substantially as described.

2. In an organ-case, the leaf B hinged to the case, and arranged to form in one position the book-rack and inclose the space F, and in the other to open said space and form the desk-top, substantially as described.

3. In an organ-case having the pediments D D', the fronts L, pivoted so as to be turned and supported in a horizontal position to open the pediments and form a bracket, or to close the pediments, substantially as described.

160,913. ORGAN-CASES. John R. Lomas, New Haven, Conn., assignor to B. Shoninger, same place. (Filed Jan. 18, 1875.)

Brief.—The music-rack, when turned down, serves for a writing-table, and the lamp-shelves are centrally pivoted, ornamented upon the under side, and turned up out of the way when not in use.

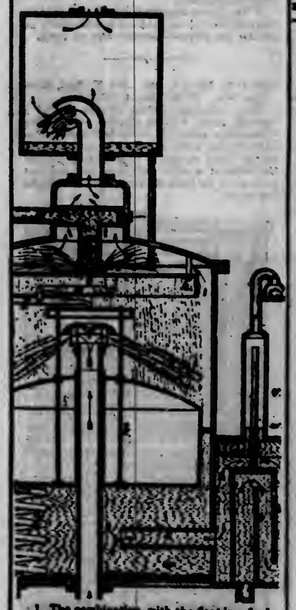
160,913.

1. In an organ-case, the leaf B, hinged to the case, one surface being arranged to form the book-rack, and the reverse the writing-desk top, substantially as described.

2. In an organ-case, the leaf B hinged to the case, and arranged to form in one position the book-rack and inclose the space F, and in the other to open said space and form the desk-top, substantially as described.

3. In an organ-case having the pediments D D', the fronts L, pivoted so as to be turned and supported in a horizontal position to open the pediments and form a bracket, or to close the pediments, substantially as described.

160,914. UMBRELLAS. H. Martin, Louisville, Ky. (Filed Sept. 11, 1874.)



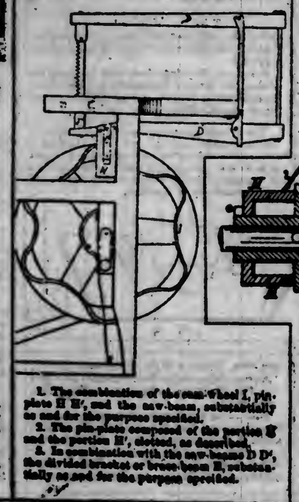
1. In an umbrella of the usual or ordinary construction, the tips B, pivoted to the outer extremities of the ribs, as described, and each tip capable of being turned up or down independently of the other, and the whole constructed so that the tips may be turned up to form a gutter or channel, or turned down to form an umbrella of the usual appearance, substantially as described.

2. The combination, with the ribs provided with the pivoted tips having the inwardly projecting arms a, of the strip C of flexible material, connected with the tips and the covering of the umbrella, substantially as described.

3. The pivoted tips B, constructed with sockets c, into which the ends of the ribs fit when the tips are in their normal position, substantially as and for the purpose described.

160,915. FEED-WATER HEATERS. Hiram S. Maxim, Brooklyn, N. Y. (Filed Nov. 13, 1874.)

Brief.—Air is admitted to and water of condensation escapes from the float through the coiled pipe communicating with it and the atmosphere. To prevent the escape of vapor, a pipe is extended upwardly within a tube, at the end of which is a return bend provided with a valve.



1. The combination, with the float in a feed-water heater, of a bolster spring, opening at one end within the float, and at the other end outside the heater, substantially as set forth.

2. The combination, in a feed-water heater, of a compound lever, f and f', having the fulcrums upon the sprinkler-plate h', and acting between the float and the valve that admits water, substantially as set forth.

3. The combination, with the oil-trap and air tube o', of the tube r', neck, and valve p, substantially as set forth.

160,916. APPARATUS FOR MANUFACTURING ILLUMINATING-GAS FROM LIQUID HYDROCARBON. Hiram S. Maxim, Brooklyn, N. Y., assignor to Maxim Gas-Machine Company of New York. (Filed Dec. 5, 1874.)

Brief.—A piston working in a cylinder, and connected with operating-valves, prevents the jarring, jerking motion. A water-pipe returns the condensed steam from the vaporizer to the boiler. The gasoline or other volatile hydrocarbon is vaporized by steam heat.

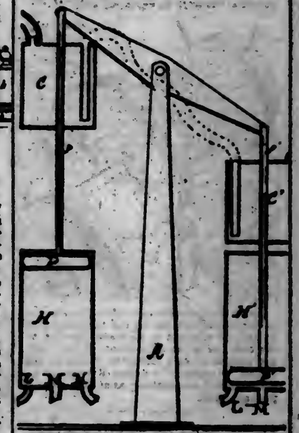
1. The combination of the cam-wheel I, plate H H', and the cam-beam, substantially as and for the purpose specified.

2. The pin-plate composed of the portion E and the portion H', arranged, as described.

3. In combination with the cam-beam D D', the divided bracket or beam-beam E, substantially as and for the purpose specified.

160,917. SCROLL-SAWING MACHINES. Robt. McConnell, Pittsburg, Pa. (Filed Aug. 3, 1874.)

Brief.—The saw is reciprocated by means of a cam through suitable connections, the machine being provided with devices for adjusting the various parts to meet the requirements of the work to be performed.

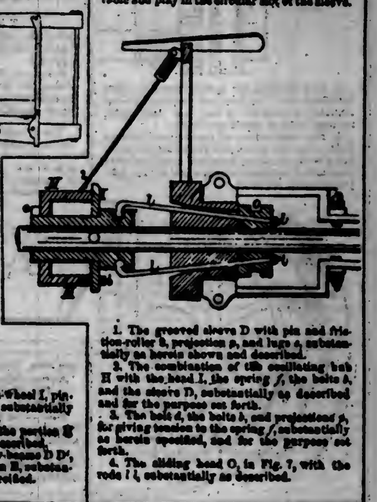


1. The combination of the cam-wheel I, plate H H', and the saw-beam, substantially as and for the purpose specified.

2. The pin-plate composed of the portion E and the portion H', arranged, as described.

3. In combination with the cam-beam D D', the divided bracket or beam-beam E, substantially as and for the purpose specified.

160,918. STEAM-ENGINES. J. W. Middleton, Philadelphia, Pa. (Filed Nov. 2, 1874.)



Brief.—The cylinder-pistons are operated by the introduction and condensation of steam. The vessels on the piston-rods are alternately filled with a liquid, one from the other, to assist the rise and fall of the pistons.

The combination of cylinders H H', provided with suitable pipes L M N, pistons F F', piston-rods p p', vessels C C', and beam A, with a mechanism for forcing the water from one vessel, C C', to the other, the parts being arranged for operation as shown and described.

160,919. WIND-WHEELS. Newell P. Mix, Avoca, and Wm. H. Jacobs, Columbus, Ohio; said Jacobs assignor to said Mix. (Filed Nov. 9, 1874.)

Brief.—The oscillating hub is placed in front of the wheel. The sleeve is moved to and from the spider by means of rods which extend through the bosses of the spider and the sliding piece, to which they are secured by nuts which are moved by a lever. The turning in and out of the wind of the fans is effected by the lever. The arms are secured to the turn-table and play in the circular slot of the sleeve.

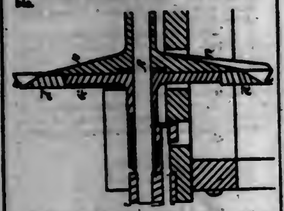
1. The grooved sleeve D with pin and friction-roller b, projection p, and lugs c, substantially as herein shown and described.

2. The combination of the oscillating hub H with the head I, the spring f, the bolts A, and the sleeve D, substantially as described and for the purpose set forth.

3. The bolt d, the bolts b, and projections p, for giving tension to the spring f, substantially as herein specified, and for the purpose set forth.

4. The sliding head O, in Fig. 7, with the rods l l, substantially as described.

160,920. GARDEN-SPRINKLERS. P. Muller, Cleveland, Ohio. [Filed Jan. 14, 1875.]



Brief.—A portable hose-rest having the discharge-pipe or nozzle of its hose attached to a suitable bearing at one end, and at the axial center of said rest, and capable of such change in its line as will enable the course of the stream of water to be varied at will.

As an improvement in garden-sprinklers, a portable hose-rest, having the discharge-pipe of its hose attached to a suitable bearing at one end, and at the axial center of said rest, and capable of such change in its line as will enable the course of a stream of water to be varied at will, substantially as and for the purposes specified.

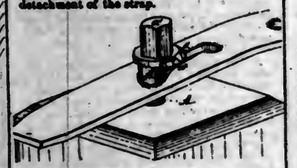
160,921. MEAT AND VEGETABLE SLICERS. John W. Markland, Lowell, Mass. [Filed Dec. 28, 1874.]

Brief.—A disk revolving in a slot in a table-top, its shaft journaled above the table; said disk slotted for the reception of cutters like plane-irons, which are made to advance or recede by an adjusting-screw at one end of the shaft, the blades or cutters acting shear-like with the edge of a bearing-box lateral to the disk and near its periphery, and also adjustable.

1. In a machine for cutting meat or other articles, a revolving disk and a series of knives mutually adjustable to and from each other, substantially as herein set forth.

2. The combination of the adjustable arms D D, with blades *d d*, and the slotted adjustable disk G, all placed upon and revolving with the shaft H, substantially as and for the purposes herein set forth.

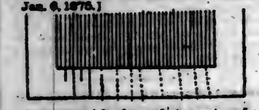
160,922.



160,923. HEATING-STOVES. Chas. Noble, Philadelphia, Pa., assignor to Chas. Noble, M. D., Chas. Noble, and Francis F. Nicholson, same place. [Filed Oct. 7, 1874.]

Brief.—The grate is vibrated horizontally by means of the pin projecting through the hollow in the ring. The curved flange on the grate prevents escape of ashes through the hollow.

The combination of the ring A, its hollow projection D, and the grate H, having a pin, *m*, extending into the said projection, and provided with a segmental curved flange, *e*, adapted to the curved edge of the projection D, all as and for the purpose specified.



160,924. DEVICES FOR HITCHING HORSES. Ernest Ohm, Terre Haute, Ind. (Filed Oct. 14, 1874.)

Brief.—Upon the nail, which is either screwed or driven into the post, the punctured hitching-strap is passed, and then secured by a detachable cap-nut which is screwed upon the upper or outer end of the nail. Said cap-nut has a notched flange, to prevent the casual detachment of the strap.

A hitching-nail for animals, consisting of the body A and detachable cap *a'*, having a notched flange, *a*, as and for the purpose specified.

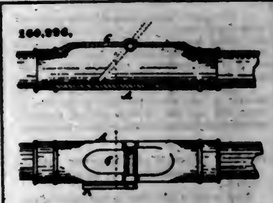
160,925. ORNAMENTAL TRANSFER-SHEETS. Otto J. E. Palm, Cincinnati, Ohio. [Filed Jan. 6, 1875.]

As a new article of manufacture, a transfer-paper sheet for use in decalcomania, when provided with a ground-color, or a covering of gold, silver, or metal leaf, and having parallel lines printed or otherwise produced upon the face thereof, substantially as and for the purpose described.

160,926. MEAT-CHOPPERS. Joshua Perkins, Danielsonville, Conn. [Filed July 16, 1874.]

Brief.—A chopping-block with the hoop inclosing the meat or vegetables to slide under the rotating knife, and so removable for cleaning or emptying deposits.

The detachable chopping-block B, carrying the bottomless vessel C, and provided with a slot, *s*, in combination with the base A, cleats *n n* on the uprights b b, catch *n*, and cutters D, capable of being raised above the vessel C, substantially as specified.



160,927.

160,928. BRIDLE-HOOK. Truman L. Pierce, Akron, Ohio, assignee of one-half his right to Jas. M. Segur, same place. [Filed Jan. 20, 1875.]

Brief.—An air-passage is arranged outside the inlet-valve, and is provided with a valve opening toward the pump, so that when the plunger is drawn out a small quantity of air will be drawn in. The air passes directly to the air-chamber to supply any deficiency therein.

160,929.

1. In sections of engine-hose, a gate or valve placed between the ends thereof, by which the water in the hose, while under pressure, may be allowed to escape from the hose on either side of the gate, substantially as and for the purpose described.

2. The herein-described bar A and gate G, when applied to engine-hose, substantially as and for the purposes hereinbefore set forth.

160,930. MILK-SAFES. Jos. F. Fool, Monroe, Wis. [Filed Mar. 4, 1874.]

Brief.—Circular shelves revolve around a vertical shaft, with a circular case having woven-wire sides, the lower half having also exterior close walls, at the upper end of which, on the inner surface, a ring packing presses the edge of a solid shelf, and prevents the passage of air from the lower cool division to the upper.

1. The solid shelf C, constructed to conform snugly to the internal shape of the safe, in combination with door A', provided with rib *a'*, substantially as and for the purpose set forth.

2. The central shaft E, solid stationary shelf G, revolving shelves G' G', ribs *a a'*, and doors A' and H, all arranged to form a combined milk-safe and refrigerator, substantially as herein described.

160,931. GAS-LIGHTING APPARATUS. Robt. M. Potter and William W. Thomas, Jersey City, N. J. [Filed Feb. 2, 1875.]

Brief.—The liquid-reservoir is divided by an annular cylinder into two chambers, by forcing air into the center of which the liquid is made to rise in the inner chamber to the mouth of an inverted cup set upon the gas-supply tube, and thereby cut off the supply.

1. The combination, with the burner A and gas-pipe B, of the cup or inverted cup J, cylinder K, and air-pipe H, substantially as and for the purposes shown and described.

2. The plunger-brush D, in combination with the burner A and pipe C, substantially as shown and described, for the purposes specified.

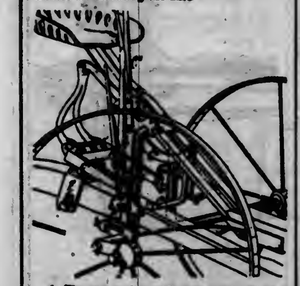
160,932. VEHICLE-SPRINGS. J. M. Pressey, Salineville, Ohio. [Filed Feb. 3, 1875.]



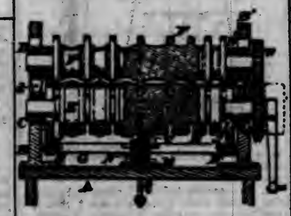
1. The combination of the spring *c* and pivoted lever *f*, having the knife-edge bearing *r* at the junction of said lever with the spring, substantially as set forth.

2. The combination, in a spring having its bearing-point *b* upon the pivoted end of a lever, *f*, of a knife-edged and oblong bearing-joint, substantially as set forth.

3. The combination of the spring *c* and the lever *f*, provided with the oblong eye *a*, with the clip *e*, and the knife-edge bearing-bolt *g*, substantially as and for the purpose set forth.

160,933. PLOW-CARRIAGES. D. W. Ralston, Rockford, Ill. [Filed Oct. 23, 1874.]

Brief.—The crank carrying the plow provided with lifting devices, operated both by hand and foot. An adjustable clamp composed of two parts, each bent at right angles. Device for elevating the axle.



1. The arm or lever C', connected with the reversed plow-beam, as described, and provided with the hand-lever C' and treadle C', whereby the driver is enabled to raise the plow by the aid either of his hand or his foot, or both, as described.

2. The clamp which connects the plow-beam with the vertical swivel and bolt, composed of the slotted angular plate P and the angular bolt P', substantially as and for the purpose set forth.

2. The furrow-wheel stub-axle crank K, mounted upon the crank-axle A', and having the eccentrically-slotted plate *k* rigidly connected to it, in combination with the lever *l*, provided with a pin for retaining the axle K, arranged and operating as described.

160,934. MACHINES FOR CREASING AND FINISHING LEATHER STRAPS. C. B. Randall, Cincinnati, Ohio. [Filed Jan. 26, 1875.]

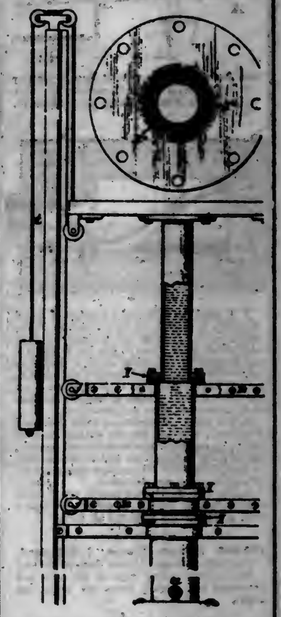
Brief.—The upper or creasing roll is supported in sliding boxes, and may be adjusted to suit varying thicknesses of stock by means of a lever and treadle. The fulcrum-bearing for the lever serves as a rest or bearing for the central portion of the lower roll.

1. In combination with the supporting-roller E is stationary bearings, and the facing-roller F in sliding bearings, the yokes J J', double-armed pressure-lever O H H', relieving-lever N, double treadle movements Q R S O T, and ratchet T, substantially as described.

2. The pedestal M, serving as a fulcrum-bearing for the lever N, in combination with the lower roller E, substantially as and for the purpose described.

3. The sliding boxes D D', provided with spurs *d*, for the purpose designated, in combination with the adjustable upper roller F, substantially as set forth.

160,935. HYDRAULIC HOISTS. H. Richmann, Cincinnati, Ohio. [Filed Jan. 13, 1875.]



Brief.—The innermost tube of the telescope rests upon the ground. The outermost sections form part of the carriage.

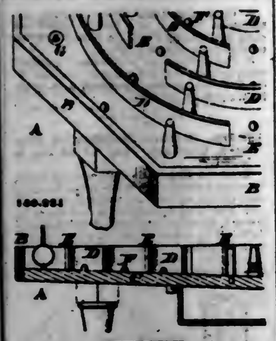
1. The described arrangement, whereby the outermost tubes F in a conjoint series are made in conjunction with the parts J L L', to constitute the cage or platform.

2. The combination of inverted telescopic water-columns C D E F, stays J, beam L, rollers K K', and guiding-standpieces A B, A' B, for the purpose set forth.

160,936. MORTISE-MACHINES. H. Richmann, Cincinnati, Ohio. [Filed Jan. 4, 1875.]

Brief.—A ring in one, two, or more pieces occupies a counterbore in the upper flange of each containing-tube, and operates, in connection with a cap secured upon said flange, as a stop to arrest the movement of the contained tube. It is conserved on its upper interior part, to make room for the packing. This construction facilitates removal of the inner tube from the outer.

1. The gland or annulus F *p*, occupying a counter-bore, O, in the head of each containing-tube, in combination with flange or equivalent projection from the lower extremity of the contained tube and with a confining-cap, I, substantially as set forth.



2. The combination of the slidable telescopic tubes, the gland F *p*, occupying the counter-bore O in the containing-tube, the leather or other flexible cup-packing, and cap I, secured and adapted to operate as set forth.

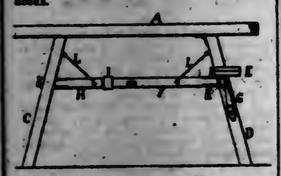
160,938. GAME-BOARDS. Michl. Riedinger, Yorkville, Ind. [Filed July 20, 1874.]

Brief.—A game-board in which a spinning-top moves about. In this case the floor has studs to deflect the course toward the center, where large numbers are made to count in favor of the spinner reaching them.

The game-table A, of octagonal contour, depressed toward the center, and having the peripheral curb or rampart B, and the contour of barriers in area of concentric circles D, having portals E, said floor having stamens or impediments F and numbered spots G at suitable intervals, for the reception of pieces or puppets to be used in connection with a spinning-top, substantially as represented.

160,925.

160,926.



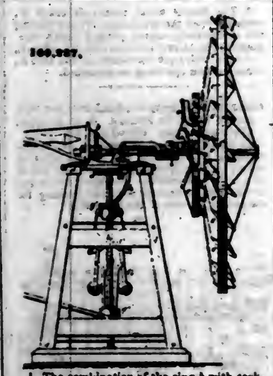
1. A mold consisting of a number of spiral segments or cores, *c*, formed with rims, webs, or flanges *c'*, by which they mutually support each other, such spiral segments or cores a bring carried by a piece of metal, *c*, shaped to receive them, and placed inside a mold-box, *b*, having a removable top, *b'*, and bottom *b''*, all constructed and arranged in manner substantially as herein shown and described.

2. The spiral segments or cores *c*, formed with rims, webs, or flanges *c'*, and without ferrets or segments of screws formed thereon, but of a like section from end to end thereof, in manner and for the purposes substantially as herein shown and described.

3. The cast spiral segments *c*, constructed as described, in combination with the flask *b b' b''*, as and for the purposes set forth.

160,926. INDIANA-TABLES. T. B. Roland, Burlington, Iowa. (Filed Nov. 27, 1874.)

Brief.—The folding legs of the table are connected by a sliding frame and heads and hooks.

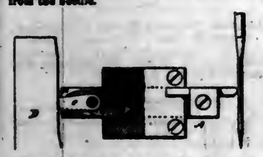


The combination of the board A with the folding frame-work D F H C, hook L, and heads I, substantially as and for the purposes above described.

160,927. WHEELS. George P. Reynds, Boston Harbor, Mich., assignor of one-third his right to E. W. Brown, same place. (Filed Nov. 6, 1874.)

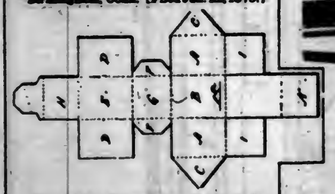
Brief.—A governing and connecting-lever arm so combined with pivoted rungs as to control the speed of the wheel by schematic operation. The top of the lever consists of a ring having cushion to fit the upper end of the thickness, and a width flange that forms the seat of the turn-table.

160,927.



1. The combination of the ring *b* with sockets *c*, the turn-table *B*, the cap-ring *d*, and a supporting-frame or derrick, substantially as described.

2. The combination of the wheel C, having the pivoted vanes *e*, ring *g*, straps *h*, rods *i*, and springs *z*, with the bell-cranks *m o*, rods *n*, sliding collars *l*, crank *j*, rods *k k'*, governor G, and lever *F*, the parts being arranged for operation substantially as shown.

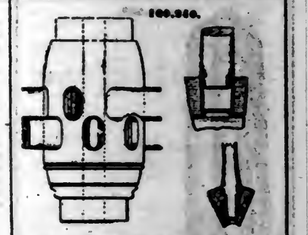


160,928. DEVICES FOR TURNING MACHINE-NEEDLE BLANKS. Edvd. Sautor, Birmingham, Conn. (Filed Dec. 26, 1874.)

Brief.—A foot hung in the tool-holder is so formed as to, upon the forward movement of said holder, bear against the former, and feel the center in its work. Upon the back movement of the tool-holder the foot turns, and its heel portion, which is cut away, bears against the former, and allows the cutter to fall away from the needle.

In a machine for turning needles, the combination of the former D, the tool-holder, and the foot *a*, having its heel cut back, as described, hung therein with the springs E and F, substantially as and for the purpose specified.

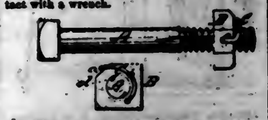
160,929. PAPER BOXES. R. De F. Shelton, Birmingham, Conn. (Filed Jan. 22, 1875.)



As an article of manufacture, the herein-described box consisting of the side B with its slit *a*, adjoining sides A A with their uniting tops C and flaps I, the end G with its flaps J J', the second end H with its tank K, combined with the lining L N, all in one piece, and as shown and described.

160,930. WHEELS FOR VEHICLES. James A. Smith, New York, N. Y. (Filed Dec. 1, 1874.)

Brief.—To secure firmness and prevent splitting the hub.

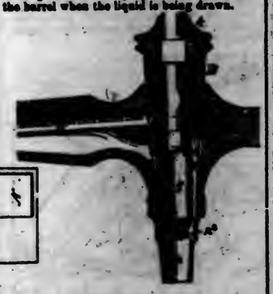


160,930.

The hub containing mortises, each of which is oblong and round-ended, and has a shoulder formed thereon, in combination with the spokes having tenons that are shouldered and made rounding to fit into said mortises, with the end of the spoke oblong in cross section, to rest against the shoulder, as set forth.

160,931. NUT-LOCKS. Benj. B. Snyder, Jr., Baltimore, Md., assignor of one-half his right to E. W. L. Ennis, same place. (Filed July 21, 1874.)

Brief.—A spring locking-pin is arranged on the exterior of the nut, its end entering an aperture through the side of the nut at right angles to the bolt. The corner of the nut is removed where the pin enters, to avoid contact with a wrench.



1. The spring locking-pin C, countersunk and arranged to have its locking end *a* extend radially through the nut B, and be held thereby close up to the grooves *d d* of the bolt A, its spring portion *b* being outside of the nut, substantially as and for the purpose herein specified.

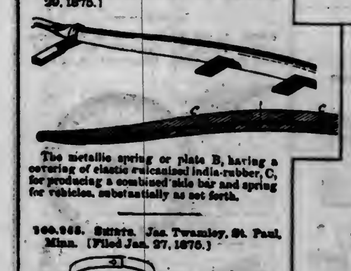
2. The nut B, having one corner clipped for the reception of the locking-pin C, substantially as and for the purpose herein specified.

160,932. BEER-FAUCETS. M. J. Sullivan, New York, N. Y. (Filed Mar. 17, 1874.)

Brief.—The duplicate ports permit the faucet to be opened by a quarter-turn. The center chamber receives the liquid to be ejected by a piston to foam the beer in the glass. The small grooves in the plug allow air to enter the barrel when the liquid is being drawn.

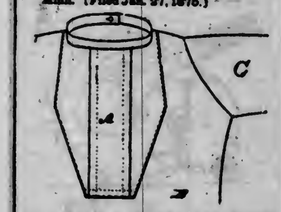
The combination, with the conical plug or valve B, of the eccentric chamber *c c'*, with eccentric discharge-aperture *c a'* in the lower end of the same, duplicated cylindrical inlet-ports *c b'* at the upper end of the chamber, duplicated horizontal air-grooves *f* in the periphery above the said ports, and a square socket, *a*, in the uppermost of the plug, as herein shown and described, for the purposes set forth.

160,933. BRUSHES FOR GRAIN-CLEANERS. Gardner E. Throop, Syracuse, N. Y. (Filed Jan. 27, 1875.)



Brief.—Removable guard or rings are placed around the brush stock at either end, for protecting the fibers on their exposed sides, and shielding them from the action of the grain. Wings or scrapers on lower head of brush adapted to carry the cleaned grain to discharge-spout whichever way the brush revolves.

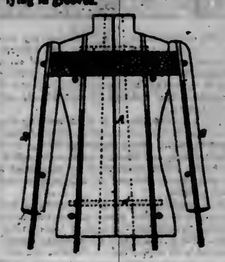
1. The removable guard or rings *c*, for protecting the fibers of the brush at its edges in grain-cleaners, substantially as and for the purposes described.



2. The V-shaped scrapers on the lower head of the runner, as and for the purposes specified.

160,934. SPRING SIDE BARS FOR VEHICLES. Jos. Tilton, New York, N. Y. (Filed Jan. 29, 1875.)

The metallic spring or plate B, having a covering of elastic vulcanized india-rubber, C, for producing a combined side bar and spring for vehicles, substantially as set forth.

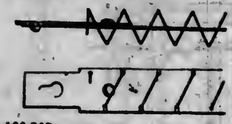


160,935. SHIRTS. Jas. Twamley, St. Paul, Minn. (Filed Jan. 27, 1875.)

A shirt having its flaps or skirt portions divided in front and rear, substantially as described and shown, and for the purpose set forth.

160,936. COAT-SHAPERS. Ellen B. Viets, Boston, Mass. (Filed Feb. 12, 1875.)

Brief.—A form upon which to true and shape coats is made with the body in four sections, and each arm in two sections, which are expanded by means of wedges between them, lying in grooves.



The cast or rest shaper, substantially as described, composed of the extensible body A and arms B B, provided with wedges, constructed essentially to operate as specified.

160,937. BODIES FOR FLORAL DECORATIONS. C. A. Warren, Watertown, Conn. (Filed Jan. 16, 1875.)

Brief.—A flat metal strip forms the base, around or through which is passed a coiled wire. The ends are provided with slots and kaphs, so that the two ends can be joined, or two or more can be united.

The herein-described body for floral decoration, consisting of the base A and coiled wire B, running through and through said base, substantially as specified.

160,938. INTERFERING-BOOTS FOR HORSES. Abraham D. Westbrook, Astoria, N. Y. (Filed June 23, 1874.)

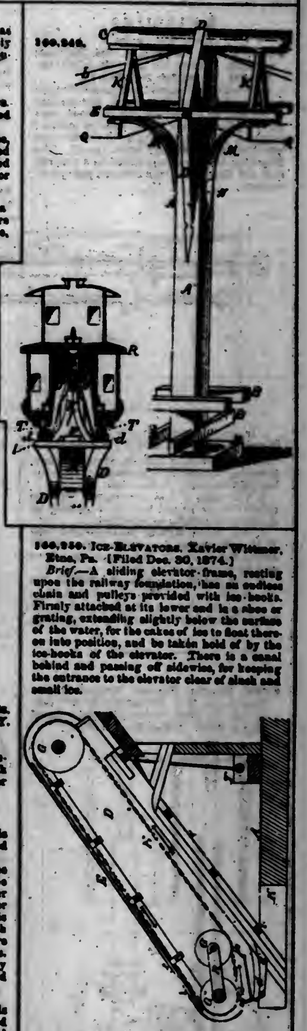
An interfering pad or boot for horses, composed of an elastic annulus or band, with yielding points projecting from its entire outer surface, substantially as specified.

160,939. ELEVATED RAILWAYS. Francis A. Williams, Kansas City, Mo. (Filed Feb. 16, 1875.)

Brief.—An elevated railway having three rails, supported on a single row of posts, one rail elevated above the other two, the upper one forming the upper chord, and the under ones the lower chords, of a truss, which is strengthened by arched beams underneath extending from post to post. The structure is also strengthened by suitable brace-rods. The upper rail is held down on top of posts by metal straps suitably secured to posts, and forming seats for the lower rails.

1. In combination with the post A and rails C, E, and E, the strap or saddle D, provided with the steps *d* and *d*, substantially as and for the purposes specified.

2. In combination with the rail C and posts A and A, the beam F, posts G and G, brace-rods H and H, cross-beam I, braces K and K, and truss-rods L and L, substantially as and for the purposes shown.



3. In combination with the rail C and beam F and their connecting parts, and with the posts A and A, the arch-beam M, cross-beams O and O, and braces P and P, substantially as and for the purposes set forth.

4. In combination with the rails E and E, the posts A and A, and the rail C, the saddles D, D, *d*, and *d*, the strap-beams I, O, and O, and braces K and K, substantially as and for the purposes shown and described.

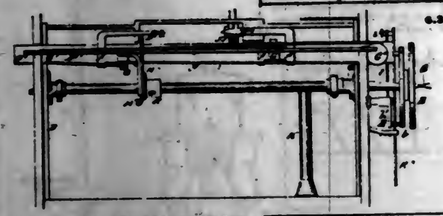
5. In combination with the rails E and E, and with the posts A and A, the cross-beams O and O and tension-rods Q and Q, substantially as and for the purposes specified.

160,940. ICE-ELEVATORS. Xavier Wittmer, Erie, Pa. (Filed Dec. 30, 1874.)

Brief.—A sliding elevator-frame, resting upon the railway foundation, then an endless chain and pulleys provided with ice-hooks. Firmly attached at its lower end is a shoe or grating, extending slightly below the surface of the water, for the cakes of ice to float thereon into position, and be taken hold of by the ice-hooks of the elevator. There is a canal behind and passing off sideways, for keeping the entrance to the elevator clear of slush and small ice.

1. The combination of inclined sliding frame D, feet *d*, pulleys G G', vibratory pulley G'', endless chain K, having ice-hooks attached thereto, and stationary railway C, substantially as and for the purposes set forth.

2. The ice-hook F, composed of bar I, bars *f f'*, and rod *f''*, in combination with chain or cable K and inclined railway C, substantially as described.



3. The ice-hook F, composed of bar I, bars *f f'*, and rod *f''*, in combination with chain or cable K, stationary railway C, pulleys G G', and upper rail P, having the arc-shaped projections P P' P'', substantially as and for the purposes set forth.

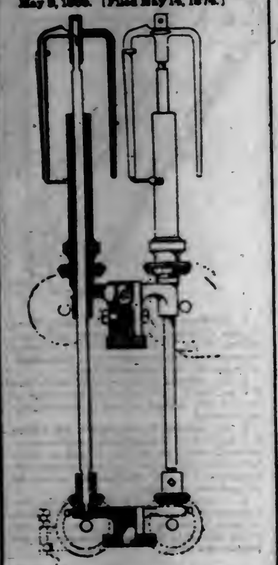
4. In combination with an ice-elevator, constructed substantially as described, the sluice or canal K, leading from the rear of the foot of the railway C, substantially as and for the purpose set forth.

REISSUES.

6,201. LOOMS. William V. Cox, Philadelphia, Pa. Patent No. 120,810, dated Oct. 31, 1871. [Filed Jan. 20, 1875.]

Brief.—The weft-threads are passed through sheds constructed by the jacquard, and are laid in the shed by a tubular finger and hook, each carrying the selected thread through one-half the shed. A reciprocating latch-needle knits the weft to the selvage warp-thread. The finger and hook are reciprocated by a grooved cam and sliding bar, with cord and pulley connections.

6,201.

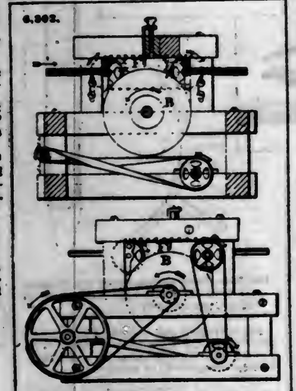


1. In a loom, the reciprocating tubular finger F^1 and reciprocating hook F^2, in combination with the oscillating hook H, having finger h, operating automatically to discharge the yarn-loop, substantially as described.

2. The needle J J, in combination with the tubular finger F^1 and hook F^2, operating together substantially as described.

3. The combination of the finger and hook F^1 F^2, with guides f, race F^3, pulleys G^1 G^2, cord g, and operating devices, substantially as and for the purpose set forth.

4. The bar E^1, cam E^2, cord i, link E^3, arm E^4, and pulley l, in combination with the cord g, pulleys G^1 G^2, finger F^1, and hook F^2, arranged to operate substantially as described.

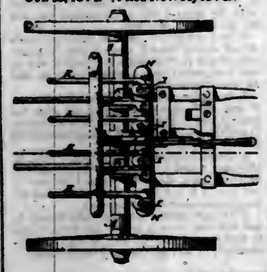


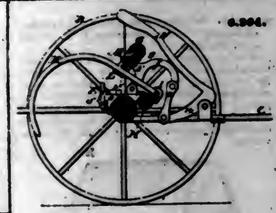
6,202. SAWING-FRAMES. Thomas Mayor, Providence, R. I. Patent No. 43,580, dated Feb. 21, 1865; reissue No. 1,969, dated May 8, 1866. [Filed May 14, 1874.]

The long bolster, adapted to extend above the base of the bobbin, having a bearing for the spindle near its top, and made in one piece with a bracket, by which it may be secured to the side of the rail G, substantially as and for the purpose described.

6,203. SAW-GRINDING MACHINES. David M. Mefford, Toledo, Ohio, assignor to the American Invention Company, St. Louis, Mo. Patent No. 137,705, dated Apr. 8, 1873. [Filed Jan. 21, 1875.]

Brief.—The adjustable rest-gage is made narrow and thin to bear on a limited portion of the saw only.



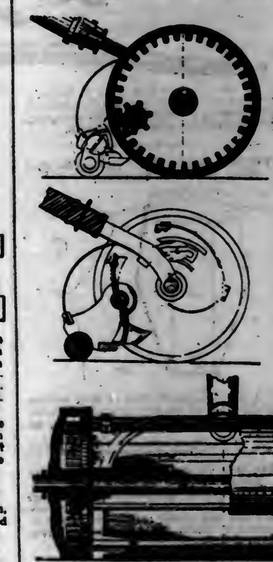


6,203.

1. In a machine for grinding long saws, the adjustable rest-gage F, constructed of a width and breadth to bear only on a limited portion of the saw widthwise and lengthwise, and located directly over the center of the grinding-wheel B, which revolves in an opposite direction to the feet, as shown and described.

2. In a machine for grinding long saws, the narrow thin-edged rest-gage F, in combination with rubber or rubber faced feed-rollers and an emery-wheel, B, arranged so as to operate substantially as specified.

6,204. HORSE HAY-RAKES. Benj. Owen, Dayton, Ohio. Patent No. 150,067, dated Oct. 13, 1874. [Filed Nov. 16, 1874.]



6,204.

1. The pivoted bearing, formed in two sections, I and I', provided with the opening i and lug i', and combined with bent end b of the rake-tooth K, substantially as and for the purposes shown.

2. In combination with the pressure-bar G of the pivoted rake, the block E and plate E', provided upon their contiguous faces with teeth or serrations e and e', and combined by means of the screw e^2, substantially as and for the purpose above described.

3. The arrangement of the hollow guide L on the under side of the bar G, near its center, and covering an orifice therein for the spring M, substantially as set forth.

6,205. LAWN-MOWERS. E. G. Passmore, Philadelphia, Pa. Patent No. 57,295, dated Feb. 23, 1869. [Filed Oct. 24, 1874.]

1. The combination, in a lawn-mowing machine, of a horizontal straight-edged stationary cutter, and a spiral cutter revolved on a horizontal axis by means of a train of gearing which is actuated by the carrying wheels of the machine, and inclosed by said wheels and by side plates.

2. The combination, in a lawn-mowing machine, of a horizontal straight-edged stationary cutter, and a spiral cutter revolving on a horizontal axis, and located between two driving-wheels, which actuate it by means of a train of gearing inclosed by said wheels and by side plates.

3. The combination, in a lawn-mowing machine, of side plates mounted on the main axle, and fitting into the rims of the driving-wheels, with a rotary and a stationary cutter, which are both supported on the side plates.

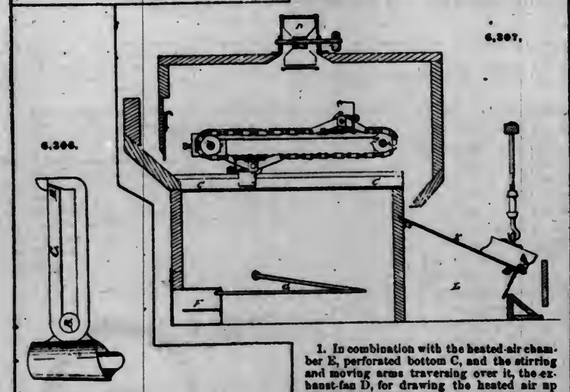
4. The combination, in a lawn-mowing machine, of two driving-wheels, cutters arranged between said wheels, and side plates mounted on the axle, and fitting into the rims of said wheels.

5. The combination, substantially as set forth, of loose driving-wheels, internal gears, fixed side plates, rotary cutters, and pinions mounted directly on the cutter-shaft.

6. The combination, substantially as set forth, of loose driving-wheels, fixed side plates, a tongue hinged on the axle, and stops on the side plate.

6,206. CHAIRS FOR SEWING-MACHINE ATTACHMENTS. John G. Powell, Philadelphia, Pa. Patent No. 142,812, dated Sept. 16, 1873. [Filed Dec. 5, 1873.]

Brief.—The attachment, having a vertical post, is held to the bed-plate by a radially-adjustable clamp, fastened to the bed by thumb-screw. The clamp is formed of two spring-arms, connected at the end where they surround the post, and having a latch at the free ends, to hold them when they are sprung together, to cause them to clamp the post tighter.



1. As an improved article of manufacture, a sewing-machine attachment provided with a vertical journal permanently attached thereto, and adapted to be grasped on its convex surface and held by friction thereon in a radially-adjustable clamp to the deck or bed of a sewing-machine, as set forth.

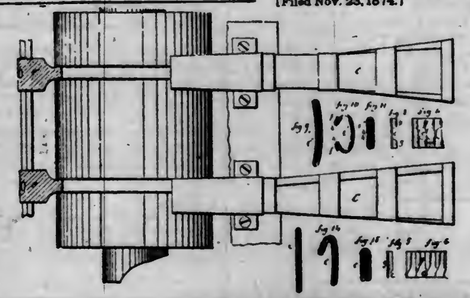
2. The vertical pillar or journal B, formed on a sewing-machine attachment, in combination with a radially-adjustable compressible clamp or arm, C, adapted to grasp the sides of said pillar, and provided with a slot for the passage of a screw to hold the same to the deck of a sewing-machine, substantially as described.

3. In combination with the compressible arm C, adapted to grasp the sides of the journal B, formed on the sewing-machine attachment, a latch, D, formed thereon, substantially as and for the purpose described.

6,207. GRAIN-DRIERS. Jesse B. Wheeler, Bolton, Mass., assignor, by mesne assignments, to Jas. A. Maloney, Georgetown, D. C. Patent No. 38,191, dated Apr. 14, 1863. [Filed Feb. 10, 1875.]

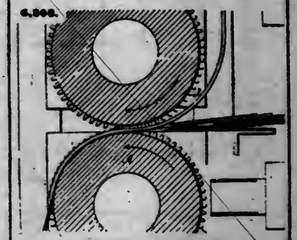
Brief.—The hot air is drawn up through the perforated floor, and discharged above by the fan. The grain is moved across the floor by stirrers on the endless chain. The overlapping inclined surfaces below the perforated floor conduct the dust into a contracted space below, allowing hot air to ascend between the joints.

6,207.



1. In combination with the heated-air chamber E, perforated bottom C, and the stirring and moving arms traversing over it, the exhaust-fan D, for drawing the heated air up through the grain or other material, and through the machine, substantially as described.

2. In combination with the hinged apron K, overlying the cool-air chamber L, the raising and lowering rods e e, and hinged valve s, substantially as described, so that said apron may be raised or adjusted without opening the chamber L, as specified.



3. The stirring and moving mechanism, consisting, essentially, of the hinged and adjustable arms a b, moved by endless chains, substantially as herein described, and for the purposes set forth.

4. In a machine for drying, cleaning, and purifying grain, meal, flour, and similar materials, the combination of a horizontal screen, forming a diaphragm within a rectangular air-tight case, an exhaust-fan and discharge connected with the upper portion of said case, a feed-hopper and regulator to feed the material into the machine the entire width of the screen, and of even depth, and means for agitating and moving the material in one direction, while the air drawn up by the fan passes in another direction, and hopper beneath said screen having inclined overlapping surfaces, all substantially as and for the purpose set forth.

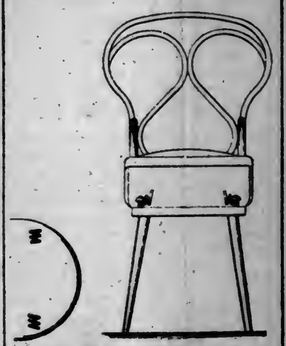
6,208. APPARATUS FOR MAKING FLUTED RUFFLES. Geo. H. Wooster, New York, N. Y., assignee of Susan A. Robjohn, administratrix of Thos. Robjohn, deceased. Patent No. 42,404, dated Apr. 19, 1864. [Filed Nov. 23, 1874.]

6,208.

6,208.

1. In combination with a pair of pressing or drawing rolls, a folding-guide, constructed substantially as described, so as to form an inclosed channel-way for guiding and supporting the material, and to turn or fold one or both edges of a strip of fabric as it passes through said guide, and deliver the same to said rolls in such folded condition, the said rolls operating to draw the said strip through said guide, and to press the fold or folds formed by said guides, substantially as described.

2. In combination with a folding-guide, constructed substantially as described, so as to form an inclosed channel-way for guiding and supporting the material, and to turn or fold one or both edges of a strip of fabric, the tongue j, substantially as and for the purpose specified.



3. The combination, with a fluting-machine, of a folding guide, constructed and arranged to deliver a strip of muslin or other fabric to the fluting-rollers, and to fold and double the said strip as it is drawn through it by the said rollers, substantially as and for the purpose herein specified.

4. The combination, with the fluting-machine and the folding guide, of an interposed pressing-guide, substantially as herein specified.

5. The folding-guide, in combination with the socket, which receives and holds in place the said folding-guide, substantially as herein specified.

6. The combination, with a fluting-machine, of the folding-guide C C', constructed to turn in the two edges of a strip of muslin, or other material, toward each other on the same side of the strip, substantially as herein specified.

6,209. TILTING CHAIRS. Daniel B. Teal, New Lisbon, N. Y., assignor to Haywood Brothers & Co., Gardner, Mass. Patent No. 38,428, dated May 5, 1863; reissue No. 5,054, dated Sept. 10, 1872. [Filed Jan. 7, 1875.]

A tilting chair with one or more springs placed intermediately between the under side of the seat and its support, having their points of oscillation in the rear of a line drawn transversely through the center of the seat.

DECISIONS OF THE COURTS.

U. S. CIRCUIT COURT, DISTRICT OF MASSACHUSETTS.

SPRING *et al. vs.* PACKARD.—SAME *vs.* HOWARD.

[*In equity.—Before* LOWELL, *J.—October*, 1874.]

The machine covered by the patent of Charles and Andrew Spring, May 10, 1859, for Lathe for Turning Irregular Forms, the claim of which is for "The combination of a griping-chuck, by which an article can be so held at one end as to present the other free to be operated upon, with a rest preceding the cutting-tool, when it is provided with a guide-cam, or its equivalent, which modifies the movement of the cutting-tool, all operating together, for the purpose set forth," is anticipated by the Pernot lathe for turning sewing-machine needles, which had the griping-chuck, the rest, and the cutting-tool, but instead of the guide-cam a pattern, it appearing that, at the date of the patent, a fixed pattern was the equivalent, in machines of this kind, for a cam pattern or guide.

The case is nowise changed by the fact that the screw of the Pernot machine operated differently from the adjusting-screw of the patented machine, the screw not being an element in the claim of the patent, and the alleged difference not being such as would constitute a defense against the patent if the Pernot machine were later in date than the patented one.

It is immaterial that Pernot did not turn needles to *a point* on his machine, as is done in the patented one. The particular form of pattern used was not of the essence of the invention, and his lathe only needed a change of pattern to make it applicable to turning the point of needles.

[*Geo. E. Betton*, for complainants.
James B. Robb, for defendants.]

LOWELL, *J.*:

The plaintiffs are the inventors and owners of a valuable and ingenuous improvement in Lathes for Turning Irregular Forms, for which a patent was issued to them in May, 1859, but which they testify was completed in the summer of 1857. They describe the machine with fullness and accuracy in their specification. Its principal application was intended to be, and is, for turning sewing machine needles and similar articles, which are to be brought to a point; and the claim is for—

The combination of a griping-chuck, by which an article can be so held at one end as to present the other free to be operated upon, with a rest preceding the cutting-tool, when it is combined with a guide-cam, or its equivalent, which modifies the movement of the cutting-tool, all operating together, for the purpose set forth.

There is no doubt, upon the testimony, that the plaintiffs were original and meritorious inventors of an improvement over the machines then in general use for turning sewing-machine needles. But a machine was brought forward by the defendants, which one Pernot swears he made in New York in 1853, and operated there for thirteen consecutive years in turning needles, in great quantities, for several of the principal manufacturers of sewing-machines, and which appears to contain all the elements of the plaintiffs' combination, working together in the same way, and producing the same results. The dates are proved by Pernot and by another witness, and corroborated by circumstantial evidence, and might have been disproved if untrue, because the manufacturers could have testified concerning the needles which they are said to have bought of Pernot. No such contradiction is given. This machine has the griping-chuck, the rest, the cutting-tool, and, instead of a guide-cam, a pattern, which, so far as this case is concerned, appears to be an equivalent; and, as we understand the testimony, it is that a fixed pattern was, generally speaking, a well-known equivalent for a cam-pattern or guide in machines of this kind, at the date of the patent. (Waters, p. 110.)

It has been argued that Pernot's machine had no adjusting-screw. It had a screw which it is insisted should be called a set-screw, and which was no doubt less useful, in some respects, than the adjusting-screw of the plaintiffs' machine. The plaintiffs, however, do not claim the adjusting-screw as part of their combination. Mr. Waters, being asked whether it is part of the combination, says—

Hardly that—that is to say, hardly an element. I regard as essential that the organization should be such as to admit of the convenient use of a screw; and that that screw should make a part of the organization I regard as essential, as an adjunct to the combination—so essential that, as I have said, I would not give a sixpence for any one of them, for the purpose of turning sewing-machine needles, without it.

It is then an important adjunct, rather than an essential element, and Pernot's screw was a sufficiently-good adjunct to enable his combination to work successfully in making needles in the way of his business; and the difference in the screw would have been no defense if his machine had been later in date than the patented one.

It is further said that Pernot did not turn his needles to a point in the machine. He gives reasons for not doing this work, but says that he did turn points for a carding-machine; and that his lathe needed only a change of pattern to make it applicable to turning the points of needles. This is obviously true, and as the particular form of pattern used was not of the essence of the invention, we are of opinion that Pernot's machine contains the whole patented combination.

It is not denied that all the elements of the combination were old and well known before 1857; it is only contended that the precise combination was new, as it undoubtedly was to the trade generally, and to the patentees themselves; but we are obliged to say that Pernot's machine, which was not patented, and was somewhat guarded from view, perhaps for the very purpose that its mode of operation might not be generally known, was yet, by the law, such an anticipation of the plaintiffs' combination that they were not the first, though they were original, inventors thereof.

Bill dismissed with costs.

LIST OF TRADE-MARKS, DESCRIPTIONS OF WHICH HAVE NOT PREVIOUSLY APPEARED IN ANY PRINTED PUBLICATION.

Registrants.	Description.	Class.	No.
Allen & Ellis	Eagle alighting on nest, with young	Chewing-tobacco	1,314

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date March 2, 1875.]

8,180.—Show-Cards for Exhibiting Vest-Buttons.—JULIUS FULD, New York, N. Y. Application filed February 16, 1875. Term of patent 3½ years.

8,181 and 8,182.—Statuary.—JOHN ROGERS, New York, N. Y. Applications filed February 11, 1875. Term of patents 14 years.

8,183 to 8,185, inclusive.—**Show-Cases.**—LAWRENCE WIEGEL, Cincinnati, Ohio, and JOSEPH LEHNBEUTER, St. Louis, Mo.—Cases B, A, and C. Applications filed January 23, 1875. Term of patents 7 years.

8,186.—Fountains.—JOSEPH W. FISKE, New York, N. Y. Application filed February 24, 1875. Term of patent 7 years.

8,187.—Bouquet-Holder or Vase.—JOHN HOARE, Corning, N. Y. Application filed January 25, 1875. Term of patent 3½ years.

8,188 to 8,190, inclusive.—**Oil-Cloth.**—CHARLES T. MEYER and VICTOR E. MEYER, Bergen, N. J., assignors to EDWARD C. SAMPSON, New York, N. Y. Applications filed February 19, 1875. Term of patents 3½ years.

8,191.—Casing of a Soda-Water Apparatus.—FRANK H. SHEPHERD and EMIL SCHWAB, Lowell, assignors to JAMES W. TUFTS, Medford, Mass. Application filed February 10, 1875. Term of patent 14 years.

8,192.—Carpet.—THOMAS J. STEARNS, Boston, Mass., assignor to THE ROXBURY CARPET COMPANY, same place. Application filed February 19, 1875. Term of patent 3½ years.

8,193.—Dental-Tool Stand.—SAMUEL S. WHITE, Philadelphia, Pa. Application filed February 23, 1875. Term of patent 7 years.

TRADE-MARKS REGISTERED DURING THE WEEK.

[Each certificate bearing date March 2, 1875.]

2,262.—Washing-Powder.—CORBETT, SCOVILLE & Co., Chicago, Ill. Application filed April 21, 1874.

"'Golden State Washing Powder.'"

2,263.—Food Made from Wheat.—E. R. DURKEE & Co., New York, N. Y. Application filed February 20, 1875.

"'GLUTENA.'"

2,264.—Medicine.—C. L. GOWDEY & Co., New York, N. Y. Application filed February 13, 1875.

"a quarter moon surmounted by a triangle with curved sides, and inclosing the letter L."

2,265.—Pickles and Vinegar.—HEINZ, NOBLE & Co., Pittsburg, Pa. Application filed February 18, 1875.

"'ANCHOR PICKLE AND VINEGAR WORKS.'"

2,266.—Watches.—J. W. TUCKER, San Francisco, Cal. Application filed July 18, 1874.

"'The Granger Watch,' and a symbol or device representing a sheaf of wheat."

2,267.—Cotton-Working Machines.—R. H. ALLEN & Co., New York, N. Y. Application filed February 24, 1875.

"'La Victoria.'"

2,268.—Liniment.—CORDELIA COUCH, New Haven, Conn. Application filed February 16, 1875.

"'POTENTILLA,' the figures of two equal triangles having equal sides and angles, and the monogram consisting of the letters 'C' and 'S.'"

2,269.—Kid or Lambskin Gloves.—HARRIS BROTHERS, New York, N. Y. Application filed December 8, 1874.

"two elliptical circles, one within the other, between which, on each end of the transverse axis, is a star; above the upper line of the outer circle the words 'Trade-Mark;' between the outer and inner circles, and upon the upper side, the words 'First Choice,' and between the same, upon the lower side, the words 'Medailles, Paris, Londres,' and within the inner circle the word 'VICTORIA,' on one line, and immediately beneath the same the initials 'H. B.'"

2,270.—Egg-Producing Food for Poultry.—L. H. SHERWOOD & Co., Hartford, Conn. Application filed February 24, 1875.

"'IMPERIAL EGG FOOD.'"

2,271.—Bonnets and other Head-Wear for Women and Children.—SAMUEL C. TALCOTT, Ashtabula, Ohio. Application filed February 23, 1875.

"'CENTENNIAL.'"

2,272.—Fans.—SAMUEL C. TALCOTT, Ashtabula, Ohio. Application filed February 23, 1875.

"'CENTENNIAL.'"

2,273.—Hats and Caps.—SAMUEL C. TALCOTT, Ashtabula, Ohio. Application filed February 23, 1875.

"'CENTENNIAL.'"

2,274.—Grinding-Mills for Fruit, &c.—THE HIGGANUM MANUFACTURING COMPANY, Higganum, Conn. Application filed February 24, 1875.

"'FARMERS' FAVORITE.'"

TO CORRESPONDENTS.

Persons ordering drawings of patents, or making inquiries in regard to patents, must always state the name of the inventor, subject-matter, and date. In making inquiries in regard to applications for patents letters must state the name of the applicant, subject-matter, and date of filing. In ordering drawings by classes, under the subject-matter index of September, 1871, (furnished gratis on application,) it will be understood that the Office cannot take upon itself to make selections of certain lines of inventions, embracing portions only of the patents in the classes as specified. The number of classes has been made as ample as the conduct of the business in this office will readily permit. An order should, therefore, embrace the entirety of a given class or classes. They cannot be subdivided unless ordered specifically by number, name, and date.

The cheapness of the copies, and the comparatively small number of patents in each of the one hundred and seventy-six classes, render an order by class by no means an onerous undertaking.

INDEX OF INVENTIONS PATENTED MARCH 2, 1875.

	Class No.	No. of Patent
Apron supporter and page, W. H. Chipley, (reissue)	38	6,310
Bag fastener, A. M. Miller	57	160,453
Bag holder, L. Crofoot	57	160,396
Bale tie, W. A. Jordan	7	160,331
Bale tie, G. N. Osgood	7	160,345
Bath, combined Turkish and vapor, H. S. Firman	8	160,412
Bed bottom, D. C. Kellam	62	160,439
Bed bottom springs, connection for, A. C. McMains	62	160,274
Belt shifter, T. S. Crane	87	160,259
Bill file, R. H. Hoffman	146	160,321
Binder, temporary, A. A. Goldsmith	15	160,419
Bit, rubber covered snaffle, F. J. Nodine	72	160,344
Bit stock, W. Tucker	29	160,365
Boot and shoe heels, machine for making, W. Stevens	16	160,481
Boot and shoe heels, machinery for trimming, W. H. Rounds	16	160,283
Bottle stopper, T. J. Holmes	1	160,325

	Class No.	No. of Patent.
Bottling aerated liquids, machine for, H. E. Clinton	1	160,394
Brick machine, E. Deshler	20	160,310
Brush, shoe, A. McElrath	22	160,450
Bucket, earthen, W. F. Towns	115	160,496
Burner for cooking stoves, vapor, F. Rosengren	65	160,382
Burner, lamp, W. McKinley	90	160,451
Butter worker, F. B. Aldrich	45	160,293
Button fastening, J. H. Keating	23	160,332
Cable stopper, D. G. Thompson	138	160,363
Calendar, J. J. Caulon	140	160,391
Cams, machine for turning pattern, W. Tucker	100	160,366
Candlestick, W. Kilburn	90	160,334
Candy mixing machine, S. F. Whitman	155	160,494
Cap, M. Mendel	38	160,452
Car brake, L. T. Hay	122	160,428
Car brake, G. M. Hopkins	122	160,269
Car brake, Scobodo and Luxa	122	160,477
Car coupling, C. F. Bake	122	160,294
Car coupling, O. T. Baker	122	160,295
Car coupling, B. F. Cadenhead	124	160,388
Car coupling, Hoopes and Smith	122	160,326
Car coupling, W. C. Scoles	122	160,473
Car, freight, Paul and Sibley	121	160,463
Car wheel, G. Palmer	122	160,462
Cars, apron for stock, C. R. Jones	121	160,329
Carburetor or hydrocarbon diffuser, H. J. Ferguson	27	160,410
Carriage, hand, W. O. Umstead	31	160,487
Carriage painter's easel, A. Hogue	31	160,324
Cartridge, D. C. Farrington	32	160,363
Cartridge holder, N. S. Goss	32	160,490
Cartridge shell holder, Holabird and Parks	32	160,432
Chair backs, machine for molding, J. Lemman, (reissue)	62	6,312
Cheese safe, W. P. Quackenbush	45	160,467
Churn, George and Stutzman	45	160,418
Churn, J. W. Simmons	45	160,288
Churns, &c., motor for, H. Odell	45	160,461
Chute reverser, drop, Crowthers and Wilkins	82	160,308
Cigar bunching machine, J. Battis, 2d	160	160,380
Cigar machine, J. Wettstein	160	160,492
Clothes and quilting frame, combined, M. Churchill	91	160,306
Clothes frame, C. F. Smith	91	160,359
Clothes line support, J. N. Fuller	91	160,315
Clutch, friction E. S. M. Fernald	87	160,264
Cock, gage, T. J. Nottingham	148	160,459
Coffee roaster, G. Boyd	154	160,384
Golter, A. M. Davis	114	160,309
Cooler, beer, J. B. Weis	19	160,291
Cooler, milk, McEwan and Gibson	45	160,273
Copper, machine for tinning sheet, W. Jenkins	113	160,328
Corn sheller, S. H. Moore	59	160,342
Cotton gin, Bucklin and Stearns	41	160,302
Cultivator, P. D. Roquemore	43	160,353
Cultivator teeth, grass, E. Leonard	43	160,444
Curtain fixture, S. H. Phinney	62	160,276
Dental engine, Edson and Evans	46	160,406
Diamonds in drills, setting, C. A. Terrey	124	160,484
Dish, air-tight, P. Shaw	88	160,286
Door check, G. Royle	24	160,285
Door checks, &c., attaching rubber cushions to, J. Shepard	24	160,476
Door plate, B. D. Stevens	24	160,482
Dough kneading board, L. L. Black	88	160,254
Draft regulator, J. Woodruff	148	160,498
Drilling machine, portable, M. Stephenson	100	160,361
Drills, setting diamonds in, C. A. Terry	124	160,484
Easel, carriage painter's, A. Hogue	31	160,324
Elevator, H. J. Reedy	79	160,469
Engine, oscillating, G. G. Lobdell	150	160,447
Engine, reciprocating steam, G. B. Dixwell	150	160,311
Engines, pyrometer for steam, G. B. Dixwell	101	160,400
Engines, pyrometrical indicator for steam, G. B. Dixwell	101	160,401
Engines, reversing link for steam, J. Simpson	152	160,358
Equalizer, draft, L. J. Seely	31	160,355
Faucet, F. Messmer	167	160,375
Faucet, J. D. Seagrave	167	160,354
Feed cutting machine, W. J. Jones	59	160,330
Fifth wheel, Barraclough and Pritchard	31	160,253
Fire escape elevator, Thomas and Joerns	30	160,485
Fire shield, J. M. Johnson	30	160,436
Fine cleaner, W. G. Pike	148	160,279
Fruit drier, H. J. Allen	48	160,377
Fruit drier, T. C. Walter	48	160,371
Fruit gatherer, M. McDevitt	63	160,341
Furnace for burning petroleum, C. Hilbert	149	160,267
Furnace for consuming smoke, Argerbright and Allensworth	149	160,378
Furnaces, apparatus for regulating the supply of air to, T. S. Prideaux	154	160,466
Furnaces, damper for, J. Woodruff	154	160,496
Furnaces, damper for, J. Woodruff	154	160,497
Furnaces, steam jet for, G. Steele	149	160,490
Gas exhauster, steam jet, E. Korting	66	160,443
Gas governor, H. J. Ferguson	64	160,409
Gas machine, carbureting, A. C. Rand	27	160,468
Gas regulator, A. Hickenlooper	64	160,430
Gas retorts, charger for, J. West	66	160,490
Grain conveyer, W. Stanton	79	160,479
Grain sampler, F. A. Furst	57	160,416
Grape and flower picker, L. B. Snow	63	160,360
Grate, shaking, J. Mahony	149	160,272
Hammer, drop, N. C. Stiles	69	160,483
Harness snap, C. E. Haynes	72	160,266
Harrow, sulky, J. Kimball	73	160,335
Harvester sheaf dropper, S. G. King	74	160,270
Hem folder, hand, F. Henry	36	160,429
Hinge, double reversible, E. Halsey	24	160,425
Horse collar, L. W. Harbaugh	72	160,318
Index, A. J. Jones	15	160,437
Index, C. Virgo	15	160,367
Knitting machine, weft thread, C. L. Spencer	89	160,478
Lamp extinguisher, W. T. Wood	90	160,499
Lamp for lighting and heating, E. A. Rippingille	65	160,352
Lamp holder, J. D. Pierce	90	160,465
Lap board, W. F. Mitchell	38	160,455
Lawn settee, H. H. Gratz	62	160,421
Leather, manufacture of, H. and C. Klemm	92	160,440
Lock, seal, J. Kinzer	93	160,336
Lock, seal, J. Kinzer	93	160,337
Lock, seal, J. Kinzer	93	160,338
Lock, seal, Wheeler and Lafrey	93	160,493
Loom shedding mechanism, G. Crompton (reissue)	95	6,314
Loom shuttle guard, J. L. Dow	95	160,261
Matches, machine for making, McC. Young	174	160,376
Mattresses, machine for stuffing, Spurgin and Freeman	62	160,289
Mechanical movement, Hart and Scott	67	160,427
Medical compound, J. M. Adamson	98	160,251
Metal rolling machine, J. Holmes	125	160,433
Metals with metal, coating, I. Adams, Jr., (reissue)	113	6,313
Mill, cider, E. Curtiss	19	160,397
Millstone balance, H. C. Byram	57	160,304
Millstone balance, C. E. Goebert	57	160,317
Mining, apparatus for, Buechley and Thorn	124	160,303
Mitten, J. H. Peabody	38	160,464
Molding machine, G. W. Wetmore	173	160,491
Mortising machine, W. I. Ludlow	173	160,340
Motor, H. Odell	67	160,460
Motor, electric, D. Williamson	50	160,495
Music leaf turner, G. L. Dimpfel	102	160,399
Music leaf turner, E. A. Maciel	102	160,449
Nail plate feeder, W. H. Field	103	160,314
Neck tie supporter, B. F. Bean	38	160,298
Needle case, A. Fowler	38	160,414
Ordnance, breech loading, B. B. Hotchkiss	105	160,434
Organ attachment, reed, J. R. Lomas	106	160,448
Organ tremolo, reed, L. K. Fuller	106	160,316
Organs, &c., pedal attachment for, R. Burdett	106	160,257
Oven, baker's, J. Hall	6	160,424
Pail, household's, E. C. Wooster	22	160,500
Paper bag machine, W. Liddell	109	160,446
Paper, cutting wet, J. Eachus, (reissue)	109	6,315
Paper, machine for applying paste to wall, J. Worley	107	160,375
Peat molding machine, Bocquet and Bénard	61	160,300
Piano action, upright, C. E. Rogers	112	160,281
Piano fortes, &c., name board for, Behning and Diehl	112	190,299
Pipe fittings, device for holding, T. P. Hardy	64	160,319
Pipe, service coupler, L. S. Chapman	167	160,305
Pitman connection, elastic, G. W. Harrison	67	160,426
Planing machine, C. P. S. Wardwell	173	160,372
Planter, corn, C. Berryman	133	160,382
Planter, cotton seed, B. F. Cadenhead	133	160,389
Plow, W. Bradford	114	160,385
Plow, sulky, W. B. Quick	114	160,280
Preserving apparatus, J. P. Schmitz	58	160,472
Printing press, W. P. Kidder	117	160,333
Pruning implement, C. Miller	63	160,454
Pruning shears, J. Chase	63	160,392
Punching machine, J. B. Saxton	119	160,474
Purifier, middlings, J. Rigby	57	160,351
Rack for holding stockings, revolving, D. K. Wertman	54	160,373
Railway rail joint, C. B. Phillips	120	160,277
Railway signal apparatus, electric, H. W. Spang, (reissue)	50	6,318
Railway signal, detonating, F. Hickman	122	160,431
Rake, horse hay, S. H. Bushnell	77	160,387
Refrigerator, W. Grayson	58	160,422
Refrigerator, I. Silsby	58	160,357
Refrigerator for pails, &c., removable, J. C. Jones	58	160,438
Registering machine, Rand and Dupont	42	160,349
Roofing tile, J. M. Lewis	126	160,445
Rudder for booms, sheer, L. W. Pond	13	160,347
Rule, stair builder's, J. J. Robinson	97	160,471
Saddle horse apparatus, A. Hitt	72	160,322
Salt and pepper boxes, top for, G. D. Paul	88	160,346
Sash holder, J. W. Reycroft	24	160,470
Saw bench, adjustable, Rice and Murkland	130	160,350
Saw gummer, H. J. Cordeeman, Jr	131	160,395
Saw mill, L. W. Pond	130	160,348
Sawing machine, Boyd and Fox	130	160,256
Sawing machine, C. H. Mayo, (reissue)	130	6,317
Scaffold, J. A. Shannon	30	160,475
Scales, platform, L. D. Berry	132	160,381
Screw plate, G. R. Stetson	14	160,362
Seaming machine, W. J. Gordon	136	160,265
Settee, lawn, H. H. Gratz	62	160,421
Sewing machine caster, Mather and Hentschel	134	160,276
Sewing machine for sewing the sweat lining of hats, R. Eickemeyer, (reissue)	134	6,311
Sewing machine tuck marker, H. C. Goodrich, (reissue)	134	6,316
Ships, telescopic tower for light, S. D. Trenchard	138	160,290

	Class No.	No. of Patent.
Shirt, G. R. Eager	38	160,312
Shoe brush, A. McElrath	22	160,450
Shovel, L. Munroe	141	160,343
Shutter worker, J. Bonsall	24	160,255
Slate, transparent, C. C. Shepherd	146	160,287
Smoke and cinder conductor, Brancher and Ring	94	160,301
Sod cutter, Hinkson and Hinckley	114	160,321
Spark arrester, locomotive, A. Mitchell	94	160,456
Spinning, bobbin for, J. Birkenhead	142	160,383
Spooling machine, J. W. West	142	160,292
Stockings, revolving rack for holding, D. K. Wertman	54	160,373
Stove grate, W. Walsh	154	160,370
Stove, heating, M. A. Cushing	154	160,398
Stove lid lifter, R. R. Ball	154	160,297
Stove pipe coupling, R. R. Ball	154	160,296
Stove pipe damper, R. M. Breckenridge	154	160,3?6
Stoves, vapor burner for cooking, F. Rosengren	65	160,282
Straw cutter, W. Gale	59	160,417
Swing, C. H. Cain	143	160,390
Switch locking device, Toucey, Smith, and Buchanan	120	160,364
Tea and coffee pot, L. Evans	136	160,408
Telegraph paper, solution for chemical, T. A. Edison	158	160,402
Telegraph paper, solution for chemical, T. A. Edison	158	160,403
Telegraph, printing, A. A. Knudson	158	160,404
Telegraph sounder and recorder, D. F. Leahy	50	160,442
Telegraph sounder, mechanical, M. F. Wessman	50	160,271
Telescopic tower for light ships, S. D. Trenchard	138	160,374
Threshing machine, Harrison and Buchanan	139	160,290
Ticket clasp, M. Disney	146	160,320
Torch, policeman's, Clark, Richardson, and Foller	90	160,260
Toy arrow shooter, J. H. Wales	143	160,393
Trap, hog, Cooper and Hiatt	144	160,369
Type, making matrices for casting, J. Greene	164	160,307
Umbrella, J. J. Eubank	165	160,423
Umbrellas, stand for holding, L. E. Ladd	62	160,407
Valve, balanced, J. A. Hutchison	152	160,339
Vegetables, machine for subsoiling and digging, T. L. Webster	114	160,327
Vehicle, spring, J. Walker	31	160,489
Vehicle wheel, A. J. Hodges	31	160,488
Ventilator, window, G. Nicholson	166	160,268
Vessels, raising sunken, H. F. Knapp	82	160,458
Wagon box, I. S. Clawson	31	160,441
Washing machine, J. K. Alwood	91	160,258
Washing machine, J. T. Forbes	91	160,413
Washing machine, A. G. Huey	91	160,435
Watch case spring, C. W. Wadsworth	36	160,368
Water closet valve, J. Farrell	8	160 313
Water meter, Ball and Fitts	167	160,379
Water wheel, S. Sherwood	168	160,356
Water wheel chute, M. B. Moomaw	168	160,457
Whalebone, straightening, W. H. Ferguson	169	160,411
Whiffletree clip, J. A. Ellis	31	160,262
Window sill, J. L. Rowland	4	160 264
Wrench, pipe, C. H. Fulmer	100	160,415

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED MARCH 2, 1875.

	Patent No.
Adams, I., Jr., Coating metal with metal, (reissue)	6,313
Adamson, J. M., Medical compound	160,251
Aldrich, F. B., Butter worker	160,293
Allen, H. J., Fruit drier	160,377
Allensworth and Argerbright	160,378
Alley, J. P., assignee	160,395
Alwood, J. K., Washing machine	160,258
American Nickel Plating Company, assignee, (reissue)	6,313
Argerbright, D., and W. Allensworth, Furnace for consuming smoke	160,378
Bailey, D. C., assignee	160,425
Bake, C. F., Car coupling	160 294
Baker, O. T., Car coupling	160,295
Baldwin, J. F., assignee	160,427
Ball, P., and B. Fitts, Water meter	160,379
Ball, R. R., Stove pipe coupling	160,296
Ball, R. R., Stove lid lifter	160,297
Barraclough, E., and T. Pritchard, Fifth wheel	160,253
Battis, J., 2nd, Cigar bunching machine	160,380
Bean, B. F., Neck tie supporter	160,298
Behning, H. and J. Diehl, Name board for piano fortes, &c.	160,299
Bénard and Bocquet	160,300
Berry, L. D., Platform scales	160 381
Berryman, C., Corn planter	160,382
Birkenhead, J. Bobbin for spinning	160,383

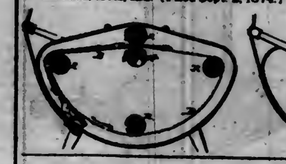
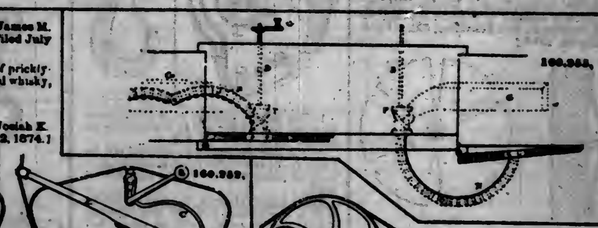
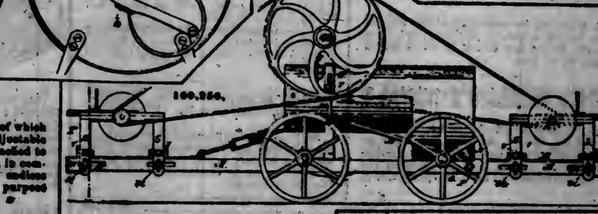
TITLES, DRAWINGS, AND CLAIMS



OF



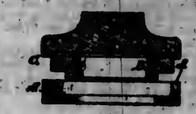
PATENTS GRANTED MARCH 2, 1875.



160,266. MEDICAL COMPOUNDS. James M. Adamson, Prairie City, Iowa. [Filed July 10, 1874.]

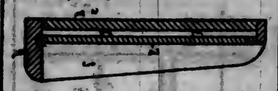
A medical compound consisting of prickly ash, rhubarb, wahoo, poplar bark, and whisky, substantially as described

160,282. WASHING-MACHINES. Josiah K. Alwood, Mota, Ind. [Filed Sept. 2, 1874.]



The bent springs C, the upper ends of which surround the journaled ends of the adjustable roller R', having their lower ends attached to the staples b of the pivoted levers L, in combination with the rollers R R' and endless belt B, substantially as and for the purpose set forth.

160,262. PITH-WHEELS. Edward Barraclough and Timothy Pritchard, Brooklyn, N. Y. [Filed Sept. 30, 1874.]

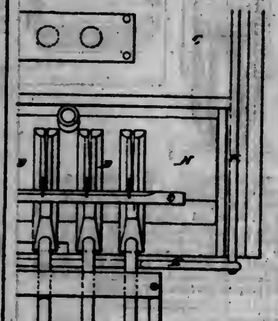


Brief.—Two circles of angle-iron fitted together with a cap-plate to exclude dust.

1. The outer flanged ring A in combination with the inner flanged ring B, as and for the purpose set forth.

2. The outer flanged ring A with inner flanged ring B and cap C in combination, as and for the purpose set forth.

160,264. DOOR-CHECKING BOARDS. L. L. Black, Lowell, Mass., assignor to himself and Geo. B. Hart, Sandwich, N. H. [Filed Jan. 18, 1875.]



As a new article of manufacture, a door-checking board composed of a back, B, and a glass top or face, E, bedded in an interposed layer, *g*, of softened substance, with or without the back and end flanges *b f*, substantially as shown and described.

160,263. SHUTTER-WORKERS. J. Burrell, Philadelphia, Pa. [Filed Sept. 30, 1874.]

Brief.—A swinging jointed rack, with downwardly-projecting arms, teeth, engages with the worm of an endless screw, and works entirely within a flanged bed-plate let into the window-sill, all parts of the device being protected from the weather; the crank-handle reached and operated from inside the window.

An improved shutter-worker, consisting of the flanged plate G, secured within the window-sill, the circular hinged or jointed rack H, attached at one end to the shutter, the endless screw F, and the crank-shaft C D, all constructed, arranged, and operating substantially as described and shown, for the purpose set forth.

The pedal F, lever E, air-reducator C, receiver B, valve D, and pedal rod-board H, all in combination, as set forth.

160,265. GAUGE-MACHINES. Robert B. Boyd and Henry C. Fox, Memphis, Tenn. [Filed Mar. 19, 1874.]

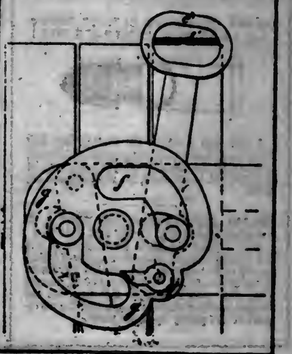
Brief.—A portable engine and boiler support an adjustable platform, on which are sewing-machines operated by the engine.

1. The combination of the carriage A, rods H, strap F', nuts J, bands N, lugs O, and slots P, all constructed and operating as and for the purposes described.

2. The combination of slots R in timbers W of carriage A, bolts U, lugs S of frame T, and slotted wedges V, all constructed as and for the purpose described.

160,267. PEDAL ATTACHMENTS FOR ORGANS, &c. Riley Burdett, Erie, Pa. [Filed Dec. 3, 1874.]

Brief.—Each pedal-key provides the wind-pressure to sound its own reed as it is played.

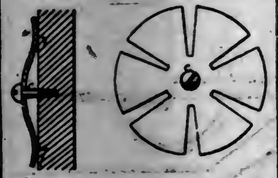


160,268. WAGON-BODIES. Isaac S. Clawson, Monroe, Wis. [Filed Jan. 11, 1875.]

The combination, with the bottom A, skirt D D, and auxiliary sides E E of a wagon-box, of the irons C, formed with the rods *a* and open-ended semi-tubes *d*, and the irons D, formed with the rods *c*, all substantially as and for the purposes set forth.

160,250. BELT-SHIFTERS. Thos. S. Crane, Newark, N. J., assignor of two-thirds his right to C. M. Bolen and F. K. Day, same place. [Filed Dec. 26, 1874.]

Brief.—Each of two partly-eccentric slots in a disk rotated on a frame by a pitman has working in it a pin attached to each of two arms pivoted to such frame at one end, their other ends having eyes, through which the bolts pass.



HELIOTYPE RELIEF PROCESS. JAMES ROSS COR & CO. BOSTON

The combination and arrangement of two shippers, *c c'*, support *x*, and slots *f f* on disk *g*, with the belts *d d'* and pulleys to be driven by the same, when operated substantially in the manner and for the purposes described

---

160,260. TICKET-CLASPS. Mordecai Disney, Oakland, assignor of one-half his right to E. C. Kibbee, San Francisco, Cal. [Filed May 18, 1874.]

A ticket-holder consisting of the annular disk, having a flanged periphery, and being radially slotted and struck up into a convex shape, as set forth.

160,261. SHUTTLE-GUARDS FOR LOOMS. J. L. Dow, Manchester, N. H. [Filed Feb. 6, 1875.]

Brief.—The guard-rod is arranged to be turned up against the rod-cap when required, and is held down in working position by a central support having a notched rib adapted to receive the rod when sprung into it.

In combination with the top-bar of the reed-frame of a loom, the stands B, B, and D and bent rod C, arranged to work substantially as described, for the purpose set forth.

160,262. WHIFFLETREE-CLIPS. J. Alderman, Chicago, Ill. [Filed Feb. 8, 1875.]

The whiffletree-clip having the head A and loop B cast in one piece, and open, as shown, to be closed and riveted cold, as and for the purpose specified.

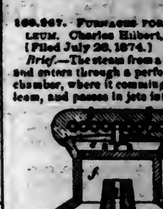
160,263. CARTRIDGES. De Witt C. Farrington, Lowell, Mass. [Filed Feb. 8, 1875.]

A cartridge in which the shell or case and the projectile are connected together, as shown, and having the metal of the projectile turned over the end of the shell, for the purposes set forth.

160,264. FIREARMS-CLEANERS. Edwd. S. M. Furnald, Stacy, Me. [Filed Jan. 6, 1875.]

Brief.—Wing-segments are secured at one end to the pulley, their concave surfaces fitting closely to the bushing. The upward movement of the lower forces the segments into contact with and cause them to quickly clasp, the flanged bushing, thereby regulating the movement of the pulley upon the shaft.

1. The flanged bushing B, in combination with the ring-segments C C, substantially as and for the purposes specified.



2. The ring-segments C C, adjusted and secured as shown and described, in combination with the pulley A, as and for the purposes set forth.

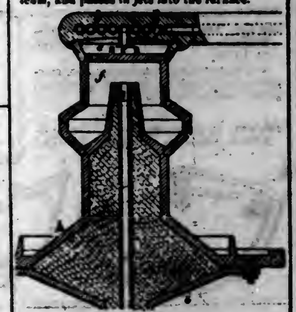
3. The levers D D, with the adjusting-screws E E, in combination with the ring-segments C C, to operate substantially as shown, and for the purpose described.

4. The combination of the flanged bushing B, ring-segments C C, and levers D D, constructed and operated as and for the purposes specified.

160,265. SEAMING-MACHINES. William J. Gordon, Philadelphia, Pa. [Filed Dec. 17, 1874.]

Brief.—A vertical plunger has pivoted seaming-jaws with inclined faces, entering corresponding recesses in the female die, opened to open the can by cams, and closed around the can by springs.

160,266. WHEELS FOR VEHICLES. Andw. J. Hodges, Peoria, Ill. [Filed Jan. 15, 1875.]



1. The double circle C C, of angle-iron, spokes B B, &c., cast in the cast-iron hub A, of one piece, all combined substantially as and for the purposes set forth.

2. The combination, with the hub A and the angle-iron spokes B B, &c., of the double circle of angle-iron fellies C C, and the tire D, substantially as described.

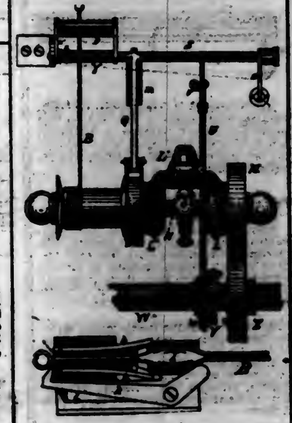
3. The combination of two circles of spokes, B B, set in a single hub, A, inclining together at their outer ends, the angle-iron fellies C C, and tire A, shrunk thereon, substantially as and for the purposes described.

160,267. FURNACES FOR BURNING PETROLEUM. Charles Hilbert, Sing Sing, N. Y. [Filed July 20, 1874.]

Brief.—The steam from a coil is superheated, and enters through a perforated diaphragm a chamber, where it commingles with the petroleum, and passes in jets into the furnace.

The petroleum supply-pipe *l*, passing through the base *h i*, filled with non-conducting material, and entering the mixing-chamber *f* that has jet-holes around the lower portions of such chamber, in combination with the superheating steam-pipe *b*, cap *c*, and jets passing into the chamber *f*, as and for the purposes set forth.

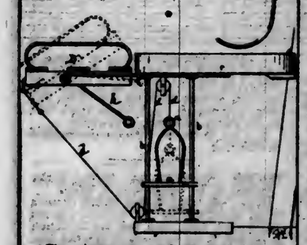
160,268. WHEELS FOR VEHICLES. Andw. J. Hodges, Peoria, Ill. [Filed Jan. 15, 1875.]



1. The double circle C C, of angle-iron, spokes B B, &c., cast in the cast-iron hub A, of one piece, all combined substantially as and for the purposes set forth.

2. The combination, with the hub A and the angle-iron spokes B B, &c., of the double circle of angle-iron fellies C C, and the tire D, substantially as described.

3. The combination of two circles of spokes, B B, set in a single hub, A, inclining together at their outer ends, the angle-iron fellies C C, and tire A, shrunk thereon, substantially as and for the purposes described.



160,269. CAR-BRAKES. Geo. M. Hopkins, Albion, N. Y., assignor of one-half his right to J. A. Straight, same place. [Filed Oct. 6, 1874.]

Brief.—A Chinese-windlass combined with a cable or chain extending throughout the train, the latter provided with automatic coupling and uncoupling devices and friction-gearing upon the locomotive, or under one of the cars, arranged to take power from an axle.

160,270. SCRAP-DROPPERS FOR HARVESTERS. Smith G. King, Round Grove, Ill. [Filed Dec. 16, 1874.]

Brief.—Arrangement of devices as claimed, whereby the bound sheaves are carried and deposited together upon the ground, where a sufficient number has been collected to form a shock.

The stirrup *a*, perpendicular rods *b b*, and cord *d*, in combination with the tilting platform D and stop-rod *h*, as and for the purpose specified.

160,271. TELEGRAPH SOUNDERS AND RECORDERS. Danl. F. Leahy, Portland, Oreg. [Filed July 17, 1874.]

Brief.—Adjustable recording-pen attached to sounding-bar. Paper passes over a concave plate, so as to spring slightly under the pen, and not interfere with the movement of the sounder-bar.

1. The adjustable pen E, provided with the inking attachment P and the supplying-trough Q, in combination with sounder N, substantially as and for the purpose set forth.

2. In combination with the sounder N and pen E, the concave plate H, substantially as and for the purpose set forth.

160,272. SHAKING GRATES. Jas. Mahony, Newport, R. I. [Filed Jan. 27, 1875.]

1. The alternately-rocking grate-sections C D, in combination with a rocking shaft, E, with toes thereon, adapted to raise the one section while the adjacent sections are depressed, substantially as herein specified.

1. The combination of the winding-drum A, spring F, cables *g*, B, and *f*, pulley C, and lever D, substantially as shown and described.

2. The combination of the fuses *e*, part *c*, cable *f*, and pulley C, for producing a gradually-increasing strain with diminishing speed, as shown and described.

3. The combination of the coupling G and cable B, as set forth.

4. The combination of the parts H and I and springs *h h*, as shown and described.

5. The combination of the sleeves J *j'*, catch *k*, and spring *l*, as shown and described.

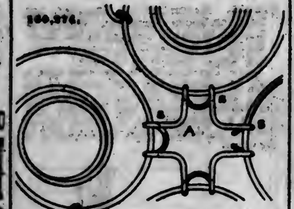
6. The combination of the pedal T, lever *o*, shaft S; lever *n*, shaft U, cam *v*, lever *w*, and clutch V, substantially as shown and described.

7. The combination of the arms *x x'*, rollers *y y*, ball Z, stud *x*, pin *x'*, spring Y, shaft S, and lever *m*, as set forth.

8. The combination of the spring *r*, sleeve *q*, rod *p*, and catch *t*, substantially as shown and described.

9. The combination of the axle W, spur-wheels X and M, epicycle-train, consisting of the wheels L L' L'', friction-wheel P and strap surrounding it, lever Q, drum R, cable B, pedal T, shaft S, levers *m*, *n*, and *o*, rollers *y y*, arms *x x'*, stud *x*, pin *x'*, ball Z, spring Y, cam *v*, shaft U, lever *w*, and clutch V, substantially as shown and described.

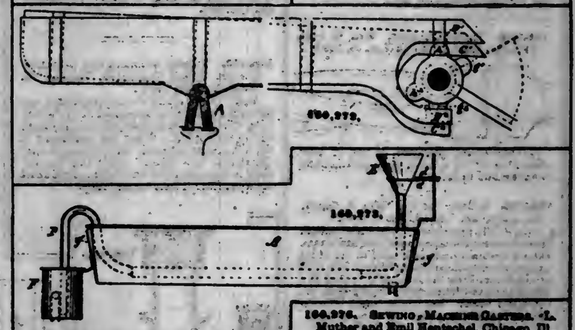
160,273. MILK-COOLERS. George McEwan and Charles O. Gibson, Derby Line, Vt. [Filed Feb. 12, 1870.]



Brief.—The milk is cooled or heated by a continuous or intermittent flow of cold or warm water through pipes immersed in the vat. The contents of the pipes are drawn off and regulated by means of the siphon-cup.

1. The combination, with the pan A, having at its end guide-stripe or flanges *g g* and standard G, of the cooling or heating pipes B, provided with induction-tube C, funnel E, and rods *d d*, substantially as and for the purpose specified.

2. The combination of the pan or vessel A, having guide-stripe or flanges *g g*, and the cooling or heating pipes B, with siphon or ejection-tube D of the cup F, provided with nozzle *e*, projecting flange *h* and *i i*, substantially as and for the purpose set forth.



160,274. CONNECTIONS FOR BED-BOTTOM SPRINGS. A. C. McMains, San Francisco, Cal. [Filed Jan. 7, 1875.]

The combination of the double four-armed clamps A B with the spiral springs, substantially as and for the purpose set forth.

1. The combination of the stem E, having stud *s'*, head *s''*, the bent *d*, and faucet or cock A, to operate as and for the purpose set forth.

2. The combination of the pin F, rod C, with groove *f*, and faucet or cock A, as and for the purpose set forth.

160,275. SEWING-MACHINE CASTERS. E. Muther and Emil Hentschel, Chicago, Ill., assignors to R. W. Phillips and Amos B. Keith, same place. [Filed Dec. 29, 1874.]

Brief.—A cross-bar carrying at its two ends caster-wheels or rollers, and likewise recessed above these rollers to receive the feet or standards of a sewing-machine table, is provided with a vertically-adjustable hook, arranged to pass through the cross-bar midway between the rollers. The upper part of this hook engages with the frame-work of the standards, and its lower part being threaded with milled-nut attachment, the hook is easily adjusted, and adapted for suspending or holding the cross-bar carrying the casters in desired position.

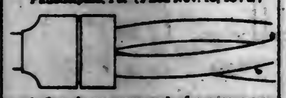
A sewing-machine caster-attaching device, consisting of the cross-bar C, constructed to receive the feet of the standards, and provided with rollers D and with the vertically-adjustable hook F, substantially as and for the purposes specified.

160,276. FAUCETS. Ferdinand Meissner, St. Louis, Mo. [Filed Aug. 10, 1874.]

Brief.—The hose is drawn into the faucet, when it is inserted in the barrel, and forced out again by a stem after insertion, when it uncoils and rises to the surface to supply air to the liquid. To cut off the supply of air the valve-rod is turned to allow the pin in it to enter a groove in the faucet, which closes the valve.

160,277. RAILWAY-RAIL JOINTS. Chas. B. Phillips, Chicago, Ill. [Filed Feb. 16, 1874.]

Brief.—A rail-joint support consisting of a flat piece of metal bolted to under sides of two adjoining rails.



The rails B B, secured beneath the joint by the flat metallic plate A, equal in width with the base of the rails, and fastened thereto by bolts and nuts, substantially as specified.

160,979. CURTAIN-FIXTURE. S. H. Phinney, Rochester, N. Y., assignor to Wm. S. Reeve, same place. [Filed Dec. 2, 1874.]

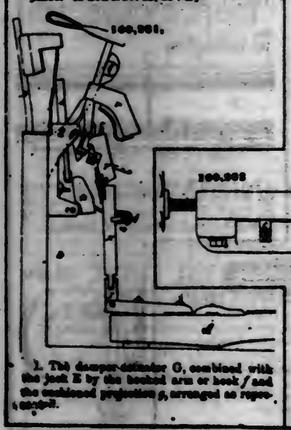
A curtain-fixture having its pawl-lever A detachably connected to the bracket B by means of an offset-lip, c, projecting on opposite sides of the axial center of said lever, and playing in the slots a in the bracket, and a centering-pivot, f, substantially in the manner and for the purposes set forth.

160,979. FLUE-CLEANERS. Wm. O. Pike, Philadelphia, Pa. [Filed Nov. 16, 1874.]

A flue-cleaner composed of one or more tubes twisted into a spiral form, substantially as shown and described.

160,980. SULKY-PLOWS. Wm. B. Quick, St. Louis, Mo. [Filed Dec. 7, 1874.]

Brief.—The plow-frame is adjustable at both ends by means of segmental braces and levers. The plow-beam proper is hinged to the frame and supplemental stationary beam. The plow can be raised from the ground by means of a bent lever and friction-roller resting upon the stationary beam. The whole frame is vertically adjustable at either end, or as a whole.



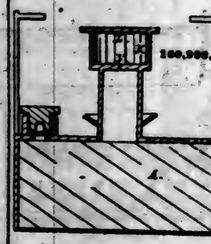
1. The plow-beam C, arranged in relation with the axle a as herein shown and described, and hinged by its brace s to the frame B and sub-beam D', in the manner and for the purpose set forth.

2. The combination of the adjustable frame B, its braces B' B', levers D' D', rods b', and axle a, as herein shown and described, to operate as and for the purpose set forth.

160,981. JUVENILE-PIANO ACTIONS. Chas. H. Rogers, Boston, Mass., assignor to the Vogers Upright-Piano Company, same place. [Filed Nov. 13, 1874.]

160,981.

1. The damper-detainer G, combined with the jack E by the hooked arm or hook f and the combined projection g, arranged as represented.



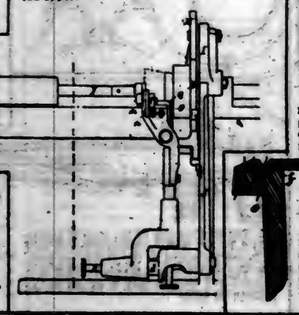
2. The jack E and escapement F, combined with the key A by the intermediate hinged piece I applied to them, substantially as set forth.

3. The hammer B, provided with the combined hook m, escapement-notch l, and arm r, arranged as described, in combination with the jack E, provided with the hooked escapement F, and the damper-actuator G applied to said jack, all being substantially as shown and specified.

160,982. VAPOR-BURNERS FOR COOKING-STOVES. Frank Rosengren, Chicago, Ill. [Filed Aug. 24, 1874.]

Brief.—There are two vapor discharges, one through a perforation in the side of the filling-tube, which may be entirely or partially closed by the screw-plug. When the perforation in the filling-tube is closed, the amount of vapor discharged and burned under the heating-plate is increased, and more heat is conducted downward to increase vaporization.

160,982.



1. The combination, with chamber A, of two vapor-discharges, both under the vessel to be heated, one with a port, L, arranged to receive and transmit heat from its flame to the plate E, to produce vapor, and the other made adjustable and arranged to regulate the quantity of heat produced, substantially as set forth.

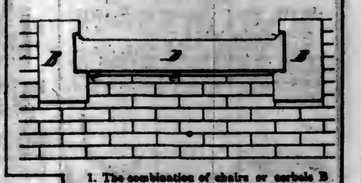
2. The combination of the filling-tube and the vapor-escape in one device, and separate and away from the regular burner-outlet, all substantially as set forth.

3. The combination of chamber A, filled with fibrous matter, with a vapor-discharge provided with plate L, having metallic conductors to convey heat from its flame to chamber A for vaporizing, and a vapor-discharge in a filling-tube not so provided, both being below the vessel to be heated, substantially as set forth.

160,983. MACHINERY FOR TRIMMING THE HEELS OF BOOTS AND SHOES. William H. Bounds, Brockton, assignor to the Shoe-Machinery Manufacturing Company, Boston, Mass. [Filed Aug. 14, 1874.]

Brief.—The machine is provided with a knife for trimming the outer surface of the heel-lifts, one for trimming the welt, acting simultaneously, which are provided with guards, so arranged that the knives may be tilted to any desired angle without injury to the upper.

1. In a heel-trimming machine, substantially as described, the combination, with the reciprocating knife Q, of the fixed guard m and the rotating guard q, when arranged as and for the purpose set forth.



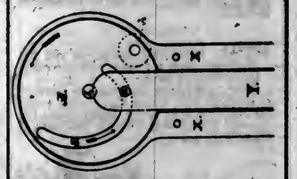
2. A heel-trimming machine provided with a reciprocating knife, Q, a fixed guard, m, welt-knife n, and a rotary adjustable guard, q, all constructed, arranged, and operating together in manner and for the purpose set forth.

3. In a heel-trimming machine, substantially as described, the combination, with the reciprocating knife and heel-pattern, of the guard U, the fixed guide m, and the rotary guard q, when constructed and arranged in manner and for the purpose set forth.

4. In a heel-trimming machine, substantially as described, the combination, with the reciprocating knife and heel-pattern, of the guard U, the fixed guard m, the welt knife n, and the rotary guard q, the whole being arranged in manner and for the purpose set forth.

160,984. WINDOW-SILLS. J. L. Rowland, New York, N. Y. [Filed Jan. 20, 1875.]

Brief.—A window or door sill made so as to be readily removable by means of chairs or seats at the ends embedded in the brick-work, which sustain the sill. The sill has a projection or drip formed on its lower side.

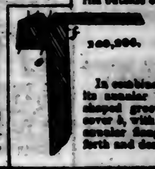


1. The combination of chairs or carbels B with a window or door sill, D, whereby the sill may be removed and another supplied in its place without removing, displacing, marring, or damaging the brick or stone work of the wall, substantially as described.

2. A sill, D, having a drip, c, substantially as described.

160,985. DOOR-CHECKS. George Royle, Buffalo, N. Y. [Filed June 10, 1874.]

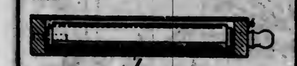
Brief.—The novel feature merely consists of the revolving disk with involute slot, the construction being such that the revolution of the disk in one direction pushes the door check or bolt out of its casing, while an opposite movement draws it back and releases the door.



The combination, with the case X, having a circular recess, of the revolving disk A, involute slot S, pin L, concentric slot t, handle h, bolt Y, and stud d, all when arranged to operate substantially as described.

160,986. AIR-TIGHT DISHES. F. Shaw, Somerville, Mass. [Filed Dec. 9, 1874.]

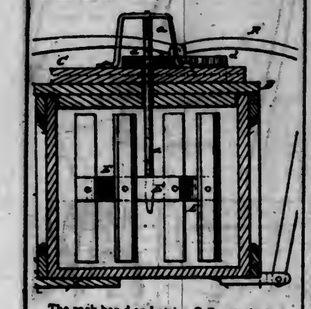
Brief.—A glass dish provided with a flanged rim and groove, over which rim and into said groove a metallic cover is compressed. A cement may be applied between the cover and rim outside of the groove, for sealing.



160,986.

In combination with the glass dish A, with its annular curved flange a d, annular V-shaped groove a, and ring f, the metallic cover b, with its annular V-shaped lip t and annular flange g, as and for the purpose set forth and described.

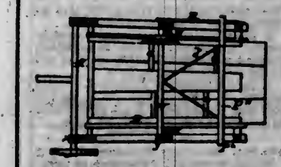
160,987. TRANSPARENT SLATES. C. C. Shephard, Passaic, N. J. [Filed Oct. 6, 1874.]



Brief.—The transparent slate is combined with rollers carrying the subjects to be copied to different points beneath the slate, as desired.

The transparent slate herein described, formed of ground glass in a frame, two rollers with a web containing the pictures or letters to be copied, and a backing, f, to retain the web in contact with the glass, as and for the purpose set forth.

160,988. CHURNS. Jas. W. Simmons, East Monroe, Ohio. [Filed Jan. 2, 1875.]

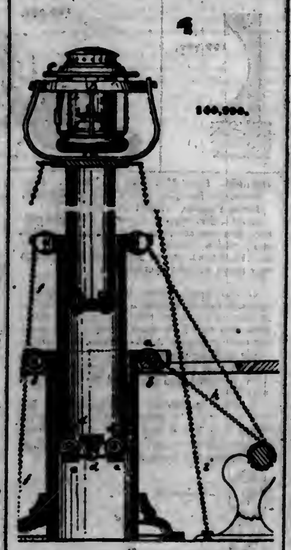


Brief.—The dasher, which has a pinion near its top, receives a vertical reciprocation from a horizontal reciprocating rack-bar, sliding in grooved cleats secured on the churn-lid. Said rack-bar is detachably connected by pitmen with the operating mechanism at either side of the churn.

The rack-bar d and stripe C C, attached directly to the lid B, in combination with shaft e, pinion h, frame D, arranged to operate the dasher by means of connecting-rods I E, all constructed and arranged as and for the purpose specified.

160,989. MACHINERY FOR STUFFING MATTRESSES. Joseph B. Spurgin and William J. Freeman, Kansas City, Mo. [Filed Mar. 17, 1874.]

Brief.—The width of the holder is regulated by bars and wedges, which are adjusted in slotted cross-bars. The stuffing material is placed in the holder, and the presser lowered thereon. It is then compressed by the cross-bar, which is placed across the presser, with one end under a hook on one side of the machine, while the other end is drawn down on the presser by a hook and lever on the opposite side of the machine. The material is then forced from the holder into the cover or ticking.

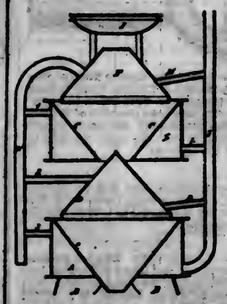


1. The holder and presser, in combination with the cross-bar F', hooks F F', and lever E, substantially as and for the purpose herein set forth.

2. The holder, in combination with the slotted cross-bar F', keys K, and wedges S, all substantially as and for the purpose set forth.

160,990. TELESCOPIC TOWERS FOR LIGHT-SHIPS. Stephen D. Trueheart, New York, N. Y. [Filed Feb. 6, 1875.]

160,990.



1. A tower for light-ships made in adjustable sections, as described, and adapted to carry a signal-light at its top, whereby the whole is adapted to be lowered to the deck of the vessel, substantially for the purpose specified.

2. The combination, with a series of tower-sections, of the pulleys b d, chains or shrouds h f i, and windlass p, substantially as and for the purposes herein set forth.

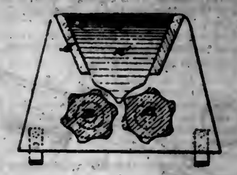
160,991. BEER-COOLERS. John B. Weis, Sandusky, Ohio. [Filed Dec. 14, 1874.]

Brief.—The beer to be cooled is divided into fine streams by passing through the perforated basin, then by falling upon the cone; thence to the inclined surface of the cylinder. It is still further cooled by passing over the other cone, and, furthermore, by its passage over the inclined sides C of the cylinder A. The amount of water flowing into cylinders and cones from the pipe J is regulated by the stop-cocks h.

1. The cylinder A, having oblique sides C, in combination with the hollow cone D, induction-pipe J, side pipe K, ejection-pipe N, and side pipes 1 2 3, substantially in the manner as described, and for the purpose set forth.

2. The cylinder A and cone D, in combination with the cylinder E, cone F, perforated bush I, induction-pipe J, side pipes M L K, stop-cocks h, and ejection-pipe N, having side pipes 1 2 3, substantially as described, and for the purpose specified.

160,992. SPOOLING-MACHINES. John W. West, Boston, assignor of one-half his right to Augustus Seaver, Milford, Mass. [Filed Oct. 31, 1874.]



Brief.—The revolving spool-carrying rods and guide-rods are arranged in the arc of a circle. The latter are compensated along the former, to lay the thread upon the spools, being connected by means of the radial arms to the stock, and central shaft moved endwise by depending arms, which engage the screw-rod.

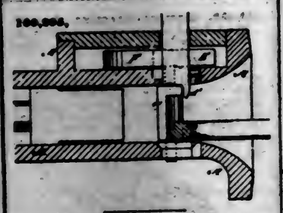
In a spooling-machine constructed substantially as described, the combination of the shaft H, provided with the arms S S', stock I, provided with the radial arms J, rods C K, and screw R r, substantially as and for the purpose set forth.

160,993. BUTTER-WORKERS. P. B. Allen, Chicago, Ill. [Filed Jan. 26, 1875.]

Brief.—The butter, being placed in a hopper, is drawn down through the machine, and in its passage is kneaded or worked by two rollers, so constructed that ribs of one work in grooves of the other. The ribs are formed concave on the front side, and convex on the rear, so that convexity of one works in concavity of the other.

The rollers D in a butter-worker, grooved longitudinally in such a way that the projections or ribs between said grooves may be concave upon the forward side, and rounded upon the rear side, and concaved or bevled upon their end parts, substantially as herein shown and described.

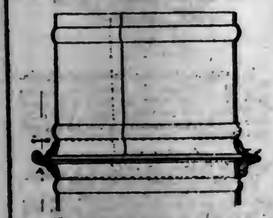
160,994. CAR-COUPLINGS. Cyrus F. Bahn, Young America, Ill. [Filed Feb. 6, 1875.]



The draw-head A, having a straight bottom, and the locking-bar B combined therewith, and hinged in the aperture a', which it accurately fits, and provided with the arc-shaped recess b', to operate with the straight coupling-link C, having dogs c on its ends, substantially as and for the purpose specified.

160,995. CAR-COUPLINGS. Owen T. Baker, Wamego, Kans. [Filed June 27, 1874.]

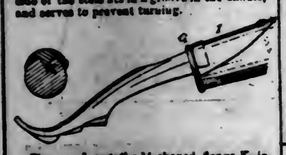
Brief.—When it is desired that the cars shall couple on coming together, the pin is placed in the position shown in Fig. 1, so as to fall when the valves C are driven front under it by the entering link; otherwise the pin is raised and tipped forward, so that its toe d will rest in a notch in the upper plate of the link-chamber.



The combination of the valve C, lever E, spring F, and coupling-pin D, and the bumper A, to adapt them to operate in connection with link B, substantially as shown and described.

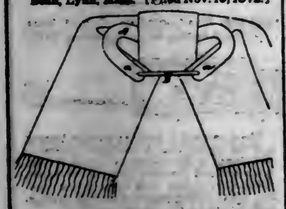
160,886.

160,886. STOVE-PIPE COUPLINGS. Robert R. Ball, West Meriden, Conn. (Filed Dec. 12, 1874.)



Brief.—The entire length of the sheet-metal sections is utilized.

A stove-pipe coupling having shoulder *f*, slots *h*, hook *i*, and slotted inclined flange *j k e*, as shown and described.



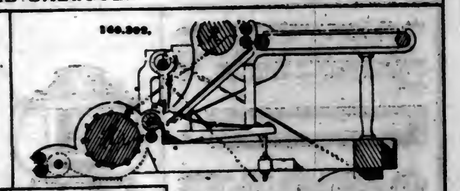
160,887. STOVE-LID LIFTERS. Robert R. Ball, West Meriden, Conn. (Filed Dec. 12, 1874.)

Brief.—A triangular flange on the under side of the stem fits in a groove in the handle, and serves to prevent turning.

The cap I and the V-shaped flange K, in combination with the disk G and handle B, for the purposes described.

160,888. NECK-TIE SUPPORTERS. Benj. F. Bean, Lynn, Mass. (Filed Nov. 10, 1873.)

The neck-tie supporter composed of the forested plate A and the elastic band B, constructed as described, and combined and arranged with the neck-tie bow and band, all substantially as specified and represented.

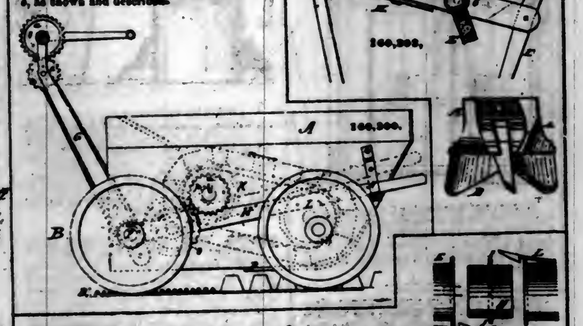


160,889. HAND-BOARDS FOR PIANO-FORTES. Jos. H. Behning and J. Diehl, New York, N. Y. (Filed Jan. 28, 1875.)

Brief.—The lower portion of the hand-board front is hollowed out to give more room for fingering the black keys.

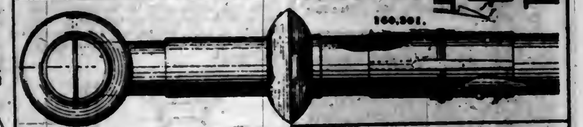
A hand-board for pianos and organs having a longitudinal concave groove cut into the front or outer side, substantially as shown, and for the purpose set forth.

160,889.



160,892.

160,890. PEAT-MOLDING MACHINES. Jean François Bocquet and Victor A. Bécard, Paris, France. (Filed Oct. 30, 1873.)



Brief.—The wheels move on a cogged railway, and operate through gearing the endless chain which carries the molds. The latter may be thrown out of gear, and the carriage may move without operating it.

1. The combination, with the stationary toothed rail laid upon a suitable horizontal surface, of a toothed wheel, B, working therewith, the axis F, a crank-shaft, C, the molding-case or hopper A, the drums K L, articulated molding-chain, and gearing for connecting the said axis, shaft, and drums, substantially as shown and described, for the purpose specified.

2. The combination of pivoted lever H, the spur-wheel *o*, mounted thereon, with the wheel *p*, drums K and L, the endless chain, and gearing for imparting motion to the wheel *o*, as shown and described.

160,890.

160,891.

160,891. SMOKE AND CINDER CONDUCTORS. Danl. L. Prancher, Lincoln, and J. L. Ring, Mount Pulaski, Ill. (Filed Dec. 26, 1874.)

Brief.—The longitudinal motion of the telescopic slides is limited by pins which work in slots in said slides. The parts are held together by spring hooks.

The combination of slides E E, having slots F, pins G, and spring hooks L with short thimble H, having median flange *j*, as and for the purpose specified.

160,892. COTTON-GINS. Edward Bonklin, Jr., Pawtucket, and Henry A. Stearns, Lincoln, assignors of three-eighths their right to Lysander Flagg, Lincoln, R. I. (Filed Sept. 30, 1874.)

In combination with the elastic feeding roller A of a cotton-ginning machine, a stationary knife attached to an adjustable arm, a reciprocating knife operated by an eccentric or equivalent device, and a spring for connecting the reciprocating knife to the arm of the stationary one, and regulating their positions with reference to the roller A without changing their positions relative to each other, substantially as and for the purpose described.

160,893.

160,893. APPARATUS FOR MINING. Wm. Buschley and Theodore Thorn, Pottsville, Pa. (Filed Feb. 3, 1875.)

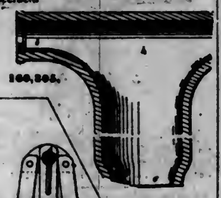
1. The screw-threaded cutter-head A, having twisted grooves *a* and angular dovetailed slots, for the insertion of the cutters B, in combination with said cutters, arranged to slide in the slots from the circumference toward the center, as and for the purpose specified.

2. The combination of the stem C, crank or handle D, feed-screw E, and the adjustable eye-pin *b* in the beam C, substantially as and for the purposes herein set forth.

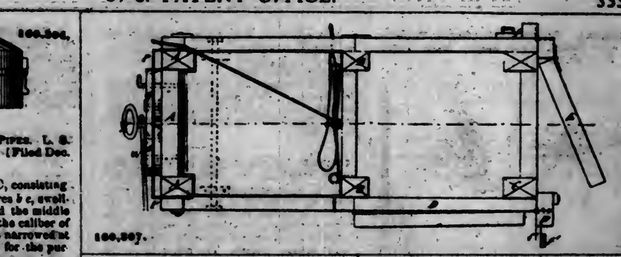
3. The combination of the beam C, carrying the drill, the adjustable clear-foot F, and pivoted lever I, with rubber shoe *h*, substantially as and for the purposes herein set forth.

160,894. MILLSTONE-BALANCES. Henry C. Byram, Dover, N. J. (Filed Nov. 19, 1874.)

1. A millstone-balance weight constructed with a projecting flange at top and bottom, one larger than the other, whereby by reversing the weight the center of gravity of the stone will be changed, substantially in the manner described.



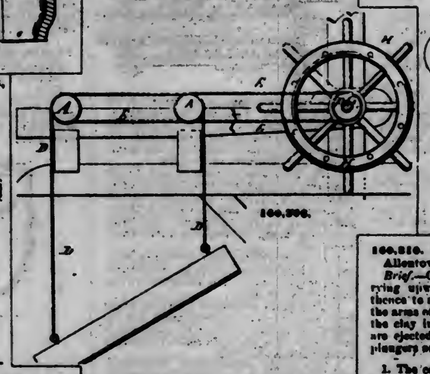
2. A millstone-balance weight constructed in rhomboidal shape, the side which is forward in the revolution of the stone slanting from front to rear, for giving a downward draft to the current of air, substantially as and for the purpose specified.



160,895.

160,895. SERVICE COUPLER-PIPES. L. S. Chapman, Washington, D. C. (Filed Dec. 30, 1874.)

A service coupler-pipe, A B C, consisting essentially of the transverse bores *b c*, swelling from their outer ends toward the middle and point of conjunction *b* into the caliber of the reservoir-chamber *a*, which is narrowed at its outlet *c*, substantially as and for the purpose specified.



160,896.

160,897.

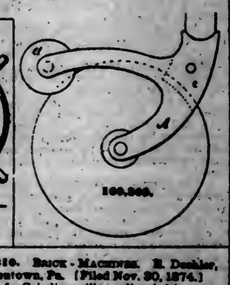
160,896. DROP-CHUTE REVERSERS. Jos. B. Crowthers, Monongahela City, and Wm. R. Wilkins, Pike Run, Pa. (Filed Jan. 25, 1875.)

Brief.—An improved combination of double windlasses and ropes for operating the reversible drop-chutes in common use, whereby they are more readily manipulated, reversed, adjusted to the rise and fall of the tide, &c.

The combination of the two ropes E, the two drums F, the two wheels H, the locking-pin L, and the shaft O with the rollers A, provided with ropes D, wound upon their ends in opposite directions, substantially as herein shown and described.

160,898. COMBINED CLOTHES AND QUILTING FRAMES. Melvin Churchill, Helvetia, Wis. (Filed Oct. 17, 1874.)

Brief.—Two sets of standards are pivoted at their upper ends, and connected by a cross-bar. Between these is journaled a quilting-frame, which can be turned up and used as part of the clothes-frame.



The slotted stands A B and pivoted tongues O' O', combined with pivoted quilting-frames E, having pivot-bar E'' and reversing bars E' E'', the battens F, pawls H, cranks I, pins J, and hooks K, being arranged and applied as and for the purpose specified.

160,899. COLTERS. Albert M. Davis, Jacksonville, Ill. (Filed Nov. 12, 1874.)

Brief.—A grooved roller and grooved block to limit vibration of colter.

1. In combination with the revolving colter, the grooved roller *a*, as and for the purpose described.

2. In combination with the colter, the grooved roller *a* and grooved block *c*, as and for the purpose described.

160,899.

160,896.

160,900. HOG-TRAPS. Jas. F. Cooper and William W. Hiett, Frankton, Ind. (Filed Oct. 24, 1874.)

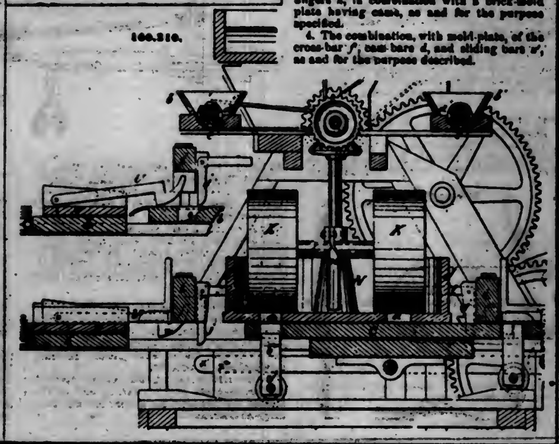
Brief.—A gangway with a gate at its entrance, hinged to the posts of which are other posts, with the rudiments of rails to start hogs from. In the anti-division the floor is lifted centrally under the animal's hind legs, around which ligatures are passed, while his head is held between the sections of a divided door. One side of the inclosure is opened for surgery upon the animal.

1. The combination of the hinged rails F *f' f''* with the sides of the rear end of the hog-trap, substantially as herein shown and described.

2. The arrangement of the two boards O, the cross-bar Q, and the stationary bars P and S, with respect to each other and the frame A, substantially as herein shown and described.

3. The combination of the three-armed lever W, the keepers V, key X, lever-pawls U, cord or chain Z, and screw-loop Y, with the boards O, the rabbet-bar S, and the cross-bar Q, substantially as herein shown and described.

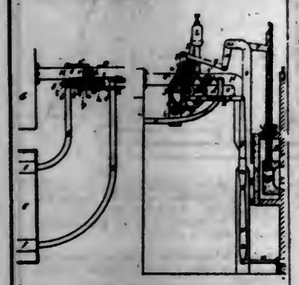
160,901. BRICK-MACHINES. B. Dunbler, Allentown, Pa. (Filed Nov. 30, 1874.)



Brief.—Grinding-mills; endless belting, carrying upward material to tempering-mills; thence to a central cylinder, with rollers on the arms of a rotating stem therein, pressing the clay into molds, from which the bricks are ejected at each end of the machine by plungers on inclined ways beneath.

1. The combination, with vessel N, having holes *a*, of the rotary grinders K K and twisted blades X, arranged to operate in the manner described.

2. The combination of the board *g*, having pivoted hook-bar U *n*, spring-platform *h*, and mold A, as and for the purpose set forth.



3. The cross-bar *i*, having angle-bar *j* and fingers *k*, in combination with a brick-mold plate having cams, as and for the purpose specified.

4. The combination, with mold-plate, of the cross-bar *f*, cam-bars *d*, and sliding bars *n'*, as and for the purpose described.

160,901.

160,211. REVERBERATING STEAM-BROILER. Geo. Buell Dimwell, Boston, Mass. [Filed Nov 20, 1874.]

1. The combination of the cooler P with the superheated-steam generator G, the engine-cylinder A, their connection-pipe H, and a valve, b, arranged in each pipe, all being substantially as described.

2. In combination with the superheated-steam boiler or generator G and engine-cylinder A, and the connection-pipe H, the two throttle-valves b f, and the cooler P, all being arranged and applied substantially in manner and to operate as described.

3. The combination of the steam alarm or whistle, with the superheated-steam generator G and engine-cylinder A, and their connection-pipe H, the two throttle-valves b f, and the cooler P, all being arranged and applied substantially in manner to operate as specified.

4. The pyrometric regulator or governor, substantially as described, consisting of the gears g h i, the vibratory shield t, the pyrometer I, and the vibratory arm p, and its pawls n o, all arranged, applied, and connected substantially as and to operate as explained.

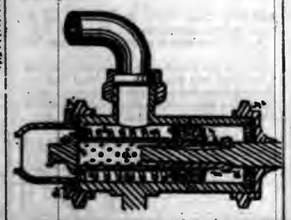
5. The combination of the said pyrometric governor, with the superheated-steam generator G and engine-cylinder A, their connection-pipe H, the valves b f, and the cooler P, all being arranged and applied substantially in manner and to operate as set forth.

6. For operating a steam-engine piston by superheated steam used expansively in the cylinder, provided with a variable cut-off or mechanism for arresting at different parts of the stroke of the piston the admission of steam to the cylinder, the new art or method, substantially as described, it consisting in elevating the temperature of the steam of the generator or superheater, as the cut-off may be increased, and lowering the temperature of the said steam as the cut-off may be lessened, the same being so as to maintain, as described, in the cylinder a high or maximum safety temperature, such as will prevent condensation of steam therein, and effect other useful purposes, as set forth.

7. The combination of the pyrometer or heat-measure with the steam-engine cylinder, its piston, valve-chest, valve, and a cut-off applied thereto, each being substantially as and for the purpose or purposes as specified.

160,212. SHIRTS. Geo. R. Rogers, Boston, Mass. [Filed Jan. 27, 1875.]

Brief.—The bosoms may be reversed by turning them on the cord attachment, as on a pivot, without removing them from the shirt.



1. A reversible shirt-front, A, made in the manner substantially as described, and provided with a pivotal cord or cords, c c', for the purposes set forth.

2. The combination of one or more reversible fronts, A, each provided with a pivotal cord or cords, c c', with a shirt, the whole being constructed and arranged substantially as set forth.

160,213. WATER-CLOSET VALVES. J. Farrell, Pittsburg, Pa. [Filed Dec. 24, 1874.]

Brief.—The operation of the valve is regulated by the inflow of water to the chamber above the piston, through a passage or passages formed on the side of the coupling, and through the passage of adjustable area formed in the operating-stem. The collar below the piston closes the passages on the side of the coupling.

1. A water-way passage, A, having an adjustable area of water-escape opening, arranged in connection with the operating-stem e, whereby the area of water-escape port may be regulated by the adjustment of the operating-stem, substantially as set forth.

2. The adjustable operating-stem e, having a tapering groove, h, arranged therein, in combination with the piston n, whereby the area of water-escape port may be varied by the adjustment of the operating-stem e with reference to the leakage of the piston, substantially as set forth.

3. The hollow perforated valve-stem a, working by a longitudinal motion in the direction of its length through the valve-port a^2, substantially as set forth.

4. The tubular connection k, having one or more water-ways, m', in combination with an adjustable operating-stem screwed therein, a loose piston thereon, and a collar, o, arranged substantially as set forth.

5. The tubular connection k, with one or more water-ways, m', an adjustable operating-stem screwed therein, a piston thereon, and a collar, o, in combination with the hollow perforated valve-stem a, substantially as set forth.

6. The valve a^2, hollow stem a, collar o, and spring c, in combination with the loose piston n, substantially as shown and described.

160,214. NAIL-PLATE FEEDER. Wm. H. Field, Taunton, Mass. [Filed Jan. 11, 1875.]

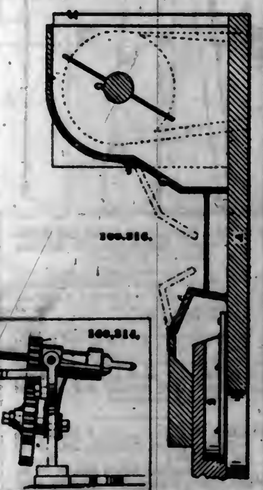
Brief.—A standard provided with a rear extension, upon which slides a head provided with spring-actuated jaws, to take hold of the rear end of the nipper-rod, and a latch to hold said head back, the latch being raised by the depression of a pin between the spring-jaws by the insertion of the nipper-rod. The feed-way is provided with adjustable stops to limit the extent of feed.

1. The forked and slotted feeder-bar or rear extending standard, being attached to the main table-standard and provided with adjustable stops, in combination with the sliding and weighted feeder-head guided thereon, substantially as specified.

2. The sliding feeder-head, having pivoted and spring-actuated jaws for taking hold of the flanged above end of the nipper-rod, substantially as described.

3. The sliding feeder-head, provided with a rear extending latch-hook and vertically-sliding pin, acting on the opposite arm of the same, for raising the latch from the rear stop, and detaching the feeder-head on the insertion of the nipper-rod and the consequent depression of the pin, substantially as set forth.

160,215. CLOTHES-LINE SUPPORTS. John W. Fuller, Cleveland, Ohio. [Filed June 13, 1874.]



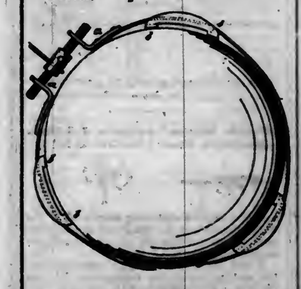
Brief.—On the upper end of a socket are two hooks with their openings in opposite directions.

A clothes-line holder, C, having at the top two hooks, c c, with their openings on diametrically-opposite sides, and the space a' between them, as shown and described.

160,216. REED-ORGAN TREMOLOS. Levi K. Fuller, Brattleborough, Vt., assignor to J. Estey & Co., same place. [Filed Dec. 30, 1874.]

Brief.—The inclosed tremolo-fan has a gate opening toward the swell-valve, and operated simultaneously therewith by knee-lever or other mechanism.

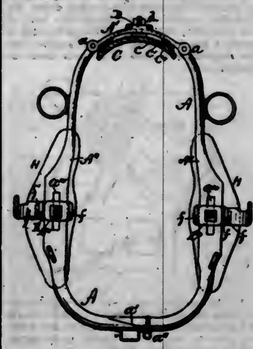
160,216.



160,214.

1. The shade F, provided with a swell, O, constructed and arranged so as to be interposed between the tremolo-fan D and the reed-cells B, substantially in the manner shown, and for the purposes set forth.

2. The shade F, having its sectional contour wholly or partially curved concentric with the tremolo-fan D, when the said shade is provided with a swell, O, hinged thereto, and arranged to wholly or partially intercept the sound or tone on its way from the reed-cells to the tremolo-fan, substantially in the manner shown, and for the purposes specified.



3. The combination of the tremolo-fan D and shade F, provided with a swell, O, attached thereto, with the reed-cells B, reeds a, and reed-swell O, all arranged to operate in conjunction with each other in the manner substantially as shown, and for the purpose set forth.

160,217. MILLSTONE-BALANCES. Christian B. Gosbert, Chambersburg, Pa. [Filed Feb. 9, 1876.]

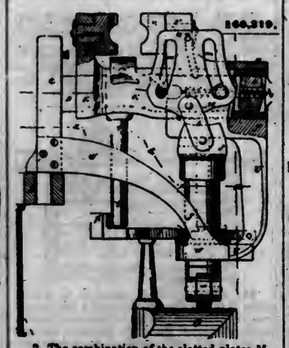
The separate weights C, provided on the inside, at each corner, with projections b, for resting rests for the weights against the stones, substantially as and for the purposes herein specified.

160,218. HORSE-COLLARS. Lord W. Harbaugh, Muscatine, Iowa. [Filed Jan. 7, 1875.]

1. The rigid collar A, in combination with the bearing-pads H, the latter being formed to fit the shoulder, and pivoted to the collar so as to oscillate freely and conform to the movements of the animal, substantially as set forth.

2. The bearing-pads H, attached to the collar A by laterally-adjustable plates E, substantially as and for the purpose specified.

3. The bearing-pads H, attached to the collar A by vertically-adjustable plates E, substantially as described, and for the purpose specified.



4. The combination of the collar A, oscillating pad C, vertically and laterally adjustable and oscillating pad H, and draft-hooks f, substantially as described, and for the purpose specified.

160,219. DEVICES FOR HOLDING PIPE-FITTINGS. Thos. P. Hardy, New York, N. Y. [Filed Dec. 6, 1874.]

Brief.—A circular track, which carries the post that holds the bar upon which the jaws are arranged, is mounted on posts attached to the bed-plate. Two jaws hold the fitting. One of said jaws is operated by slotted plates, which are attached by a link to the roller-carrying standard. An incline is formed upon the bed, and as the roller travels up said incline the slotted plates are moved upward and the jaws opened, and vice versa.

1. The two movable jaws E F, the spring H, and cross-bar b', in combination with the arm D and carrying-block C, substantially as herein shown and described.

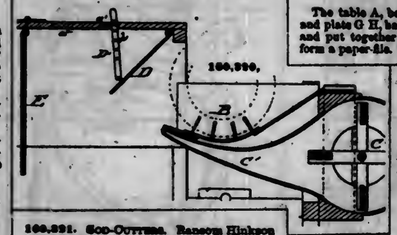
160,219.

2. The combination of the slotted plates M, the guide-pins m' f' o', the links L, the standard J, and the guide-rod I, with the two movable jaws E F, substantially as herein shown and described.

3. The combination of the inclines O with the standard J, the links L, the slotted plates M, and the two movable jaws E F, substantially as herein shown and described.

4. The combination of the guide P and loose collar E with the standard J, links L, slotted plates M, and movable jaws E F, substantially as herein shown and described.

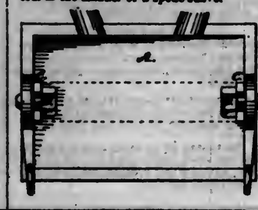
5. The combination of the guide S and arm T with the movable jaws E F, standard J, link L, and slotted plates M, substantially as herein shown and described.



6. The combination of the brace-arms U W with the standard J, the movable jaws E F, and the carrying-block C, substantially as herein shown and described.

160,220. THRASHING-MACHINES. T. Harrison and Wm. C. Buchanan, Belleville, Ill. [Filed Dec. 6, 1874.]

Brief.—Arrangement of fan with upwardly-inclined nozzle immediately beneath the concave, to blow off the chaff from the thrashed grain immediately on its exit from the thrashing devices.



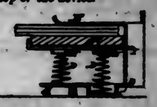
The combination, with the fan C, having tapering channel C', of the hinged plates D and E, all arranged, with respect to concave B and opening a', substantially as and for the purpose specified.

160,220.

160,221. SOD-CUTTERS. Ransom Hinkson and N. P. Hinkley, Buffalo, N. Y. [Filed July 14, 1874.]

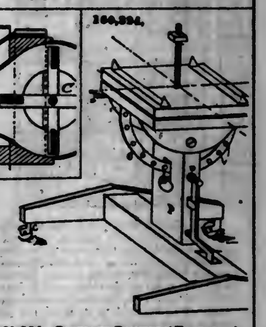
Brief.—A box-frame to be drawn upon the ground; the cutter adjustable below its bottom in the manner of a spoke-shave.

In a sod-cutter, the combination of a hollow or box-shaped gage-board, A, an adjustable cutter, C C', and the handles B B, all arranged for joint operation, substantially in the manner and for the purposes described.



160,222. SADDLE-HORSE APPARATUS. A. Hitt, Flora, Ill. [Filed Aug. 10, 1874.]

In combination with the crupper and pulley-strap F, the stay-straps J, substantially as and for the purposes described.



160,223. BILL-FILES. Richd. H. Hoffman, Keyser, W. Va. [Filed Jan. 20, 1875.]

Brief.—The bottom, back, and top are of one piece. A slot in the back passes a tongue which extends from the spring-follower. Bills or papers are clamped between this follower and the top of the device.

The table A, bed B C, springs D, plate E, and plate G H, having arms I, all constructed and put together in the manner described to form a paper-file.

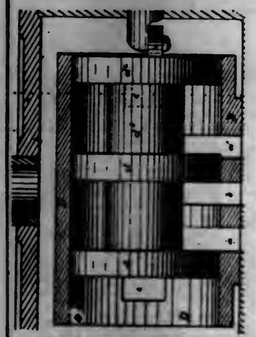
160,224. CARRIAGE-PAINTERS' EASELS. A. Horne, Rutland, Ohio. [Filed Dec. 28, 1874.]

The combination of the adjustable platform T, provided with a semicircular ratchet-bar, O, with the upright post P and the turn-table T, substantially as herein shown and described, and for the purpose set forth.

160,325. BOTTLE-STOPPERS. T. J. Holmes, Boston, Mass. [Filed Jan. 6, 1875.]

Brief.—The vent-opening in the cap and the passage through the screw-shank are of such form as to allow of the entrance of an atomizing-tube, and at the same time to afford room for the passage of air between the outside of the tube and the inside of the screw-shank. The shank is inserted in a cork or rubber stopper.

The cap *b*, with its vent-opening, in combination with the hollow screw-shank *a* and stopper A, substantially as and for the purpose described.

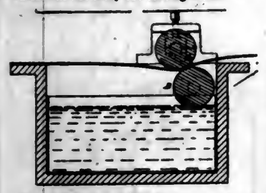


160,326. CAR-COUPLINGS. W. R. Hoopes and M'L. Smith, West Chester, Pa., assignors of one-third their right to B. Keech, same place. [Filed Feb. 16, 1875.]

1. The combination, with the slotted draw-head A, of the slide C, arms *a a*, stirrup D, with rod *b*, and the weight E, substantially as and for the purposes set forth.

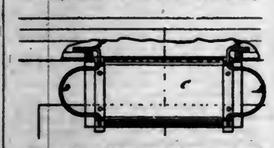
2. The stop *f*, in combination with the stirrup D, arms *a*, and slide C, substantially as and for the purposes set forth.

160,327. BALANCED VALVES. James A. Hutchison, Pittsburg, Pa. [Filed Jan. 9, 1875.]



1. The piston-valves *d d'* and the valve-case D, in which they operate, arranged in the steam-chest B, the interposed valve *d''* serving to govern the exhaust-port, whereby steam-pressure being free to act against the outer ends of the outer piston-valves, and in the operation of the engine, between the valves, each valve will be balanced at all times, the combination being substantially as set forth.

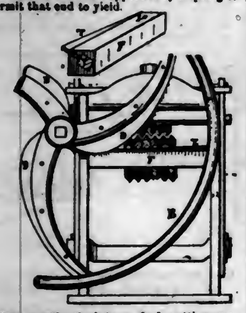
2. The steam-supply ports *c* in the valve-case D, and the receiving and exhaust ports *a a'* *b*, the area in cross-section of each of said ports being greater than the aggregate area of each pair of said supply-ports, in combination with an arrangement of valves for conveying and uncovering the same, substantially as described.



160,328. MACHINES FOR TINNING SHEET-COPPER. William Jenkins, Newark, N. J. [Filed Jan. 26, 1875.]

Brief.—Coats a sheet on one side only by elevating one of the rollers above the surface of the metal, and giving it a dead surface which will not carry the coating metal.

The combination, with the vat A, of two rolls, B C, the former running in the molten metal within said vat, and provided with a surface that will cause the adhesion thereto of said metal, while the latter has a dead surface, or one that will not permit the adhesion of said metal, all substantially as shown and described, so that a sheet of copper may be tinned on one side in the manner set forth.

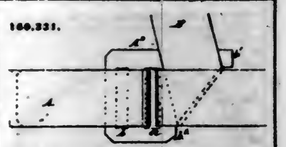


160,329. APRONS FOR STOCK-CARS. C. R. Jones, Berlin, Ill. [Filed Jan. 30, 1875.]

The combination of the bails or handles D and hooks E with the apron C, for enabling it to be readily secured to and released from the door-posts of a car, substantially as set forth.

160,330. FEED-CUTTING MACHINES. Wm. J. Jones, Hamilton, Ohio. [Filed May 5, 1874.]

Brief.—The cutter upon the front of the machine, with which the rotary cutter operates, is pivoted at its inner end, and its outer or articulated end is supported by a spring to permit that end to yield.



The combination, in a feed-cutting machine, of rotary knives D with the pivoted yielding knife T and grooved adjustable block F, substantially as described.

160,331. BALE-TIES. Wm. A. Jordan, New Orleans, La., assignor to Planters' Cotton-Tie Association, same place. [Filed Jan. 12, 1875.]

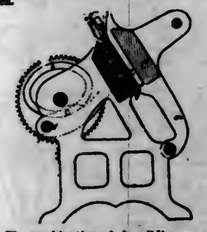
1. The buckle A^1, provided with the slots *a* and *b* and the angular extension A^1, substantially as described, and for the purpose set forth.

2. The buckle A^2, provided with the slots *a* and *b* and the angular extension A^1, having the projections b^1 and b^2, substantially as and for the purpose set forth.

1. The combination of the sliding or reciprocating feeder E, provided with mechanism for actuating it, as described, with the printing-press or bed C and platen A, arranged and to operate as set forth.

2. The combination of the feeder K, provided with mechanism for actuating it, as described, with the platen A and bed C and one or more sheet holders or clamps, L, as specified, arranged and connected with the bed as set forth.

160,332. BUTTON-FASTENINGS. J. H. Keating, Boston, Mass. [Filed Feb. 3, 1875.]



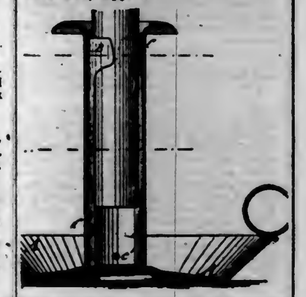
1. The button-fastening composed of the flexile wire A and the bead B, provided with perforations *a a* thereto, all substantially as shown and described.

2. The bead B, as made or provided with the middle bead *c*, the two arches *d d*, and the eyes *a a*, arranged in it, as set forth.

3. The bead B, as made with the lips *b b*, the eyes *a a*, the middle bead *c*, and the two arches *d d*, all arranged as set forth.

160,333. PRINTING-PRESSES. W. P. Kidder, Malden, Mass. [Filed Dec. 9, 1874.]

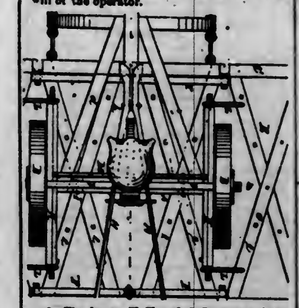
Brief.—On flanges on the vertical edges of the platen slide grooved blocks, united by a bar extending over the face of the platen. In its upward movement it presses down the clamping-fingers, and pushes off the hand of the operator; in its downward movement it meets a pin extending at right angles from the fingers, and thus tilts them from the platen.



1. The combination of the sliding or reciprocating feeder E, provided with mechanism for actuating it, as described, with the printing-press or bed C and platen A, arranged and to operate as set forth.

2. The combination of the feeder K, provided with mechanism for actuating it, as described, with the platen A and bed C and one or more sheet holders or clamps, L, as specified, arranged and connected with the bed as set forth.

160,334. CANDLESTICKS. Wells Kilburn, Napa City, Cal. [Filed Jan. 30, 1875.]



Brief.—The cross-wire presses against and raises the candle when the movable tube is raised. The tube can be entirely removed by lifting it so that the cross-wire passes out between the spring-jaws.

An improved candlestick, formed by the combination of the spring-jaws B and the loose tube C, provided with a cross-wire, *c*, in its lower part, with each other and with the base A, substantially as herein shown and described.

160,335. SULEY-HARROWS. Jos. Kimball, Pleasant Home, Neb. [Filed Jan. 6 1875.]

Brief.—The harrows are in sections, and hinged together longitudinally, and supported by levers resting upon the axle-tree of supporting-wheels. The driver's seat is so arranged as to act upon the levers, and these in turn raise the harrows from the ground at the will of the operator.

1. The levers H H and J J, arranged to operate with the bars K, rods L, harrows E E, axle A, and wheels B B, substantially as described, and for the purpose specified.

2. The driver's seat, combined with the levers H H and J J, bars K, rods L, harrows E E, axle A, and wheels B B, substantially as described, and for the purpose specified.

160,336. SEAL-LOCKS. Jacob Kinser, Pittsburg, Pa., assignor to himself, D. M. Watt, Robt. Pitcairn, and John J. Torley, same place. [Filed Sept. 29, 1874.]

1. The guides B' B'', arranged in line with the mortise in the flange D' of the hinged lid, in combination with the bolt B, hasp P, and spring-catch, substantially as set forth.

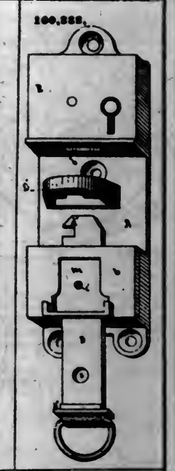
2. In the hinged lid D, the flanges *a'*, at the sides of its seal-opening, which, when the lid is closed, project inwardly, or cover a portion of the seal-seat of the lock-case, in combination with recesses *a''* in such flanges at suitable intervals, substantially as and for the purposes set forth.

3. The studs *c'*, for supporting the seal from below, in combination with the recess *c''*, substantially as described.

4. The bolt-B, in combination with a catch, *a'*, for locking it in one position, so as to lock the door, a loop and catch, *b b'*, for fastening it in another position, so as by engaging a hasp, P, to fasten the door without locking, and such bolt having a third position where it neither locks nor fastens the door, substantially as set forth.

5. As a new article of manufacture, a metallic seal-holder for seal-locks, having a distinguishing mark or design stamped or engraved thereon or therein, substantially as set forth.

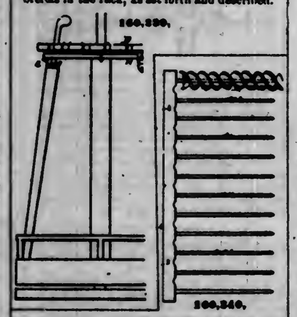
6. As an imperforate or finely-perforated sheet-metal key-hole protector, arranged as a part of the seal between the frangible plate and the key-hole, and which, as a part of the seal, shall be broken or destroyed in the removing of the seal, substantially as and for the purposes set forth.



160,337. SEAL-LOCKS. Jacob Kinser, Pittsburg, Pa., assignor to himself, D. M. Watt, Robt. Pitcairn, and John J. Torley, same place. [Filed Dec. 10, 1874.]

1. A locking-bolt, spring-catch, and hinged lid, in combination with a seal-seat for holding a seal over both the head of the catch and the key-hole of the bolt, or over the catch alone, at the pleasure of the user, the said devices being arranged in or connected with a single case, and the bolt and catch working each independently of the other, substantially as set forth.

2. The hole *d*, through which to disengage the bolt-catch, arranged in the same seal-seat with the key-hole, in combination with a stop device to prevent the backward movement of the seal when slid forward so as to cover also the key-hole, substantially as set forth.



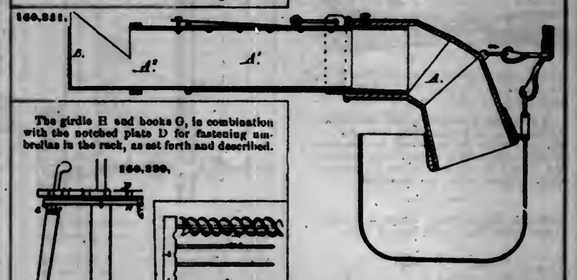
160,338. SEAL-LOCKS. Jacob Kinser, Pittsburg, Pa., assignor to himself, D. M. Watt, Robt. Pitcairn, and John J. Torley, same place. [Filed Dec. 15, 1874.]

In a seal-lock, the combination of two cases, one containing the lock, and the other the sealing devices, such lock and seal working independently of each other, and constructed with the staple for receiving the hasp between the cases, substantially as set forth, whereby the locking-bolt can be sealed with or without locking.

160,339. STANDS FOR HOLDING UMBRELLAS. Leonard B. Ladd, Philadelphia, Pa. [Filed May 6, 1874.]

Brief.—The umbrellas are held in the notched disk by means of a locked girdle.

The girdle H and hooks G, in combination with the notched plate D for fastening umbrellas in the rack, as set forth and described.



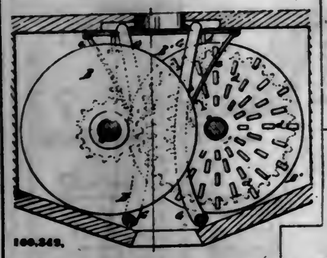
160,340. MORTISING-MACHINES. Washington Irving Ludlow, Washington, D. C. [Filed Aug. 7, 1874.]

Brief.—Guide-pins in a frame are used for a corresponding hole in an auger, to bore in the jambs of doors and windows for the corrugations of the hinges.

The device for forming hinge-mortises herein described, consisting of a plate with guide-pins, which may be secured between the door and seat, and a hollow cutting-tool working upon said guide-pins, substantially as herein set forth and specified.

160,341. FRUIT-GATHERERS. M. McDevitt, Hampton, Va. [Filed Jan. 9, 1875.]

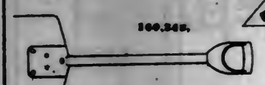
Brief.—An adjustable tube is provided at the upper end with a device for separating the fruit from the branch. It passes down the tube to the ground or lower extremity of the tube, which is curved and cushioned, to check the descent of the fruit, and prevent injury by bruising. The fruit is received into a basket, and a handle is mounted upon a sliding ring, so that the picker can be manipulated with either hand.



1. The fruit-gatherer herein described, composed of two or more tubes sliding one within another, provided with means for securing the same in any desired adjustment, and having a suitable covering device, B, at its upper extremity, as and for the purposes described.

2. The fruit-gatherer herein described, having the curved body, cushioned as shown, to prevent injury to and check the speed of the approaching fruit, as shown and specified.

3. The movable handle D, adapted to serve on the body A, and allow the operator to change hands at will, as specified.



160,342. CORN-SHELLERS. Saml. H. Moore, Chicago, Ill. [Filed Feb. 16, 1875.]

Brief.—The ear descends between the overlapping portions of two sheller-disks, held toward each other by springs, and is held in position by two pivoted toothed bars retained against ear by springs.

160,842.

The combination, substantially as described, of the toothed disks B B', the hinged toothed arms or jaws C C, and the springs *b b* and *c c*, for the purpose herein set forth.

160,843. SHOVEL. Isaac Monroe, Peabody, Mass. (Filed Feb. 12, 1875.)

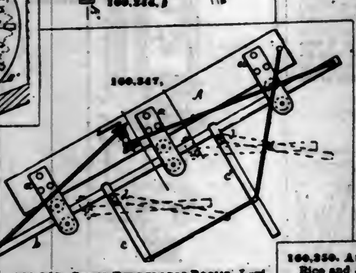
Brief.—The blade is struck up from a sheet of metal, and the handle is made of wood, with a broad foot-piece, to which the blade is strongly riveted, without strengthening-straps upon either side.

As an improved manufacture, the shovel having a sheet-metal blade and a wooden handle furnished with a foot, and arranged with and fixed to said blade by rivets or fastenings, all as specified.

160,844. RUBBER-COVERED SNAFFLE-BITS. F. J. Nodine, Brooklyn, N. Y., assignor to C. Nodine, A. Nodine, and R. H. Nodine, same place. (Filed Feb. 17, 1873.)

A snaffle-bit partially covered with conical sections A A, of rubber, which leave the middle joint of the bit uncovered, but terminate at their outer ends in bulbs *a*, which embrace the loops *b* at the ends of the bit, substantially as herein shown and described.

160,845. BALE-TIES. Galen N. Osgood, Savannah, Ga. (Filed July 17, 1874.)

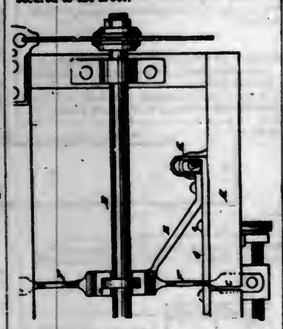


A cotton-bale tie of hoop metal, one end having half mortises cut into its edges to coincide with cuts made into the edges of the other end, forming tenons to be bent around through the half-mortises when lapped, locking them together, substantially as herein set forth.

160,846. TOPS FOR SALT AND PEPPER BOXES. George D. Paul, Brooklyn, E. D., N. Y., assignor to Paul Brothers & Co., New York city. (Filed Oct. 10, 1874.)

The perforated top of a pepper-box, in combination with an agitator provided with thumb-piece B and crushing points C, sliding upon a rod, D, and returned by a spring coiled around said rod, as and for the purpose specified.

160,846.



160,847.

160,847. SIDE-RUDDERS FOR BOOMS. Levi W. Pond, Eau Claire, Wis., assignor of one-half his right to Eau Claire Lumber Company, same place. (Filed July 13, 1874.)

The combination of the boom A, movable bar *b*, and rudders *c c'* with suitable operating devices, substantially as and for the purposes specified.

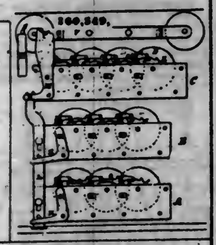
160,848. SAW-MILLS. Levi W. Pond, Eau Claire, Wis., assignor of one-half his right to Eau Claire Lumber Company. (Filed June 16, 1874.)

Brief.—The arbor of a circular saw is made adjustable longitudinally by means of a vibrating adjustable bar swung upon a collar secured to the arbor.

1. The pivoted bar F, in combination with the nut M and screw-shaft L, substantially as and for the purpose described.

2. The combination of the movable or spring bar F with the sliding bar G, brace or bar H, lever K, and stationary saw-guide O, substantially as and for the purpose set forth.

3. The combination, in a saw-frame, of the saw-mandrel B, provided with one or more collars, *c*, with the movable or spring bar F, nut M, screw-shaft L, sliding bar G or H, and lever K, substantially as specified.

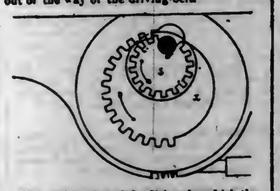


160,849. REGISTERING-MACHINES. Charles B. Rand and John T. Dupont, New York, N. Y. (Filed Jan. 11, 1875.)

Brief.—Two or more sets of registering-wheels so arranged that when any number is registered on either dial it will also be registered on a third dial for totals.

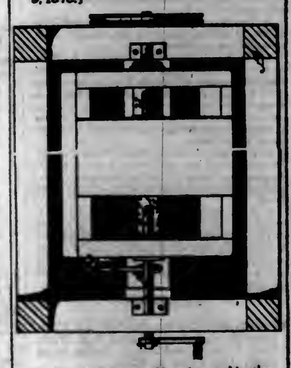
1. The combination of two or more special ranges, A B, of tallying apparatus, with another range, C, connected with the apparatus, for working them in such manner that it tallies for each tally of the special ranges, substantially as specified.

2. The combination of the bar L with the bell-cranks K of two or more ranges of special tallying apparatus and the lever M of a range for totals, substantially as specified.



3. The revolving pin S and notched bar V, in combination with the notched lever M of the tallying-range C, substantially as specified.

160,849.



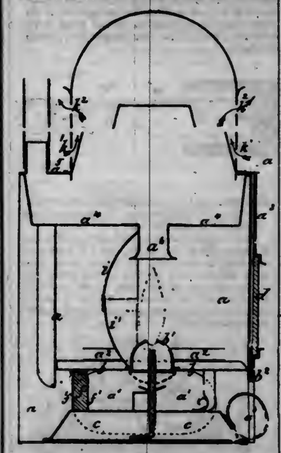
160,850. ADJUSTABLE SAW-BENCHES. D. H. Rice and J. W. Markland, Lowell, Mass. (Filed Jan. 13, 1875.)

Brief.—The saw is carried by a frame attached to a revolving disk moved by worm-gears, for the purpose of raising and lowering it. A stationary annular disk provided with internal gear, which acts upon a pinion attached to the frame carrying the journal-boxes of the saw-arbor, serves to keep the frame out of the way of the driving-belt.

The combination of the disk *x*, by which the saw is raised and lowered, with the revolving disk S and mandrel *c*, substantially as described.

160,851. MIDDLINGS-PURIFIERS. Jas. Rigby, Springfield, Ohio, assignor of one-half his right to T. A. Farr, same place. (Filed Jan. 9, 1875.)

1. In a middlings-purifier, the combination with a covered bolt-sash having an axially-oscillating motion to throw its contents from side to side, of an air-admitting tube or inlet at the head, and an air-exhausting tube or passage at the tail end of the sash, whereby a current of air is drawn over the whole surface of the material therein from the head to the discharge end thereof, substantially as and for the purpose herein specified.



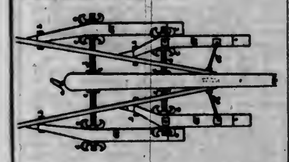
2. In a middlings-purifier, the combination, with an axially-oscillating sash, B, and driving-crank *d*, of a connecting-rod, D, provided with a longitudinal slot playing upon the pivot, which connects it with the sash at the close of each oscillation, substantially as and for the purpose herein specified.

3. In a middlings-purifier, a clearer, G, constructed and arranged as described, in combination with an axially-oscillating bolt-sash, B, substantially as and for the purpose herein specified.

4. In a middlings-purifier, the combination of an axially-oscillating covered bolt-sash, B, a sliding clearer, G, an exhaust-pipe, H, exhaust-fan I, and air admitting and feeding tube L, substantially as and for the purpose herein specified.

160,852. LAMPS FOR LIGHTING AND HEATING. Edwd. A. Rippingille, Holborn, England. (Filed Dec. 14, 1874.)

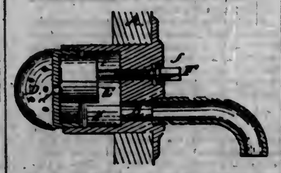
Brief.—The wooden hinge is a poor conductor of heat. The glazed slide acts as a catch to hold the lamp from horizontal movement. One-half the reflector is attached to the lamp-body, and the other to the cone-plate.



1. The cone-plate *b*, combined with the oil-reservoir *c* by hinging it to a piece of wood or other non-conducting material, *f*, in manner substantially as herein shown and described.

2. For forming the front of the lamp-stove, a glazed slide, *d*, in combination with grooves *e' f*, in manner substantially as herein shown and described.

3. The combination of the reflectors *i i* with the lamp for heating and lighting, in manner substantially as herein shown and described.

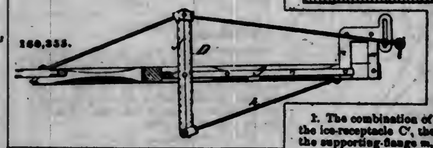


160,853. CULTIVATORS. Peter D. Roquemore, Pascola County, Tex. (Filed Nov. 9, 1874.)

Brief.—Standards pivoted to handles, allowing change of pitch by slots in the beam; the center standard removable.

The combination of beam A, having diagonal slots *a a*, adjusting-braces *d*, adjusting cross-rods and nuts *b c*, and standards *e*, pivoted to the handles, all arranged and operating substantially as set forth.

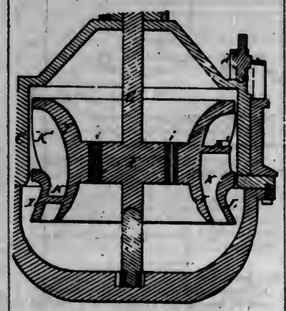
160,854. FAUCETS. J. D. Seagrave, Worcester, Mass. (Filed Sept. 26, 1874.)



The faucet described, consisting of the case B having a chamber, E, and pad or valve within said chamber operated by screw F with a key, in combination with the diaphragm D and strainer J, constructed and operating in the manner and for the purposes above set forth.

160,855. DRAFT-EQUALIZERS. L. J. Seely, Waldron, Ind. (Filed Jan. 25, 1875.)

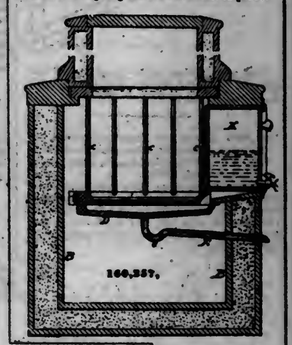
Brief.—Device for throwing the line of draft to one side of the beam for three horses.



The improved draft-equalizer for plows, &c., composed of a slotted and rigidly supported and braced clevis, B, at the front end and land-side of the plow-beam, with adjustable draft-eye C, in combination with the strengthening draft and stay rods *a' b*, clevised to laterally-braced cross-bar D and bolted to front and rear ends of beam, substantially as specified.

160,855.

160,856. WATER-WHEELS. S. Sherwood, Independence, Iowa. (Filed Apr. 3, 1873.)

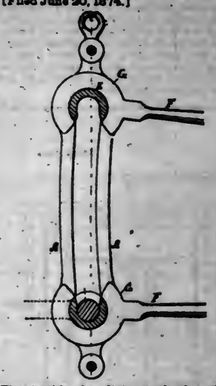


Brief.—The buckets are provided at their lower ends with an inclosing rim, and thereby enabled to receive a very large volume of water, which, as it passes into and through the wheel, is confined in a small space as it approaches the bottom of the wheel, and is finally delivered in a very small volume, compared with that at which it enters. By this means it is claimed the full force and power of the water is obtained.

In combination with the wheel I I J, the buckets K, formed with a very large broad mouth or receiving-end, and a small delivery or bottom-discharge end, and blades K' placed in a very gradual and downwardly-curved position on the wheel, the top portion of the blades being separated some distance apart, and the lower ends brought nearer together and protected by an inclosing flaring rim or band, L, as and for the purposes described.

160,857. REFRIGERATORS. Isaac Silsby, Georgetown, D. C. (Filed Sept. 30, 1874.)

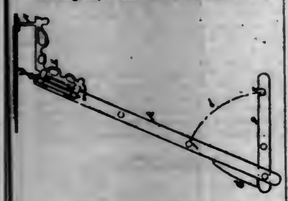
Brief.—The ice box, having open sides and top, and a sealed drip-tube, is suspended in an air-chamber, and covered by a detachable packed air-chamber. The refrigerator is ventilated by repeatedly closing the hinged door, whereupon foul air is forced out of a self-closing valve. The water-cooler is removable from the side of the refrigerator, and has under it, and attached to it, a flue, for the passage of cold air to the cooler, and the return of condensed moisture to the drip-pan, which acts also as a spring to hold the cooler in place.



160,857.

1. The combination of the chamber B with the ice-receptacle C', the same consisting of the supporting-flange *m*, bars *c c*, drip-bottom D, with sealed drip-pipe E, surrounding air-chamber K, and superposed air-chamber G, as and for the purpose described.

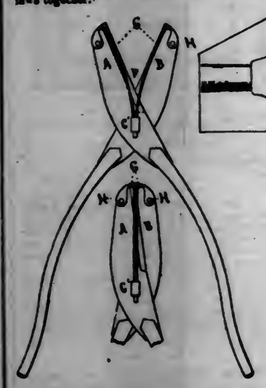
2. The combination, with the chamber B, of the lid G and self-closing valve I, whereby, in closing the lid, a current of air is forced through the chamber B, and the chamber immediately closed, as and for the purpose set forth.



160,858. REVERSING-LINKS FOR STEAM-ENGINES. John Simpson, Meadville, Pa., assignor to Dick & Church, same place. (Filed June 20, 1874.)

The combination-links A, having slots, united to a block, B, and made circular at each end, in combination with the eccentric rods F, having notched pivots E, and the collar G, as and for the purpose specified.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON



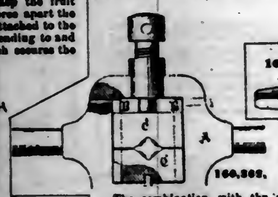
160,340. CLOTHES-FRAMES. C. F. Smith, Torrington, Conn. [Filed Jan. 25, 1875.]

The combination, with frame A, of the bracket L, jointed thereto, and having stud N, as and for the purpose described.

160,360. GRAPE AND FLOWER PICKERS. L. B. Snow, Cleveland, Ohio, assignor to himself and L. Grant Meddaugh, same place. [Filed Mar. 21, 1874.]

Brief.—The springs both grasp the fruit when severed, and serve to force apart the jaws of the implement, being attached to the extremity of each jaw, and extending to and being secured by the pivot which secures the jaws together.

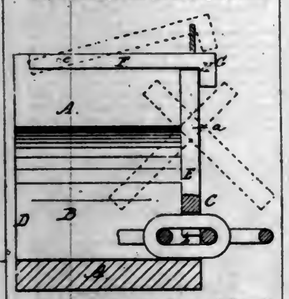
First, the blade A; secondly, the blade B; thirdly, the device *c*, which performs the double function of a pivot for the blades, and a clamp in which the spring is secured; fourthly, the spring G, formed of a single piece of metal, and performing the double office of holding open the blades at exactly the required distance and grasping the stem, as and for the purpose described.



160,361. PORTABLE DRILLING-MACHINES. Michael Stephenson, Stratford, Canada. [Filed Dec. 10, 1874.]

Brief.—The block G embraces the two drill-spindles, and constitutes a nut for the feed-screw, that is rotated by hand through the medium of the crank on a counter-shaft, and the two spindles are rotated by a crank through the medium of the shaft and two pairs of beveled gears.

The combination, in a portable hand-drill, of a pair of vertical drill-tools having the bevel-gear wheels D D, the horizontal shaft B having the pinions C and journaled in the upper ends of the frame, the collar or block G embracing the drill-spindles, and the vertical adjusting-screw H, the whole being constructed and arranged for operation as herein shown and described.



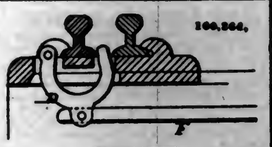
160,362. SCREW-PLATES. Geo. R. Stetson, New Bedford, Mass. [Filed Jan. 18, 1875.]

Brief.—Pivoted ways receive the dies. A stud enters, when the dies are advanced by the adjusting-screw, a socket in one of them, and serves to fasten the parts in working position.

The combination, with the solid integral screw-plate A, hinged guides B, separate from but hinged to the die-plate, and dies C, of the stud F, entering a socket in the rear of one die, and the screw-bolt E, working through a nut of die-plate against the other die, as and for the purpose specified.

160,363. CABLE-STOPPERS. D. G. Thompson, Waltham, Mass. [Filed Aug. 5, 1874.]

The gate E, pivoted to the stand through which the chain passes, and having at its lower end a slot, *b*, as shown, in combination with the pivoted lever F, for locking the upper end of the pivoted or swinging gate in position when it has interlocked with the chain, substantially in the manner herein shown and described.



160,364. SWITCH-LOCKING DEVICES. John M. Toucey and Wm. H. Smith, New York, and W. Buchanan, Yonkers, N. Y. [Filed Jan. 7, 1875.]

Brief.—The locking device is a U-shaped bolt pivoted at one arm, so that the other rises by a longitudinal movement of the connecting-rod, and performs the office of a locking-bolt.

1. The hinged bolt D, for the purpose of locking switching-rails, substantially as above set forth.

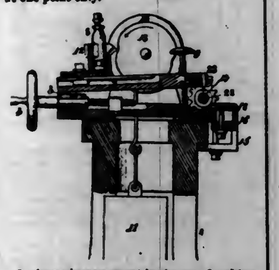
2. The combination of the hinged bolt D with rod F and a suitable operating-lever, for the purpose above set forth.

160,364.

160,365. BIT-STOCKS. William Tucker, Fiskedale, Mass. [Filed Sept. 19, 1874.]

Brief.—The bit-stock is provided with a central V-shaped projection within a flat socket, for holding auger-bits having corresponding V-shaped notches in the flat holding ends or shanks of the same.

1. A stock or holder, H, having a central V-projection, *y*, within the inner end of a large flat socket, *x*, and a clamp-screw, *z*, in the same longitudinal plane, substantially as herein illustrated and described, for the purpose specified.

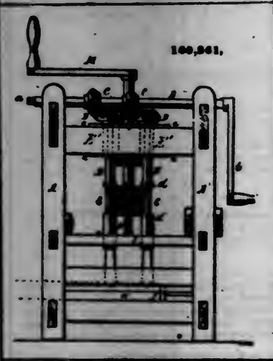


2. The stock or holder H, Figs. 1 and 2, having a flat socket, *x*, projection *y*, and clamp-screw *z*, at one end, and a square, *w*, at its other end, for application to the head of an ordinary brace, as and for the purpose herein set forth.

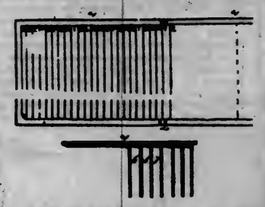
160,365.

160,366. MACHINES FOR TURNING PATTERN-CAMS. William Tucker, Fiskedale, Mass. [Filed Nov. 21, 1874.]

Brief.—The tool-post, with cutter, rests and is adjustable on the frame, which is hinged at one edge to the slide, while the other edge rests through the medium of the knife-edge in the rotating pattern-cam, which latter differs from others in use in that it is mainly cylindrical, having an irregularity of surface at one point only.



1. As an improvement in the art of making pattern-cams, the process of producing a series of uniform depressions or forms by operating the cutting-tool mechanically through the medium of a rotary cam, 22, having a single depression or form of the required shape or depth, substantially as herein described.



2. The combination of the rotary shaft 19, the generating-cam 22 thereon, constructed with a single depression or form of a given shape or depth, the treadle-edge 23, and the vertical feed-screw 9, with a weighted tool-carriage or its equivalent, for manipulating a cutting-tool, 12, in the manner herein set forth.

3. The combination, in an engine-lathe, of a weighted tool-carriage, provided with a treadle-edge, 23, at the rear end of its upper member, a generating-cam, 22, supported at the rear end of its lower member by a recessed journal-box, 18, a shaft, 19, supported against longitudinal displacement, and on which the generating-cam 22 and journal-box 18 are adapted to slide, and gearing 24 25 26 for rotating the shaft and generating cam in unison with the lathe-spindle, substantially as herein shown and described, as means for cutting a pattern-cam on the periphery of the face-plate by means of the lathe-tool, in the manner set forth.

160,361.

160,367. INDEXES. Chas. Virgo, Bradford, Yorkshire, England, assignor to Arthur W. Carter, Newton, Mass. [Filed Nov. 12, 1874.]

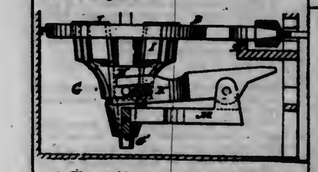
1. An index-book constructed of leaves so arranged that their front edges recede from each other a suitable distance, so as to present to view one or more letters of the alphabet at their head-lines, which may be read from right to left, and vice versa.

2. A series of sheets attached at different points to a base or support, so that when folded down either to the right or left in the same plane with the base their free edges will recede from each other and expose their index character.

160,368. WATCH-CASE SPRINGS. C. W. Wadsworth, Peekskill, N. Y. [Filed Nov. 30, 1874.]

Brief.—A watch-case spring made in two parts, the movable part being adjustable in corrugations in the rigid holder.

The combination, with watch-case, of the rigid holder A and untempered spring B, the former being end-corrugated and having lugs *a*' *a*' with downwardly-inclined apertures, arranged as and for the purpose specified.

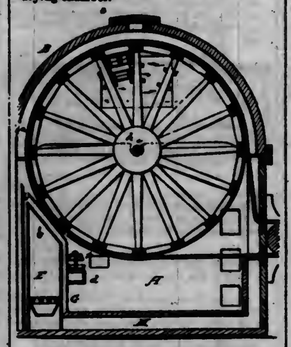


160,369. TOY ARROW-SHOOTERS. John H. Wales, Milford, Mass. [Filed Dec. 28, 1874.]

The toy for shooting arrows formed of the tube A, provided with an open ring, B, upon one side and the rubber band C, substantially as herein shown and described.

160,370. STOVE-GRATES. William Walsh, Albany, N. Y. [Filed Jan. 20, 1875.]

Brief.—The arms have a vertical movement independently of the annular surrounding portion of the grate.



1. The combination of the circular horizontally-oscillating part B, and the vertically-movable part C, having legs I formed on its hub H, and projecting up in the spaces between the radial arms E of part B, as shown and described, to operate as specified.

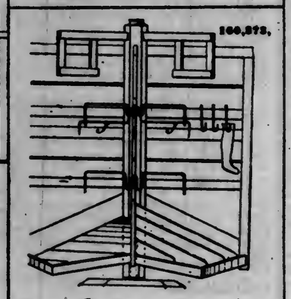
2. The combination of slotted lever K, fulcrum-plate M, the vertically-adjustable grate C, having hub H, provided with pins Q and the supporting-bar O, as shown and described.

160,371. FRUIT-DRIERS. Thos. C. Walter, San Francisco, Cal. [Filed Jan. 30, 1875.]

Brief.—A chamber surrounding the furnace and discharging the heated air at the top, and a flue to conduct the same air back from the drying-chamber.

1. The case A B, furnace E, chamber *b*, and flue H, in combination with steamer *f* and pipe or chamber *d*, all constructed and arranged as and for the purposes herein specified.

2. The combination of the fruit-drier case A B, furnace E, exterior shell C, forming hot-air chamber *b*, and the flue H, as and for the purposes herein set forth.



160,372. PLANING-MACHINES. Chas. P. S. Wardwell, Lake Village, N. H. [Filed Mar. 16, 1871.]

Brief.—By means of guide-rods pivoted to the middle of the table, and sliding in ways in the bed, the table can be adjusted independently at either of its edges, for varying the thickness of either edge of the clapboard without changing the thickness of the other edge.

1. The table B, when provided with means for independently adjusting either of its edges, in order to vary the thickness of either edge of the clapboards without changing the thickness of the other edge thereof, substantially as herein specified.

2. The guide rods or pins C C, pivoted to the middle of the table B, and sliding in holes or ways in the bed A, for keeping the table in position without interfering with the independent adjustment of its edges, substantially as set forth.

160,372.

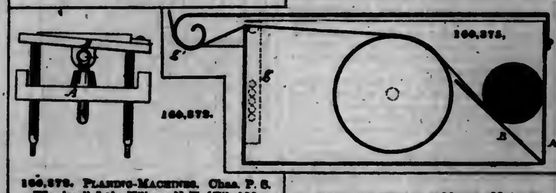
160,373. REVOLVING RACKS FOR HOLDING STOCKINGS. Danl. K. Wertman, Shenandoah, Pa. [Filed Nov. 30, 1874.]

The hooks I and pins J, in combination with a revolving rack, for the purposes described.

160,374. MECHANICAL TELEGRAPH-SOUNDERS. Martin F. Wessmann, Cherry Hill, N. J. [Filed May 19, 1874.]

Brief.—"Snapper sound," the sound being produced by the snapping of a "buckle" or dent in the spring.

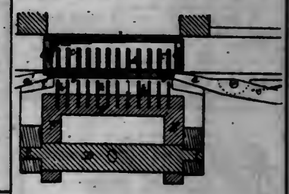
1. A mechanical sounder, composed of an indented elastic metallic strip, A, and a base, B, the strip being attached to the base at one end, while the other end is free to move, substantially as and for the purpose herein specified.



2. The sounder-base B, having inclosing sides *b b*, or their equivalents, substantially as and for the purpose herein specified.

3. The finger-guard C on the end of the metallic sounder-strip A, substantially as and for the purpose herein specified.

160,375. MACHINES FOR APPLYING PASTE TO WALL-PAPER. John Worley, Cleveland, Ohio. [Filed Dec. 30, 1874.]

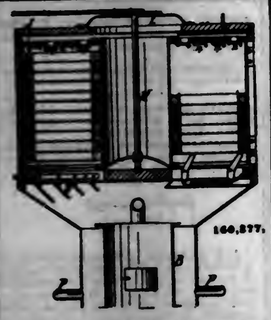


The combination of the box A, the partition B, the scraping-edge of the front wall of the box, and the adjustable lid with the latch *g* and the projecting-bended front, all constructed and combined to operate substantially as described.

160,375.

160,376. MACHINES FOR MAKING MATCHES. McClintock Young, Frederick, Md. [Filed Aug. 12, 1874.]

Brief.—The matches are forced from the plates in which they were dipped, and drop into proper receptacles ready for boxing, &c.



1. In combination with the plates holding and carrying a series of matches, the sliding frame carrying a similar series of plungers, and the tray or box, arranged and operating as and for the purpose described and represented.

2. In combination with the plates, the guiding-grooves and spring-dogs for bringing and holding the plates in proper position while the plungers are driving out the matches, substantially as described.

160,377. FRUIT-DRIERS. H. Julian Allen, Sturgis, Mich. [Filed Aug. 22, 1874.]

Brief.—By rotation of the radial chambers, each one can in turn be brought opposite the door in the inclosing-cylinder, and communication with the heating-chamber cut off and fresh fruit introduced. The moist air is exhausted from the dome over the drier, and forced into the furnace. The condensed vapor flows from the pipes connected with the fan through a drip-pipe into a close vessel.

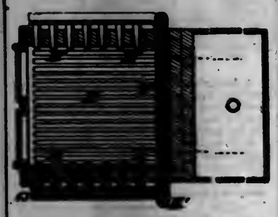
160,877.

1. A series of radial chambers, rotating upon a common center post, and arranged within an inclosing-cylinder, all of said radial chambers, except the one adjoining the door, communicating with the heating-chamber below, and a space above, substantially as and for the purposes set forth.

2. The combination, with the revolving radial chambers, of the openings *m*, communicating with the space *J*, and dampers *n* and *p*, as and for the purpose set forth.

3. The combination, with the revolving radial chambers and the inclosing-cylinder, the devices herein named, for rotating said radial chambers, consisting of the disk T and lever V, as set forth.

4. The door section of the inclosing-cylinder, in combination, with the radial chamber in connection therewith, said radial chamber having no communication with the heating-chamber, and being cut off from communication with the space above by the cover or damper *p*, substantially as described, and for the purpose specified.



5. The combination, with the revolving radial chambers, open space J, and dome L, of the pipe M, rotary exhaust-blower N, pipes O P P, drip-pipe *s*, and closed reservoir S, all constructed and arranged substantially as described and shown.

6. In combination with the door section and a revolving or radial chamber, into which the door opens, the devices or spring-latches, in connection with the devices for raising the fruit-screens, substantially as specified.

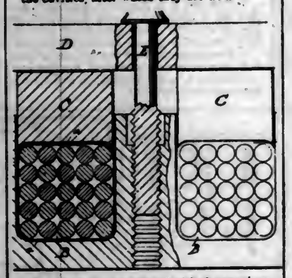
7. In combination with the heating-chamber E, the revolving radial chambers, and inclosing-cylinder, the series of sliding dampers D, to close the bottom of said radial chambers, and the dampers *n* and *p* for closing the top of the same, as set forth.

8. In combination with the pipe O, the drip-pipe *s* and closed reservoir S, substantially as shown.

160,878. FURNACES FOR CONSUMING SMOKE. Daniel Arguebright and Wm. Allensworth, Troy, Ohio. [Filed July 29, 1874.]

The combination of the central air-blast pipe D, having the throttle-valve I, the exposed downwardly-projecting and boiler-encircling pipes E E', the portion F F', crossing the throat of the furnace above the bridge, and exposed at that point and forming a check to the highly-heated gases, and the exterior flask-pipes G G', having nozzles H H' inserted obliquely downward through the wall of the fire-chamber, as and for the purpose set forth.

160,879. WATER-METERS. Phinehas Ball and Hezekiah Pitts, Worcester, Mass., assignors to Union Water-Meter Company, same place. [Filed Aug. 8, 1874.]

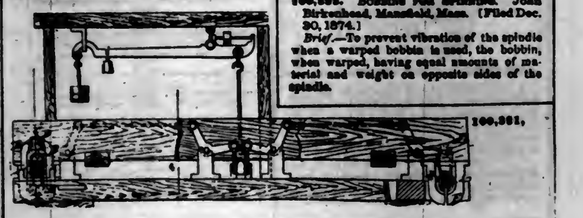


Brief.—To arrest the movement of the pistons at the end of stroke, the connecting piston-rods are provided with lugs, which abut against a fixed leg on the interior of the casing.

In combination with the double-acting piston B, the stop *g* and legs *f f*, arranged substantially as and for the purpose described.

160,880. CIGAR-BUNCHING MACHINES. Jno. Battin, 2d, Salem, Mass. [Filed Aug. 18, 1874.]

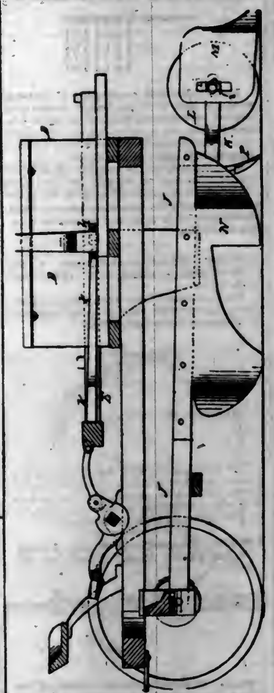
Brief.—The cigars to be bunched are placed in two cavities in a bed-plate, which are provided with the tying-ribbons. By means of a screw two plungers compress the cigars in the cavities, after which they are tied.



The block A, constructed with the openings B, for the reception of the cigars to be bunched and pressed, in combination with the followers C C, horizontal bar D, resting on the follower, and the vertical screw E, passing through the bar and into the block A, for pressing the cigars, as and for the purpose described.

160,881. PLATFORM-SCALES. Luther D. Berry, Moline, Ill., assignor of one-half his right to G. M. Sargent, Des Moines, Iowa. [Filed Dec. 10, 1874.]

Brief.—Iron arches project downward from the platform and upward from the base at each corner of the scales. Knife-edges at the ends of the levers, which are of the second kind, rest in the lower of two links hung from the base-arches, and the platform-arches rest in the lower of two links hung from the levers, thus allowing free horizontal vibration. The suspension devices are prevented by their construction from accidental disconnection.

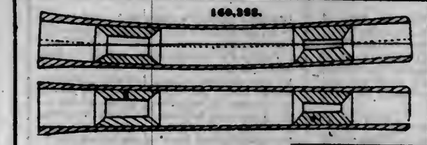


The combination, with the levers A A and platform-sticks E E of a platform-scale, of the arches B B and F F, links C C and G G, pins D D, and yokes H H and J J, all constructed and arranged substantially as and for the purposes herein set forth.

160,881.

160,882. CORN-PLANTERS. Creston Berryman, Juda, Wis. [Filed Jan. 2, 1875.]

Brief.—The hopper is made in two compartments, one of which has a slide reciprocated through it for planting ordinary seed, while the other has a pivoted disk worked by a pawl for planting pumpkin-seed. Pivoted to the axle are two sets of longitudinal beams, to which are attached coverers. Secured to the beams, and projecting ahead, are slotted frames, in which are adjustably journaled gage-wheels. In front of the gage-wheels, and upon their journals, are adjustably secured dividers for clearing away the rubbish.



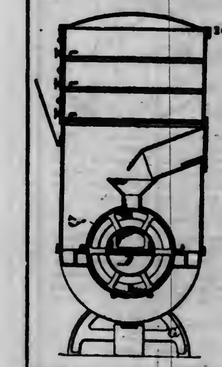
1. In combination with a corn-box, D, having a pumpkin-seed compartment, the revolving ratchet dropping-wheel k and pawl *l*, arranged to operate substantially as and for the purposes herein set forth.

2. The dividers M, provided with slot *s*, in combination with wheels L, bolt *s*, and adjustable frame K.

3. The combination of the frame J J, pivoted to the axle of the adjustable gage-wheel L, with dividers M, shovel P, dividers N, and coverers O, all constructed substantially as and for the purposes herein set forth.

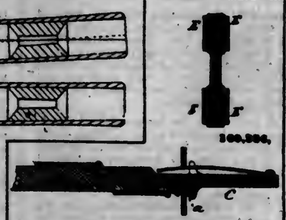
160,883. BOBBINS FOR SPINNING. John Birtwhead, Mansfield, Mass. [Filed Dec. 30, 1874.]

Brief.—To prevent vibration of the spindle when a warped bobbin is used, the bobbin, when warped, having equal amounts of material and weight on opposite sides of the spindle.



160,886.

The improved quill-bobbin, substantially as described, consisting of a single tube of uniform bore without heads, and not only having each of its two adhesive spindle-bearings arranged at or about the same distance from the next adjacent end of the bobbin, that each bearing is from the center of the bobbin, but having an open chamber extending from each bearing to the next adjacent end of the bobbin, and constituting part of the bore, all as represented.



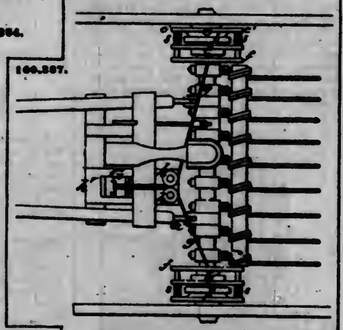
160,884. COFFEE-ROASTERS. Geo. Boyd, Philadelphia, Pa. [Filed July 31, 1874.]

Brief.—The location of the grate as indicated insures thorough utilization of the heat. Bread or similar substances placed on the trays above the roaster are impregnated with the flavor of the coffee.

The combination of the rotating cylinder A, its surrounding screen B, and the fire-grate D, arranged within the cylinder, as set forth.

160,884.

160,886.



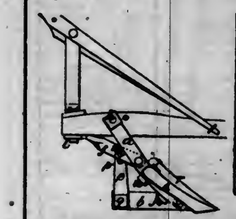
1. The spindle of the damper-plate, constructed with the notch *a*, combined with a spring arranged to enter and bear against the edge of the perforation in the pipe, substantially as described.

2. The combination of the damper-handle C and non-heat-conducting pads E, arranged in recesses in said handle each side of the center, substantially as described

---

160,887. HORSE HAY-RAKES. S. H. Rushnell, Fairport, N. Y. [Filed Jan. 26, 1875.]

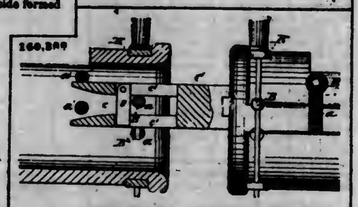
Brief.—The rake discharges its load by means of spring friction-clutches engaging with clutching-plates on the hubs of the wheels.



160,887.

In a horse-rake having the teeth fast on the axle, the frictional clutch-sections *b c*, armed collar *e*, connecting-rod *f*, rods *d*, and springs *a*, combined with chains *g* and treadle G, substantially in the manner and for the purposes set forth.

160,888. PLOWS. William Bradford, Valdosta, Ga. [Filed Dec. 7, 1874.]



Brief.—The standard and land-side formed and braced as shown.

The brace *f*, combined with the heel-foot-bar *e*, the heel-bar *c*, and the beam, with the three points of attachment *g m l* of these parts arranged above the plowshare, as described, whereby the pivots of the heel-bar *c* and the land-side *b* are relieved from the strain upon the foot-bar and its brace.

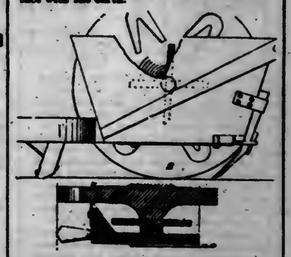
160,889. STOVE-PIPE DAMPERS. R. Moss Brockenridge, West Meriden, Conn. [Filed Dec. 21, 1874.]

Brief.—The spring holds the notch firmly in place. The pads may be of cork or other non-conductor.

160,889.

160,890. CAR-COUPLINGS. B. F. Cadenhead, Bolingbroke, Ga. [Filed Aug. 21, 1874.]

Brief.—To uncouple it is necessary to remove the draw-pin B', which releases the coupling-pin, so that it may be withdrawn. The link is held horizontally by a pin, E, passed through either of the holes *a'*.



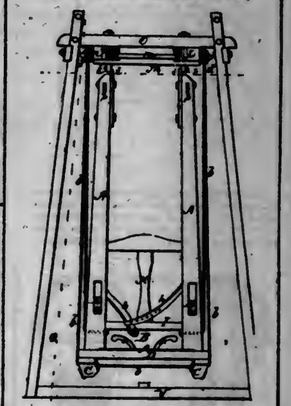
1. A car-coupling link, C, having at each end slots *a' a'*, and pivoted drop-catches D D, combined as and for the purpose described.

2. The combination, with cross-bar B, of cross-pieces B' B', and draw-pin B', combined as and for the purpose specified.

3. The combination, with the coupling-link C and the draw-head, having rear perforations *a' a'* of the pruner-pin E, applied as and for the purpose described.

160,891. COTTON-SEED PLANTERS. B. F. Cadenhead, Bolingbroke, Ga. [Filed Nov. 4, 1874.]

Brief.—Journaled within a seed-box, having slotted bottom, front, and back, is the seed-wheel, provided with recesses at regular intervals between the periphery and the hub, and having arms passing through the hub on each side, to work the seed to the bottom. Motion is imparted to the seed-wheel by contact with the earth.



1. A seeder provided with a single seed wheel, B, recessed as shown, journaled and revolving in the seed-box and on the ground, thus both supporting the whole and distributing the seed in the manner described.

2. A seed-wheel for cotton-planters, having the seed-recesses arranged at regular intervals between the periphery and hub, as shown and described.

3. A recessed seed-wheel, journaled in the seed-box, and provided with a stirrer on each of its side bosses, as shown and described.

4. The combination, with a front furrowing-plow, of a wheel, B, recessed as shown, and which distributes the seed laterally in the furrow made, and on opposite sides of said furrow, as shown and described.

160,892. SWINGS. Cornelius H. Cain, Jeffersonville, Ind. [Filed Jan. 19, 1875.]

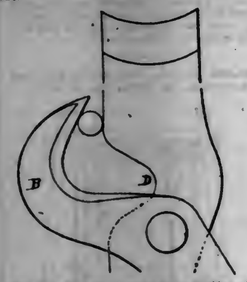
1. The combination of the slotted tapering hangers A A, with inclined tie B, seat I, stays G, back H K, and arms E, all constructed substantially as and for the purposes herein set forth.

2. The combination of the hangers A A, with seat attached thereto, tie B, having slots *a a*, treadle C D, rope *b*, and pulleys *d d*, all constructed and arranged substantially as and for the purposes herein set forth.

3. The combination, with the hangers A A, having bosts *i*, of the blocks L, tie-board M, axle *m*, washers *n*, pulleys *d*, and eyebolts *h*, all as and for the purposes set forth.

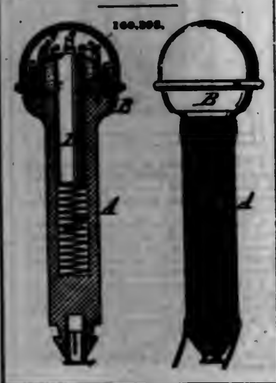
4. The combination of the head-block O, rests B, stationary blocks V, bar W, with a self-acting swing hung therein, substantially as herein set forth.

160,391. CALENDARS. John J. Conlon, New York, N. Y. [Filed Dec. 30, 1874.]



1. In a movable-card calendar, the combination of the day-cards C, having the names of the days printed on opposite sides and edges thereof, the month-cards D, having the names of the months printed thereon in a like manner, the numeral-cards E, with the numerals printed on both sides, each set being, respectively, wider than the one next succeeding, as described, and a suitable clip frame or case, B B, for holding and binding them together, attached to a backing, A, substantially in the manner shown, and for the purposes set forth.

2. In a movable-card calendar, the holder or case for the cards, composed of a back card, A, and the clips B B, said clips being constructed in the manner shown, with tongues *a a*, lower lip *c*, body *e*, and upper lip *f*, and attached by clinching to the back card, substantially as shown, and for the purposes specified.



160,392. PRUNING-SHEARS. Jeff. Chase, Orange, Mass. [Filed Dec. 19, 1874.]

Brief.—One blade of the shears carries upon its end, and in a direct line with it, a chisel-edge, and has a recess near the pivot. The other blade is the usual hooked and recessed one.

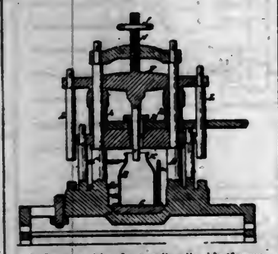
The described pruning-shears, consisting of the hooked blade B, and the blade A with the recess D, as specified, and the chisel *a* on the extremity of and in line with the blade A and the handle, all constructed as herein set forth.

160,393.

160,393. POLICEMEN'S TORCHES. Wm. H. Clark, J. W. Richardson, and John Foller, Washington, D. C. [Filed Jan. 2, 1875.]

Brief.—The igniter-ring is rotated by means of the pivoted handle, and ignites the matches. The stationary ring or cap is lined with non-conducting material, and obviates too rapid melting of the candle.

1. In a billet, the combination of the recessed candle tube or holder A, helical spring E, and ring or cap C, substantially as specified.



2. In a billet, the combination, with the aforesaid tube A, spring E, and ring C, of the match-holders *a* and igniter G, substantially as and for the purpose set forth.

3. The handle *c*, pivoted to the igniter-ring G, in combination with a torch, substantially as described.

4. The tube A, provided with a cylindrical recess at its upper end, and helical spring E, in combination with the screw-threaded cap B, ring C, provided with match holders *a*, and a match-igniter, G, substantially as and for the purpose described.

160,394. MACHINES FOR BOTTLING AERATED LIQUIDS. Henry E. Clinton, Seymour, Conn., assignor to the firm of John Matthews, New York, N. Y. [Filed Feb. 4, 1875.]

Brief.—The bottle stands on an adjustable bed-plate, and is clasped by a sectional safety-screen casing, which has arms that extend to and fit loosely around the standard, to permit the jaws of the casing to be swung to one side by means of the levers, which are connected to a block that slides in a slot. The filling-head and bar have each an opening, through which the liquid may pass to the bottle below, and in which the cork plunger works, to force the cork into the mouth of the bottle

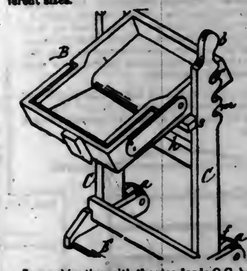
1. In a machine for bottling liquids the sectional safety-screen casing hinged to a support, which is independent of and not joined to the bed-plate upon which the bottle stands, and operated with or without a lever, substantially as and for the purpose set forth.

2. The sectional safety-screen casing B, hinged to the standard C and operated with or without levers *e*, in combination with the bed-plate *b* and pin *m*, substantially as described.

3. The swinging bar I, with projections *h* interposed between the filling-head E and sliding plunger-bar F, as and for the purpose set forth.

4. The swinging bar *i* and its projections, in combination with the sleeves *i* encircling the standards C and D, and with the plunger-bar F and its plungers *e*, substantially as and for the purpose set forth.

160,395.

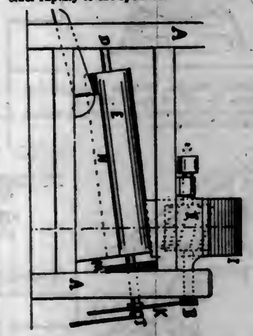


160,396. SAW-GUMMERS. R. J. Cordesman, Jr., Cincinnati, Ohio, assignor to James P. Alley, same place. [Filed Feb. 16, 1874.]

Brief.—The milling-tool C is placed at an angle not quite perpendicular to the plane of the saw, clamped in head A, and is gradually moved across the edge of the saw by means of the screw D, the gearing E, and the nut F the latter being fastened to the head by a pin, *f*, that may be withdrawn to allow the nut to be rapidly turned back by the fingers for re-adjustment of the cutter.

In combination with a saw-gummer constructed substantially as described, the loose nut F *f* and pin G, operating substantially in the manner and for the purpose specified.

160,398. BAG-HOLDERS. Leonard Crofoot, Pavilion, N. Y. [Filed Sept 21, 1874.]



Brief.—Bag-holder provided with a stationary and removable platform, whereby the holder can be adapted for filling bags of different sizes.

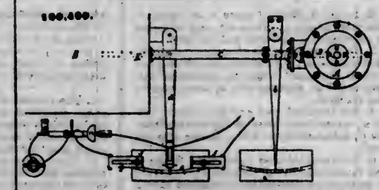
In combination with the standards C C, having the open notches *m m* and spout B, with its clamp *p*, the lower platform E arranged at the bottom of the standards, and the intermediate removable platform G, arranged between the lower platform and the spout, substantially as and for the object specified.

160,397. CIDER-MILLS. Enos Curtiss, Traverse City, Mich. [Filed Jan. 18, 1875.]

Brief.—The two wooden expressing-cylinders are arranged in the press at an inclination, so as to serve as a trough to convey the cider rapidly to the spout H.

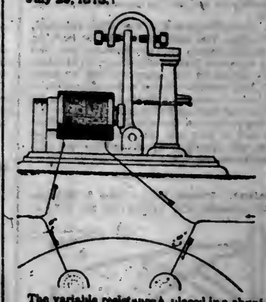
1. In a cider mill and press, the wooden inclined rollers E, in combination with the shaft D, cog-wheel M, handle P, and spout H, as heretofore specified and shown.

2. The combination of the wooden inclined rollers E and their shafts D with the frame A, toothed drum F, hopper I, shaft B, driving-wheel K, handle P, cog-wheels M M', scraper N, and spout H, all arranged as specified and shown.

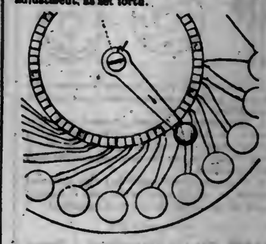


160,398. HEATING-STOVES. Mark A. Cushing, Aurora, Ill. [Filed June 16, 1874.]

Brief.—The tubes are fitted together with tongues and grooves.

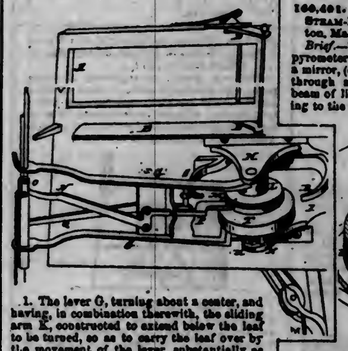


160,399.



160,400.

160,402. ADJUSTABLE ELECTRO-MAGNETS FOR RELAYS, &c. Thos. A. Edison, Newark, N. J., assignor to himself and George Harrington, Washington, D. C. [Filed July 29, 1873.]



The variable resistance *b*, placed in a shunt-circuit, in combination with an electro-magnet for equalizing action of the current in the electro-magnet and dispensing with the spring-adjustment, as set forth.

1. In an open stove, the combination of a series of vertical contiguous tubes, which have a rib on one side and a depression on the other, are open only to the exterior surrounding air, and form the back and sides of said stoves, substantially as described and shown.

2. In an open stove, the combination of the combustion-chamber with a radiating-chamber placed immediately above it, the back and sides of said chamber being composed of separate contiguous tubes, which have a rib on one side and a depression on the other, and air-passages extending continuously through said tubes from the bottom to the top, substantially as described

160,399. MUSIC-LEAF TURNERS. George L. Dimpfel, Benicia, Cal. [Filed Sept. 14, 1874.]

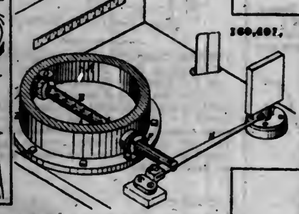
1. The lever G, turning about a center, and having, in combination therewith, the sliding arm K, constructed to extend below the leaf to be turned, so as to carry the leaf over by the movement of the lever, substantially as herein described.

2. The lever G, with its lifting-arm K passing below the leaf, and the arm J passing above the leaf, so as to retain it between the two while it is being turned, substantially as herein described.

3. The device for operating the lever G and sliding arm K, consisting of the pulley L with its contained spring, the connecting-rod P, and the knee-lever N, linked to the arm K, the whole constructed to operate substantially as and for the purpose herein described.

4. The device for operating the sliding arm J, consisting of the knee-lever Q, pivoted to the lever G and linked to the arm J, and the curved stationary arms R and S, when constructed to operate substantially as herein described.

5. In combination with the pulley L, with its contained spring, mounted as shown, the ratchet-wheel U and the pawl V, for regulating the tension of the spring, substantially as herein described.



6. In combination with the pulley L, with its spring-lever G and sliding arms J and K, operated as shown, the cord M, passing over the pulley and connecting with a treadle, so as to be operated by the foot, substantially as described.

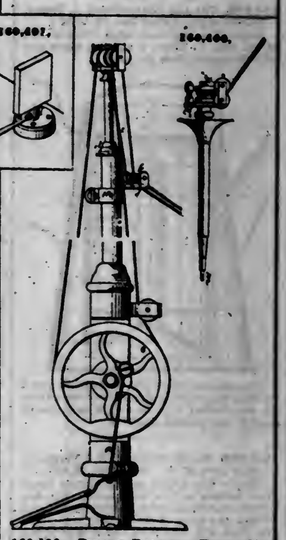
7. The metal strip X, arranged with spring-clips to be attached to the leaf, when used in combination with the turning device having the sliding arms J and K, substantially as and for the purpose herein described.

160,401. PYROMETRICAL INDICATORS FOR STEAM-ENGINES. Geo. Basil Dimwell, Boston, Mass. [Filed Jan. 12, 1875.]

Brief.—The longitudinal expansion of the pyrometer-bar moves a lever, thereby turning a mirror, (on which a beam of light is thrown through a slitted plate,) which reflects the beam of light to a degree on a scale according to the angle of mirror.

160,401.

160,404. PYROMETERS FOR STEAM-ENGINES. Geo. Basil Dimwell, Boston, Mass. [Filed Dec. 19, 1874.]



Brief.—A pyrometer is placed in the cylinder and one in the superheater of a steam-engine, to ascertain the temperature the steam in the superheater must be to maintain a certain temperature in cylinder. The scale of the pyrometer in the superheater may be graduated to indicate the temperature of the cylinder at any cut-off after their relations to one another have been determined.

1. The combination of the two pyrometers D E with the superheater B and the engine-cylinder A, to be operated by each, as and for the purpose specified.

2. In combination with the two pyrometers D E, superheater B, and the engine-cylinder A, applied as described, one or more adjustable slides, *f f'*, and one or more electro-magnetic alarms, applied thereto and to the pyrometer of the superheater, all substantially as and for the object and purposes as explained and represented.

The rod B, tubular and perforated, as described, applied to the cylinder and to the lever H, in manner, and to operate therewith as specified.

160,405.

160,405. SOLUTIONS FOR CHEMICAL TELEGRAPH-PAPER. Thos. A. Edison, Newark, N. J., assignor to himself and George Harrington, Washington, D. C. [Filed June 1, 1874.]

The solution for chemical telegraph-paper prepared with ferricyanide of potassium, substantially as set forth.

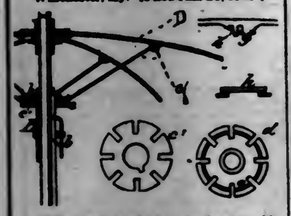
160,406. SOLUTIONS FOR CHEMICAL TELEGRAPH-PAPER. Thos. A. Edison, Newark, N. J., assignor to himself and George Harrington, Washington, D. C. [Filed June 1, 1874.]

The solution for chemical telegraph-paper prepared with tannin and hydrosulphuret of ammonia, substantially as set forth

160,406. SOLUTIONS FOR CHEMICAL TELEGRAPH-PAPER. Thos. A. Edison, Newark, N. J., assignor to himself and George Harrington, Washington, D. C. [Filed June 1, 1874.]

The solution for chemical telegraph-paper, prepared with tincture of logwood, substantially as set forth.

160,406. DENTAL ENGINES. Horace M. Edson and Robert L. Evans, Toledo, Ohio. [Filed Feb. 4, 1875.]



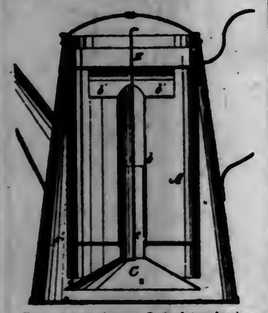
Brief.—The spring-rod, with endless belt, is combined with an independent hand-piece furnished with pulleys. Adjusting-pulleys for the belt are secured upon the standard, on which the spring-rod moves.

1. In a dental engine, the hollow stem D, the spring-rod E, and a continuous cord or belt, which runs from the driving-wheel to the hand-piece, in combination with the pulleys and the independent hand-piece, all substantially as and for the purposes herein set forth.

2. In combination with the hollow standard, spring-rod, and continuous cord or belt, an adjustable clamp on the standard, provided with a pivoted frame and pulleys, all substantially as and for the purposes herein set forth.

3. The combination, in a dental engine, of the hollow standard inclosing a spring, an extension-rod having pulleys on its top, the adjusting-pulleys on the standard, the continuous cord or belt, and the independent hand-piece, all substantially as and for the purposes herein set forth.

160,407. UMBRELLAS. John J. Bubank, Winchester, Ky. [Filed Jan. 29, 1870.]



1. The notched rib *a*, in combination with the staff A and a spring-catch, *b*, as and for the purposes described.

2. The flanges *c*, slotted, grooved, and perforated, as described, in combination with the slotted cap *c'*, the washer A, and the stud *f*, substantially in the manner and for the purposes specified.

3. Fins *g* on ribs D, provided with eyes and notches, in combination with pins *h*, having heads on them, for the purposes described.

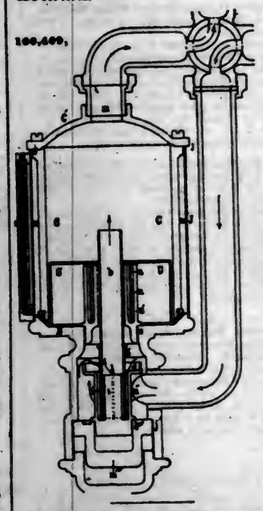
160,408. TEA AND COFFEE POTS. L. BYERS, Pittsburg, Pa. [Filed Dec. 12, 1874.]

Brief.—The wire is connected with the tube of the cone, for lifting it and the inside cup with their tubes from the pot.

The separate pieces A C, the latter having a tube, *a*, that slides in a tube, *b*, of the former, in combination with the wire E, arranged as and for the purposes specified.

160,409. GAS-GOVERNORS. H. J. Ferguson, New York, N. Y. [Filed Oct. 16, 1874.]

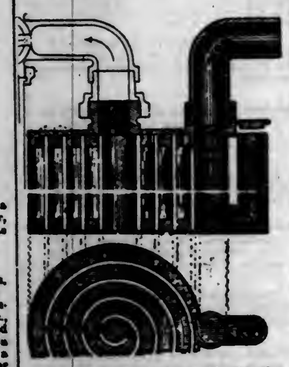
Brief.—The double communicating chambers contain a fluid, such as mercury, &c., which operates the valve-carrying float located within the inner chamber. The valve is in the form of a split tube, and it dips into a vertically-adjustable mercury-chamber, over which the gas must pass on its way to the burners.



1. In a gas-governor, the jacket J, forming external of the body of chamber C the annular space *a*, substantially as herein shown and set forth.

2. Jacket J, forming space *a*, in combination with flange *j*, orifices *o o*, and chamber C, substantially as shown and set forth.

3. The central float-tube *b* and movable jacketed counterpart *b'*, in combination with float-valve U, slits *c* and *f'*, and the adjustable mercury-vessel *w''*, substantially as herein shown and set forth.



4. The threaded neck *e* of the mercury-vessel *w'*, in combination with the bottom of chamber C, substantially as herein shown and set forth.

5. The threaded neck *e'*, threaded flange *f*, and thumb-piece *m''* of the mercury-vessel *w''*, in combination, substantially as herein shown and set forth.

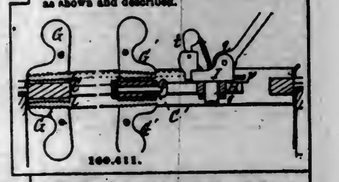
160,410. CARBURETERS OR HYDROCARBON-DIFFUSERS. H. J. Ferguson, New York, N. Y. [Filed Oct. 16, 1874.]

Brief.—The cover of the carburetor is detachable, and has secured to its under side by screws a spiral coil of metal, to which is secured a vertical scroll-coil of fibrous material. The lower end of the fibrous scroll is also attached to a metallic coil, by which its sides are kept separate.

In a gas-carburetor, the combination of a detachable cover with a vertical scroll-coil, consisting of a thin sheet of fibrous absorbent material, provided with detachable strips of heavy metal at each end, and secured to the cover, substantially as herein shown and set forth.

160,411. METHODS OF STRAIGHTENING WHALEBONE. Wm. H Ferguson, Rochester, N. Y. [Filed May 15, 1874.]

Brief.—The whalebone strips, after being heated by steam, are stretched in frames to take out the kinks and left to dry.



1. The process of straightening whalebone herein described, the same consisting in heating the strips by steam, straining the same in a longitudinal direction, and drying it while under this tension, substantially as set forth.

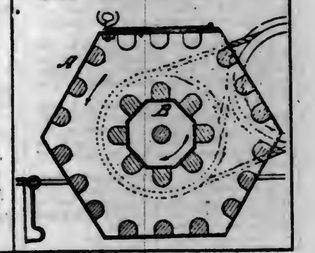
2. The combination of the stationary and movable head-blocks C C', provided with jaws G G', for clamping and holding strips of whalebone under tension, as and for the purpose specified.

3. The combination, with the movable head-block C', of the pinion *d* and sliding rack-bars E E, engaging with notches of the frame, as shown and described, and for the purpose specified.

4. In combination with the head-blocks C C', provided with jaws for holding the tension of the strips, the fulcrum-bar H, provided with a jack for drawing the strips through the jaws, as described.

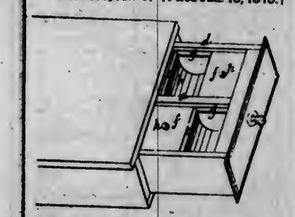
5. The jack consisting of the bearing I, rack-bar *p*, lever *q*, and jaw *t*, pivoted to an extension of the rack-bar, so as to move therewith, as shown and described.

160,412. COMBINED TURKISH AND VAPOR BATHS. Henry S. Firman, Jersey City, N. J. [Filed June 3, 1874.]



Brief.—A special arrangement of pipes, cocks, and other appliances, with an arm-hole located in the top plate, and provided with a hinged cover adapted to be opened from the inside, enables the bather to use the apparatus without the services of an attendant.

1. The bath described, adapted, by means substantially as described, for convenient use without the services of an attendant, consisting, essentially, in the open top to permit the projection of the head for the purpose of comfort and observation, the system of pipes with regulating-cocks within convenient reach, the adjustable chair, the arm-hole, and the window *a'*, arranged as and for the purpose set forth.



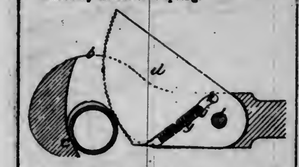
2. The arm-hole, relatively arranged as described, and provided with the hinged cover, adapted to be operated from the inside, as set forth.

160,413. WASHING-MACHINES. J. Thomas Forbes, Charleston, S. C. [Filed Aug. 31, 1874.]

The two prismatic ribbed drums A B, arranged one within the other, in combination with shafts G H and pulleys E E' F F', for giving opposite motions to said drums, whereby a beating and rubbing action on the clothes is produced, substantially as described.

160,414. NEEDLE-CASES. Ambrose Fowler, West Troy, N. Y. [Filed Jan. 16, 1875.]

1. The combination, with a case divided into separate rows of compartments or receptacles *b*, for needles or other articles for show or sale, of separate sliding covers *f* for each compartment, so arranged that only one compartment of each separate row is opened at a time by the movement of said slides, whereby the needles or other articles of the several compartments are prevented from being mixed while being handled.



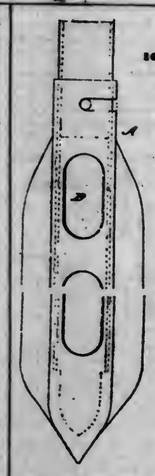
2. The combination, with a case of separate rows of compartments *b*, and separate sliding covers *f* for each compartment, of a stop or stops, *i*, whereby the movement of one or more covers is limited to a distance equal to the width of the cover, to exactly uncover one compartment at a time in the row.

3. The combination, in a case for needles and other similar articles, of separate lines or rows of separate compartments *b*, an equal number of separate and distinct slides, *f*, of equal width with the compartments, and sliding in ways *g* in the same plane, either all at a time or singly, substantially as and for the purpose set forth.

4. The combination, with a case of separate rows of compartments *b*, and separate and equal number of sliding covers *f* therefor, having a limited movement, of a stop or stops, *j*, in the outer case, substantially as described, whereby the inward movement of the compartment-case automatically closes all the slides of the separate rows.

160,415. PIPE-WRENCHES. C. H. Fulmer, Indianapolis, Ind. [Filed Jan. 25, 1875.]

Brief.—An improvement on Patent No. 154,471, August 25, 1874. The tongue is held in position for use in any position of the wrench by means of a spring.

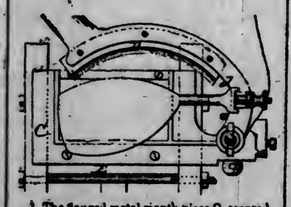


The combination, in a pipe-wrench, of the pivoted tongue *d*, arranged to open and close with the jaw, as described, of a spring, *g*, fixed within and carried by said tongue and a fixed bearing-pin, *j*, in the jaw for said spring, whereby the tongue is always held in position for use without regard to the manner in which the wrench is handled.

160,416. GRAIN-SAMPLERS. F. A. Furst, Baltimore, Md. [Filed Feb. 10, 1875.]

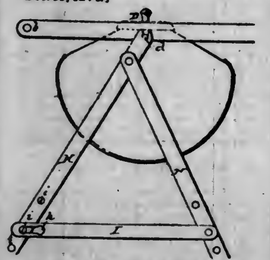
Brief.—A device for testing the quality of grain at different depths when stored in bulk.

A grain-sampler, consisting of the perforated casing A, provided with the wings *a*, in combination with the hollow shaft B, correspondingly perforated, the said shaft being adapted to be partially revolved within the said casing to a position causing the sampler to be opened or closed, as may be desired, substantially as specified.



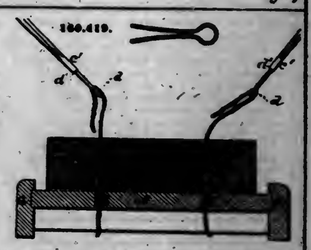
160,416.

160,417.



160,417. STRAW-CUTTERS. Warren Gale, Chicopee Falls, Mass. [Filed Nov. 20, 1874.]

1. The flanged metal mouth-piece C, secured to the frame-piece E, and having the parts *a b*, which form a carrier for the lever-knife, extended beyond the side of the mouth of the box A, permitting the removal of the leg B without displacing the said mouth-piece, as and for the purpose set forth.



2. The curved handle, to which the curved blade D is attached, pivoted on an extension at the lower part of the metal mouth-piece, and in line with the stationary blade thereon, to cause both ends of the curved knife D to operate upon the feed at or about the same time, as set forth.

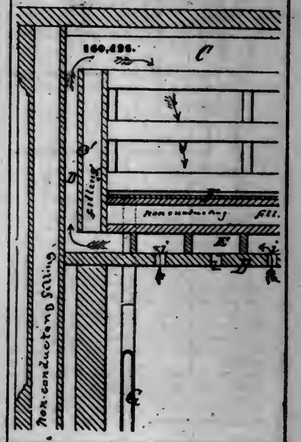
160,418. CHURNS. David W. George and John J. Stutzman, Pulaski, Iowa. [Filed Dec. 19, 1874.]

The folding frame H H, having notches *d*, and having beaded pins *i i*, to which are connected the slotted braces I I for adjusting the height of the removable churn-box, all constructed substantially as set forth.

160,419. TEMPORARY BINDERS. Abram A. Goldsmith, Charleston, S. C. [Filed Nov. 14, 1874.]

The sling-needles H, having triangular blades *c*, merging into cylindrical portions *c'*, shoulders *d'*, reduced portions *c''*, and eyes *d*, substantially as specified.

160,420. CARTRIDGE-HOLDERS. N. S. Goss, Neosho Falls, Kans. [Filed Jan. 23, 1875.]

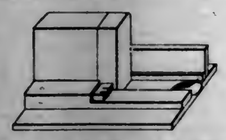


A cartridge spring-socket, having a flaring or funnel-shaped top, and the tongue A and groove G, constructed and arranged substantially as described, for the purpose specified.

160,421. LAWN-SETTEES. H. H. Grats, Lexington, Ky. [Filed June 9, 1874.]

Brief.—The settee is provided with a stationary back and a slatted seat. At the upper rear edge of the seat a cover is hinged, which can be turned up against the stationary back to form a solid back, or down upon the seat to protect it from rain, snow, &c.

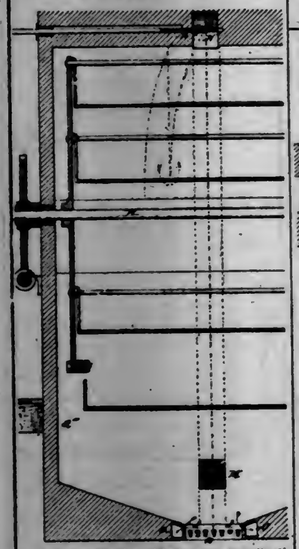
The combination, in a lawn-seat, of a body, A, having a slat seat, *a*, a stationary back, B, and a solid back, D, hinged at its lower edge to lie against the back or upon the slat seat, substantially as set forth.



160,422. REFRIGERATORS. Wm. Grayson, St. Louis, Mo. [Filed Dec. 12, 1874.]

Brief.—The ice-box, slatted on both sides to form air passages, has a packed end and an arched and packed bottom. Beneath the bottom is a chamber communicating with the provision-chamber, and with the flue along the packed end of the ice-box.

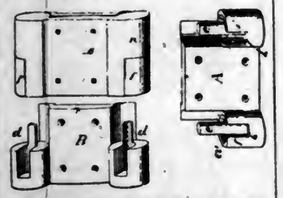
1. An ice-box, C, having a non-conducting filling at its bottom and inner end, and provided with open-slatted sides, substantially as described.
2. The ice-box C, the doubly-inclined bottom of which is provided with a filling, in combination with a perforated platform, B, chamber E, and air-passage D, substantially as and for the purpose set forth.
3. The perforated platform B, in combination with the air-chamber E, communicating with the air-passage D, substantially in the manner as described.



160,423. MAKING MATRICES FOR CASTING TYPE. John Greene, London, England. [Filed Apr. 4, 1873.]

The mold described, having the side piece *b*, block *c*, pouring-opening *d*, constructed and arranged as and for the purpose described.

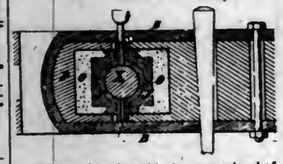
160,424. BAKERS' OVENS. Jas. Hall, Cincinnati, Ohio. [Filed Oct. 24, 1874.]



Brief.—Draft may be through either the upper or the lower flues.

1. In combination with the grate-bars D of the furnace, which open directly into the body of the oven, the perforations *d* and flues *e e*, arranged on either side of the grate, and flue F, leading to the uptake, substantially as specified.
2. The combination, in a bake-oven, of the curved top *a* and curved back *a'*, the latter extending past the direct flue M down to a level with the grate, substantially as and for the purpose specified.

160,425. DOUBLE REVERSIBLE HINGES. E. Halsey, San José, Cal., assignor of one-half his right to Daniel C. Bailey, same place. [Filed Mar. 17, 1874.]

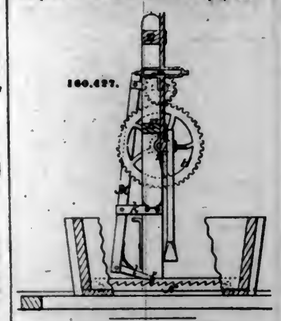


Brief.—The hinge opens both ways, but cannot be unshipped in any position unless the part on the gate be off the pintle. The plate upon the post is convexed to give a rocking motion when the gate closes, and thus prevent undue jarring.

1. The combination of the leaves or plates A and B, one having the sockets *j j* slotted at *k k*, and the cylindrical pintles *r s*, with annular spaces *j j* around them, the other leaf B having the inwardly-inclined slots *i i* and the segments *d d*, adapted to fit in said spaces, all constructed and arranged as shown and described.
2. The leaf B, having a convexity, as shown and described, in combination with the leaf A, said leaves being provided with pintles and sockets, adapted to co-operate substantially as and for the purpose specified.

160,426. ELASTIC PITMAN-CONNECTIONS. Geo. W. Harrison, Lansing, Mich. [Filed July 7, 1874.]

Brief.—The pitman has a recessed chamber in the end to receive the india-rubber block and the metallic box J.

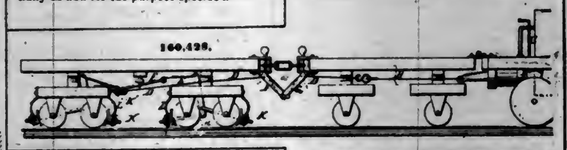


1. In combination with the recessed end of the pitman, the shouldered metallic boxes J, which together form an inclosed chamber to receive the elastic blocks O, substantially as set forth.
2. In combination with the pitman having a recessed end, the recessed cap P, elastic blocks O, metallic boxes J, and strap B, substantially as set forth.

160,427. MECHANICAL MOVEMENTS. John A. Hart and Harmon Scott, Iola, Kans. [Filed Jan. 30, 1875.]

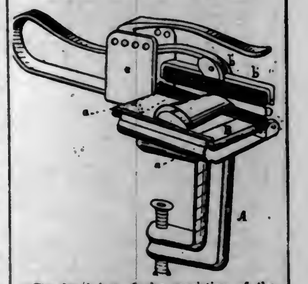
Brief.—A double ratchet-bar, having its teeth set in opposite directions, is rigidly secured to the main box. A vertically-reciprocating and laterally-moving pawl engages the teeth, and imparts a horizontally-reciprocating motion to the box, the whole being operated by the clothes-pounding mechanism.

1. In a mechanical movement for operating washing and other machines, the combination, with a vertically-vibrating pawl, *i*, actuated by the mechanism for imparting a vertically-reciprocating movement to the shaft, of the double bar N, having its teeth set in opposite directions, substantially as specified.
2. The combination, with a vertically-vibrating pawl, *i*, of the spring S, for the purpose of accelerating the change of the said pawl from one series of teeth to the other, of double ratchet-bar N, substantially as specified.
3. The combination, with an actuating pawl, *i*, having lateral play, of the separating-strip *s*, substantially as specified.
4. The double ratchet-bar N, having its teeth *i' i'* arranged in oppositely-inclined series, separated by a strip, *s*, and set with their bite in opposite directions, the same being adapted for use substantially as specified.



160,427.

160,428. CAR-BRAKES. Lamar T. Hay, Xenia, Ohio. [Filed May 28, 1874.]

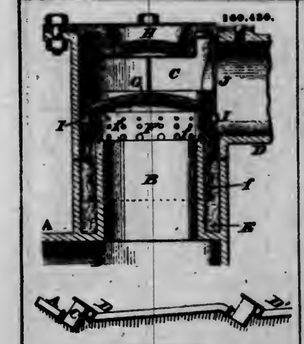


Brief.—Rubber springs upon brake-shoes and cord of a continuous railway-brake.

160,428.

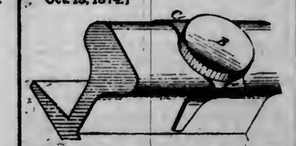
The combination, with the brake cord or chain D, yielding frame F G, brake-rods E, and brake-connections, of the rubber springs K K', whereby the cord D, yielding frame F G, and brake-shoes are relieved of sudden strains, substantially as described.

160,429. HAND HEM-FOLDERS. F. Henry, Philadelphia, Pa. [Filed July 28, 1874.]



The hand hem feeder, consisting of the yielding presser-bar D, the grooved plate B for variable hemmers, and the clamp A, substantially as and for the purpose set forth.

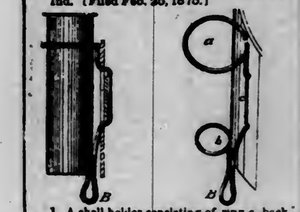
160,430. GAS-REGULATORS. Andw. Hickenlooper, Cincinnati, Ohio. [Filed Sept. 28, 1874.]



Brief.—Removable weights for regulating the position of the perforated valve, such perforations diminishing from bottom to top of the valve, and all in combination with ascending gas-mains.

In combination with the ascending mains D D' D'', the permanent case C B, side pipes A D, liquid-chamber E, perforated valve F, removable weights O, and detachable cap H, constructed and operating substantially as and for the purpose specified.

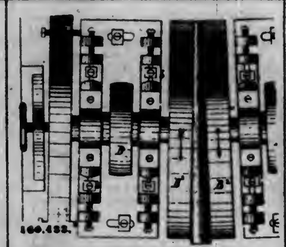
160,430.



160,431. DETONATING RAILROAD-SIGNALS. Francis Hickman, Reading, Pa. [Filed Oct. 13, 1874.]

In a torpedo consisting of a pellet, A, cap B, and straps C C, the cap and straps formed of a single piece of soft or ductile sheet metal, for the purposes herein set forth.

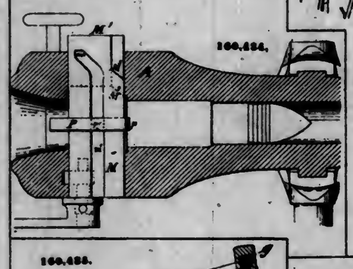
160,432. CARTRIDGE-SHELL HOLDERS. W. H. Holabird and Aaron Parks, Valparaiso, Ind. [Filed Feb. 26, 1875.]



1. A shell-holder consisting of ring *a*, back wire A, and spring shell-clamp and charge-supporter, substantially as described.
2. The combination of ring *a*, back wire A, spring-hook B, and ring *b*, arranged substantially as shown and described.
3. A shell holder consisting of ring *a*, wire A, attaching-loop C, spring-hook B, and ring *b*, substantially as shown and described

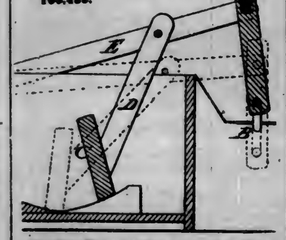
160,433. METAL-ROLLING MACHINES. J. Holmes, Pittsburg, Pa., assignor to himself and Hussey, Wells & Co., same place. [Filed Jan. 20, 1875.]

Brief.—A pair of plane-faced disk-rolls, geared to revolve in opposite directions, with an open-sided tapering guide between them, the axial line of which is a little above the centers of the rolls, whereby the rod, in being rolled, is given a longitudinal movement.

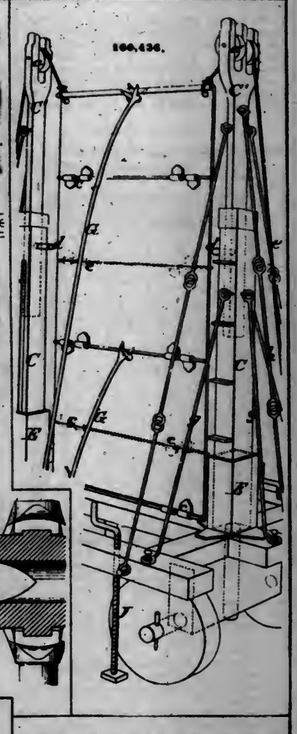


1. A pair of plane-faced disk-rolls with their faces inclined to each other and their centers opposite, and arranged for the introduction of the rod or bar to be tapered on the side of the greatest opening, the feed being from such side toward the side of the least opening, whereby, on the completion of the taper, the rolls will have a bite or bearing along the entire length of the taper, substantially as set forth.
2. The plane-faced inclined disk-rolls B' B', arranged with a line of bite from at or near the center to the side of least opening, in combination with an open-sided tapering guide arranged along such line of bite, and with reference to a feed from the side of greatest opening, substantially as set forth.

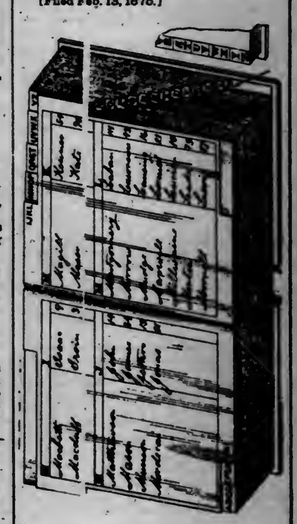
160,434. BREECH-LOADING ORDNANCE. B. B. Hotchkiss, New York, N. Y. [Filed May 20, 1874.]



1. The extractor P', with its hook *p* and pin *p'*, in combination with the gun A, and with the groove *m'* in the breech-block M, as herein specified.
2. The breech-block M, having the groove *m'* and offset M', in combination with the extractor-hook P *p*, as herein specified.
3. The bevel or flare M' on the breech-block M, in combination with the groove *m'* and the extractor P *p*, operating together as herein specified.



160,434.



160,435.

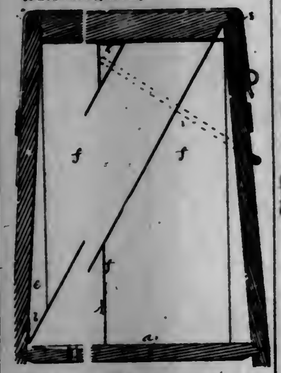
160,436.

160,437. INDEXES. A. J. Jones, Cincinnati, Ohio, assignor to H. H. Tinker, same place. [Filed Feb. 13, 1875.]

160,438. WASHING-MACHINES. A. G. Huey, Garnett, Kans. [Filed Oct. 10, 1874.]

Brief.—The beaters are operated by levers that are attached to a rod having a spring and a hand-crank.

In combination with the beaters C, pivoted beater-arms D, levers E, crank B, and rods F *e'*, the spring *g*, applied to rod F, as shown and described.

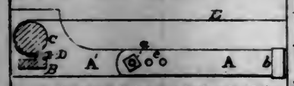


160,439. FIRE-SHIELDS. John M. Johnson, Stillsville, Ind. [Filed Jan. 9, 1875.]

Brief.—A fire-shield consisting of a series of metal plates hinged together at their edges, and extended by means of ropes and pulleys attached to extensible posts. The whole is mounted on a truck, which is provided with steadying-screws.

1. In a fire-shield, the extensible parts C C' and hinged folding sections, operated substantially as described.
2. In combination with a folding fire-shield, the extensible parts C C', the carriage D, and the steady-screws J, substantially as and for the purposes described.

An indexed book, each of whose leaves for family names is accompanied by a secondary group or series of notched and initialed leaves for Christian names of individuals, said secondary group being capable of being read forward and backward, and separate space for incorporations, firm-names, and miscellaneous matter, substantially as and for the purpose designated.



160,439. REMOVABLE REFRIGERATORS FOR PAILS, &c. Jas. C. Jones, New York, N. Y. [Filed Nov. 3, 1874.]

The ice-chamber D, arranged diagonally within the vessel A, and provided with flanges *r r* and *s* at its upper portion, and a flange, *t*, at its bottom, in combination with the vertical wings *f*, substantially as and for the purpose described.

160,440. BED-BOTTOMS. Danl. C. Kellam, Detroit, Mich. [Filed Jan. 12, 1875.]

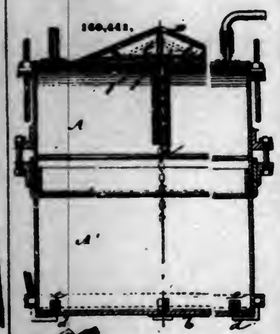
Brief.—The attachment of the fabric to the wedges instead of to the roller enables it to be detached, and any irregular stretching or sagging caused by use to be adjusted by simply readjusting the fabric on the wedges, and then securing it thereto.

1. The fabric E, loose at both ends of the bed-bottom, as shown, in combination with the rollers C, cross-pieces B, wedges D, and frame A A', substantially as and for the purposes specified.

2. The extensible frame A A', the part A being provided with the holes *c*, in combination with the bolts and nuts *a*, bands *b*, rollers C, and cross-pieces B, substantially as herein specified, for the purposes set forth.

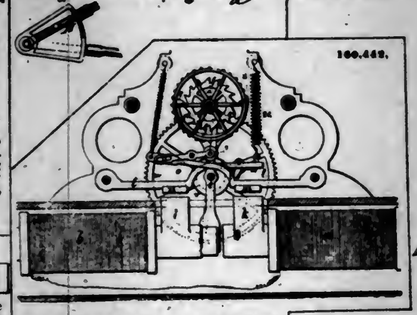
160,441. MEANS FOR RAISING SUNKEN VESSELS, &c. Henry F. Knapp, New York, N. Y. [Filed May 12, 1874.]

1. The jacks constructed of upper and lower sections A A', fitted together and forming a single structure, substantially as described, and for the purposes specified.



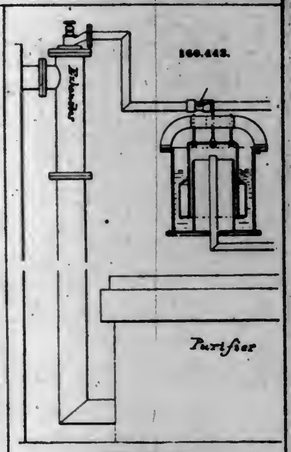
2. The full open bottom jacks, constructed with rising and falling or movable bottoms B, essentially as shown and described.

3. The combination, with the open bottom jacks and their movable bottoms B, of the lower supports or pins *d*, and the holes or pockets *e* in the movable jack bottoms, substantially as and for the purpose herein set forth.



4. The combination, with the hydro-pneumatic lifting-jacks, of the attached perforated water-distributer E arranged around the bottoms of the jacks, essentially as described.

5. The slide valve H, in combination with the inlet and exhaust pipes or hose I J, and tubular connection G of the jack, substantially as described.



160,442.

160,443.

160,444.

160,444. GRASS-CULTIVATOR TEETH. Ezra Leonard, Akron, Ohio. [Filed Dec. 16, 1874.]

Brief.—A tooth with sharp cutting-front, and curved to allow the flattened point to run under the sod nearly parallel with the surface, and cut upward.

160,444,

160,449.

160,445. PRINTING-TELEGRAPHS. Adolphus A. Knudson, Brooklyn, N. Y. [Filed Aug. 18, 1874.]

Brief.—Improvement in Knudson's Patent No. 149,143. Type-wheel escapement controlled by rapidly-alternating pulsations. Prolongation of current allows extended poles *l k* to attract armatures *n m*, one accomplishing the printing, the other straining spring *u* to furnish the power to turn type-wheel.

The combination, in a printing-telegraph instrument, of two magnets in one circuit, and a polarized armature between them operating the escapement, a printing or impression lever receiving motion from a lateral core and armature, and self-winding mechanism receiving its power from lateral cores and another armature, substantially as set forth.

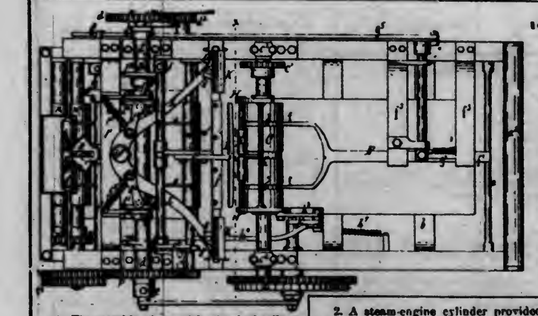
160,446. STEAM-JET GAS-EXHAUSTER. E. Korting, Hanover, Germany. [Filed Dec. 3, 1874.]

Brief.—The steam-jet exhauster is located beyond the scrubber, so that the tar is deposited before coming into contact with the steam, thus preventing the deposit of crystallized naphthaline in the pipes.

The combination, with the scrubber or washer and the purifier, of a gas apparatus, a steam-jet exhauster, located beyond the scrubber and before the purifier, as and for the purposes described.

As a new article of manufacture, the above-described cultivator-tooth, consisting essentially of the shank C, the colter B, and the two-winged share H, having the sharp cutting-edge D, curved to run nearly parallel with the surface of the ground, substantially as set forth.

160,445. ROOFING-TILES. John M. Lewis, New Castle, Ohio. [Filed Jan. 13, 1875.]



The tiles A and B, constructed with the longitudinal grooves *a b'*, tongues *a' b'*, shoulders *a' b'*, cross-grooves *a' b'*, tongues or ribs *a' b'*, stops or keys *a'*, and notches *b'*, when

---

160,446. PAPER-BAG MACHINES. William Liddell, Buffalo, assignor to himself and Howland & Co., Sandy Hill, N. Y. [Filed Nov. 3, 1874.]

Brief.—The tube end is spread open and creased for folding, is then fed into delivery-rolls a proper distance, and cut off to bag length. The bag-blank is then pasted and folded to close its bottom as it travels over an inclined table.

160,446.

1. The combination, with the feed-rollers C C', of the reciprocating bar F and expanding-springs *f f* attached thereto, for distending the mouth of the tube against the peripheries or faces of the rollers, preparatory to folding the same, substantially as hereinbefore set forth.

2. The combination, with the feed-rollers C C' and expanding-springs, of the side folding hands and arms K L, constructed and combined as described, for forming the side laps of the bottom of the bag, substantially as hereinbefore set forth.

3. The combination, with the arms L L and side folding-hands K K hinged thereto, of the shoulders *k* and springs *k'*, substantially as and for the purpose hereinbefore set forth.

4. The combination, with the rollers C C, of the side folding-hands K K, and the folding-rollers *h h*, adapted to the peripheries of the feed-rollers, for folding the upper and lower bottom laps, substantially as hereinbefore set forth.

5. The combination, with the feed-rollers C C' and folding-rollers *h h*, of the swinging bearings H H, links *h'*, and rock-lever *h''*, for operating the folding-rollers simultaneously, substantially as hereinbefore set forth.

6. The combination, with the simultaneously-operating folding-rollers *h h*, of the projecting plate or spring *h''*, for folding one of the laps a little in advance of the other, substantially as hereinbefore set forth.

7. The combination, with the intermittingly-revolving pasting-plate R and shaft *r'*, of the notched disk *r s* and spring-pawl *s'*, for supporting the pasting-plate in its proper position while at rest, substantially as hereinbefore set forth.

8. The combination, with the driving-shaft D and paster-shaft *r'*, of the connecting gear-wheels P S, and the perfect and mutilated gears S' S', for imparting an intermittent rotary motion to the pasting-plate, substantially as hereinbefore set forth.

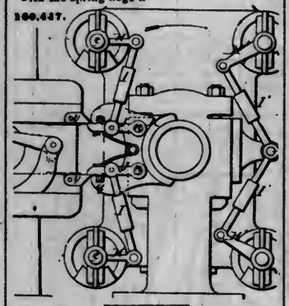
9. The combination, with the table M and tape conveyer *o o'*, of the folding-plate U, for refolding the lower bottom lap of the bag, substantially as hereinbefore set forth.

10. The combination, with the table M and conveyer *o o'*, of the folding-plate U and oscillating striker V, the bottom lap 3 being folded and held down by the striker until the folder-plate has folded back the bottom lap 4 and secured it in an overlapping position over the lap 3, substantially as hereinbefore set forth.

11. The combination, with the folder-plate U secured to the shaft *u*, of the sliding bar *u'*, spring-dog *u''*, and spring-arm *u'''*, for operating the folder-plate, substantially as hereinbefore set forth.

12. The combination, with the oscillating striker V and paster-shaft *r'*, of the sliding bar *v'*, cam *v''*, and spring *v'''*, for operating said striker, substantially as hereinbefore set forth.

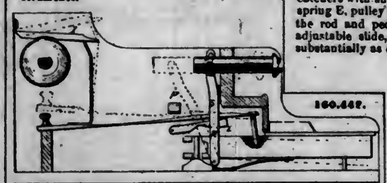
13. The combination and arrangement, with the table M and revolving pasting-plate R, of the friction-roller *r''*, substantially as and for the purpose hereinbefore set forth.



160,447. OSCILLATING ENGINES. Geo. G. Lobdell, Wilmington, Del. [Filed Aug. 6, 1873.]

1. The combination of the circular slotted valve G and its spindle *s*, with a set-screw, *k*, at each end of the spindle, and an elastic medium interposed between each screw and the spindle, all substantially as and for the purpose described.

2. A steam-engine cylinder provided with a jacket, the space between which and the said cylinder is separated by a partition into two passages, one for the live steam and the other for the exhaust steam, as set forth.



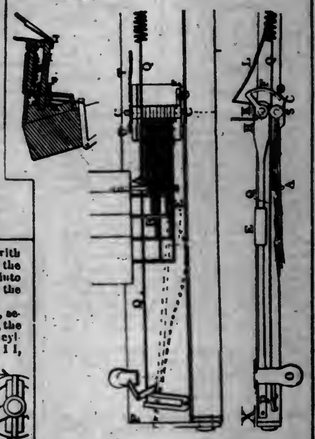
3. The combination of the arms H H, secured to the spindles of the steam-valves, the spring-arms J J, hung to a bracket on the cylinder's trunnion, and the connecting-rods I I, with the spring-dogs *i*.

160,447.

160,448. REED-ORGAN ATTACHMENTS. J. R. Lomas, New Haven, Conn., assignor to B. Shoninger, same place. [Filed Jan. 16, 1875.]

Brief.—A set of chime-bells is arranged as an attachment for organs or other keyed instruments.

160,448.



1. A series of bells arranged and secured in axial line upon a shaft having a non-conducting surface, substantially as described, and combined with a corresponding series of keys, substantially as specified.

2. The combination of a series of bells and a corresponding series of elastic hammer-levers with a corresponding series of keys and the interposed stop P, substantially as described.

3. The combination of a series of bells, a corresponding series of elastic hammer-levers in connection with a corresponding series of keys, and the interposed stop P with the hinged fulcrum L and cam R, in connection with a stop, T, substantially as described.

4. The combination of a series of bells, a corresponding series of elastic hammer-levers in connection with a corresponding series of keys, the interposed stop P, and the checks I, substantially as specified.

160,449. MUSIC-LEAF TURNERS. Ernst A. Mandel, Washington, D. C. [Filed Oct. 9, 1874.]

1. In a leaf-turner, the combination of a series of swinging arms and catchers with shaft H, and its curved lever F arranged to slide thereon, substantially as described.

2. In combination with shaft H, the swinging arms, curved and sliding lever F, and the spring E, constructed and arranged to operate substantially as described.

3. In combination with shaft H, swinging arms, and sliding lever F, the spring E, the pulley K, and spring L, all arranged to operate substantially as described.

4. The shaft H and sliding curved lever F, with its spring E, the pulley K, spring L, and elbow-lever M, all combined and arranged to operate substantially as described.

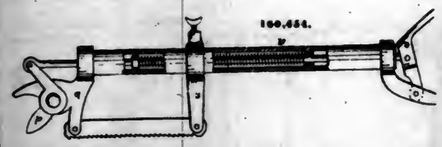
5. In combination with swinging arms and catchers, the gatherer A, cord Q, spring N, and compound lever P, substantially as described.

6. In combination with shaft H and hinged box X, the flat spring T, substantially as described.

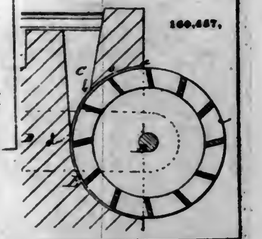
7. The combination of swinging arms and catchers with shaft H, sliding lever F, having spring E, pulley K, spring L, and elbow-lever, the rod and pedal, the gatherer A, with its adjustable slide, and the hinged box X, all substantially as described.

160,450. SHOE-BRUSHES. Andw. McElrath, New York, N. Y. [Filed Apr. 6, 1874.]

Brief.—The back of the brush has receptacles for implements used in blacking boots and shoes, and are inclosed by a cover. The brush back, by being made thick, permits it to be grasped and held with ease.



The boot-polishing brush having a hollow back provided with the cavities *o* and *o'*, and connecting-grooves to receive the auxiliary implements specified, and the hinged cover C for confining them in their appropriate places, as shown and described.



160,451.

160,454.

160,457.

160,451. LAMP-BURNERS. W. McKinley, Tremont, Ohio, assignor to himself and O. Kiser, same place. [Filed Jan. 16, 1875.]

Brief.—Wick-tube, spur-wheels, and shaft, each detachable, to aid in cleaning lamp-burner. Spur wheels with peripheral groove and latch, and boss upon the shaft for securing shaft in place.

1. The combination, with the burner cap A, of a detachable wick-tube, C, a detachable set of spur-wheels, D, and a detachable shaft, E, substantially as and for the purpose described.

2. In a lamp-burner, the set of toothed wheels D, having the circumferential grooves, and adapted, by reason of a connecting-barrel, to move laterally upon a shaft, and revolve rigidly with it, substantially as described.

3. The combination, with shaft E, of the boss G and catch H, substantially as and for the purpose described.

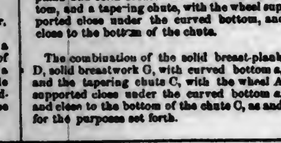
160,452. CAPS. Moses Mendel, New York, N. Y., assignor to Adolph Schwarz. [Filed Feb. 16, 1875.]

Brief.—A "cap-shaped" head-covering formed with neck and ear muffs in one piece, the latter being of sufficient length to encircle the neck one or more times, and provided with suitable fastenings at their ends. The muffs, when disused, are wound around the side crown.

The muffs B B', forming a continuation of the back and side portions of the cap A, and provided with the fastenings *b b' c*, as herein shown and described, for the purpose set forth.

160,453. BAG-FASTENERS. Asher M. Miller, Sturgis, Mich., assignor of one-half his right to J. B. Jacobs, same place. [Filed Oct. 21, 1874.]

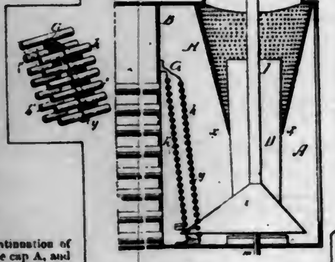
The metal plate curved to form a segment of a circle, with its ends curved in reverse direction, or turned outwardly, as described, and provided with the slot *a*, in connection with the cord B, as and for the purpose specified.



160,454. PRUNING IMPLEMENTS. C. Miller, Boonville, Mo. [Filed Aug. 3, 1874.]

Brief.—Shear-blades are mounted upon a hollow metal tube, and an extension of one of the blade-shanks serves as an arm to carry a saw-blade. The other end of this saw-blade is pivoted in an arm, which embraces and adjusts upon the tubular operating-rod of the combined devices.

The combination of shear-blades, saw with its adjustable arm, and tubular metal support *c*, all arranged as shown.



160,455. LAP-BOARDS. Wm. F. Mitchell, Lynn, Mass., assignor of two-thirds his right to H. W. French and A. R. Payne. [Filed Oct. 15, 1874.]

Brief.—The lap-rest is placed upon the knee, and the table revolves, so as to be brought into any desired position

The portable writing or work board herein shown, consisting of the flanged lap-rest *c d d*, revolving board *a*, and hinge-pin *e*, all arranged and constructed substantially as and for the purpose herein set forth.

160,456. LOCOMOTIVE SPARK-ARRESTERS. Alex. Mitchell, Wilkesbarre, Pa. [Filed Jan. 15, 1875.]

1. A spark-disintegrating screen in which notched bars G G are combined with two sets of rods, substantially in the manner described.

2. In a locomotive smoke-box, the tubes I, having flaring lower ends, and communicating above with the chimney, in combination with nozzles *a*, from which jets of live steam may be projected into said tubes, all as set forth.

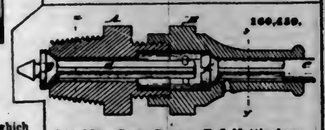
160,457. WATER-WHEEL CHUTES. Mark B. Moomaw, Catawba, Va. [Filed June 28, 1873.]

Brief.—A breast water-wheel so combined with the chute as to avoid the presence of any great amount of air between the water and the wheel, which thereby receives the full concussion of the water. There is a solid breast-plank and solid breast-work with curved bottom, and a tapering chute, with the wheel supported close under the curved bottom, and close to the bottom of the chute.

The combination of the solid breast-plank D, solid breastwork C, with curved bottom *a*, and the tapering chute C, with the wheel A supported close under the curved bottom *a*, and close to the bottom of the chute C, as and for the purpose set forth.

160,458. WINDOW-VENTILATORS. Granville Nicholson, Brooklyn, N. Y. [Filed Jan. 20, 1875.]

Brief.—A ventilator-frame not only made in sections and adjustable in the direction of its length, to suit different widths of window, but the sections of which (there may be two or more) are constructed with a tongue and groove on their adjacent faces, whereby the sections may be slid the one over against the other, thus giving great compactness to the ventilator.

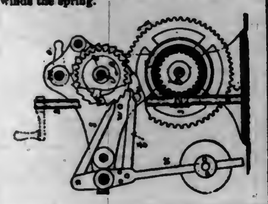


1. A contracting and expanding ventilating frame or bar having one or more stops or projections, *c*, on its back or outer surface intermediately of its height, substantially as and for the purposes herein set forth.

2. In combination with the contracting and expanding ventilating frame or bar, the bolts or catches *d* applied to the adjustable sections of the bar, essentially as described.

3. The adjustable or expanding and contracting sections of the ventilating frame or bar, in dovetail fit with each other throughout their length, whereby the frame may be shut up within the length of a single section, substantially as herein set forth.

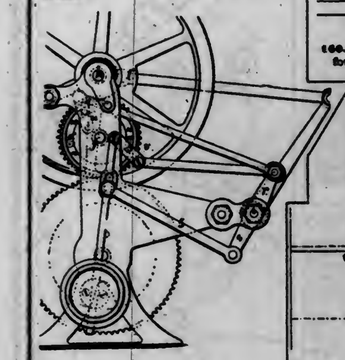
160,459.



160,459. GAGE-COCKS. T. J. Nottingham, Cincinnati, Ohio. [Filed Nov. 13, 1874.]

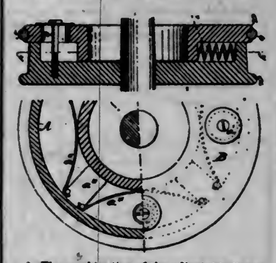
A gage-cock in two parts, A B, having separate valves C D, both arranged to close automatically by boiler-pressure, substantially as specified.

160,460. MOTORS. Henry Odell, Peekskill, N. Y. [Filed Aug. 22, 1874.]



Brief.—Surplus power is utilized by slipping the pinion on the vertical shaft, so that it gears into the worm-pinion of the shaft, and winds the spring.

In combination with the pawls *s t*, rock shaft *b*, and revolving shaft *m*, the movable pinion 5 and worms 3 7, for transmitting motion from the shaft *m* to the spring-barrel shaft *b*, and partially wind the same, substantially as set forth.



160,461. MOTORS FOR CHURNS, &c. Henry Odell, Peekskill, N. Y. [Filed Nov. 11, 1874.]

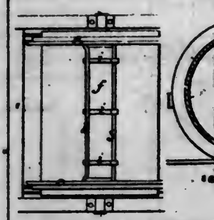
Brief.—Power is transmitted from the spring to the fly-wheel by combining friction-clamps with a revolving wheel and its connections.

The double friction-clamps *s* and *o*, friction wheel *g*, constructed and operating substantially as set forth, in combination with a fly-wheel and connections and a motor for the friction-wheel, as specified.

160,462. CAR-WHEELS. George Palmer, Littlestown, Pa. [Filed Jan. 26, 1875.]

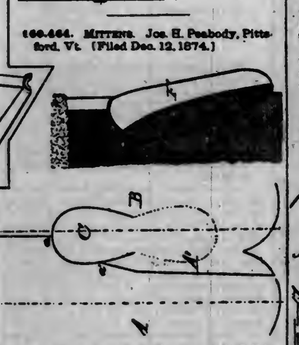
1. The combination of the adjustable flange B with the main wheel A, as and for the purpose set forth.

2. The combination of the bolts *a'*, springs *a''*, and slots *b* with the adjustable flange B and car-wheel A, as and for the purpose described.



3. The combination of the india-rubber band *b'* with the adjustable flange B, as and for the purpose described.

4. In a railway-car wheel, the vertical adjustable flange B, to yield when coming in contact with frog or switch, and secured to the main car-wheel by bolts, either with or without springs attached to such bolts, as and for the purpose set forth.



160,463. FREIGHT-CARS. George Paul and Josiah Sibley, Kenton, Ohio. [Filed Jan. 2, 1875.]

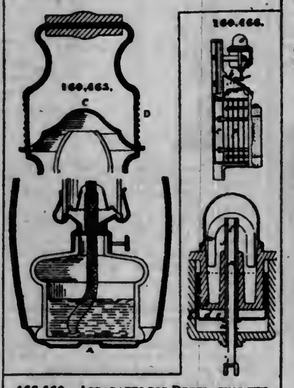
Brief.—Rotary cylindrical freight-cars with peculiar door-fastening.

The combination, with the door *f*, having hinges *i*, of the locking-bar *k*, substantially as and for the purpose set forth.

160,463.

160,464. MITTENS. Jos. H. Peabody, Pittsford, Vt. [Filed Dec. 12, 1874.]

A mitten composed of pieces A B C F, in combination with facing-pieces E G, all cut and united as described and shown.



160,465. LAMP-HOLDERS. Jas. D. Pierce, Milwaukee, Wis., assignor of two-thirds his right to J. B. Smith and F. R. Pierce, same place. [Filed Jan. 22, 1875.]

Brief.—The holder is adapted to receive lamps of various sizes.

1. The combination of bottom A, wire B, forming a handle at the top, and shade C, arranged substantially as set forth.

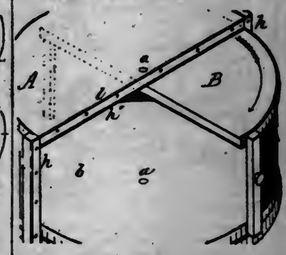
2. The combination of bottom A, side wire B, shade C, handle E, and notch D, substantially as specified.

160,466.

160,466. APPARATUS FOR REGULATING THE SUPPLY OF AIR TO FURNACES. Thomas S. Prideaux, Blackheath, England. [Filed Dec. 4, 1874.]

Brief.—The cistern being raised to the top of the cylinder, the plunger, entering the cistern, displaces the mercury, which is forced out over the top of the cistern, and descends to the bottom of the cylinder. The cistern, being depressed, enters the body of the fluid, which then gradually re-enters the cistern through the small orifice in its bottom.

1. In combination with the furnace-door and movable damper *b p*, the screw segment *y*, forming a part of the door and the lifting-rod *z*, the segment being adapted, when the door is opened, to lift the rod and move the damper, as described.

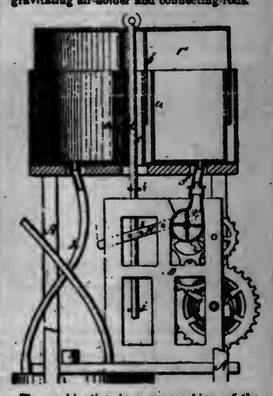


2. The combination of the furnace-door, having the segment *y*, as described, the lifting-rod *z*, the movable damper *b*, and the motor-regulator *o g*, the damper being opened by the movement of the door, as described, and closed by the operation of the regulator, substantially as set forth.

3. The combination of the receiving-cylinder *g*, the cistern *d*, having the hole *e* and the plunger *h*, substantially as described.

4. The combination of the grating *c c c* and the dampers *b p*, the grating being adapted to heat and distribute the air received through the damper, substantially as described.

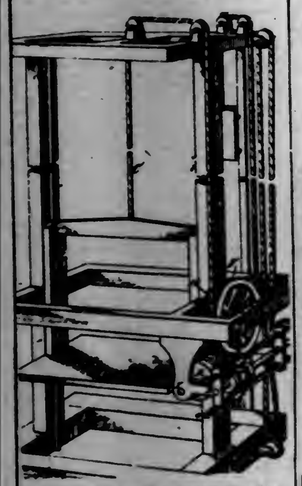
5. The combination of the cylinder *g*, cistern *d*, plunger *h*, cistern-rod *f*, connecting-rod *i*, and weight *w*, as and for the purpose described.



160,467. CHIMNEY-SAFES. Wm. P. Quackenbush, Holley, N. Y., assignor of one-half his right to H. M. Latimer, same place. [Filed Oct. 24, 1874.]

The half-circular sections A B, turning one within the other, the bottom *b*, attached to the inner section and turning with it, and the packings *h h h* at the joints between the sections, all combined and arranged to operate in the manner and for the purpose specified.

160,468. CARBURETING GAS-MACHINES. A. C. Rand, Minneapolis, Minn. [Filed Dec. 15, 1874.]



Brief.—The machinery which operates the air-blower is regulated automatically by a gravitating air-holder and connecting-rods.

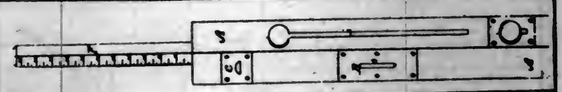
The combination, in a gas-machine, of the water-tank B, with central concentric tubes *a e*, the holder C with central tube *b*, the rod *d*, extending through the tubes and having pins *i i*, the lever H, the air-forcing apparatus E, and machinery D, all substantially as set forth.

160,469. ELEVATORS. H. J. Reedy, Cincinnati, Ohio. [Filed July 31, 1874.]

Brief.—The hoisting-rope has a weight to counterbalance the platform, and passes around a flanged wheel on a shaft, which has also a worm-wheel driven by the belt-shaft. The belt is shifted by pins worked by a slotted drum on a parallel shaft.

1. The combination, in a hoisting-machine, of positive driving and locking mechanism H G I i, frictional grooved sheave-wheel F, platform A, rope C, and weight D, substantially as described.

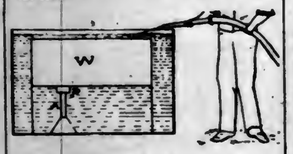
2. The combination of shifter-shaft L M, projection S, spring brake-bar T, and driving-pulley J, operating substantially as and for the purpose specified.



160,470. SASH-HOLDERS. J. W Reycroft, East Cambridge, Mass. [Filed Jan. 20, 1875.]

Brief.—Wedge-shaped blocks in inclined recesses are operated by rotary knob, cords, and pulleys, in ordinary manner. Elastic bands attached to the lower end of the block, and fastened above them, give a friction-surface, and at the same time serve as retractors, automatically drawing up the wedges until released by rotary movement of the knob or handle.

In combination with the mush a a a' and its frame b b, the rotary knob or handle d, cords c c', pulleys f f', inclines g g', runners h h', and elastic retracting-bands i i', substantially as and for the purpose herein set forth and described.



160,471. STAIR-BUILDERS' RULES. John J. Robinson, Orange Court-House, Va. [Filed Dec. 17, 1874.]

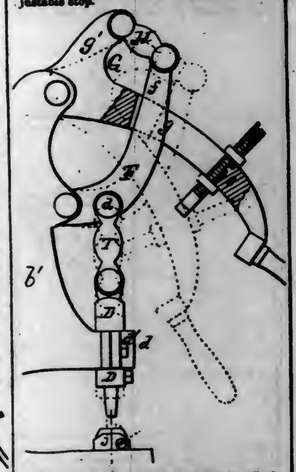
The improved stair-builder's rule consisting of the case A, spirit-levels B and C, extension-rule F, and adjustable stud I, provided with a prick, all combined and arranged substantially as shown and described.

160,472. PRESERVING APPARATUS. John P. Schmitz, San Francisco, Cal. [Filed Dec. 2, 1874.]

Brief.—The tank or case which contains the meat is provided with a fire-protector. Within this fire-protector the flame is allowed to burn as long as there is sufficient oxygen within the tank to support combustion. When the flame dies out, (which may be perceived through the glass plate,) the tank is placed within the box, which is then filled with water for the purpose of cooling said tank. After the tank is sufficiently cooled the water is drawn off, and the tank lifted out; then tie with a string the elastic tube, after which cut the same apart, and place thereon a screw-cap and fasten to the screw

1. The flexible pipe A, applied to the tank W, in combination with the screw-stem P and the oil-can, substantially as and for the purpose described.

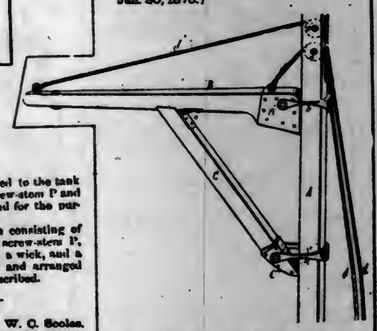
2. The preserving apparatus consisting of the tank W, fire-protector D, screw-stem P, the flexible pipe A, containing a wick, and a suitable oil can, all combined and arranged substantially as shown and described.



160,473. CAR-COUPLINGS. W. C. Scales, Circleville, Ohio. [Filed Aug. 26, 1874.]

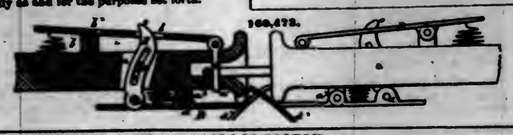
1. The combination of the lever D, having incline d', and the post E, with the lever B and the pin C, as shown and specified.

2. The levers B D, post E, and pin C, in combination with springs b and d', substantially as and for the purposes set forth.



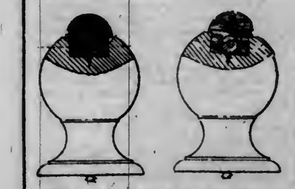
160,474. PUNCHING-MACHINES. James B. Sexton, Falls, Iowa. [Filed Nov. 7, 1874.]

Brief.—The power-arm of the lever is provided with a slot, through which operates another lever, and in which is placed the adjustable stop.



The combination, substantially as described, of the lever G, link H, lever F, arm T, die-holder D, and frame B, as and for the purpose set forth.

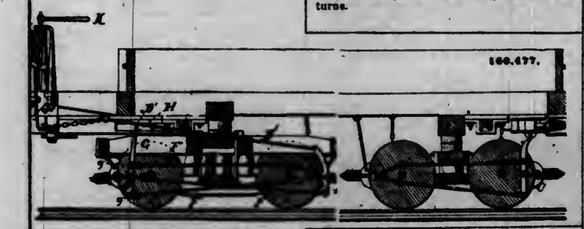
160,475. SCAFFOLDS. John A. Shannon, Bowling Green, Ohio, assignor to himself and Earl A. Thurstin, same place. [Filed Jan. 30, 1875.]



The bracket B and its shoe B', provided with the clevis b, the brace C, hinged to the bracket, and provided with the shoe C' and clevis b', in combination with the standard A, sheaves a a', and ropes d d' substantially as and for the purpose set forth.

160,472.

160,476. ATTACHING RUBBER CUSHIONS TO DOOR-CHECKS, &c. Jas. Shepard, Bristol, Conn. [Filed Feb. 16, 1872.]



Brief.—A piece of wood is inserted in the rubber, and this piece of wood afterward glued in the socket. The two surfaces of wood can be firmly held, while it is somewhat difficult to glue rubber to wood.

The improvement herein described in the art of securing rubber cushions to articles of wood by means of a key of wood, or other material equally adapted for gluing, which key is first secured to the rubber cushion, and then glued to the wooden article, substantially as set forth.

160,477. CAR-BRAKES. Ferdinand Soobodo and Franz Luza, Cleveland, Ohio. [Filed Jan. 30, 1875.]

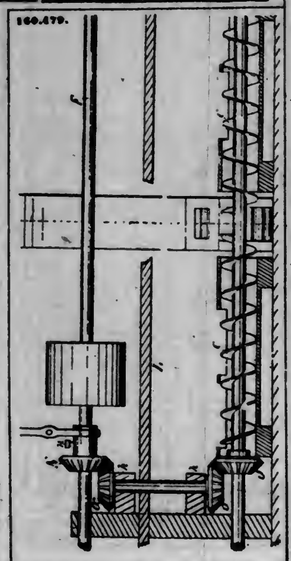
Brief.—A sliding block, adjustable, so that the brakes may be operated by a push, but not by a pull, or vice versa, or only by hand.

1. The combination, with the brake-shoes and draw head, of the levers E G, their connecting-rods F F', and the brake-rod D, whereby the brake-shoes are automatically or by hand brought into contact with the wheels, said wheels then, by their action against the shoes and through the connections G E F F', causing the shoes to still further bind and "brake" the wheels, substantially as and for the purposes set forth.

2. The combination of the draw-bar, the sliding block H, the levers E G, and their connecting-rods F F', substantially as and for the purpose set forth.

3. In combination with the block H, bearing the lever G, the lever or rod K and the yoke L, substantially as and for the purpose set forth.

4. The combination, with the draw-bar, of the shifting-block and mechanism for shifting the said block H, whereby the brakes may be operated either by a draft or by a push upon the draw-bar, or can be adjusted so as not to be affected by either, substantially as and for the purpose described.



5. The draw-bar, provided with the sliding block H, the spring M, and the barbed or arrow-headed arm N, for operating automatically the brake-shoes of the car, substantially as and for the purposes set forth.

6. The combination, with the sliding block H, yoke L, and lever K, of the pawl and ratchet-wheel P, for holding the block H in position, substantially as described.

160,478. WEFT-THREAD KNITTING-MACHINES. Charles L. Spencer, Providence, R. I. [Filed June 24, 1874.]

Brief.—The filling-yarn passes between a pair of corrugated disks, which crimp it, and deliver it in that condition to the needles, so that it will not be subject to strain by the return of the needles into line.

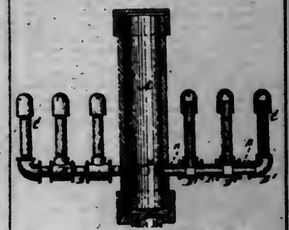
160,479.

1. The corrugated wheels A A, for separating the needles of a knitting-machine and crimping the filling-yarn when inserted, substantially as herein described.

2. The combination of the wheels A A, trumpet-guide D, and the reciprocating needles of a knitting-machine, substantially as herein described, and for the purpose specified.

3. In combination with a weft-thread knitting-machine, mechanism, substantially as described, for crimping or corrugating the filling-yarn previous to its presentation to and between the needles, substantially as and for the purpose set forth.

160,479. GRAIN-CONVEYERS. Wm Stanton, Erie, Pa. [Filed Jan. 21, 1875.]

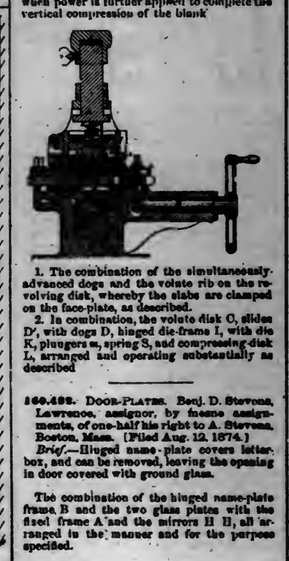


Brief.—In each compartment of the ship there is at bottom a case, open at top, inclosing a right and left hand screw-conveyer; also, a vertical shaft with bevel-gearing, operated by power attached to a horizontal shaft with a sliding pinion. An elevating bucket-belt is adapted to operate each compartment by turns.

1. In the several grain-compartments of a ship's hold, right and left closely-inclosed screw conveyers C C', open at the top, in combination with the gearing connecting shafts U and the line driving shaft F, connecting the separated conveyers, the elevator-leg E, and the shifting-gear N, as set forth.

2. The combination, with the right and left conveyers C C' and their operating gearing O O' O'' N, arranged in each separate grain-storing compartment of a ship's hold, of the line-shaft F, connected with the separate conveyers, to operate each independently of the other as each separate compartment is emptied of its grain, and the leg is shifted from an empty to a filled compartment, as herein set forth.

160,480. STEAM-JETS FOR FURNACES. Geo. Steele, Mott Haven, New York, N. Y. [Filed Sept. 3, 1874.]



Brief.—The object of the jets is to increase the draft in furnaces.

The combination of the steam-reservoir A, the radial pipes B, the detachable nipple-connections B^1 B^2, and the nipples C C', substantially as and for the purpose herein set forth.

160,481. MACHINES FOR MAKING BOOT AND SHOE HEELS. Wm. Stevens, Northampton, England. [Filed Oct. 16, 1874.]

Brief.—Simultaneously-advancing slides, upon which are mounted dogs faced to correspond with the outer surface of a finished heel, serve to laterally press the blank. At the same time a nail-die is turned over upon the outer lift, and the nails forced through the lifts, when power is further applied to complete the vertical compression of the blank

1. The combination of the simultaneously-advanced dogs and the volute rib on the revolving disk, whereby the slabs are clamped on the face-plate, as described.

2. In combination, the volute disk C, slides D', with dogs D, hinged die-frame I, with die K, plungers n, spring S, and compressing disk L, arranged and operating substantially as described

160,482. DOOR-PLATES. Benj. D. Stevens, Lawrence, assignor, by mesne assignments, of one-half his right to A. Stevens, Boston, Mass. [Filed Aug. 12, 1874.]

Brief.—Hinged name-plate covers letter-box, and can be removed, leaving the opening in door covered with ground glass.

The combination of the hinged name-plate frame B and the two glass plates with the fixed frame A and the mirrors H H, all arranged in the manner and for the purpose specified.

160,482.

160,482. DROP-HAMMERS. N. C. Stiles, Middletown, Conn., assignor to the Stiles & Parker Press Company, same place. [Filed May 11, 1874.]

Brief.—A weighted lever is attached loosely to the eccentric bearing of the forward roll. A pair of clamps, hung on eccentric bearings, bite upon the strap, and prevent it from falling after being released by the rolls. A lever, connected by a rod to a weighted treadle, acts when the treadle is depressed to turn the eccentric bearing of the forward clamp, thereby drawing said clamp away from the strap, and allowing the hammer to fall. As the lever for operating the clamp is raised, it in turn raises the weighted lever before referred to, a stud on which strikes against an arm attached to the bearing of the forward rolls, turns it, and causes the roll to approach the strap, the bearing being kept in its turned position by a latch which engages with a stud on the lever. A cross-bar attached to projecting wings, which inclose the bearings of the forward roll, is provided with a long arm, on which is an adjustable stop, which the hammer in its ascent strikes, turns the bearing, and releases the strap.

160,483.

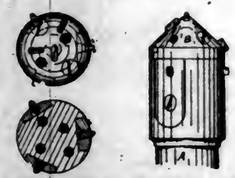
1. The combination of the rolls D^2 and E^2, the lever L, its counter-balance L^1, and the latch L^2, substantially as and for the purpose specified.

2. In combination with the two rolls D^2 and E^2, the eccentric bearings D^3 for the shaft of the driven roll D^2, pinions D^1, shaft I^1, and pinions F^2, for the purpose of adjusting said driven roll, substantially as set forth.

3. The clamps F F^1, the one F of which is provided with an adjustable eccentric bearing, k, substantially as and for the purpose set forth.

4. The combination of the two rolls D^2 and E^2, the lever L, and the latch L^2 with the clamps F F^1 and the lever F^3, all operating together substantially as described.

5. In combination with the rolls D^2 E^2, the lever I^2, and rod P, the slot I^3 in said rod, substantially as and for the purpose specified.



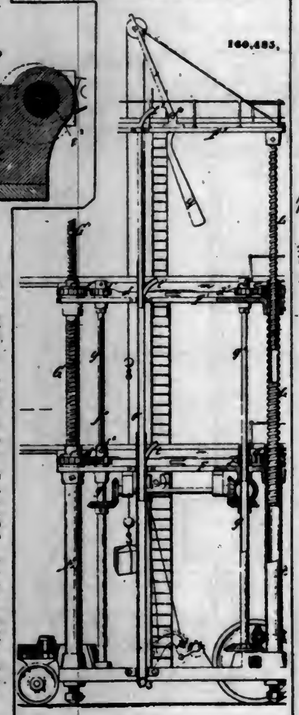
6. In combination with the rolls D^2 E^2, the hammer B, vertical bar P, and stop I^3, the trip N, substantially as and for the purpose specified.

7. The piece B^1, projecting from the hammer, combined with the spring-pin b^1 and corresponding recess in said piece, and the perforation b^2, substantially as and for the purpose specified.

8. In combination with the spring-pin S, and the nut by which the parts are secured together, and recesses upon the under side of said nut to receive said spring-pin, the perforation S^1, opening into the said recess, but of less diameter than the said recess, substantially as described, for the purpose of disengaging said pin.

160,484. METHODS OF SETTING DIAMONDS IN DRILLS. Chas A. Torrey, Southwark, England. [Filed Aug. 14, 1874.]

Brief.—The diamond is placed upon the drill-head, projecting through an orifice in the cap, which is forced down to its place by a screw.



The combination of a perforated cap with a drill or other cutting or boring tool, substantially as and for the purpose specified.

160,485. FIRE-ESCAPE ELEVATORS. Chas. F. Thomas and Herman Joerns, New York, N. Y. [Filed Jan. 29, 1875.]

Brief.—The several platforms are supported on telescoping columns, on which are cut screw-threads. On top of each platform, and encircling the columns, are screw pinion-wheels, which engage with supplemental pinion-wheels which in turn engage with pinion-wheels on the driving-shafts. The supplemental pinion-wheels are pivoted to levers, by which they are thrown in and out of gear. The driving-shafts, as well as the water-supply pipe, are telescopic. The several platforms are extensible, and the extreme sections are provided with grapnels for engagement with the window-sill. On the top platform is pivoted a weighted derrick, provided with pulleys and ropes, for raising and lowering goods.

160,485.

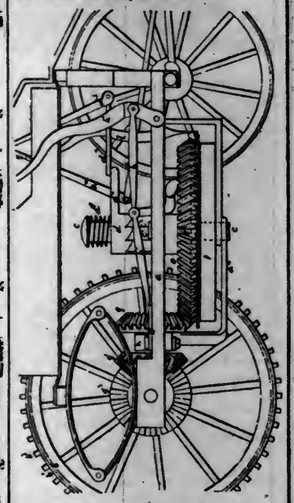
1. The combination of two or more frames or platforms, the lowest one of which is supported by two or more hollow columns rising from a truck-frame, while the upper platform or platforms are supported by screws, to which a rising and falling motion is imparted, substantially in the manner herein shown and described.

2. The combination of two or more platforms, F F^1 F^2, hollow columns E, screws O G^1, nuts e e^1, shafts g g^1, and lever-frames d d^1, which carry intermediate cog-wheels c c^1, and which are connected to suitable shipping levers, substantially in the manner set forth.

3. The combination of hinged traps I with the slides H, platforms F, hollow columns E, and elevating-screws O, substantially as set forth.

4. The combination of grapnels s with the traps I, slides H, and platforms F, substantially as described.

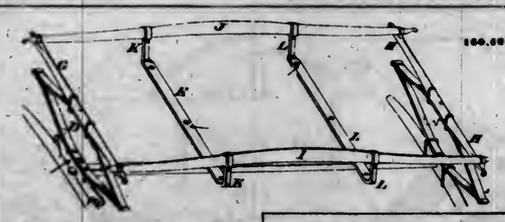
5. The combination of a balanced derrick, L_1 with a platform, F^2, screws G^2, and hollow columns E, substantially as set forth.



160,486. EARTHEN BUCKETS. W. F. Towns, Ravenna, Ohio. [Filed Feb. 13, 1875.]

The earthen bucket a, having a projecting flange, c, in combination with the bail b, substantially as herein set forth.

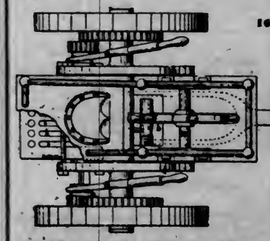
160,487. HAND-CARRIAGES. Wm. O. Umstead, St. Clairsville, Ohio, assignor of one-third his right to J. F. Baldwin, same place. [Filed July 22, 1874.]



Brief.—A vehicle propelled by power stored in a coiled spring by the driver.

1. The coiled spring f, master-wheel c, shaft c, frame a a^2, platform a^3, clutch c^1, clutch-lever d d^2, ratchet c^2, and pawl c^3, combined to operate as and for the purposes specified.

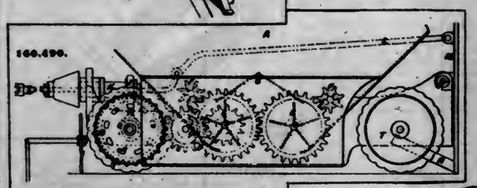
2. The combination, with the master-wheel c, pinions g g^1, and frame a a^2, of the lever h^1, links h^2 h^3 h^4 h^5, sliding bearing h, yoke h^1, and pawl i, as and for the purposes set forth.



160,488.

160,488. SPRING-VEHICLES. Jas. Walker, Cincinnati, Ohio. [Filed Feb. 4, 1875.]

The combination of bent bearing-bars K and L, attached rigidly to the spring side bars I and J at points intermediate between their middle and end portions, said bars I and J resting upon the extremities of spring cross-bars G and H, connected by elliptical springs D and E with the bolster and the rear axle, respectively, substantially as set forth.



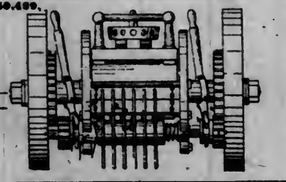
160,489.

160,489. MACHINES FOR SUBSOILING AND DIGGING VEGETABLES. Theodore L. Webster, Brooklyn, N. Y. [Filed Feb. 11, 1875.]

Brief.—A pair of bearing-wheels support upon their axle-tree an adjustable frame, which carries a revolving digger or fork-head. Rotation is given to the fork-head by means of cog-gears applied to the bearing-wheels, working into pinions that slide upon the shaft of the fork-head. The fork-head has, in addition to a rotary motion, an endwise intermittent motion, for the purpose of keeping the forks clear, which pass through a slotted cleaning-table, which also partakes of the endwise motion.

160,490.

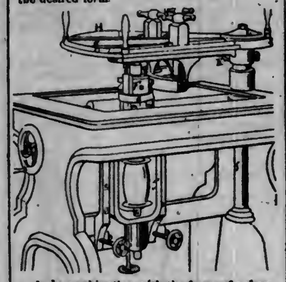
1. The charger described, provided with the revolving distributing-blades E, receiving motion from the movement of the carriage in the retort, as set forth.



2. The combination of the disk M and the plow N, substantially as described.

3. The combination of the wheel T, the wheel G, the forked arm H, the eccentric wrist J, and the hollow rod K, substantially as described.

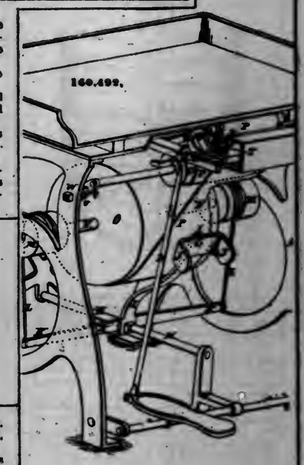
4. The combination of the revolving blades E, the pinions F F, and the transverse rake-shafts for feeding down the coal.



5. The charger described, having the hopper A, inclined guiding-board C, rake-shafts F, and feeding-blades E, combined and arranged as and for the purpose described.

160,491.

160,491. MOLDING-MACHINES. George W. Wetmore, Sturgis, Mich. [Filed Feb. 4, 1875.]

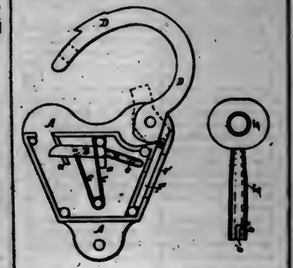


Brief.—The article to be molded or shaped is attached to a horizontally-vibrating table, and moved past a revolving cutter, which gives it the desired form.

1. In combination with the frame of a shaping-machine having a traversing cutter-head, the spindle G, quadrant H, provided with the ways g g g, the several clamping devices I I^1 I^2, each moving in one of the ways g, substantially as shown, and for the purpose set forth.

2. The combination, with the quadrant H and the several cross-heads and clamps I, of the feed-screws J, pinions K, and gear L, for simultaneously giving the said cross-heads I a radial adjustment with relation to the spindle G, as shown and set forth.

160,492.



160,492. CIGAR-MACHINES. Josephine Wettstein, Highland, Ill., administratrix of John Wettstein, deceased. [Filed July 21, 1874.]

Brief.—The wheel that carries the usual belt is oscillated by means of a knee-lever, that turns two pulleys situated upon either side of the wheel, through bands wound around the pulleys in opposite directions.

1. The movable roller Q, fixed rollers R S T, and belt P, in combination with the arm E, rock-shaft F, arms G G, rod D, and treadle C, for adjusting the roller Q, as and for the purpose set forth.

2. The drum O, shaft N, and pulleys M, in combination with belts L, cross-bar K, and knee-lever I J, for operating the drum O, as and for the purpose specified.

160,493. SEAL-LOCKS. C. O. Wheeler and Anthony Laffrey, Chicago, Ill. [Filed Dec. 4, 1874.]

160,494. CHARGERS FOR GAS-RETORTS. J. West, Maidstone, Great Britain. [Filed Nov. 17, 1873.]

Brief.—The charger, upon being projected into the retort, pushes the coke before it into coke-boxes, and upon being withdrawn it distributes the coal in the retort by means of revolving blades, revolving rakes, and a plow.

A padlock wherein the key-hole is arranged in the rear edge of the case, and is surrounded by a recess, open at one end or side to receive a seal, the said lock also being provided with a pivoted shackle, having its head constructed substantially as specified, to close the said open end or side of the recess and inclose or lock the seal when the shackle is locked.

160,494. CANDY-MIXING MACHINES. S. F. Whitman, Philadelphia, Pa. [Filed Jan. 23, 1875.]

Brief.—A concave-bottomed cylindrical vessel holds a shaft fitted to revolve, which bears a series of vanes. A yoke arranged to revolve in an opposite direction carries similar vanes. Vanes at the bottom of the shaft, curved to conform to the concave bottom of the vessel, are inclined transversely, to raise the contents and keep the same from being scorched.

1. The combination of the vessel A, having a concave bottom, with the inclined rotating vanes d', curved to accord with the said concave bottom of the vessel, as set forth.

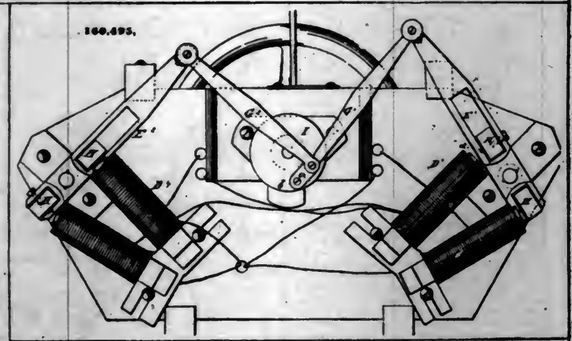
2. The combination of the vessel A, the shaft B, carrying vanes b and d', and the two sets of vanes m n, arranged above the vanes b d', and caused to revolve in contrary directions, as specified.

3. The shaft B, made in two parts detachable from each other, and the lower portion carrying the vanes m, in combination with the tubular shaft d, and with the yoke D carrying the vanes n, all substantially as set forth.

160,495. ELECTRIC MOTORS. D. Williamson, Greenville, N. J. [Filed Jan. 8, 1875.]

Brief.—Upon a sliding sleeve on the fly-wheel shaft are two disks, the cut-away portions of which oppose one another. These disks allow conducting-pieces, each connected with its magnet and attached to swinging arms, to come into contact at proper times with a metallic disk connected with one pole of the battery. When the disks are in position, so that the swinging arms rest upon both disks, the machine comes to rest, and, according as one or the other of the disks revolves under the swinging arms, the revolution of the shaft is to the right or to the left.

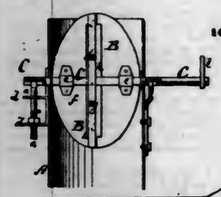
1. The cushions or bumpers d in combination with the magnets and armature-levers, substantially as and for the purpose specified.



2. The cams L L', attached to the adjustable slide K, in combination with rollers n or equivalents, as and for the purpose described.

3. The cams L L', arranged as described, in combination with the slide K, arms m, rollers n, springs t, and bars s, substantially as and for the purpose set forth.

4. Two or more cross-bars, s, in combination with the fixed insulated device h and h' and the sliding cams L L', whereby the currents are completed and broken, dispensing with all friction, for the purpose herein described.

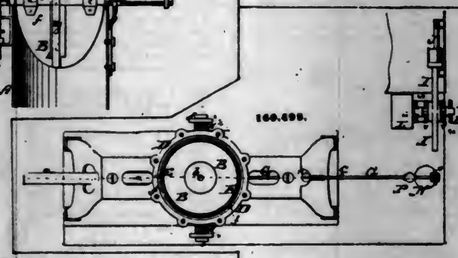


5. The magnets D^1, D^2, D^3, and D^4, and levers E^1 E^2, in combination with pitman G^1 G^2, crank d, and pin b, and shaft B, all as and for the purpose herein described.

160,496.

160,496. DAMPERS FOR FURNACES. Joseph Woodruff, Rahway, N. J. [Filed Feb. 1, 1875.]

Brief.—The damper being of two sections, the parts may be inserted or removed separately.

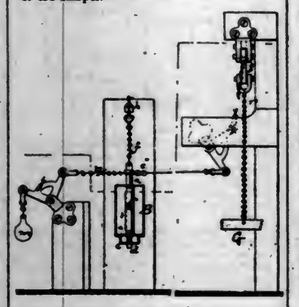


1. The damper C, mounted on the vertical arbor a, which rests partially on the step d, and is partially suspended by the chain f, substantially as and for the purpose described.

2. The adjustable screw g, fitted in a stationary lug, A, and combined with the chain f, and with the arbor a of the damper C, substantially as set forth.

3. The combination of the weighted bell-crank j with the arbor a of the damper C, and with the bell-crank l, link q, and operating-lever G, all arranged for operation, as specified.

160,498.



1. The damper B, made in two sections, f g, each section having a strap, s, for connection with the shaft C, with which said damper is combined, substantially as described.

2. The arched braces i and ribs h, applied to and combined with a sectional damper, B, substantially as and for the purpose specified.

3. The adjustable supporting-pins a b, combined with a recessed shaft, C, and with a damper, substantially as and for the purpose specified.

160,497. DAMPERS FOR FURNACES. Joseph Woodruff, Rahway, N. J. [Filed Feb. 1, 1875.]

Brief.—The adjustable suspension from above, in connection with the supports from below, is designed to facilitate the operation of the damper.

160,498. DRAFT-REGULATORS. Jos. Woodruff, Rahway, N. J. [Filed Feb. 1, 1875.]

Brief.—The parts m and C constitute in effect a double diaphragm. The part a limits the movement of the lever, and thus prevents the draft-opening from being entirely closed.

1. The lever G of a draft-regulator, arranged beneath the diaphragm C, with which it is combined, for transmitting the effect of steam-pressure on said diaphragm to a damper, and to dispense with a superstructure of the supporting-frame, substantially as described.

2. In a draft-regulator, the combination of the lever G and cross-bar j with the links i i, yoke H, and upper flexible diaphragm C, the yoke straddling said diaphragm, substantially as described.

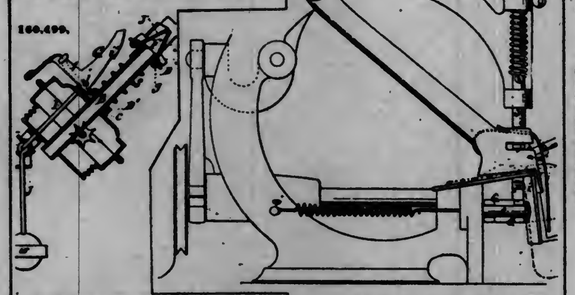
3. The lower diaphragm B, combined with the flanged tube b, nut s, supporting-plate d, and steam-supply pipe a, substantially as described.

4. The combination of the inner ring E, having the projecting lugs f f, with the outer rings D D, and with the diaphragms B C, substantially as and for the purpose described.

5. The upper diaphragm C, arranged beneath and combined with a secondary or false diaphragm, m, which connects directly with the lifting-plate g and yoke-pivot h, substantially as described.

6. The combination of the lever G of a draft-regulator with the rod e, chains s t, and segmental transmitting-lever I, substantially as and for the purpose specified.

7. The damper J, combined with the segmental lever I and chain p, and with the chains s t and rod e, substantially as set forth.



8. The combination of the slide P, which carries the projecting toe Z, with the lever G, for affecting the suspended weight N, substantially in the manner herein shown and described.

160,499. LAMP-EXTINGUISHERS. William T. Wood, Mount Juliet, Tenn. [Filed Feb. 6, 1875.]

Brief.—When the lamp is overturned the pendent swinging weight draws down the hinged rod, and thereby releases the notched lever, and allows the extinguisher to be operated by the spring.

1. The combination, with the sectional interlocking jaws f of an extinguisher-cap and the wick-tube B, of the slotted plate D, guide-rods e, and springs s, substantially as specified.

160,499.

2. The combination, with the guided and vertically-movable extinguisher-cap holder-plate D, operated to extinguish the flame by springs s, of the angular vertically-vibrating notched lever O, substantially as specified.

3. The combination, with the extinguisher cap-plate D, springs s, and holding-lever O, of the jointed rods I J, having each a bell-shaped attachment, x x', and the latter a weight, w, upon the lower end, adapted to be received within the body of the lamp, substantially as specified.

160,500. HOUSEMAIDS' PAILS. Emma C. Wooster, New York, N. Y. [Filed Nov. 2, 1874.]

Brief.—The pail is furnished with side pockets, which are open at their bottoms, and the water that drips from sponges and brushes in these pockets is caught in a trough around the bottom of the pail.

The implement consisting of pail A, trough B, soap-dish C, and brush-receptacle D, all constructed and connected substantially as and for the purpose shown and described.

REISSUES.

6,210. APRON-SUPPORTERS AND PAGES. W. H. Chipley, New Midway, Md. Patent No. 147,479, dated Feb. 17, 1874. [Filed Nov. 21, 1874.]

The combination of the hard-rubber spring nose A and slide C, when constructed and arranged to operate relatively to each other, substantially as described, and for the purpose set forth.

6,211.

6,211. SEWING-MACHINES FOR SEWING THE SWEAT-LININGS OF HATS. R. Bickemeyer, Yonkers, N. Y. Patent No. 52,006, dated Feb. 20, 1866. [Filed Jan. 27, 1875.]

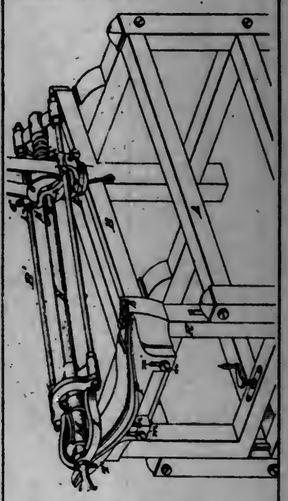
Brief.—The cloth-plate is inclined backward from its front edge, which is carved out so as to conform to the shape of the crown of a hat, and has depending therefrom a plate which is bent in a similar form. The presser foot is formed with two faces, and is attached to an arm which is pivoted to the goose-neck of the machine, in such a position that when the presser is raised by the presser-bar it moves away from both the cloth and depending plates. To the side of said presser is attached a secondary plate, of a form corresponding to the depending plate, and serves as a guide to conduct the hat to the presser and stitching mechanism. Upon the upper edge, and on the outside of this plate, is arranged another guide, by means of which the sweat-lining is placed in proper position on the hat for stitching. The feed-dog, having two serrated surfaces, is arranged below in such a manner that it operates toward and from the angle formed by the junction of the cloth and depending plates.

1. In combination with a mechanism for making stitches, and a presser-foot, a guide for controlling the edge of the sweat-lining, and a cloth-plate, these four elements being constructed and relatively arranged substantially as described, whereby the re-entering corner of the hat formed by the junction of the brim and side crown may be held in proper position with relation to the sweat-lining and the stitching mechanism, to receive stitches through the sweat-lining and the hat, as specified.

2. A stitching mechanism and a feeding mechanism, in combination with a yielding presser-foot having two acting surfaces, and arranged to act substantially as described, whereby the re-entering corner of the hat formed by the junction of the side crown and brim may be held in proper position with relation to the stitching mechanism to receive stitches, as specified.

3. The combination, with a presser-foot having two acting surfaces, of a feed-bar having two serrated acting surfaces, and operating substantially as described.

4. In combination, a yielding presser-foot, a cloth-plate or table, the edge of which is arranged with reference to a needle to form stitches in a hat, as specified, a mechanism for making stitches, and a stationary depending plate, whose surface supports a side crown, as described.



5. In combination with a presser-foot having two pressing-surfaces, a mouth-piece, substantially as described, for guiding the hat to the stitching mechanism.

6. In combination with the yielding presser-foot, a guide which controls the edge of a sweat-lining, and an auxiliary sweat-guide, these two being constructed and operating substantially as described.

7. A presser-foot having two acting surfaces, in combination with a guide which controls the edge of the sweat-lining, and which is arranged relatively to the stitching mechanism, as hereinbefore described, and a depending side-crown support, whereby a hat and a sweat-lining to be sewed therein may be held in proper relative position, as described, the combination of these elements being and acting to form stitches through the hat and the lining, as herein set forth.

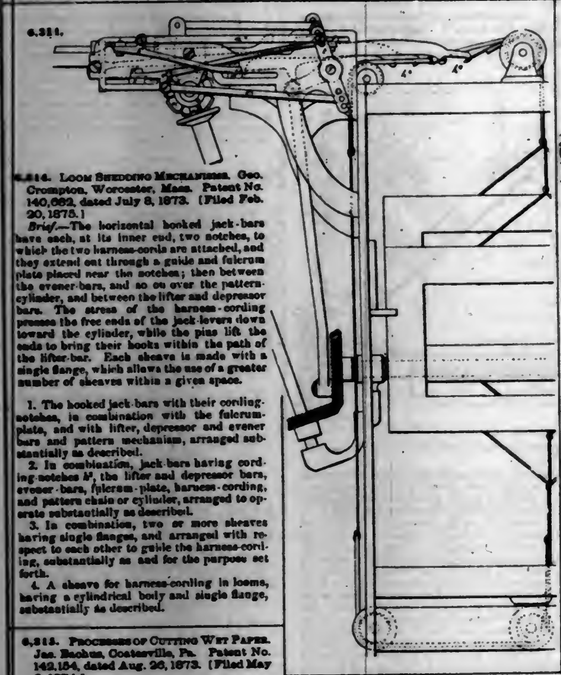
6,212. MACHINES FOR MOLDING CHAIR-BACKS. John Lemman, Cincinnati, Ohio. Patent No. 93,803, dated Aug. 17, 1869. [Filed July 30, 1874.]

Brief.—Chair-backs can be molded as desired by means of a vertically-adjustable form, in connection with a swinging radial cutter-spindle frame, the cutter-spindle being rotated by a single localized pulley, and the movement of the spindle over the form controlled by a coiled spring fitted over the spindle between its bearings and the end of the cutter-frame. Picture-frames may be made by a proper arrangement of the form, work, and cutter-frame, with suitable driving mechanism; and by a suitable-shaped form "wave-moldings" may be cut.

1. A cutter-spindle, N, journaled in bearings of a swiveling sweep, B, substantially as herein shown and described.

2. The sliding and swiveling cutter-frame A' B' and cutter-spindle M N, constructed and operating substantially in the manner described, in combination with the form F, for the purpose specified.

3. The coiled spring V, in combination with the projection T of the cutter-frame, when constructed and arranged substantially in the manner and for the purpose specified.



4. The arrangement of the sliding frame R, form F, made adjustable by screws m m and slots m' m', cutter-frame A' B', spindle M N, spring V, and projection T, all being constructed and arranged to operate as described.

6,213. COATING METALS WITH METAL. American Nickel-Plating Company, (assignee of Isaac Adams, Jr.,) New York, N. Y. Patent No. 57,271, dated Aug. 21, 1866. [Filed May 3, 1869.]

Brief.—To protect articles subject to heat and moisture against corrosion. Especially applicable to gas-burner tips and similar articles.

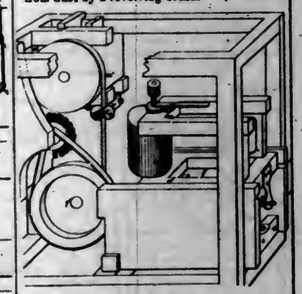
Rendering gas-tips and other articles of metal anti-corrosive to heat or moisture by surfacing them with nickel, substantially as set forth.

6,314.

6,314. LOOM SHEDDING MECHANISMS. Geo. Crompton, Worcester, Mass. Patent No. 140,662, dated July 8, 1873. [Filed Feb. 20, 1873.]

Brief.—The horizontal hooked jack-bars have each, at its inner end, two notches, to which the two harness-cords are attached, and they extend out through a guide and fulcrum plate placed near the notches; then between the evener-bars, and so on over the pattern-cylinder, and between the lifter and depressor bars. The arms of the harness-cording pressure the free ends of the jack-levers down toward the cylinder, while the pins lift the ends to bring their hooks within the path of the lifter-bar. Each sheave is made with a single flange, which allows the use of a greater number of sheaves within a given space.

1. The hooked jack-bars with their cording-notches, in combination with the fulcrum-plate, and with lifter, depressor and evener bars and pattern mechanism, arranged substantially as described.



2. In combination, jack-bars having cording-notches b^1, the lifter and depressor bars, evener-bars, fulcrum-plate, harness-cording, and pattern chain or cylinder, arranged to operate substantially as described.

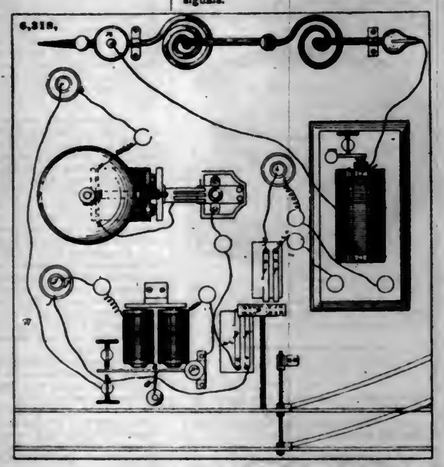
3. In combination, two or more sheaves having single flanges, and arranged with respect to each other to guide the harness-cording, substantially as and for the purpose set forth.

4. A sheave for harness-cording in looms, having a cylindrical body and single flange, substantially as described.

6,317. SAWING-MACHINES. Chas. H. Mayo, Bath, Me., assignor, by mesne assignments, to himself, Edwd. Gove, and E. W. Marble, same place. Patent No. 109,436, dated Nov. 22, 1870. [Filed Apr. 10, 1873.]

Brief.—The log is rotated and moved toward a band-saw, the teeth of which are freed from dust by a revolving brush.

1. In a sawing-machine for sawing logs, as described, the combination of a band-saw, traveling continuously in one direction, and a revolving cleaning-brush, rotating in the same direction with, but at a different rate of speed from, the saw, and operating in connection with said saw, substantially as shown and set forth.



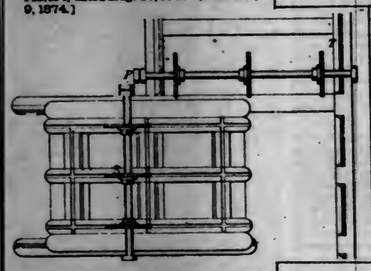
2. The combination of the head or frame a^3, swiveled as explained, the carriage m, and the endless band-saw a^2, under the arrangement and for operation as herein set forth.

3. The combination, with the endless band saw, of the directing-roller c', the horizontally vibratory roller-bar x', and the devices for adjusting the position of said roller and bar, under the arrangement shown and described.

6,313. ELECTRIC RAILWAY-SIGNAL APPARATUS. Henry W Spang, Reading, Pa. Patent No. 141,305, dated July 29, 1873. [Filed Nov. 12, 1873.]

Brief.—Uses Geissler tubes for night visual signals.

6,313.



1. A Geissler tube, or its equivalent, illuminated by electricity, in combination with a track or railway switch circuit-closer, for general railway-signal purposes.

2. In combination with a track or railway switch circuit-closer, a visual signal illuminated by an induced electrical current.

3. In combination with a railway-signal apparatus and a track or railway switch circuit-closer, a visual signal illuminated by an induced electrical current.

6,315. PROCESSES OF CUTTING WET PAPER. Jas. Bachus, Coatesville, Pa. Patent No. 140,154, dated Aug. 26, 1873. [Filed May 9, 1874.]

The process of sawing paper board as herein described, consisting in sawing the paper board while it is in the wet state in which it is taken from the paper-making machine, substantially as described, and for the purpose set forth.

6,316. TUCK-MARKERS FOR SEWING-MACHINES. Harry C. Goodrich, Chicago, Ill. Patent No. 61,618, dated Jan. 29, 1867. [Filed Feb. 11, 1875.]

Brief.—Reissue of Patent No. 61,618. The curved spring-arm is notched at the outer end, and coiled at the curve to cause it to rise. The part of the marker resting on the table has a flange to guide the last-made tuck which passes under it, and also to prevent it riding on the marker and being creased again.

6,316.

1. In a tuck-marker for sewing-machines, a lip or flange, J, arranged to prevent the last-made tuck from being creased a second time, as herein set forth.

2. The combination of plate A and its spar, of the notched arm B, coiled at C, to throw it upward in the path of and to be depressed by the movement of the needle-actuating devices, to crease the fabric, substantially as described.

HELIOTYPE RELIEF PROCESS, JAMES R. OSGOOD & CO. BOSTON

OFFICIAL GAZETTE

OF THE

United States Patent Office.

VOL. 7.—NO. 10. TUESDAY, MARCH 9, 1875. PRICE { $6,00 per year—single. $5,00 per year in clubs.

The OFFICIAL GAZETTE is published on Tuesday of each week, from the United States Patent Office. The subscription price for 1875 is six dollars per year for single subscribers; five dollars per year to clubs of not less than five sent at one time, and which will be mailed free of postage to separate addresses if desired. Subscriptions will commence and terminate with the year. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

DECISIONS OF THE COURTS.

U. S. CIRCUIT COURT, DISTRICT OF CONNECTICUT.

THE RUSSELL AND ERWIN MANUFACTURING COMPANY *vs.* THE P. & F. CORBIN MANUFACTURING COMPANY AND FREDERICK H. NORTH.

[*In equity.—Before* WOODRUFF *and* SHIPMAN, *J. J.—April*, 1874.]

The claim of the letters patent granted to Rodolphus L. Webb, December 31, 1867, for an "Improvement in Reversible Locks and Latches"—namely, "The combination of a lock and latch when the latch-bolt and its operative mechanism are arranged in a case or frame independent of the main case, and constructed so that the latch-bolt may be reversed, substantially as described, without removing the said independent case from the main case," is infringed by the combination of a lock and latch in which the latch-bolt and its operative mechanism are arranged in a skeleton frame within an outer or lock case, which operates to preserve the proper relations of the yoke and tumbler while being moved forward and backward, although it does not so operate when the latch and latch mechanism are removed from the outer or lock case.

Infringement is not avoided by the fact that, when the patentee's latch-bolt is drawn forward for the purpose of reversing it, the case or frame moves forward with it in a straight line, and that the defendants' frame, when the latch-bolt is drawn forward, moves in a curved line.

Nor is infringement avoided by the fact that the defendants introduce a catch and spring to hold the latch and its mechanism in position, after reversal, until the knob-spindle is inserted. This superadded device may improve the aggregate structure, but it has no effect whatever upon the functions or mode of operation of the patented devices, nor does it justify the defendants in appropriating them to their own use.

The word "independent" in the claim does not mean that the latch and its mechanism operate without any contributory aid from the main case or adjuncts thereto. All that it imports is that there is an outer case and a separate inner frame or case in which the latch mechanism is arranged and held in position.

[*Charles E. Mitchell* and *Benjamin F. Thurston*, for complainant. *Charles R. Ingersoll* and *Charles F. Blake*, for defendants.]

WOODRUFF, *J:*

The bill of complaint herein is filed to restrain the alleged infringement by the defendants of letters patent for an "Improvement in Reversible Locks and Latches," granted on the 31st of December, 1867, to Rodolphus L. Webb, and assigned by him to the plaintiff on the 12th of May, 1868, and to recover from the defendants the gains and profits arising from such infringement, and for other relief. The answer of the defendants places their defense upon two grounds—viz., that the invention described in the patent is not the invention of Webb, but of one Burton Mallory, and was known and used by him before the said Webb had any knowledge thereof, and was described in letters patent granted to Mallory May 5, 1863; and that, under any proper construction of the patent to Webb, the defendant corporation has not made use of or employed any improvement described or claimed in the said letters patent, or sold any locks which correspond with the construction claimed by the patentee, as described in his claim. They then allege that the locks which they have made and sold are constructed with the improvements described in letters patent issued to W. T. Munger, March 1, 1870.

In a suit in this court between the present complainant and the same Burton Mallory referred to in the answer of these defendants, we considered the construction and validity of the claims in the patent granted to Webb, held him to be the first inventor, and adjudged the said Burton Mallory an infringer of the rights of these complainants. (*Russell & Erwin Manufacturing Co.* vs. *Mallory*, 10 Blatch., 140.) The defendants in this cause have so far acquiesced in that decision that, on the trial of this cause, the only question raised and discussed, or to which proofs on the part of the defendants were addressed, was whether the locks and latches produced, and which, as admitted, the defendant corporation is engaged in manufacturing and selling, do infringe the patent granted to Webb on

which this suit is founded. Upon that question we entertain no serious doubt. There is, it is true, a conflict of testimony. The defendants have examined experts, who point out noticeable differences between the latch mechanism made by the defendants and that made by the complainant; but those differences are mainly formal, and in some respects verbal only. If, in any feature, there is material change of construction, it is at most an addition, modification, or improvement on the structure of the patentee, which nevertheless embraces its substantial features, and operates by the same substantial means and in substantially the same way. We do not think it necessary to enter very fully into the details of the patented invention in disposing of this case. It is described with some minuteness, in the opinion of the court in the suit against Burton Mallory, above referred to. (10 Blatch., 140.)

The claim of the patentee is in these words—

> What I claim, therefore, and desire to secure by letters patent is the combination of a lock and latch, when the latch-bolt and its operative mechanism are arranged in a case or frame independent of the main case, and constructed so that the latch-bolt may be reversed, substantially as described, without removing the said independent case from the main case.

The description in the preceding specification and the drawings and model of the patentee show that the case or frame in which the latch mechanism is arranged is of thin sheet metal, partially surrounding the mechanism of the latch, to hold the parts in proper relative position when drawn forward for the reversal of the latch-bolt, and while it is being returned to its place. But the patent cannot be avoided by making that case or frame a skeleton frame operating in substantially the same way. The patentee seems to have anticipated some such attempt to limit the meaning of the word "case," by inserting the words "case or frame," as, for the purposes of his invention, synonymous, as, in their connection and application to this mechanism, we think they are. The defendants use a frame, which operates to preserve the proper relations of the yoke and tumbler while being moved forward and backward, as does the complainant's "case or frame." It was suggested that it does not so operate when the latch and latch mechanism are removed from the outer or lock case, but that, when so removed, the forward end of the bolt is not sustained, but falls, and the due adjustment of the mechanism is not preserved; whereas, it is said the case used by complainant always preserves the parts in their proper adjustment, whether in or out of the outer or lock case. We apprehend the question of infringement does not depend upon what capacity the several parts of the latch mechanism used by the defendants have or have not, when in no condition for practical use, or outside of the conditions in which the latches of both parties are intended to operate, and in which alone they are in fact used. If, therefore, in point of fact, there be any such difference between the two structures, (which, however, the complainant denies,) the question would still be, Do the defendants, in making their locks and latches, construct and insert a mechanism and frame, which, in the actual condition and relation to the means of practical use, is like the complainant's patented invention, producing the same result in substantially the same way, by substantially the same means? If they do, then it is not material that, outside of those conditions, or removed from the outer or lock case, the complainant's latch mechanism and frame has the capacity of holding the parts in due relation, which the defendants' has not. This may show that the defendants' device is not good or not so useful and convenient as the complainant's; but that is all.

Besides, the patent to Webb is not for the latch with its mechanism and case in a condition not adapted to use. As more fully explained in a former suit, above referred to, it is limited to the structure which contains the latch mechanism within an outer case. It will not avail, therefore, to say that they do not infringe because when removed from the outer case the defendants' devices will not operate in the same manner as the complainant's device will do when thus removed. If the defendants can make their peculiar frame and mechanism of the latch useful outside of any outer case, probably the complainant would not object that, by doing so, the patent was infringed. If the opinion in the former case was correct, the defendants infringe, if their device, constructed and used in the arrangement and connection described in the patent for the aggregate structure, does operate in the same way and produce the same result by substantially the same means. In this view we think the defendants' frame is not even entitled to be treated as an equivalent. It is, in substance, the same thing as the complainant's case or frame.

Again, there is a difference in the line of motion of the case or frame. When the complainant's latch-bolt is drawn forward for the purpose of reversing it, the case or frame moves forward with it, in a straight line. By means of a projection in the main case, at a corner or projecting angle of the defendants' frame, the movement of their frame, when the latch-bolt is drawn forward, is in a curved line forward, the frame being made to turn on such projecting angle as a center of motion. This difference is so obviously an immaterial variation, so far as the question of infringement is concerned, that, although the defendants' expert witnesses gave it some prominence, their counsel expressly declined to claim for it any significance.

So another difference is stated by the defendants' experts. When the complainant's latch-bolt has been drawn forward, reversed, and returned to position, but the knob-spindle has not been inserted, it can easily be drawn forward again—it is not held in place until such spindle is inserted. The same is true of the defendants' devices which are claimed to infringe. But the defendants have superadded another device—a catch operated by a spring, by which, when the latch and its mechanism is returned to its proper position, it is caught and held in position before the knob-spindle is inserted. This is a merely superadded device. If of any conceivable utility, it may improve the aggregate structure, but it has no effect whatever upon the office, functions, or mode of operation of the patented devices, nor does it justify the defendants in appropriating them to their use.

It is further insisted that, because the complainant's patent, and especially the claim therein, characterizes the case or frame as "independent" of the main case, and the defendants, in their structure, make the main case useful by inserting studs therein to receive the bearing of the bolt-spring, there is, therefore, no infringement. That argument can have no force, unless we should construe the claim as involving, in the aggregate structure, the complete independence of the latch mechanism from any office or function of the main case. Such is, in substance, the argument. In the first place, the claim does not, in terms or by a just interpretation of its meaning, import that the latch and its mechanism, in the combination in which it is described and patented, operate without any contributory aid from the main case or adjuncts thereto; but only that the case or frame is independent of the main case, which means separate from, or forming no part of, the main case; and this is literally and exactly true of both complainant's and defendants' case or frame. Second, when the claim and specification are read together, it becomes obvious that the contributory aid of the main case to the successful operation of the latch, in connection with a lock-case, as it is patented, is just as essential as in the defendants' device. Studs therein guide the movement of the latch mechanism, the inner side of that case, or a stud therein, (shown in the drawings,) sustain the mechanism against the backward thrust, and against the bearing of the spring before the knob-spindle is inserted, and the latch is sustained by, and slides between, the two surfaces of that outer case. The claim does not, therefore, mean, and could never be understood by one who ever read the specification or saw the model, that the latch and its mechanism operated independently of the main case. All that it imports is that there was an outer case and a separate inner frame or case, in which the latch mechanism is arranged or held in position. Whether the bearing of the bolt-spring was against the case or frame of the latch mechanism, or against a stud or studs in the outer case, is of no materiality to the claim of the patent. The whole operates substantially in the same way, and produces the same result, and by substantially the same means.

A decree must be entered for the complainant, agreeably to the prayer of the bill of complaint, with costs to the complainant.

U. S. CIRCUIT COURT, SOUTHERN DISTRICT OF OHIO.

JAMES F. TRADER, SAMUEL R. COLLIER, AND GEORGE VLEREBOME, PARTNERS, AS TRADER, COLLIER & VLEREBOME, *vs.* A. L. MESSMORE AND JAMES COULTIS, PARTNERS, AS MESSMORE, COULTIS & CO., ROBERT M. BOWMAN, AND W. H. BOWMAN.

[*In equity.—Before* SWING, *J.; January*, 1875.]

Where complainants had used their device for thirteen years without ascertaining that their patent covered such a device as that which formed the alleged infringement, and this latter had become the subject of a patent and possessed superior utility to that of complainants: *Held*, that the patent sued on should be interpreted strictly.

It becomes important, in interpreting the language of a patent, to know what construction the patentee himself placed upon it; and to this end recourse may be had to the files of the application, to ascertain what changes were made in the original specification and claims, and the significance of those changes as revealed by the history of the case.

The patent of William Blessing, December 13, 1859, for "an improvement in seed-planters," must, in view of the application record, be narrowly interpreted, so as to limit the invention to a *particular* arrangement of a *particular* top with *particular* openings, so that the chaff may be removed in a *particular* way. Thus construed, it does not control a device in which there are no lateral chaff-openings in the periphery of the distributer, through which the chaff is worked by the vibrations of the feed-bar, but in which, instead, the chaff falls directly to the ground.

While patents are to be construed liberally, they should not be so construed as to enable patentees to reach out and cover every improvement or invention which, after seeing the same, they conclude they might have embraced within their patent, but which was not so embraced and included.

[*Wood* and *Boyd*, for complainants.
Fisher and *Duncan*, for defendants.]

SWING, *J.*:

This suit is brought by the complainants against the respondents for the infringement of letters patent granted to William Blessing, December 13, 1859, for an "Improvement in Seed-Planters," and extended for seven years from December 13, 1873, the title to which, for certain territory described in the bill, has become vested in complainants.

The respondents admit the manufacture and sale by them, within the territory claimed, of a certain planter, which has been introduced in evidence as the "Bowman distributer," but deny that this is an infringement of the invention claimed in the Blessing patent. They also deny that Blessing was the original and first inventor.

The determination of this case depends upon the construction which shall be given by the court to the patent of the complainants. It is said by the courts that "patents should be liberally construed;" that we should look at the whole instrument, the patent, specifications, drawings, and claim, and ascertain from them the nature and extent of the patentee's invention. This is undoubtedly true; but, in doing so, Mr. Justice Woodbury, in *Smith* vs. *Downing*, (1 Fisher, 69,) said: "We should not put a broader construction on the language of the patentee than the whole subject-matter and description and nature of the case seem to indicate as designed; no fancied construction, but rather what is natural and clear, considering what already exists upon the same subject."

With these general suggestions let us approach the examination of this particular invention.

In the specification first filed by William Blessing, his claim was for "the employment of the feed-bar, in combination with the chaff-chamber;" but this application was rejected, for the reason that the patent granted to Chapin Street for grain-drill, May 29, 1855, contained substantially the same device claimed by him. Whether it did so or not may not be material—except in this, that it did contain a feed-bar and chaff-chamber; but it becomes important in interpreting the language subsequently used by the applicant in his amended specification and claim, and to know the construction he himself placed upon it.

The rejection was on the 5th of October. Afterward, on a subsequent day in October, the applicant empowers his attorney, L. D. Gale, to amend the papers; and soon after Mr. Gale files with the Commissioner the following, by way of amendment:

"In reply to your letter of 5th instant, refusing the claim of William Blessing for a distributing apparatus for a corn-planter, I have amended the claim to modify the application and confine the claim to the construction of the semi-lunar top with its recess and the side

openings H. You will, therefore, please correct the existing claim and substitute therefor the following:"

What I claim as my invention, and desire to secure by letters patent, is—

The arrangement of the top portion of the distributer made with a semi-lunar opening, and the recess under the covered portion of the said top, when the periphery of the said top is made with the chaff-openings H on either side of the reciprocating seed-bar, so that the seed-bar, by its reciprocating action, shall work out the chaff through the passages H H on either side of the seed-bar, and thus prevent choking the distributer.

On the 27th of October the specifications were returned to him, so as to enable him to amend or erase the nature of his invention, so that it might not conflict with the claim as amended; and on the 28th day of October he filed his amendment, by striking out or cancelling lines fifteen to twenty-four, inclusive, and inserting in place thereof the following:

The nature of the invention consists in the arrangement of the top part of the seed-distributer, having on its periphery or sides peculiar chaff openings for removing chaff and other obstructions, more particularly described in the specification.

The original claim was the employment of the feed-bar, in combination with the *chaff-chamber*, but the amendment was—

The arrangement of the top portion of the distributer made with a semi-lunar opening, and the recess under the covered portion of the said top, when the periphery of the said top is made with the chaff-openings H on either side of the reciprocating seed-bar, so that the said bar, by its reciprocating action, shall work out the chaff through the passage H H on either side of the seed-bar.

And he said the object of this amendment was to *confine* the claim to the construction of the semi-lunar top with its recess and side openings. And, without looking to what he said was his *object*, does not a fair construction of the language show plainly that he had limited the invention originally claimed by him to a *particular* arrangement of a *particular* top with *particular* openings, so that the chaff may be removed in a particular way? He certainly did not intend to claim a chaff chamber, however constructed, and certainly not every mode of removing chaff.

We think it, therefore, clear that this patent must receive the limited construction indicated. If so, it is very clear that the respondents' device does not embrace either the particular top with its particular arrangement or its particular openings. But suppose we give it a broader construction, and say complainants are entitled to a chaff chamber, and one of a different form, and openings of a different form, and at a different place; still, in order to find that the respondents infringe, we must find that they have a chaff-chamber and openings substantially alike in mode of operation and results.

If the respondents' device can be said to have a chaff-chamber at all, it is so different in operation that it can hardly be said to be substantially the same. The complainants' chaff-chamber is for the reception of the chaff, and openings are made necessary for its escape, and the operation of the seed-bar is necessary to carry it from the chamber through the openings. In the respondents', by the arrangement of the parts, the chaff falls directly to the ground, or upon that portion of the mechanism upon which the device is fastened; no other openings are necessary; and the seed-bar performs no office, such as is required by the seed-bar in complainants' device.

But there is another view of this matter. Their devices are very different in form. The respondents have received a patent for them from the Government; and the presumption of law is that it is novel; that it involved invention; and the proofs of complainants' and respondents' experts show very clearly that it is of superior utility to that of complainants'. Under such circumstances, I do not feel disposed to give such a construction to the complainants' patent as will embrace the respondents' device; and more so, as complainants had been using their device for thirteen years without ever ascertaining that their patent covered such a device, or its suggesting to them the valuable changes and alterations made by respondents' invention. While patents should be liberally construed, they should not be so construed as to enable patentees to reach out and cover every improvement or invention which, after seeing, they conclude they might have embraced and included within their patent; but which was not so embraced and included.

EXTENSIONS GRANTED.

31,378.—Improvement in Harvesters.—Granted to RUFUS DUTTON, February 12, 1861; reissue No. 4,125, dated September 20, 1870; reissue No. 4,217, dated December 27, 1870.

Claim.—1. A hollow metal casing-plate, separate and apart from any driving or carrying wheel, which casing-plate makes one side or main part of a box or case which incloses and protects the secondary gear-wheels of a mowing or reaping machine, substantially as described.

2. A box or case, made substantially as described, of two casing-plates, separate and apart from any driving or carrying wheel, which box or case incloses and protects the secondary gear-wheels of a mowing or reaping machine.

3. A hollow metal casing-plate, separate and apart from any driving or carrying wheel, which casing-plate makes one side or main part of a box or case which incloses and protects the secondary gear-wheels, and which casing plate also supports a journal of the secondary gear-wheel axle of a mowing or reaping machine, substantially as described.

4. A box or case made, substantially as described, of two casing-plates, separate and apart from any driving or carrying wheel, which box or case incloses and protects the secondary gear-wheels, and also supports the journals of the secondary gear-wheel axle of a mowing or reaping machine.

31,394.—Improvement in Molding Pottery.—Granted to ELIZABETH LINTON, administratrix of WILLIAM LINTON, deceased, February 12, 1861.

Claim.—A revolving core-mold in combination with a stationary yielding or traversing lip-mold, or top-molder, operated by springs, so as to hold the vessel formed in the mold when the core is removed, substantially as described.

31,445.—Improvement in Lime-Kilns.—Granted to MARGARET DONALDSON, administratrix of RICHARD DONALDSON, deceased, February 19, 1861; reissue No. 1,476, dated May 19, 1863.

Claim.—1. The cooler F beneath the kiln communicating therewith and exposed to the air, all substantially as described.

2. In combination with the said cooler I claim the beveled blades L, so arranged and operating as to support the lime within the said cooler, and to permit the lime to fall therefrom, substantially as described.

3. The tray-like lid G, when hung to the cooler and arranged for closing the same, substantially as specified.

4. Making that part of the interior of the kiln beneath the flues of the funnel form illustrated and described, for the purpose specified.

5. Combining with a lime-kiln, substantially as described, a chimney surmounted with a damper, T, or its equivalent, for the purpose specified.

Disclaimer filed February 15, 1875.

Disclaims the fifth clause of the claim, as above set forth.

31,502.—Improvement in Machine for Breaking Coal.

Granted to R. A. WILDER, February 19, 1861.

Claim.—1. So constructing and arranging a rotating toothed disk in a coal-breaking machine as that it shall serve the purpose of a breaker as well as form one of the sides of the hopper into which the coal to be broken is thrown, substantially as described.

2. I also claim, in combination with a rotating toothed disk forming one side of the hopper, a perforated plate or plates, F, forming the bottom of said hopper, substantially as described.

3. I also claim hinging the bottom of the hopper F at its middle and adjusting it at its ends, for the purpose of passing the coal to or from the center or to or from the larger and smaller openings in it, so as to break the coal of greater or less sizes, substantially as described.

4. I also claim, in combination with the rotating disk and the perforated bottom, the curved shroudings E, as and for the purpose described.

5. I also claim constructing and operating a coal-breaking machine, so that the teeth or knives of one rotated vertical disk shall pass the teeth or knives of the other rotated vertical disk in opposite directions, so that they may strike the coal that comes between them on opposite sides at the same moment, for the purpose of cracking the coal into pieces and preventing the waste by crushing or pulverizing, substantially as described.

31,511.—Improvement in Lamps.—Granted to CHARLES W. CAHOON, February 19, 1861; reissue No. 1,735, dated August 9, 1864.

Claim.—1. The combination of the chimney-holder and clamp chimney-fastenings of a lamp with the support of the chimney-holder by a horizontal joint, the combination as a whole operating substantially as set forth.

2. I also claim the combination of the chimney-holder, chimney-fastenings, support for the chimney, joint, and thumb-plate, the whole operating substantially as set forth.

3. I also claim the combination of the preceding combination with a guard, arranged substantially as set forth.

4. I also claim the combination of a spring with the chimney-holder, chimney-fastenings, support for the chimney, and joint, the whole operating substantially as set forth.

5. I also claim the combination of a chimney-guard with the chimney-holder, chimney-fastenings, support for the chimney, and joint, the whole operating substantially as set forth.

6. I also claim the combination of a transparent plate with an opaque metal lamp-body, substantially as set forth.

DISCLAIMERS FILED.

31,445.—Improvement in Lime-Kilns.—RICHARD DONALDSON, Mount Nebo, Pa.—Patented February 19, 1861; reissue No. 1,476, dated May 19, 1863. Disclaimer filed February 18, 1875. Disclaims:

"That part of the claim in said Letters Patent which is in the following words, to wit:

"'5. Combining with a lime-kiln, substantially as described, a chimney surmounted with a damper, T, or its equivalent, for the purpose specified.'"

105,599.—Improvement in Concrete Pavements.—JOHN J. SCHILLINGER, New York, N. Y.—Patented July 19, 1870; reissue No. 4,364, dated May 2, 1871. Disclaimer filed March 1, 1875. Disclaims:

"That part of the specification in the following words, to wit: 'and since the concrete in setting shrinks, the second block when set does not adhere to the first, and so on,' which occur near the middle part of the specification, and the following words near the end of the specification:

"'In such cases, however, where cheapness is an object, the tar-paper may be omitted, and the blocks formed without interposing anything between their joints, as previously described. In this latter case the joints soon fill up with sand or dust, and the pavement is rendered sufficiently tight for many purposes, while the blocks are detached from each other, and can be taken up and relaid each independent of the adjoining block.'"

Carbureter, J. F. and G. E. Lockwood	27	160,690
Carriages, shifting seat for, J. P. Cost	31	160,651
Cartridge belt, D. Taylor	55	160,730
Castings, chilling, E. A. Chubb	33	160,508
Chair, folding rocking, G. O. Wellman	62	160,629
Chair, opera, G. W. Borel	62	160,641
Chair, reclining, N. H. Hill	62	160,675
Chair seat, C. Brown	62	160,643
Chair, tilting, C. F. Spencer	62	160,694
Chimney cap, J. Gorton	4	160,668
Chimney staging bracket, P. Willard	30	160,736
Chimney ventilator, J. Howes	166	160,523
Chinch bug gatherer, E. H. Marsh	63	160,606
Clay pulverizer, D. Rudy	20	160,618
Cloth pressing machine, W. Hebdon	37	160,594
Clothes pin, Farrington and Potter	91	160,661
Clothes sprinkler, W. Olson	91	160,698
Coffee urn, H. C. Wilcox	136	160,633
Column, wrought iron, J. B. Cornell	21	160,574
Cotton opener and lapper, Whitehead and Atherton	28	160,558
Crane, J. Dorman	79	160,513
Cuff holder, H. B. Adams	38	160,636
Cultivator, P. F. Landphere	43	160,602
Curling iron, J. M. Baxter	161	160,637
Curtain fixture, C. P. Rose	62	160,718
Cylinders, relief valve for air and steam brake, Rider and Shillito	122	160,715
Dental plate, J. N. Clark	46	160,573
Dental plate, G. W. N. Kelsea	46	160,714
Digging machine, potato, T. Head	114	160,593
Dish of pottery ware, J. Moses	115	160,539
Door hanger, W. Johnston	24	160,598
Dredging box, J. S. Field	88	160,663
Drill and planter, seed, L. L. Haworth	133	160,592
Dyeing wool on sheep skins, method and apparatus for, A. Jack	11	160,677
Elevator, H. Pearce	79	160,615
Elevator or chain pump, water, O. A. Davis	118	160,578
Elevator, water, J. Keith	118	160,547
Envelope and letter sheet, combined, A. Petersohn	146	160,708
Fare box, C. G. Imlay	42	160,676
Faucet for drawing off effervescent liquors, C. Greiner	1	160,589
Fence, portable, H. Prickett	52	160,711
Fire arm, breech loading, E. Whitney	18	160,738
Fire arm, revolving, D. Smith	123	160,551
Fire arms and ordnance, chamber of, T. Mac Nell	55	160,691
Fire box, water, J. De Butt	148	160,652
Fire place fender, J. Old	154	160,541
Flowers, manufacture of sheet wax for, M. J. McColl	54	160,608
Fountain, perfume, E. Rath	161	160,713
Fruit drier, L. A. Gould	48	160,587
Furnace, hot air, W. Burrows	154	160,644
Furnace, metallurgic, J. Felx	99	160,662
Furnace, ore roasting, J. H. Clark	99	160,649
Garden sprinkler, F. M. Gray	63	160,516
Gas, retort for the manufacture of illuminating, D. L. MacNeill	66	160,740
Gear for shafting, driving, S. S. Hepworth	67	160,522
Goods on bias, apparatus for cutting, S. Mayer	38	160,607
Governor for horse powers, J. D. Heebner	69	160,595
Governor, steam, D. L. F. Chase	69	160,572
Grain and straw lifter, D. Crane	79	160,576
Grain binder, C. L. Travis	74	160,732
Grain, implement for binding, W. A. Patterson	74	160,705
Grain thrasher and separator, D. Lippy	159	160,689
Grate, Swartout and Whedon	154	160,553
Grave cover and monument, R. H. Sipes	54	160,622
Grinding rolls or rollers, machine for, J. M. Poole, (reissue)	100	6,323
Harvester, C. W., and W. W. Marsh, (reissue)	74	6,329
Harvester, C. W. and W. W. Marsh, (reissue)	74	6,330
Harvester, wheel, G. D. Rowell	74	160,546
Hasp, Smith and Egge	93	160,723
Hat and cap, P. Goldmann	76	160,666
Hat box, G. L. Jaeger	76	160,680
Hay loader, L. Underwood	77	160,556
Hinge for safe doors, &c., W. R. Perry	24	160,616
Hoe, J. N. Burton	141	160,645
Hoe and plow combined, horse, A. D. Simons	114	160,621
Horses, feed bag for, H. Engelbert	144	160,650
Horses, sun protector for car, V. Henry	144	160,521
Horseshoe, T. B. Bishop	60	160,565
Horseshoe bars, device for bending, Hale and Johnston	60	160,590
Hose coupling, W. Painter	81	160,700
Hose, foot pipe for suction, W. P. Painter	81	160,704
Hose, hydraulic, J. D. Joslin	81	160,526
Hose to hose coupling, attaching, A. J. Morse	81	160,696
Hydrant for fire plugs, &c., non-freezing, H. I. Chapman	167	160,571
Ice former, S. Kranss	83	160,601
Ice making apparatus, W. Hood	83	160,596
Key, folding door, B. Erbe	93	160,660
Knit fabric, Kent and Lecson	89	160,684
Knitting machine, Kent and Lecson	89	160,685
Lamp, F. Kampfe	90	160,683
Lamps, apparatus for supplying oil to, R. V. De Guinon	90	160,653
Lamp, hydro electric, W. H. Zimmermann	64	160,739
Latch, gate, R. C. Bernard	93	160,639
Lathe for turning irregular forms, J. Beandry	172	160,638
Lemon press, H. Newberger	68	160,697
Loom shuttle, J. H. Peasley	95	160,544
Measure, dry, D. M. Mefford	132	160,609
Measuring tank, J. Lessler	132	160,530
Metal bending machine, J. C. Chapman	125	160,647
Motor, J. M. Cayce	67	160,646
Needle blanks, machine for beveling the ends of, S. C. Kingman	104	160,686
Night soil, apparatus for removal of, W. Painter	96	160,701
Night soil tanks, discharge gate for, W. Painter	96	160,702
Night soil tanks, measuring indicator for, W. Painter	42	160,703
Oil, safety tank for, J. H. Hayward	107	160,520
Oleaginous matter from textile material, apparatus for extracting, R. Scaife	96	160,550
Ordnance, projectile for, J. G. Butler	55	160,569
Ore feeder, J. Tullock	3	160,628
Organ key board, L. K. Fuller	106	160,515
Organ stop action, F. M. Brush	106	160,568
Organ tremolo, reed, J. R. Lomas	106	160,605
Overalls, J. Moore	38	160,537
Packing, hydraulic, J. F. Taylor	118	160,731
Pantaloon stretcher, J. D. Ryan	38	160,619
Paper feeder, pneumatic, S. Schofield	117	160,721
Paper or other material, machine for cutting, J. Ball, (reissue)	109	6,324
Peg cutter, W. J. Squires	16	160,724
Pegging jack, J. J. Stewart	16	160,727
Petroleum, apparatus for the storage of, G. Des Georges	51	160,511
Piano stringing and tuning device, W. F. Kearsing	112	160,600
Picture holder, J. Binney	62	160,564
Pin, toilet, A. N. Kellogg	104	160,528
Pipe for suction hose, foot, W. Painter	81	160,704
Planter, seed, H. E. Pennypacker	133	160,707
Plow, J. Lane, (reissue)	114	6,320
Plow, side hill, C. H. Stratton	114	160,625
Pocket book safety attachment, E. G. Wheeler	38	160,630
Press, C. S. Swan	7	160,626
Press, hay and cotton, B. J. Day	7	160,579
Printer's galley, A. T. De Puy, (reissue)	117	6,326
Printer's galley, A. T. De Puy, (reissue)	117	6,327
Printer's galley, A. T. De Puy	117	160,654
Pruning shears, C. H. Billings	63	160,563
Pulley, friction, T. F. Carver	67	160,570
Railway, elevated, J. B. Cornell	120	160,650
Railway rails, machine for patching, Moore and Mills	120	160,536
Rake, horse hay, B. Meilinger	77	160,693
Range, cooking, J. Old	154	160,542
Reflector, B. Goetz	90	160,584
Register, air, G. Lawrence	154	160,688
Register, hot air, H. Fritz	154	160,514
Road scraper, McCall, Watkins, and Scott	51	160,535
Rubber dam tension weight, T. G. Lewis	46	160,604
Sash and blind fastener, combined, J. Christie	24	160,509
Sash fastener, J. H. Husted	24	160,595
Sash holder, L. Quitman	24	160,712
Sash holder, J. Sweet	24	160,554
Sash holder, J. B. Wilford	24	160,735
Saw swaging machine, L. W. Pond, (reissue)	131	6,322
Sawing shingles, machine for, W. Huey	174	160,524
Screw driver, W. F. Patterson	29	160,543
Screw tap, T. S. Wild	14	160,559
Seed drill and planter, L. L. Haworth	133	160,592
Seed dropper, E. M. Morgan	133	160,611
Seeders, slip teeth for, G. D. Rowell	133	160,547
Separator, grain, O. K. Wood	159	160,561
Sewing machine, A. S. Dinsmore	134	160,512
Shafting, driving gear for, S. S. Hepworth	67	160,522
Shingles, machine for sawing, W. Huey	174	160,524
Shirt bosom supporter, J. S. Edmunds	38	160,658
Shoe, ladies', G. L. Davis	16	160,510
Shoes, manufacture of, W. Froehlich	16	160,583

	Class No.	No. of Patent.
Shutter and blind fastener, C. B. Haynes	24	160,672
Shutter bower, J. B. Hand	30	160,671
Sinks, attachment for, J. Murdock	8	160,540
Sky light bar, J. Harney	30	160,518
Sower, seed, A. Walker	133	160,733
Spark arrester for locomotives, C. S. and E. Osborn	94	160,614
Spokes, machine for tapering the tenons of, W. M. Sharpeteen	31	160,722
Stencil cutter, P. L. O'Brien	54	160,613
Stereotype plate holder, A. Case, (reissue)	164	6,325
Stone, apparatus for crushing, S. H. Johnson	153	160,682
Stove, cooking, J. S. Van Buren	154	160,557
Stoves, air chamber for, E. Hawks	154	160,519
Stud fastening, S. Zacharias	86	160,634
Sugar, apparatus for the manufacture of hard, J. O. Donner	155	160,656
Sugar cutting machine, J. O. Donner	155	160,657
Sugar machine, centrifugal, J. O. Donner	155	160 655
Sun protector for car horses, V. Henry	144	160,521
Surcingle, H. M. Witter	72	160,560
Table, extension, G. Ahrens	62	160,562
Table, folding extension, J. F. Birchard	62	160 506
Tackle block, G. Martin	79	160,534
Teeth, plate for artificial, B. J. Field	46	160,582
Telegraph apparatus, duplex, M. G. Farmer	50	160,581
Telegraph paper, solution for chemical, T. A. Edison	158	160,580
Thill coupling, E. Jarrell	31	160,681
Thill coupling, G. F. Smith, (reissue)	31	6,331
Thill coupling, S. M. Strader	31	160,728
Thill coupling, G. Wright	31	160,738
Tire shrinker, D. Strattan	60	160,729
Tool handle, H. Staples	29	160,725
Trap, fly, Rukgabee and Clarke	143	160,719
Umbrella handle, E. Layman	165	160,603
Umbrellas, parasols, &c., handle for, G. W. Tucker	165	160,627
Valve for street water mains, J. Bird	167	160,640
Vehicle end gate rod, W. J. Lewis	31	160 531
Vehicle fender, N. Jackson	31	160,679
Vehicle, spring, Phenix and Curtis	31	160,709
Vehicle spring and side bar connection, J. W. Gosling	31	160,586
Vehicle spring equalizer, N. Jackson	31	160,678
Vehicle torsional spring, C. W. Saladee	31	160,549
Vehicle wheel, J. H. E. Boykin	31	160 642
Velocipede, J. A. Crandall	31	160,575
Ventilator, chimney, J. Howes	166	160 523
Vest, bricklayer's, J. Moore	38	160,536
Vise, T. L. Baylies	100	160,505
Wagon, axle and thimble skein, L. L. Anderson	31	160,502
Wagon end gate, S. C. Myers	31	160,612
Wagon seat, W. H. H. Snellbaker	31	160,623
Walls, coping for, J. C. Wright	4	160,737
Washing machine, G. Huntington	91	160,597
Washing machine, T. Patterson	91	160,706
Watch case spring, J. Menegay	36	160,610
Watches, reversible pinion for, J. Gordon	36	160,585
Wax for flowers, manufacture of sheet, M. J. McColl	54	160,608
Weather strip, E. C. Underwood	30	160,535
Weed cutter and biller, J. Robson	43	160,545
Well strainer, drive, W. C. Macomber	167	160,692
Wind wheel, J. M. Kauffman	118	160,599
Windlass, M. G. Imbach	79	160,675
Windlass, F. S. Rowland	79	160,617
Windmill, A. and W. Graf	118	160,588
Windmill, Sheckler and Bolender	118	160,620
Wood planing machine, W. W. Carey	173	160,507

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED MARCH 9, 1875.

	Patent No.
Adams, D. L., Car coupling	160,635
Adams, H. B., Cuff holder	160 636
Ahrens, G., Extension table	160,562
Alderson, F. B., Bill file	160,501
American Car Fare Register Company, assignee	160,676
American Invention Company, assignee	160,609
American Ring Company, assignee	160,627
Anderson, L. L., Wagon axle and thimble skein	160,502
Ascough, W., Combined bevel, try square, and dividers	160,503
Atherton and Whitehead	160,558
Ball, J., Machine for cutting paper or other materials, (reissue)	6,324
Balmforth, V. V., Button hole casing	160,504
Baxter, J. M., Curling iron	160,637
Baylies, T. L., Vise	160,505
Beandry, J., Lathe for turning irregular forms	160,638
Bell, A. J., assignee	160,717
Benton, M. P., assignee	160,504
Bernard, R. C., Gate latch	160,639
Billings, C. H., Pruning shears	160,563
Binney, J., Picture holder	160,564
Birchard, J. F., Folding extension table	160,506
Bird, J., Valve for street water mains	160,640
Bishop, T. B., Horseshoe	160,565
Blackman, A. L., Machine for swaging car wheels	160,566
Blymyer, J. S., assignee	160,689
Boardman and Mann	160,533
Bolender and Sheckler	160,620
Borel, G. W., Opera chair	160,641
Boykin, J. H. E., Vehicle wheel	160,642
Bradford, H., assignee	160,735
Bradley and Hubbard, assignees	160,710
Bronson, E. D., Broom bag	160,567
Brown, C., Chair seat	160,643
Brush, F. M., Organ stop action	160,568
Buffalo Dental Manufacturing Company, assignee	160,694
Burrows, W., Hot air furnace	160,644
Burton, J. N., Hoe	160,645
Butler, J. G., Projectile for ordnance	160,569
Carey, W. W., Wood planing machine	160,507
Carver, T. F., Frictional pulley	160,570
Case, A., Stereotype plate holder, (reissue)	6,325
Cayce, J. M., Motor	160,646
Chapman, H. I., Non-freezing hydrant for fire plugs, &c.	160,571
Chapman, J. C., Metal bending machine	160,647
Chase, D. L. F., Steam governor	160,572
Christie, J., Sash and blind fastener combined	160,509
Chubb, E. A., Chilling castings	160,508
Clark, J. H., Ore roasting furnace	160,649
Clark, J. N., Dental plate	160,573
Clarke and Rukgabee	160,719
Clarke, F. J., Earth auger	160,648
Coolidge, J. K. and E. C., assignees	160,673
Cornell, J. B., Wrought iron column	160,574
Cornell, J. B., Elevated railway	160,650
Cost, J. P., Carriage shifting seat	160,651
Coursolles, T. G., assignee	160 638
Crandall, J. A., Velocipede	160 575
Crane, D., Grain and straw lifter	160,576
Curtis and Phenix	160,709
Curzon, J., Lamp burner	160,577
Davis, G. L., Ladies shoe	160,510
Davis, O. A., Water elevator or chain pump	160,578
Day, B. J., Hay and cotton press	160,579
De Butt, J., Water fire box	160,662
De Guinon, R. V., Apparatus for supplying oil to lamps	160,653
De Puy, A. T., Printer's galley, (reissue)	6,326
De Puy, A. T., Printer's galley, (reissue)	6,327
De Puy, A. T., Printer's galley	160,654
Des Georges, G., Apparatus for the storage of petroleum	160,511
Dinsmore, A. S., Sewing machine	160,512
Donner, J. O., Centrifugal sugar machine	160,655
Donner, J. O., Apparatus for the manufacture of hard sugar	160,656
Donner, J. O., Sugar cutting machine	160,657
Dorman, J., Crane	160,513
Eau Claire Lumber Company, assignee, (reissue)	6,322
Edison, T. A., Solution for chemical telegraph paper	160,580
Edmunds, J. S., Shirt bosom supporter	160,658
Egge and Smith	160,723
Engelbert, H., Horse feed bag	160,659
Erbe, B., Folding door key	160,660
Estey, J. & Co., assignees	160,515
Ewing, T., assignee	160,730
Farmer, M. G., Duplex telegraph apparatus	160,581
Farrington, G. K., and B. S. Potter, Clothes pin	160,661
Feix, J., Metallurgic furnace	160,662
Field, B. J., Plate for artificial teeth	160,582
Field, J. S., Dredging box	160,663
Fitzhugh, H. M., Barrel	160 664
Fitzhugh, H. M., Barrel	160,665
Fritz, H., Hot air register	160,514
Froehlich, W., Manufacture of shoes	160,583
Fuller, L. K., Organ key board	160,515
Goetz, B., Reflector	160,584
Goldmann, P., Hat and cap	160,666
Goodwin, J., Invalid bedstead	160,667
Gordon, J., Reversible pinion for watches	160,585
Gorton, J., Chimney cap	160,668
Gosling, J. W., Spring and slide bar connection for vehicles	160,586
Gould, L. A., Fruit drier	160,587
Graf, A. and W., Windmill	160,588
Graham, J., assignee	160,729
Grain Binder Company, assignee	160,732
Gray, A. F., Vapor burner	160,669
Gray, F. M., Garden sprinkler	160,516
Gray, J. H., assignee	160,570
Gray, S. S., Vapor burner	160,670
Greiner, C., Faucet for drawing off effervescent liquids	160,589
Hale, J. N., Temporary binder	160,517
Hale, R., and J. B. Johnston, Device for bending horse-shoe bars	160,590
Hamburger, H., assignee	160,735
Hand, J. B., Shutter bower	160,671
Hapgood & Co., assignees, (reissue)	6,320
Harney, J., Skylight bar	160,518
Harrington, G., assignee	160,580
Harris, G. W., assignee	160,507
Harvey, C. W., Bag fastener	160,591
Hatch, J. W., Apparatus for crimping the stiffening of boots and shoes, (reissue)	6,319
Hawks, E., Air chamber for stoves	160,519
Haworth, L. L., Seed drill and planter	160,592
Hayes, J. P., assignee, (reissue)	6,321
Haynes, C. B., Shutter and blind fastener	160 672
Hayward, J. H., Safety tank for oil	160,520
Head, T., Potato digging machine	160,593
Hebdon, W., Cloth pressing machine	160,594

	Patent No.
Heebner, J. D., Governor for horse powers	160,595
Henry, V., Sun protector for car horses	160,521
Hepworth, S. S., Driving gear for shafting	160,522
Heresme, C., Gaiter boot, (reissue)	6,328
Hill, N. H., Reclining chair	160,673
Hoe, R. & Co., assignees, (reissues 6,325, 6,326, 6,327,)	160,654
Hoff, C., Sheet metal bucket	160,674
Hood, W., Ice making apparatus	160,596
Howes, J., Chimney ventilator	160,523
Huey, W., Machine for sawing shingles	160,524
Huntington, G., Washing machine	160,597
Husted, J. H., Sash fastener	160,525
Imbach, M. G., Windlass	160,675
Imlay, C. G., Fare box	160,676
Jack, A., Method and apparatus for dyeing wool on sheep skins	160,677
Jackson, N., Vehicle spring equalizer	160,678
Jackson, N., Vehicle fender	160,679
Jacobus, S. H., assignee	160 660
Jaeger, G. L., Hat box	160,680
Jarrell, E., Thill coupling	160,681
Johnson, S. H., Apparatus for crushing stone	160,682
Johnston and Hale	160,590
Johnston, W., Door hanger	160,598
Jones, D., assignee	160,602
Joslin, J. D., Hydraulic hose	160,526
Kampfe, F., Lamp	160,683
Kauffman, J. M., Wind wheel	160,599
Kearsing, W. F., Piano stringing and tuning device	160,600
Keith, J., Water elevator	160,527
Kellogg, A. N., Toilet pin	160,528
Kent, J., and H. Leeson, Knit fabric	160,684
Kent, J., and H. Leeson, Knitting machine	160,685
Kingman, S. C., Machine for beveling the ends of needle blanks	160,686
Kinsman, J. H., and F. W. Smith, Wash basin	160,687
Klemm, F., assignee	160,584
Krauss, S., Ice former	160,601
Lambart, R. C., Machine for trimming boot and shoe heels and soles	160,529
Landphere, P. F., Cultivator	160,602
Lane, J., Plow, (reissue)	6,320
Lane and Bodley, assignees	160,615
Lawrence, G., Air register	160,688
Layman and Aukner, assignees	160,603
Layman, E., Umbrella handle	160,603
Leeson and Kent	160,684, 160,685
Lessler, J., Measuring tank	160,530
Lewis, T. G., Rubber dam tension weight	160,604
Lewis, W. J., Vehicle end gate rod	160,531
Lippy, D., Grain thrasher and separator	160,689
Lockwood, J. F., and G. E., Carbureter	160,690
Lockwood, S., assignee	160,671

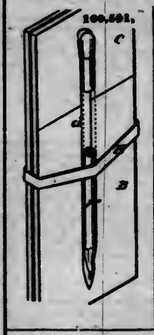
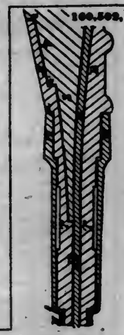
TITLES, DRAWINGS, AND CLAIMS

OF



PATENTS GRANTED MARCH 9, 1875.

160,501. BILL-FILES. Franklin B. Alderson, San José, Cal. [Filed Jan. 23, 1875.]

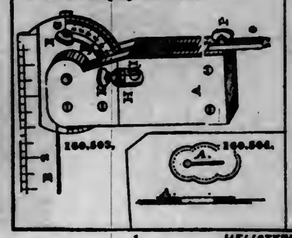


Brief.—The upper clamp or cover is made with a hinged flap, and provided with a longitudinal groove for the reception of a pencil, whereby the latter, in combination with the elastic band that encircles both clamps, is caused to hold the hinged flap in position.

The hinged front B C of a paper holder, having the groove or slot *d d* extending across both parts, in combination with the rigid bar F and single elastic strap E, substantially as and for the purpose herein described.

160,501.

160,502.



160,502. WAGON-AXLES AND THIMBLE-SKEINS. Isaac L. Anderson, Lancaster, Mo. [Filed Feb. 3, 1875.]

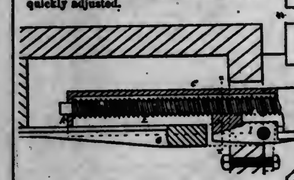
The combination of the axle A, formed with the shoulders *s* and *s'*, the projection *p*, and the tapered spindle S, the thimble T formed with the socket B, shoulder *s*, the level bearings *b*, *b'*, and *b''*, nut N, tension-rod R, adjusted in a groove on the under side of the axle A and its spindle S, and extending through a longitudinal aperture in the thimble T, and the nut *n*, all constructed to operate substantially as and for the purpose specified.

160,503. COMBINED BEVELS, TRY-SQUARES, AND DIVIDERS. William Ascough, Buffalo, N. Y. [Filed Dec. 20, 1874.]

1. The combination, with the stock A of the pointed tongue B, provided with the projection L, thumb-screw G, fastening-screw K, passing through one side of the stock A and the protractor E, and engaging with a nut, K', and the adjustable plate I let into the recess H, all when arranged substantially as described, and for the use and purpose set forth.

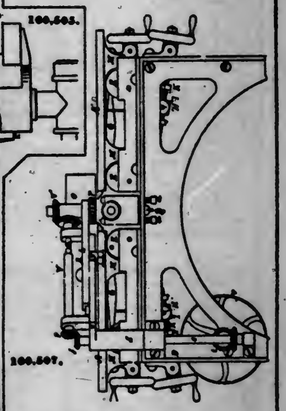
2. The combination, with the stock A, of the pointed tongue B and the reversible compass-point O, provided with a dovetail tenon, and engaging with a like mortise in the stock A, and fastened therein by the thumb-screw P, in a manner substantially as described, and for the use and purpose set forth.

160,503.



160,504.

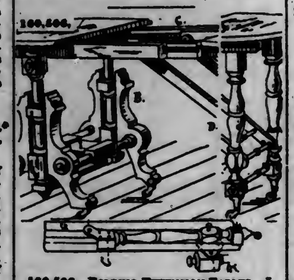
160,504. BUTTON-HOLE CASINGS. Virginia Viard Balmforth, Oakland, Cal., assignor of one-half her right to Mrs. M. P. Benton, same place. [Filed Dec. 18, 1874.]



The attachable and removable button-hole casing or lining, consisting of the outer ornamental piece A, in combination with the inner strengthening-piece C, the same being stitched or worked, substantially as set forth.

160,505. VISES. Thos. L. Bayliss, Edgartown, Mass. [Filed Aug. 27, 1874.]

Brief.—When the front end of the box-slide is raised the vibrating piece is relieved of the imposed weight, and the greater weight of the rear end of said piece causes said end to drop and disengage the threads of the nut and screw, thus permitting the movable jaw to be quickly adjusted.



160,505.

1. The vibrating piece I, provided with the nut H and bearing-pieces *u u*, in combination with the movable jaw and screw of a vise, substantially as described, and for the purpose set forth.

2. The bed-plate G, provided with the flanges *b b*, bearing-pieces *u u*, and nut H, in combination with the box-slide C, provided with the flanges *p p*, and plate A, and clamping-screw E, when the parts specified are arranged so as to permit a vertical movement to be given to the box-slide, substantially as described, and for the purpose set forth.

160,506.

160,506. FOLDING EXTENSION-TABLES. J. F. Birchard, Milwaukee, Wis. [Filed June 12, 1874.]

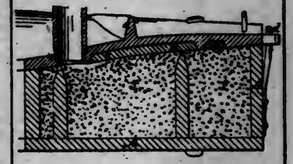
Brief.—The main supporting-frame is provided with four legs, and to this frame the top and slides are pivoted. To the outer end of the slides a pair of legs is pivoted, which, together with the permanent top and slides, fold against the main supporting-frame. A shelf is arranged in the lower part of said frame, to hold the loose leaves when not in use.

1. An extension folding table, constructed as described, and provided with leaves A and A', permanent pillars and legs B B, slides G, and joint L, substantially as shown and specified.

2. The combination of loose legs C C, brace D, and slides G, arranged substantially as described.

3. The shelf I for supporting the loose or extra leaves of an extension-table, in combination with pillars and feet B B, substantially as shown and described.

160,507.



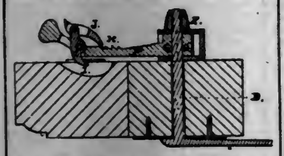
160,507. MACHINES FOR PLANING WOOD. Wilson W. Carey, Lowell, Mass., assignor to himself and Geo. W. Harris, same place. [Filed Oct. 22, 1874.]

Brief.—The table is provided upon its under side with four stops for preventing the advance movement of the same toward the cutter, and is made vertically adjustable by means of two pairs of eccentrics, connected together, and operated by a downwardly-projecting arm, which is adjustable by a tangent-screw provided with two stop-nuts. The material is fed to the cutter by a serrated feed-wheel, secured to the foot of a vertical shaft, which is attached to a horizontal, adjustable, and detachable arm, and is operated by the main driving-shaft through intermediate bevel-gearing.

1. The combination of the table A and its stops M M with the two pairs of eccentrics E F, their connection-rod G, and the operative arm H, extending from one of said eccentrics and provided with an adjusting-nut, I, and screw K, all being arranged substantially in manner and to operate as specified.

2. The combination of the journal T, shaft *s*, and gear *f* with the sleeve S, arm R, and its shaft V, provided with the gear *p*, the said gear *f* having a diameter less than that of the sleeve, and all being constructed, arranged, and applied substantially as set forth.

160,508. PROCESSES OF CHILLING CASTINGS. Edwin A. Chubb, Ionia City, Mich. [Filed Sept. 14, 1874.]

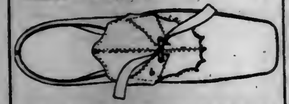


A series of sand molds adapted to a single chill-plate, so that the said chill-plate, after being once heated, shall be kept heated by the molten metal of the preceding mold, substantially as described.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON

160,509. COMBINED FASTENERS FOR MEETING-RAILS OF SASHES AND BLINDS. John Christie, New Orleans, La. [Filed Jan. 11, 1875.]

Brief.—The swinging arm is notched on top, and with these notches a hinged pawl passing through a slot near the outer end of the arm engages, the other end carrying a hook to fasten underneath a recessed plate. Combined with this window-sash fastening is a catch, having a right angled shaft with squared end, which passes up through an auger-hole in the meeting-rail, and terminates in a threaded nut on top of the sash-fastening, coacting with it to fasten the blind or shutter, in such manner that when in place one cannot work without the other, and the shutter can only be opened from the inside; the pawl and notches of the sash-fastening device serving also to draw the meeting-rails together, for excluding dust, and to prevent rattling.

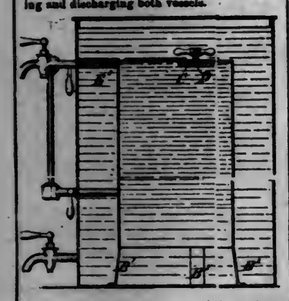


1. The blind-catch A, the right-angled shaft B, having squared end C, thread-screw D, and nut E, in combination with the sash-fastening F, all substantially as and for the purpose hereinbefore set forth.

2. The combination of the square cut G in the sash-fastening F, the pawl or clutch J, and the notches or ribs H, substantially as and for the purpose hereinbefore set forth.

3. The combination of the hook I and pawl or clutch J, hinged together, with the arm of sash-fastening F, substantially as and for the purpose hereinbefore set forth.

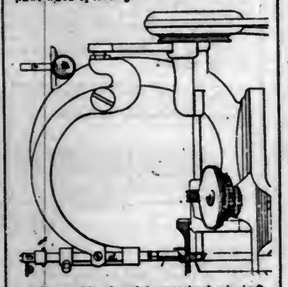
160,510. LADIES' SHOES. Gustavus L. Davis, Haverhill, Mass. [Filed Feb. 5, 1875.]



Brief.—The lapels are cut from the vamp, and form an integral part thereof, being left uncut at their bases. Pieces of the same material of which the vamp is made are stitched underneath the openings.

In a shoe, having its vamp overlapping and covering the front ends of its quarters, the lapels *b b* formed in the vamp, in manner and for the purpose set forth.

160,511. APPARATUS FOR THE STORAGE OF PETROLEUM. Gabriel Des Georges, Montreal, Canada. [Filed Dec. 8, 1874.]

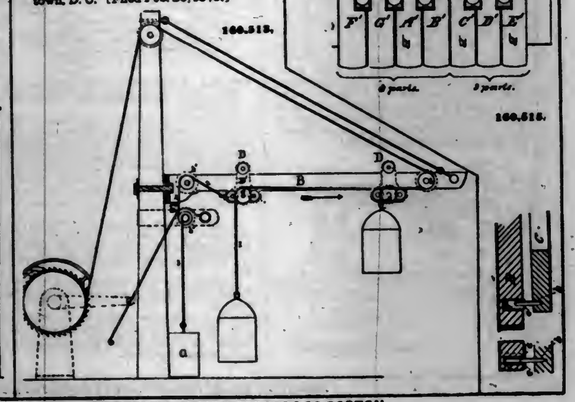


Brief.—An open-bottomed vessel for containing the oil is placed concentrically within an outer vessel, which contains water. The pressure of the water holds the oil within the inner vessel. Its height is shown by a gage outside. Suitable devices are shown for filling and discharging both vessels.

In apparatus for boiling petroleum and similar articles in store, surrounded by and under the pressure of water, an inner open bottom vessel, B, provided with an opening, C, plug D, let-off valve E, and gage F, in combination with an outer vessel, A, provided with let-off valve G, substantially as herein described.

160,512. SEWING-MACHINES. A. S. Dinsmore, Boston, Mass. [Filed Jan. 3, 1876.]

Brief.—The needle reciprocates in a horizontal path, and penetrates the fabric impaled on pins projecting from a circular basting-plate, which revolves and carries the work forward as it is stitched. The basting-plate is operated by a worm on the hook-shaft and wheels that gear into a rack on top of the plate. One of the wheels is loose on its shaft, (to allow the plate to be turned and the cloth brought into position at the start,) and is locked by means of a pawl when operating.



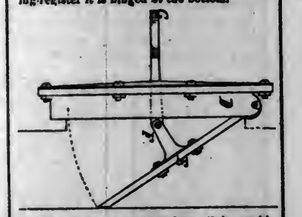
1. The combination of the rotating hook-shaft and its worm-gear with the toothed baster-plate, the toothed wheel for moving the baster-plate, and connecting-gearing, substantially as described.

2. The combination of the hook-shaft and its worm-gear with the shaft I, operated from the hook-shaft by gearing, its ratchet, and the toothed wheel *j* and pawl, and the baster-plate, substantially as and for the purpose set forth.

3. The combination of the horizontally-moving baster-plate with the needle-bar, needle, presser-bar, presser, and finger and collar *f*, the finger and collar holding the presser from the fabric while the feed takes place or the baster-plate is moving, substantially as and for the purpose set forth.

4. The combination of the frame A and its standard for supporting a stitch-forming mechanism with the circular and toothed baster-plate, the supporting-ring, and mechanism actuated by the hook-shaft to move the baster-plate, substantially as described.

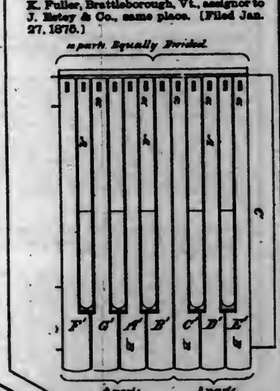
160,513. CRANES. Jerry Dorman, Georgetown, D. C. [Filed Feb. 20, 1875.]



160,514.

1. In a crane for hoisting coal and other materials, a winding-drum, cords and pulleys, traveling-car and counter-weight, arranged, substantially as described, to elevate the loaded bucket, and its outward movement shall elevate the weight, which will retract the car when the bucket is emptied.

2. The combination of the traveling-car D, cords 2 and 3, pulleys *b' b''*, and axle *b''*, and weight G, substantially as and for the purpose described.



160,514. HOT-AIR REGISTERS. H. Fritz, Cleveland, Ohio. [Filed Dec. 1, 1874.]

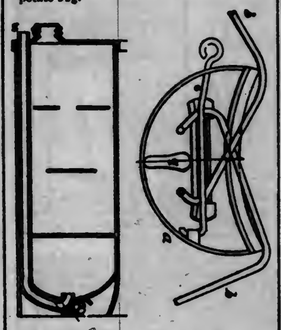
Brief.—When used as a hot-air register the valve is hinged at the top; when as a ventilating-register it is hinged at the bottom.

The removable register-frame C, in combination with the hinged valve E F, and swinging handle G, said frame constructed with the perforated face, to admit of the egress of hot air, and projecting sides D, which enter or embrace the opening in the flue, the frame C D also forming the valve-seat and hinge or trunnion bearing for the valve E F, as and for the purposes set forth and shown.

160,515. KEY-BOARDS FOR ORGANS. Levi K. Fuller, Brattleborough, Vt., assignor to J. Estey & Co., same place. [Filed Jan. 27, 1876.]

160,515.

160,516.



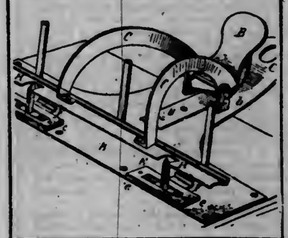
1. In a key-board or manual for organs, the keys made of equal width at the rear ends A A, and the white keys spaced at the front ends B B, in two groups of unequal width, as described and shown, and having all the pivot and guide pins equally spaced, substantially as set forth.

2. A key-board or manual for organs containing five kinds of keys, namely, the white keys A' B' C' D' and the black key, the keys A', B', and C' being duplicates of the keys C', F', and E', respectively, and all interchangeable, letter for letter, substantially as specified.

3. The improved method of bushing the guide-pins *b b*, consisting in having the ends *c c* of the felt *e* glued to the under side of the keys, so as to project therefrom and from the cushion between the keys and the key-frame, substantially in the manner shown, and for the purposes herein described.

160,516. GARDEN-SPRINKLERS. Frank M. Gray, Norwood, Ill. [Filed June 15, 1874.]

Brief.—Shelves are so located in the vessel as to catch and hold temporarily the solid matter used. An open air-pipe extends to the bottom for delivering the air at that point, and thereby serving to agitate the contents, and aid in keeping the solid matters mixed with the water. The device is intended for use in the application of paris-green mixed with water to potato-vines, to destroy the potato-bug.



1. The receptacle *a*, in combination with one or more flexible discharge-pipes, *b*, compressing-rod *c*, and open air-inlet pipe *g*, substantially as and for the purposes set forth.

2. The receptacle *a*, provided with one or more shelves within the same, in combination with one or more discharge-pipes, *b*, and the air-pipe *g*, substantially as and for the purposes set forth.

3. In a garden-sprinkler, the vessel *a*, in combination with one or more flexible tubes, *b*, and the open air-pipe *g*, having its lower opening at or near the center of the bottom of the vessel, substantially as and for the purpose specified.

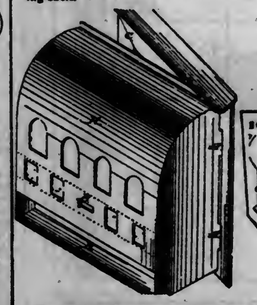
160,517. TEMPORARY BINDERS. J. N. Hale, Boston, Mass. [Filed Aug. 18, 1874.]

Brief.—The invention consists in the particular construction and combination of the device as shown.

The lower jaw B, slotted as shown, to form recesses for the heads of the fasteners, and the slotted plate E, supported upon the lower jaw by the interposed washers *c*, in combination with the bifurcated slip F for holding the fasteners, and the slotted movable jaw H, arms G, thumb-lever D', and a spring, I, all constructed and arranged substantially as herein shown, for the purpose described.

160,518. SKYLIGHT-BARS. James Harney, Brooklyn, N. Y., assignor of one-half his right to J. Seton, same place. [Filed Oct. 14, 1874.]

Brief.—A V shaped skylight-bar in which the gutter is wholly within the spread of the ledges which support the glass; said gutters being perforated to admit the water into the center of the bar, through which channel it is conveyed away. The glass-sustaining ledge is provided with grooves, through which the condensed vapor from the under side of the glass is admitted to the interior of the bar.



1. The grooves *c*, arranged so as to permit water to flow, as described, and for the purpose set forth.

2. The lengthwise groove, gutter, or depression *b*, in combination with the grooves *c*, and with the perforations *c*, as described and set forth.

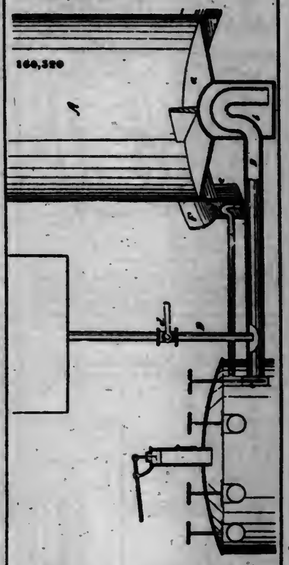
3. In a skylight-bar formed of sheet metal, the gutters or gutter *d*, provided with suitable inlet-apertures *c c*, substantially as and for the purpose set forth.

160,519. AIR-CHAMBERS FOR STOVES. E. Hawks, Troy, N. Y. [Filed Nov. 26, 1874.]

Brief.—The recess may be used as a warming-shelf.

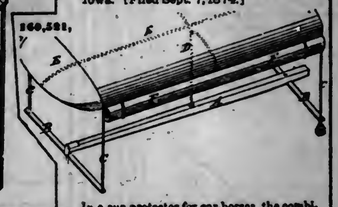
The combination, in an auxiliary chamber, for heating the air prior to its passage to the fuel-chamber of the reverberatory dome H, recessed warming-chamber D, and draft-damper B, arranged between the warming-chamber and reverberatory dome, substantially as and for the purpose described.

160,520. SAFETY-TANKS FOR OIL. John H. Hayward, New York, N. Y. [Filed July 23, 1874.]



Brief.—Prevents a fire by running oil into subterranean tank, with liquid seal to prevent flame following it. Provides also interposition of water between tanks.

1. A storage-tank, A, for inflammable fluid, and the safety-reservoir C, connected by a conduit or pipe furnished with a trap or seal, as described, leading out of the bottom of the tank into the reservoir, through which the fluid, by its own gravity, will flow from the tank into the reservoir without opening a passage for the communication of flame from one to the other, substantially as and for the purpose specified.



2. The combination, with the storage tank A and safety-tank C, of the water-reservoir E and its discharge-pipe D, leading into the pipe H, whereby when fluid is on fire in the tank A a body of water may be interposed directly between the burning fluid and the safety-tank C, as described.

3. The drip-pan F, formed upon the external base of the tank A, and a discharge-pipe, constructed, arranged, and operating as and for the purpose specified.

160,320

160,521.

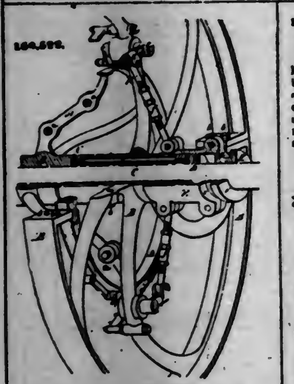
160,521. SUN-PROTECTORS FOR CAR-HORSES. Victor Henry, Cedar Rapids, Iowa. [Filed Sept. 7, 1874.]

In a sun-protector for car-horses, the combination of a shifting-pole, A, provided with front and rear cross-bars B B, and the supporting-casters *a a* therefor, with the branching skeleton-frame C D, rising from said cross-bars, and carrying the awning E and the side flaps F thereof, as shown and described.

160,522. DRIVING-GEARS FOR SHAFTING. S. S. Hepworth, New York, N. Y. [Filed Feb. 6, 1875.]

1. The devices A B E, each constructed in two opposite and symmetrical parts, which can be united around a shaft, in combination with friction-bands constructed in two parts, and operated by toggles and cranks, substantially in the manner herein described.

2. The friction-packing in the forms F F', composed of the end grain of soft wood filled with shoe-pegs driven into it, substantially as herein described.



3. The bushing U, with its wings *e* and holes for passing oil to the shaft, substantially as herein described.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON

160,522. CHIMNEY-VENTILATORS. J. Howes, Worcester, Mass. [Filed Apr. 14, 1874.]

Brief.—Under a strong pressure of wind the upper portion of the horizontal air-receiving passage is lifted, and the strain on the bearings of the cowl is diminished.

The divided compressor C, in combination with the tube B and flue A, substantially in the manner and for the purposes above described.

160,524. MACHINES FOR SAWING SHINGLES. William Huey, Salisbury, Md. [Filed Jan. 26, 1875.]

Brief.—The track upon which the carriage runs is curved vertically, so as to form the segment of an ellipse.

The carriage M, moving upon a track which forms a portion of an ellipse, in combination with the horizontally-moving frame V, as and for the purposes specified.

160,525. FASTENERS FOR MEETING-RAILS OF SASHES. Julius H. Husted, Chicago, Ill. [Filed June 30, 1874.]

Brief.—A horizontally sliding spring bolt has one or more notches on the bottom of the bolt, which engage with corresponding slops or shoulders on the bottom of the case, and of the catch or keeper, making a step-shaped series, by means of which the bolt can be readily locked within its case, or in other desired positions.

The combination, of the bolt D, provided with stem H and notch F, with the stop n, elevated end M, case A, catch or keeper K, and spring m, as and for the purpose set forth.

160,526. HYDRAULIC HOSE. J. D. Joslin, Cleveland, Ohio. [Filed Jan. 6, 1875.]

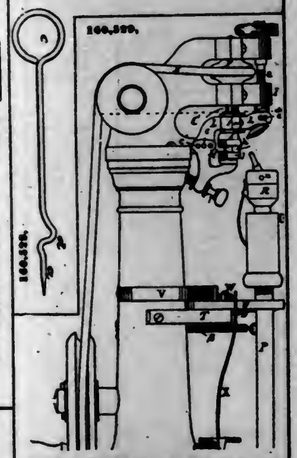
1. The hydraulic hose, lined upon the inside and outside with canvas alone, with a filling between the said linings of canvas and rubber, substantially as and for the purpose described.

2. In combination with the hose constructed with the outer and inner canvas linings, and intermediate alternate layers of canvas and rubber, the single outstanding seam *e*, formed by turning the two free edges of the outside wrapper C outward, cementing them together by an intermediate rubber stratum, and sewing the same close to the body of the hose at *e'*, as and for the purpose described.

160,527. WATER-ELEVATORS. J. Keith, Providence, R. I. [Filed July 27, 1874.]

Brief.—Upon disconnecting the bucket windlass-shaft and crank-shaft, which are loosely connected by a sleeve-joint, the crank-shaft will be lowered, permitting the windlass-shaft (2 feet with its friction-wheel in contact with a friction-shoe, thereby retarding the descent of the bucket.

The combination of a bucket windlass-shaft and crank-shaft, loosely connected by a sleeve-joint, and operatively connected, by a clutch, with a lever which controls the clutch, and also supports the journal-box of the crank-shaft, a stationary friction-shoe, and a friction-wheel mounted on and secured to the windlass-shaft, substantially as described, whereby, on disconnecting the two shafts by means of the lever, the crank-shaft will be lowered, thereby permitting the windlass-shaft to rest with its friction-wheel in contact with the friction-shoe, as and for the purposes specified.



160,528. TOILET-PIN. Ansel N. Kellogg, Chicago, Ill. [Filed Nov. 16, 1874.]

1. The toilet-pin provided with a curve of a helical nature in the shaft near the point thereof, in combination with a ring, *c*, at the head, substantially as specified.

2. The toilet-pin *a*, provided near the point with a curve, *d*, which stands upon one side of the shaft, and the ring *c* at the head, so constructed that it shall lie flat, while the curve stands upward or outward, substantially as specified.

160,529. MACHINES FOR TRIMMING THE HEELS AND SOLES OF BOOTS AND SHOES. Richard C. Lambert, Quincy, assignor to F. S. Potter, trustee, New Bedford, Mass. [Filed Jan. 27, 1875.]

Brief.—The boot or shoe is mounted upon a vertical standard, which may be adjusted at any required angle relative to the cutter-head, and held positively in each position by means of ratchet and pawl. Improvement on Patent No. 152,368, of June 23, 1874.

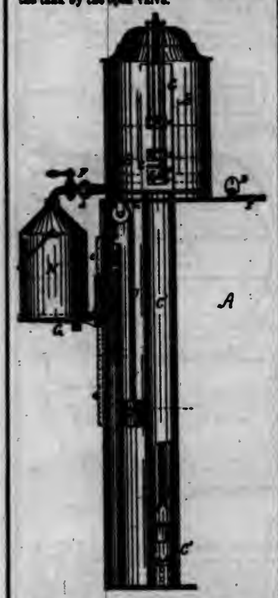
1. The gages *h h* or *j j*, arranged to partially inclose the cutter-head D, and to vibrate about an axis coincident, or nearly so, with the axis of the cutter-head, substantially as described.

2. In combination with a rotary cutter-head and its spindle, the gages *h h* and gage-carrier *g*, provided with an annular journal surrounding the spindle, and mounted in a bearing concentric, or nearly so, with the axis of the spindle and cutter-head, substantially as described.

3. The combination of the gages *h h*, the gage-carrier *g*, and the bifurcated lever L, pivoted to the frame at a point coincident with the axis of the longitudinal curve of the front side of the cutters, and shiftable means of adjusting the movable end thereof, substantially as described.

4. The combination of the gages *j j*, the pivoted stand *i*, and the bifurcated lever M, provided with the horizontal arm M', and pivoted to the frame at a point coincident with the axis of the longitudinal curve of the front side of the cutters, and the screw N, for adjusting the same, substantially as described.

5. The combination, upon the jack of a sole or heel edge trimming machine, of a pivoted heel-pin, constructed with a lever-arm, with a spring secured to the vertical standard, and adapted to press against said lever-arm and hold the pin in an inclined position, all substantially as and for the purpose described.



6. In combination with the jack-rod P, the forked lever U, pivoted to the stand T, the pawl *s*, and ratchet-teeth *p*, all as and for the purposes described.

7. The combination of the jack-rod P, forked lever U, pawl *s*, ratchet-teeth *p*, and lever W, provided with the pin *w*, all arranged substantially as described, for the purposes specified.

8. The combination of the jack-rod P, forked lever U, springs S and V, and the treadle-lever X, all arranged substantially as described.

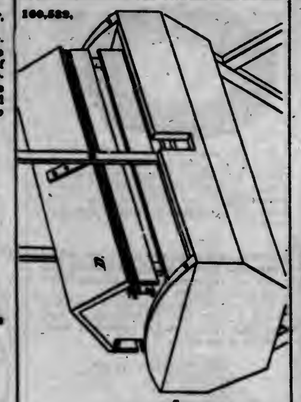
160,530. MEASURING-TANKS. Jos. Lessler, Buffalo, N. Y. [Filed Sept. 23, 1874.]

Brief.—A tank having on top a measuring-can, provided with a pump extending to the lower part of tank, to raise the contents of tank into the measure, which has valves arranged at various heights, according to the quantity to be measured, all the excess pumped into the measure being allowed to return to the tank by the open valve.

1. The measuring device consisting of the cylindrical vessel or can B, tube C, having openings 1 2 3 4 and valves *a a' a'' a'''*, or their equivalents, pump E, and cock F, having check-valve *d*, arranged and operated substantially as herein before set forth.

2. The combination and arrangement of the adjustable shelf or bracket G, ways or guides *e e*, tank A, and measure B, as herein before specified.

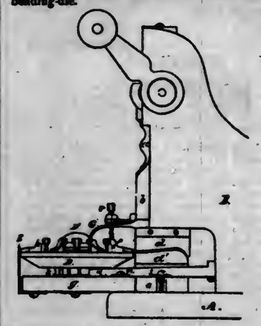
160,531. RED-GATE RODS FOR VEHICLES. William J. Lewis, Pittsburg, Pa. [Filed Dec. 17, 1874.]



A wagon-box rod having an upset flange or collar, *c*, at the base of the ring, substantially as set forth.

160,532. MACHINES FOR SANDING BRICK-MOLDS. Daniel Oscar Loy, Farmer City, Ill. [Filed Aug. 8, 1874.]

Brief.—A vibrating sanding-case is pivoted to the ends of a waste-trough, and provided on each side with recesses for the reception of the molds to be sanded. The molds are held in place by pivoted levers, which serve also to vibrate the case.



In combination with the rocking sanding-case D, provided at each side with a recess for the reception of the empty molds, the levers F, for locking in the molds and manipulating the case, substantially as shown and described.

160,533.

160,534. MACHINES FOR BENDING AWLS, NEEDLES, &c. Chas. S. Mann and W. Y. A. Boardman, West Medway, Mass., assignor to New England Awl and Needle Company, same place. [Filed Jan. 6, 1875.]

Brief.—A blank is entered into a spring grasping device or jaw by aid of a notched guide. In its circuit with the jaws (on the revolving table) it is first gaged, then bent by the dies, (during which bending it is released by the screw and again grasped when bent,) and afterward released by an arm and allowed to fall from the machine. A spring-retainer descends in advance of the upper bending-die.

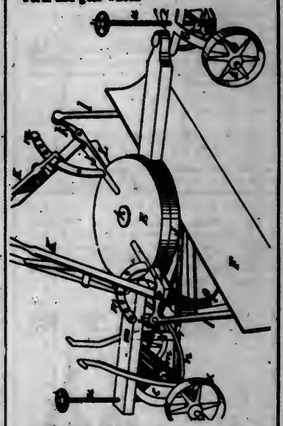
1. In a machine for bending or curving sewing-awls, &c., the combination, with the rotary table and its series of spring jaws or grippers, of the notched guide E, substantially as and for the purpose set forth.

2. In combination with the table and its series of spring jaws or grippers, the dies *d d'*, substantially as and for the purpose set forth.

3. The spring-retainer *n*, in combination with the dies *d d'*, substantially as and for the purpose set forth.

4. In combination with the movable die or head *b* and the series of spring jaws or grippers, the tripping-dog *e* and releasing-dog G, or either one of them, substantially as and for the purpose set forth.

5. In a machine for bending or curving sewing-awls, &c., the combination of the following elements: A rotary table provided with a series of spring jaws or grippers for holding the awls, mechanism for guiding the shanks of the awls into the jaws, mechanism for adjusting or inserting endwisely in the projecting parts of the awls, mechanism for holding the awls while being curved, mechanism or dies for imparting the desired curvature to the awls, and mechanism for discharging the awls when curved or finished, the whole being arranged substantially as shown and described.



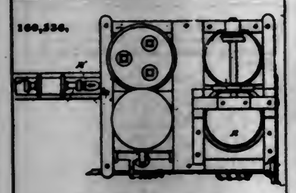
160,535. TACKLE-BLOCKS. Gratin Martin, Lynn, assignor of one-half his right to R. McIntyre, Everett, Mass. [Filed Dec. 4, 1874.]

In a tackle-block, the concave rollers *d d'* and convex rollers *c c*, combined and arranged to operate substantially as and for the purpose specified.

160,536. ROAD-SCRAPERS. Abijah McCall, Saratoga, and Jas. T. Watkins and Jasper S. Scott, Santa Clara, Cal. [Filed Dec. 17, 1874.]

Brief.—A wheeled scraper having a turn-table and various lever adjustments, to enable the scraper to be adapted to any angle of roadway. The axles are bent in opposite directions, to adjust the vehicle to inclinations of ground, the axle-shaft being operated by a worm and gear-wheel.

1. The turn-table E, with its arms I, in combination with the crank-levers K, connecting-rods l, racks m, and scraper F, substantially as and for the purposes above described.

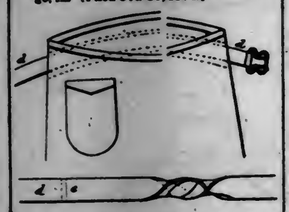


2. The scraper F, with its perforated semi-circular plate O and connecting-bar P, in combination with the rod *n*, braces *n*, and V-shaped push-bars *q q*, constructed and applied substantially as and for the purpose above described.

3. The axles A B, having oppositely-bent journals and pinions *t*, in combination with the upright shafts *u*, with screws *s'* and V, substantially as and for the purpose described.

160,537. MACHINES FOR PATCHING RAILWAY-RAILS. John R. Moore and James G. Mills, Chicago, Ill. [Filed Dec. 23, 1874.]

Brief.—Two disks fastened on the end of a shaft carry between them a series of rollers, that operate to hammer the top of the rail as it passes between the first pair of rolls. A horizontal steam-hammer situated upon a movable carriage, held up to the machine by a weight, is arranged to strike the end of the rail as it comes from the second pair of rolls, to upset the heated portion. A vertical plate capable of a limited movement is situated on the carriage in front of the hammer, and it is against this plate that the rail strikes and pushes the carriage back, while, at the same time, the hammer delivers its blows against the plate, from whence they are transmitted to the rail.



160,526.

1. The combination of the rolls and the rotary hammer, arranged substantially as shown and described with relation to each other, for the purpose of thereby causing the top of the rail or the patch thereon to be struck by the passage of the hammer between the rolls at their point of bite on the rail.

2. The combination of the sliding or yielding carriage N', carrying a steam-hammer, the slide R', mounted on the same carriage, and arranged to be struck by the said hammer and by the end of the rail, and the rolls for forming and compressing the rails and conducting them to the slide R' all operating together substantially as specified, and for the purposes set forth.

160,527. OVERALLS. Jonas Moore, Chicago, Ill. (Filed Oct. 20, 1874.)

The overalls, substantially as described, having straps *d*, crossed and twisted, as at *c*, and fitting the tube *e*, as specified, whereby the garment is held up without additional support or fastening, all constructed as and for the purpose set forth.

160,528. BRICKLAYERS' VESTS. Jonas Moore, Chicago, Ill. (Filed Oct. 20, 1874.)

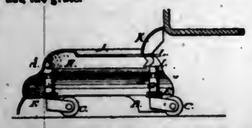
As a new article of manufacture, the bricklayers' vest herein described, having the body A, stripe B, and collar C cut and combined to form the arm-holes and bracing-support, as specified and shown, whereby the vest is held in proper position on the person without the use of a waistband, as set forth.

160,529. DISHES OF POTTERY-WARE. Jas. Moore, Trenton, N. J. (Filed Jan. 25, 1875.)

160,530.

In a dish of pottery-ware having corrugations *a* on its outside, and a smooth interior surface, B, the outwardly-projecting rim *b*, corrugated on its under side and smooth on its upper surface, with or without scallops *b'* on its outer edge, substantially as shown and described.

160,531. ATTACHMENTS FOR SINKS. John Murdock, Carver, Mass., assignor of one-half his right to Zibar Nickerson, same place. (Filed Oct. 26, 1874.)

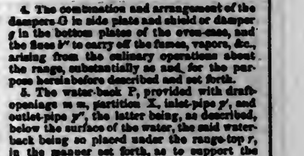


Brief.—An attachment for sinks, consisting of a foraminous table for supporting dishes, &c., which may be turned upward or backward when not in use.

The table B, provided with the legs F and pintles *a a*, in combination with the sink A, provided with the rim D, and the socket-piece C, having the slots *b b* and hooks *c c*, substantially as and for the purpose set forth.

160,532. FIRE-PLACE FENDERS. Jas. Old, Pittsburg, Pa. (Filed May 2, 1873.)

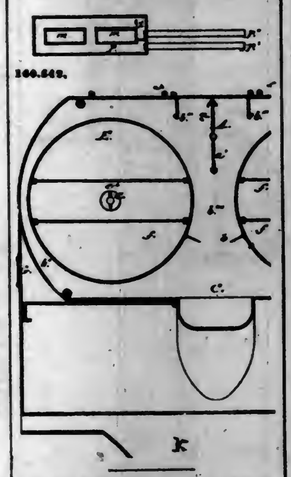
Brief.—The casters are held in place by a rubber band or other spring embracing the shaft between the upper and lower legs. A removable guard extends between the feeder and the grate.



1. In a fire-place fender the casters C, arranged in rear of and concealed by the feet B, in combination with the legs I and ledges or bearings E, substantially as and for the purpose hereinbefore described and set forth.

2. The washers O, in combination with the casters C and ledges or bearings E, substantially as and for the purpose hereinbefore described and set forth.

3. The guard K, in combination with the fender-apron J and grate M, substantially as and for the purpose hereinbefore described and set forth.



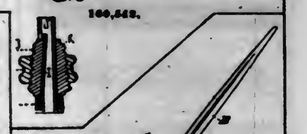
160,533.

4. The combination and arrangement of the damper G in side plate and shield or damper *g* in the bottom plates of the oven-case, and the flues *b''* to carry off the fumes, vapors, &c., arising from the culinary operations about the range, substantially as and for the purpose herein before described and set forth.

5. The water-back F, provided with draft-openings *n n*, partition X, inlet-pipe *p'*, and outlet-pipe *p''*, the latter being, as described, below the surface of the water, the said water-back being so placed under the range-top *r*, in the manner set forth, as to support the same, substantially as and for the purpose hereinbefore described and set forth.

160,534.

160,535. SCREW-DRIVERS. Wm. F. Patterson, Boston, Mass. (Filed Dec. 15, 1874.)



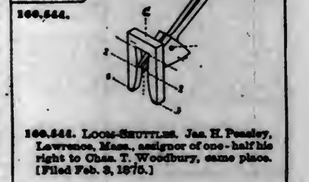
Brief.—A supplemental adjustable or reversible blade is attached to the main or fixed blade of a screw-driver by means of a detachable clamp provided with sectional screws and spring, and a clamping-nut. The rear end of the supplemental blade is secured in an adjustable step upon the main blade by a thumb-screw.

The screw-driver herein described, consisting of the blade B, adjustable step G, provided with screw H and shoulder *s*, reversible blade F, detachable clamp C, provided with the sectional screws D K and spring I, and the clamp-nut E, when constructed and arranged to operate substantially as and for the purpose specified.

160,536.

160,537.

160,538. COOKING-RANGES. Jas. Old, Pittsburg, Pa. (Filed Sept. 10, 1874.)

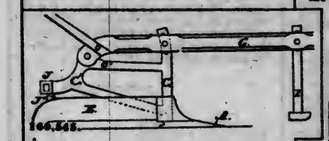


Brief.—The damper placed between the rotating ovens may be brought into contact with the surface of either, for the purpose of removing the soot. The water-back has draft-openings through it, and serves as a support for the top plates.

1. The damper A, having wings *a a'*, in combination with the direct flue *b'''*, flues *b'*, and circular ovens E, substantially as and for the purposes hereinbefore described and set forth.

2. The circular ovens E, arranged to revolve on their axes, in combination with the damper A, substantially as and for the purpose hereinbefore described and set forth.

3. The ash-pit K, in combination with the direct flues L and C, and in the rear of the fire-chamber, to receive the ashes, dust, soot, &c., carried by the draft through the flue L and openings *n n* in the water-back, substantially as and for the purpose hereinbefore described and set forth.



160,539.

160,540. LOCK-SHUTTLES. Jas. H. Pressley, Lawrence, Mass., assignor of one-half his right to Chas. T. Woodbury, same place. (Filed Feb. 3, 1875.)

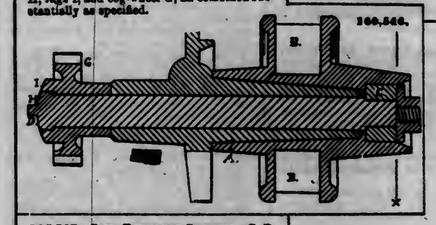
In a loom-shuttle, the spindle B, constructed substantially as described, in combination with the slotted bar C, having the narrow opening on the line 2 2 and wide opening on the line 3 3, arranged to operate substantially as and for the purpose specified.

160,541.

160,542. WEED-CUTTERS AND HILLERS. Jos. Robson, Osceola, Wis. (Filed May 7, 1874.)

Brief.—The standard has arms extending backward and hinged to the rear end of beam. This gives vertical adjustment to the point, and holds the bars which govern the expansion of the cutting and hilling wings.

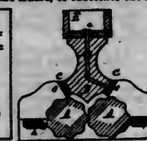
1. The adjustable standard C, with rearwardly-projecting arms *O' O'*, which are hinged to the rear end of the beam G, and have a socket to receive the adjusters J, in combination with the triangular weed-cutter A and horizontal knives H, substantially as and for the purposes described.



2. The combination of the standard C, having arms C', weed-cutter A, knives H, having adjusters J, and mold-board E, substantially as described and shown, and for the purposes set forth.

160,543. WHEELS FOR HARVESTERS. G. D. Rowell, Appleton, Wis., assignor to Rowell & Morris, same place. (Filed Jan. 16, 1875.)

1. Thimble-skein A, hub B, collar C, stem D, and nut E, all in combination, substantially as described.



2. Thimble-skein A, stem D, with its head H, lugs I, and cog-wheel G, all combined substantially as specified.

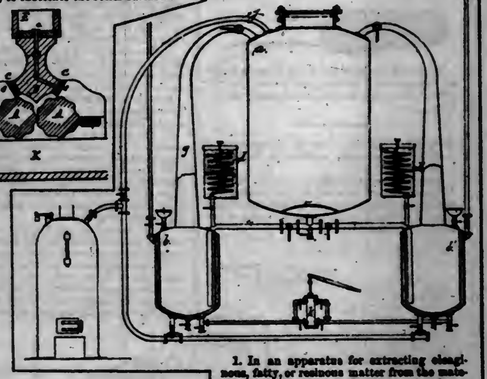
160,544.

160,545. BUTTER-WORKERS. Daul. Hague, Belvidere, Ill. (Filed June 6, 1874.)

Brief.—A machine in which the butter is fed upon and between two corrugated rollers, to each of which a spring-scraper is held. Water descends through minute channels in the frame, to lubricate the roller-surfaces.

160,546.

160,547. SLIP-TEETH FOR SEEDERS. G. D. Rowell, Appleton, Wis., assignor to Rowell & Morris, same place. (Filed Jan. 16, 1875.)



Brief.—The tooth is pivoted to the cultivator-beam, and has a brace projecting backward and upward between the forked rear ends of the beam. This brace has a projection which fits into a notched cam, for graduating the pitch of the tooth, and also to release the brace by the turning of the cam when the tooth strikes an obstruction.

1. The combination of slip-tooth B, having brace C, with notched cam D, substantially as set forth.

2. The beam A, tooth B, having brace C, and cam D, having indicator-figure E, all in combination substantially as set forth.

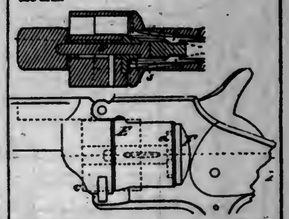
160,548.

1. The fluid-receptacle E, fluid-passages *c d*, and outlets *e*, in combination with the corrugated rollers A, as and for the purposes described.

2. The butter-worker herein described, composed of the fluid-passages *c d*, in uprights D, corrugated rollers A, self-acting cleaners H, and receptacle K, the parts arranged with relation to each other, substantially as and for the purpose described.

160,549.

160,550.



1. In an apparatus for extracting oleaginous, fatty, or resinous matter from the materials named in the specification, a closed vessel, *a*, for holding such materials, communicating with other vessels, *b b'*, in which the spirit-vapors are condensed, the vapors passing into the top of *a*, and down through the material therein, and out of the bottom of the vessel to the condenser, substantially as shown and described.

2. The combination, with the closed vessel *a*, of the vessels *b* and *b'* and their connecting-pipes *n p*, and a pump for increasing the circulation, substantially as described.

3. The combination, with the vessel *a*, of the vessels *b b'*, pipes *n p*, boiler *c*, pipe *f*, cisterns *f'*, and pipe *i*, as and for the purposes described.

160,551. REVOLVING FIRE-ARMS. Dexter Smith, Springfield, Mass. (Filed Jan. 21, 1875.)

Brief.—The object is to extract all the shells from the cylinder at the same time, which is accomplished by means of an ordinary extractor-plate, provided with a projection having a peripheral shoulder, in which clutches operating in the rear of the recoil-shield engage, to hold the extractor-plate stationary while the cylinder is moved forward. The clutches are so arranged that when the arm is half-cocked they are disengaged from the shoulders of the projection, thus entirely detaching the cylinder from the lock-frame of the arm.

1. The extractor-plate O', having the hollow stem C, arranged to move upon the center-pin O, and within the cylinder E, and provided with the peripheral shoulder *i*, in combination with one or more catches, *f*, arranged within the recoil-plate and frame, and operated by the movements of the hammer, substantially as described.

2. The extractor-plate O', having the hollow stem C, arranged to move upon the center-pin O, and within the cylinder E, and provided with the peripheral shoulder *i*, in combination with one or more catches, *f*, to hold the extractor stationary while the shells are being withdrawn, substantially as before set forth.

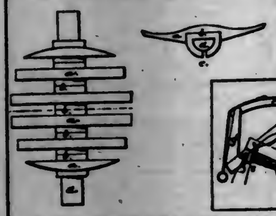
160,552. VEHICLE TORSIONAL SPRINGS. C. W. Saladee, Pittsburg, Pa. (Filed Oct. 16, 1874.)

Torsional springs, combined in pairs, one rod of each pair above the other, substantially as and for the purpose set forth.

160,553. APPARATUS FOR EXTRACTING THE OLEAGINOUS MATTER FROM TEXTILE MATERIAL. Reginald Scaife, London, Great Britain. (Filed Nov. 10, 1874.)

Brief.—The textile material contained in the vessel is subjected to the hydrocarbon vapor from the vessel through the pipe. The oleaginous matter collected in the bottom of the vessel *a* is then drawn off through pipe *b'* into the condenser *b'*. When in this vessel it is then vaporized, and allowed to pass up through pipe *n*; thence through the material in the vessel *a*, and then again the oleaginous matter is drawn off through pipe *h* into the condenser *b*, where it is again vaporized, as before. The material is afterward treated with steam, in order to drive off the traces of the naphtha vapor.

160,552. TOOTH-BRUSHES. Saml. Stevens, New York, N. Y. [Filed June 18, 1874.]

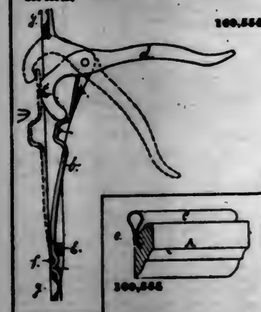


Brief.—The brush part is made of the vegetable fiber of palm-trees, and is woven into a sort of edging, and applied to the device by winding.

The brush made of the palm fiber, in loops extending from a heading, and wound around and attached to a handle, substantially as set forth.

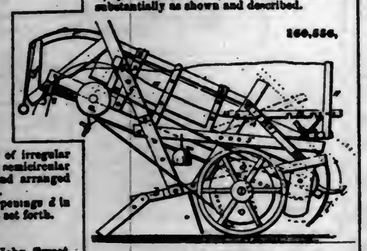
160,553. GRATES. John H. Swartout and Albert L. Wheden, Geddes, N. Y. [Filed Oct. 20, 1874.]

Brief.—The grate-bars inclose the bearing-bar, and protect it from injury through excessive heating. The area of the fire-surface may be adapted to stoves or furnaces of different sizes and forms.



1. The series of grate-bars a of irregular lengths, in combination with the semicircular supporting-bar d, constructed and arranged as and for the purposes specified.
2. The air-space c, below the openings d in the grate-bars a, for the purpose set forth.

160,554. SASH-HOLDERS. John Sweet, Providence, R. I., assignor of one-half his right to John A. Tillinghast, same place. [Filed Dec. 12, 1874.]

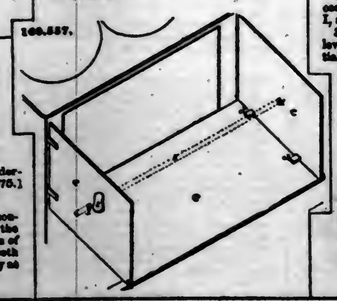


Brief.—A peculiar method of attaching and securing the spring (new in this class of device) constituting the essential novelty.

The frame A, cast with the cross-piece c and the bolsters E and f, and carrying the cam-lever d e, acted upon directly by the spring h, the latter cast around the bolsters, and secured below them by the lower screw g, passing through a hole in the spring, all substantially as shown and described, for the purpose set forth.

160,555.

160,556.



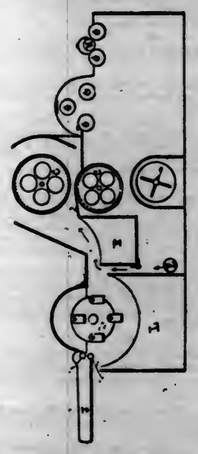
160,556. HAY-LOADERS. L. Underwood, Ottawa, Ill. [Filed Jan. 4, 1875.]

1. The rods d, projecting down through the axle, beams, and tongue, for the purpose of scattering the hay or grain, substantially as set forth.
2. The combination of the hay-rake and weighted levers, the rake being pivoted upon the rear end of the levers, substantially as shown and described.
3. The combination of the rake, weighted levers, and holding-latch, the rake being pivoted upon the end of the levers, and held in any desired position, substantially as described.
4. The combination of the rake, weighted levers, holding-latch 12, lever 11, and cords 13 and 15, substantially as specified.
5. The pulleys o, having the projections or catches o^2, arranged alternately in pairs and single ones, substantially as shown.
6. The combination of the revolving forks, blocks m, and washers n, the washer being countersunk into the forks to prevent hay or grain from working between them, substantially as shown and described.
7. The hinged spring-slat 2, arranged at the head of the bed to prevent the downward passage of hay or grain, substantially as specified.
8. The combination of the slats 3 4, substantially as shown and described.
9. The combination of the adjustable rods e^1, screw d^1, connecting-rods g^1, and bars e^1, substantially as shown and described.

160,557. COOKING-STOVES. JaRw S. Van Buren, Troy, N. Y. [Filed Apr. 29, 1874.]

Brief.—The double doors of the stove are opened and held at right angles to its face by a bottom plate provided with hooks for the purpose. The doors and the plate form three sides of the reservoir-casing or oven.

1. The combination of the doors, a cover, and a bottom plate, substantially as described.
2. The doors c or end plates, pivoted or hung upon a stove or range, in combination with a reservoir, A, provided with lips j, whereby the reservoir is supported upon the side of the stove or range, substantially as shown.
3. The combination of the doors c, provided with supports d, with the plate e, having braces or cushions for holding the doors in position, substantially as shown.
4. A water-reservoir, A, having the flange i upon each end, in combination with suitable supports, whereby it is supported in position, and can be adjusted back and forth in relation to the side of the stove, substantially as specified.



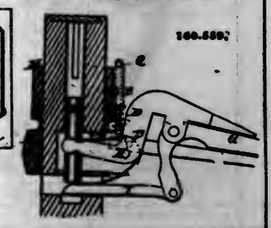
160,557.

160,558. WEATHER-STRIPS. R. O. Underwood, Boston, Mass. [Filed Jan. 22, 1875.]

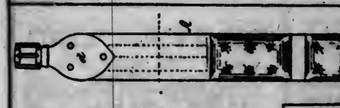
The weather-strips described, the same consisting of the molding A, provided with the recess B, and the vibrating doubled strips of rubber C attached thereto by placing both edges together in the offset e, substantially as and for the purpose specified.

160,559. COTTON OPENERS AND LAPPERS. Wm. R. Whitehead, Miles Platting, England, and Abel T. Atherton, Lowell, Mass. [Filed Apr. 13, 1874.]

Brief.—The air-port is isolated from the dust-chambers, so that none of the waste beaten from the cotton shall be blown back thereto. The beater-shaft is supported at each end in a bushing which is ball-shaped, so that its bore may align itself with the shaft should the machine or the floor settle, and is adjustable endwise to take up wear.



1. The combination of a beater and the two separate dust-chambers L and F with the air-opening E, isolated from both chambers, as and for the purpose set forth.
2. The combination, with the shaft N and adjustable-bushing O, of the stand M and plate S, the upper surface of the former and lower surface of the latter being made plain, to allow endwise adjustment of the bushing, as and for the purpose set forth.

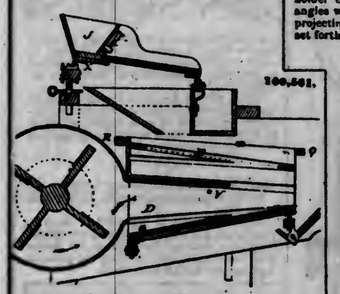


160,560. SCREW-TAPS. Thomas S. Wild, Chicago, Ill. [Filed Dec. 22, 1874.]

Brief.—A body slotted transversely and longitudinally, the latter to admit the dies and their wedge-shaped holder, said holder being moved to expand the dies by means of the lever, and held in place by the sliding piece. A gage is acted upon by the nut being tapped, and, through the medium of two levers and a slide, releases the tap when the cut is finished.

1. The combination of the tap-stock A provided with a transverse recess or opening to receive the sliding piece I, the die-holder B, and the sliding piece I, substantially as and for the purpose specified.
2. The combination of the die-holder B, the compound levers D and G, and sliding piece I, substantially as described.
3. The combination of the sliding rod Q, the levers O and G, and sliding piece I, substantially as and for the purpose specified.

160,560.

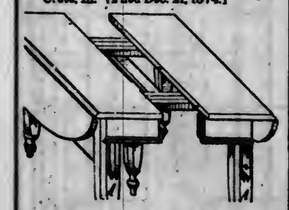


160,560.

160,560. SURCINGLES. Henry M. Witter, Worcester, Mass. [Filed Feb. 9, 1875.]

1. A surcingle composed of a tubular fabric, having intermediate pocket-spaces, forming a part thereof, substantially as described.
2. A surcingle having intermediate stuffed pockets, forming integral parts thereof, and practically solid ends, substantially as described.
3. A surcingle having intermediate stuffed and tufted pockets, forming integral parts thereof, practically solid ends, and leathers a d, substantially as described.

160,561. GRAIN-SEPARATORS. Orville K. Wood, West Chazy, N. Y. [Filed Sept. 1, 1873.]



Brief.—A fanning-mill provided with vibrating feeder having device to give it smooth or tremulous motion at will, and the shoe supported upon rod passing through and between guide-bars to steady its movements.

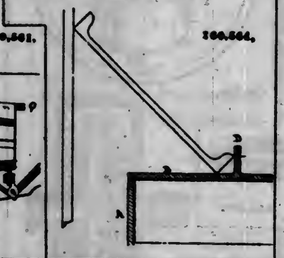
160,561.

1. The combined smooth and cog rollers, having two grooves, in combination with the fluted iron X under the feeder J, for the purpose of giving either a smooth or tremulous motion to the rear end of the feeder without the necessity of changing the rollers, the parts being constructed and arranged substantially as described.
2. The rod V and the guides Q R, used to guide and direct the movement of the shoe D, made and constructed substantially as described, and used for the purpose set forth.

160,562. EXTENSION-TABLES. Geo. Ahrens, Crete, Ill. [Filed Dec. 21, 1874.]

The legs A of an extension-table provided with slots a to receive the movable leaves, substantially as set forth.

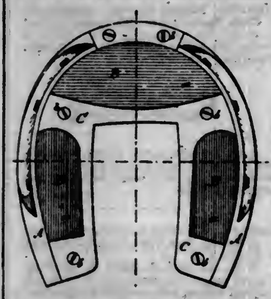
160,563. PNEUMO-SEMARS. C. H. Billings, La Grange, Ind. [Filed Jan. 28, 1875.]



Brief.—A toggle-joint is pivoted by one end to the shank of the movable blade of a pair of shears, and by the other to the shank of the fixed jaw. This joint is operated by means of a lever which has its fulcrum upon the fixed jaw of the shears, and is connected to said joint by a pivoted link.

160,564.

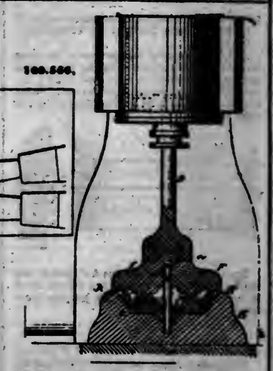
In a pruning implement, the combination, with the movable jaw C and the fixed jaw A, of the toggle-jointed links D D', connecting-rod E, and vibrating actuating-lever F, pivoted to the shank of the fixed jaw A, substantially as specified.



160,564. PICTURE-HOLDERS. Josephine Bancroft, Boston, Mass. [Filed Apr. 20, 1874.]

As an article of manufacture, a picture-holder composed of the arms A B, at right angles with each other, the rest D, and the projecting piece G, all as and for the purpose set forth.

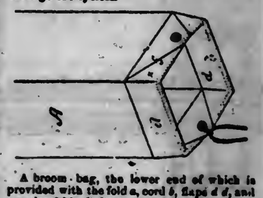
160,565. HORSESHOES. Thomas B. Bishop, Washington, D. C. [Filed Aug. 4, 1874.]



Brief.—The inner plate secures the rubber cushion in place, allowing projecting portions on the latter to serve as toe and heel calks.

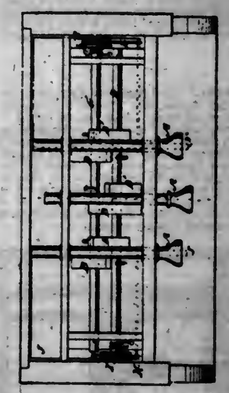
At a new article of manufacture, the combination of the shoe A with the rubber B and inner plate C, together with the projecting cushions c, rounded at the front edges c, all constructed and arranged as described, and for the purposes set forth.

160,566. MACHINES FOR SWAGING CARWHEELS. Albert L. Blackmon, Nashville, Tenn. [Filed Feb. 20, 1875.]



A combination of mandrel i, its eye hole g, and conical-shaped ends with the hole f in die-plate F, the dies F and E, escape-hole d, and the anvil E, when constructed in the manner and for the purposes set forth and described.

160,566.



160,567. BROOM-BAGS. Edwd. D. Brunson, Amsterdam, N. Y. [Filed Nov. 14, 1874.]

Brief.—The lower end of the paper tube is turned down to form a binding with a string inside, and two opposite (upper and lower) flaps are each folded in V shape, and held by eyelets. The sides are each turned in halfway across the end of the tube, outside of which the V shaped flaps are held by a string through the eyelets.

A broom-bag, the lower end of which is provided with the fold a, cord b, flaps d d, and angular folds d^2 d^2, the latter being provided with eyelets i for the reception of strings h, substantially as described, and for the purpose set forth.

160,568. ORGAN-STOP ACTIONS. Frederick M. Brush, Potsdam, N. Y. [Filed June 27, 1874.]

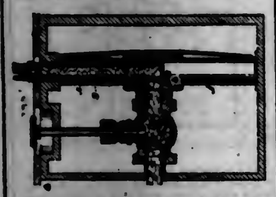
The draw-stops A, having legs B B', and the rock-shafts C D, provided with the pulleys M I, springs K O, and cords H L, in combination with on and off treadles, all the said parts being constructed to operate substantially as and for the purpose set forth.

160,569. PROJECTILES FOR ORDNANCE. J. G. Butler, New York, N. Y. [Filed Nov. 23, 1874.]

Brief.—The area of that portion of the sabot which comes in contact with the bore of the cannon is reduced by means of cutting annular grooves in the outer surface of the same, requiring less force to impress the rifling and close windage.

The combination of the ribs *d*, *d'*, and *d''* and the annular groove *e* with the cup-shaped sabot B, substantially as and for the purpose hereinbefore set forth.

160,570. FRICTION-PULLEYS. T. F. Carver, Worcester, Mass., assignor of one-half his right to Jas. H. Gray, same place. [Filed Feb. 3, 1875.]

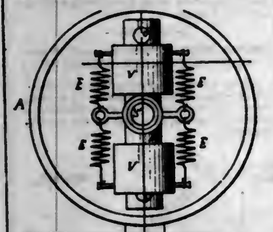


Brief.—The sliding of the collar causes the rotation of the cylindrical grooved nut, and the latter, acting on the threaded end of the longitudinal rod, slides the latter in or out, so as to cause the friction-ring with which it is connected to bear against one or the other of the loose pulleys.

The combination of the cylindrical nut B, having spiral grooves I and exterior and interior threaded portions, the collar K, having internal spiral lugs J, the recessed shaft H, having the slots *h*, and the rod E, having the threaded outer end *e*, the inner end of said rod being connected by the pin O, or its equivalent, with a sliding friction or other locking device rotating with the shaft H, and adapted to be locked with a loose pulley or pulleys on said shaft, substantially as specified.

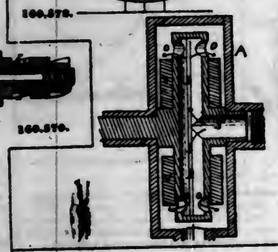
160,571. NOZZLE-PRESERVER HYDRANTS FOR FIRE-PLUGS, &c. Huston I. Chapman, Portland, Oreg. [Filed Feb. 23, 1875.]

Brief.—Within a cylinder communicating with the water-main is fitted another cylinder having an opening through its side near the bottom, through which the water is discharged when the hydrant is in use. The interior cylinder, when the hydrant is not in use, is lowered in the outer cylinder, out of the reach of frost. The whole is inclosed in a box filled with dry sawdust.



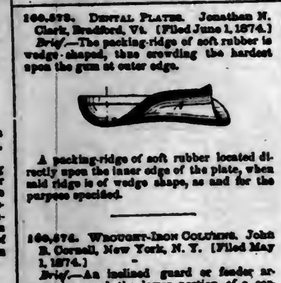
(In combination with the pipe L, the cylinder A A' and the sliding cylinder C B, substantially as and for the purposes described.

160,572. STEAM-GOVERNORS. Daniel L. F. Chase, Somerville, Mass. [Filed Dec. 1, 1874.]

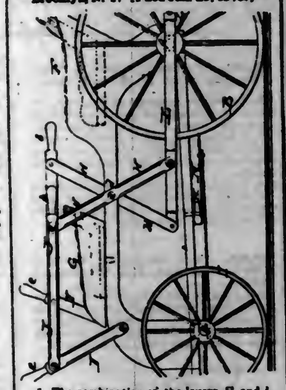


1. The combination, in a steam-governor, of a stationary steam-chamber, having induction and eduction ports, with a rotary steam conductor or conductors, disposed within said chamber, and provided with steam ports and valves, arranged to close such ports by direct centrifugal action, substantially as set forth.

2. In a governor for steam engines, &c., the combination of the case A A', provided with induction and eduction ports D C, the driving shaft B B', provided with hollow arms B E, having ports O O, the centrifugal valves V V, and springs E E, substantially as shown and described.



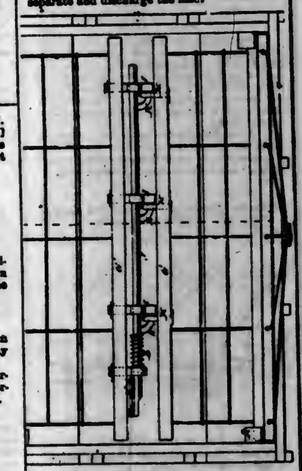
3. The combination of the centrifugal valves V V, with the hollow arms or conductors B B, provided with steam-ports O O, and the casing A A', substantially as shown and described.



160,573.

160,574.

160,575.



1. The combination of the levers H and I, handles *b* and *c*, and rod J, with the rod L, crank-wheel B, and the two seats F and G of a velocipede, substantially as shown and described.

2. The pivoted T-shaped front axle E, combined with the T-shaped steering and foot lever M, and joined to each foot-lever behind its pivot, substantially as and for the purpose shown and described.

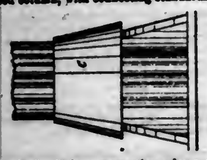
160,576. GRAIN AND STRAW LIFTERS. D. Crane, Knight's Landing, Cal. [Filed Dec. 28, 1874.]

Brief.—The cord P, connected to the tripping-rod, is given a jerk, which moves the rod length-wise sufficient to withdraw the hooks from the staples, thus allowing the parts to separate and discharge the load.

The combination, in a grain and straw lifter, with bars G G', having staples H I, of the spring-rod J, having hooks K, as and for the purpose specified.

160,577. LAMP-BURNERS. James Curtis, Darien, Conn. [Filed Jan. 26, 1875.]

Brief.—The spring-valve is opened by the mouth of the oil-can, and closes automatically on the withdrawal of the same.



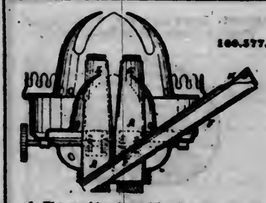
160,578. PACKING. Daniel L. F. Chase, Somerville, Mass. [Filed Dec. 1, 1874.]

Brief.—The packing-ridge of soft rubber is wedge-shaped, thus crowding the hardest upon the gum at outer edge.

A packing-ridge of soft rubber located directly upon the inner edge of the plate, when said ridge is of wedge shape, as and for the purpose specified.

160,579. WROUGHT-IRON COLUMNS. John B. Cornell, New York, N. Y. [Filed May 1, 1874.]

Brief.—An inclined guard or fender arranged around the lower portion of a corrugated column, with connecting-standards.



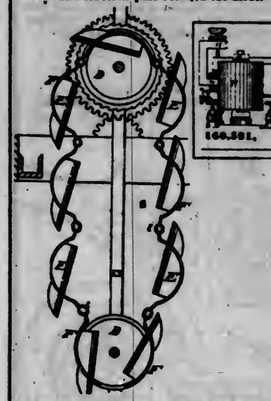
The fender C, for a supporting-column connected to the foundation-plate, to form a lateral support to the column, substantially as specified.

160,580. DENTAL PLATES. Jonathan M. Clark, Bradford, Va. [Filed June 1, 1874.]

Brief.—The packing-ridge of soft rubber is wedge-shaped, thus crowding the hardest upon the gum at outer edge.

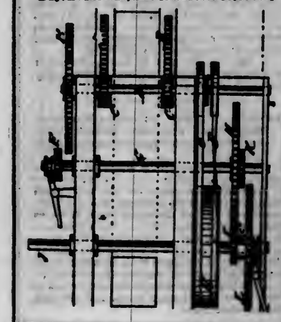
A packing-ridge of soft rubber located directly upon the inner edge of the plate, when said ridge is of wedge shape, as and for the purpose specified.

160,577.



1. The combination, with a lamp-burner, of a feed-tube, F, having spring-valve H, arranged as and for the purpose described.

2. The combination of radial slotted tubes A, twisted into alignment at the lower end, with a single ratchet-bar or wick-raiser, as and for the purpose specified.

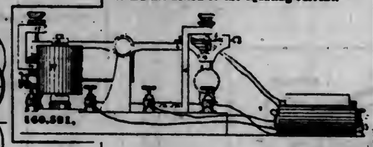


160,578. WATER-ELEVATORS OR CHAIN-PUMPS. Orson A. Davis, Washington, Cal. [Filed Jan. 23, 1875.]

Brief.—The pulleys consist of two disks, in combination with a series of connected buckets, which are provided with a curved plate or guard, which projects upon each side, so as to provide bearings upon the disks, and allow the buckets to pass between the disks.

The pulleys D D, each of which consists of two disks, *d d*, in combination with the series of connected buckets E E, when each of said buckets is provided with a curved plate or guard, F, which project upon each side so as to provide bearings upon the disks, and allow the buckets to pass between the disks, substantially as and for the purpose described.

160,579. HAY AND COTTON PRESSES. B. J. Day, Evansville, Ind. [Filed Jan. 18, 1875.]



The combination, in drive mechanism for press followers, of pinion K and gear-wheel L, arranged upon the counter-shaft G and the driving-shaft J, respectively, with the pinion I, gear-wheel H, slide-pinion F, spur-wheel E, and the press-follower, pinion I and gear-wheel L being secured to a sliding sleeve, *e*, all as shown, and for the purpose specified.

160,580. SOLUTIONS FOR CHEMICAL TELEGRAPH-PAPER. Thos. A. Edison, Newark, N. J., assignor to himself and George Harrington, Washington, D. C. [Filed June 1, 1874.]

The solution for chemical telegraph-paper prepared with ferrocholoride of sodium, substantially as set forth.

160,581. DUPLEX-TELEGRAPH APPARATUS. Moses G. Farmer, Salem, Mass. [Filed Sept. 20, 1872.]

Brief.—Claims that when the circuit of a duplex apparatus is closed the static charge in the line causes the coil in main circuit to momentarily affect the armature before the equating-coil sets thereon. Prevents this by introducing momentarily an inducted current into the main line, to hinder the action of such charge, or else into the equating-circuit, to aid the action of the equating-current.

160,581.

1. The combination of a main telegraphic circuit and its batteries with an induction-coil so arranged as to hinder the effects of static charge, substantially as set forth.

2. The combination of an induction-coil with an equating-circuit to help the equating-circuit to neutralize the effect of static charge on the relay in the main circuit, substantially as set forth.

3. The combination of a continuity-preserving key and an induction-coil with an equating-coil and an independent equating-battery, substantially as set forth.

4. The combination, in the main or equating circuit of an induction coil or coils, in such parts of the main or equating circuits as are open when the main and equating batteries are disconnected, substantially as set forth.

5. The combination of the circuit-preserving key above alluded to with a relay or its equivalent, and with one or more induction-coils, substantially as set forth.

6. The combination of the continuity-preserving key with a relay, an inductive coil or coils, and with a means of regulating both the strength of the inductive stroke or strokes and the strength of the equating-current, substantially as set forth.

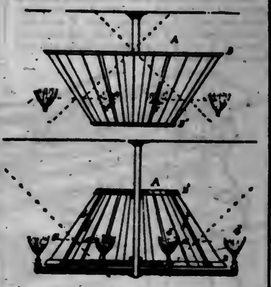
7. The combination of primary and secondary helices with the means above described of preventing the appearance of a spark upon rupturing the primary circuit, substantially as above described.

160,582. PLATES FOR ARTIFICIAL TEETH. Benton J. Field, Loakeville, N. C. [Filed Feb. 9, 1875.]

Brief.—A nut with an oblong rectangular slot is secured in the plate, and forms an integral part of it. The flattened end of the tooth-pin is passed through this slot, and firmly secured therein by giving it a partial turn.

The combination of the nut with that part of the plate which may be made of some other material, the nut being embedded in or surrounded by said material, and making a part of the plate, and used in combination with a flattened pin in the tooth, which is keyed by being turned in the recess of the plate, substantially as described.

160,583. MANUFACTURE OF SHOES. Wm. Froehlich, New York, N. Y. [Filed Dec. 9, 1874.]



1. In the art of manufacturing shoes having wooden heels, the application of the wooden heel to the sole previous to the application of the leather covering *d* to the heel, to allow said covering to lap around the sole, substantially as specified.

2. A shoe, made with a wooden heel, B, whose leather covering *d* laps around the branch *a* of the sole, substantially as and for the purpose specified.

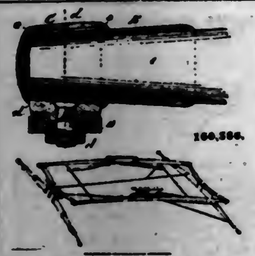
160,584. REFLECTORS. Bernard Goetz, Philadelphia, Pa., assignor of one-half his right to Frederick Klemm, same place. [Filed Feb. 11, 1875.]

Brief.—For a reflector a polygon having inclined re-entering angles upon both sides, arranged to throw light both upward and downward.

1. The combination, in the reflector A, of the exterior and interior reflecting-surfaces *b* and *b'*, arranged to throw the rays of light both upward and downward, substantially as herein shown and described.

2. In combination with an inclined many-sided reflector and its surrounding gas flames or radiants, the exterior reflecting-surface *b'*, whereby the rays of light are thrown upward to illuminate a ceiling or other overhead surface, substantially as herein shown and described.

160,585. REVERSIBLE PINIONS FOR WATCHES. John Gordon, San Francisco, Cal. [Filed Dec. 3, 1874.]

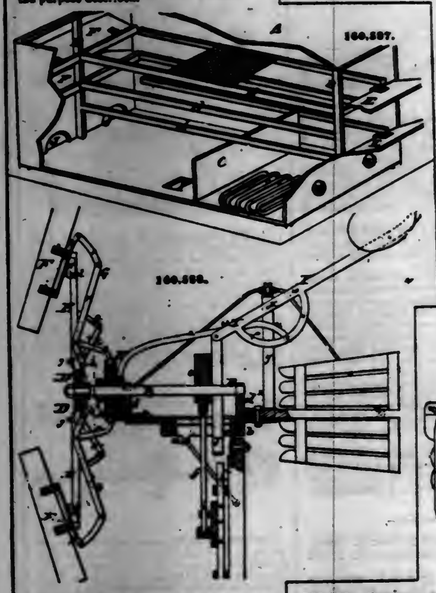


The staff A, with its center-wheel B and loose pinion D, in combination with the cap or disk *f*, with its corrugations or indentations *i* arranged to receive the ends of the teeth of the pinions, and the compressing-spring n and nut *o*, all combined and arranged to operate substantially as and for the purpose above described.

160,586. SPRING AND SIDE-BAR CONNECTIONS FOR VEHICLES. John W. Gosting, Cincinnati, Ohio. [Filed Oct. 14, 1874.]

Brief.—The side bars and end spring are coupled, so as to avoid the torsion of the spring.

The combination of spring B, side box A, and sleeve E, having ears *e e*, with elastic packing *d''* and divided socket C, attached by independent screws, all substantially as and for the purpose set forth.



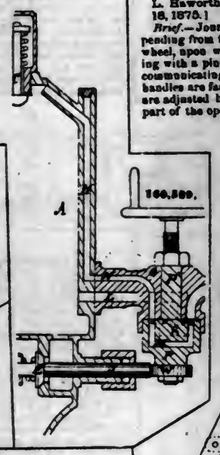
160,586.

160,587. FRUIT-DRIERS. Levi A. Gould, Santa Clara, Cal. [Filed Nov. 27, 1874.]

Brief.—By means of the partition the heated air is first forced upwardly through the contents of the drier. The opening at the bottom is designed to carry off the air which is most moistened. That which is less heavily charged with moisture is discharged through the lower openings in the rear wall. A stove, instead of the steam or hot-air coil, may be used.

The drying room or box A with its tracks d d arranged above one another, and provided with the partition or bridge-wall C and discharge-openings I and J, and the opposite doors E E and F F, substantially as and for the purpose described.

160,587.



160,588.

2. The combination of the pivoted wings F of a wind-wheel, jointed levers G G, and disk D, with the links e, and with the rotary slide H, the links e terminating in balls that are confined in sockets formed by the two plates that compose the slide H, substantially as herein shown and described.

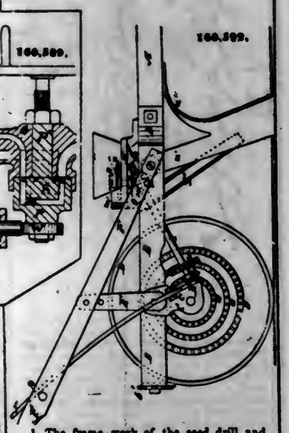
160,589. FAUCETS FOR DRAWING OFF EFFERVESCENT LIQUIDS. Carl Greiner, New York, N. Y. [Filed Aug. 18, 1874.]

Brief.—A two-way cock communicating with channel-ways in a chamber arranged above the fountain allows the gas to escape previous to drawing off the liquid, which prevents any sparting of the liquid.

The chamber A with a channel-way, H, valve E, and rod J, in combination with a faucet, O, provided with two channel ways, L N, and outlet K, and having a plug, P, provided with two channel-ways, S and M, and the cam-wheel W, the whole being arranged and operating together in the manner and for the purpose substantially as described.

160,589.

160,590.



160,591. BAG-FASTENERS. C. W. Harvey, Waterloo, Iowa. [Filed Feb. 5, 1875.]

An improved bag fastener, formed by the combination, with each other, of a rubber block, A, a screw, B, and two metallic washers, C D, substantially as herein shown and described.

160,592. SEED DRILLS AND PLANTERS. L. L. Haworth, London, Ohio. [Filed Jan. 18, 1875.]

Brief.—Journaled to revolve in hangers depending from the metal frame is the bearing-wheel, upon which are sets of cogs for gearing with a pinion on the adjustable shaft, for communicating motion to the seed-dist. The handles are fastened to bars at the front, and are adjusted by a central brace. The upper part of the opening-plow is cut in stripe.

160,592.

1. The frame-work of the seed drill and planter, consisting of the adjustable handles F, the braces E, the bars B B, hangers C C, attached with braces E to bars B by a common bolt, and the adjustable bar F, attached to the two bars B B, so as to act both as a scraper and also as a brace to secure the loose ends of the said bars B B, all combined and arranged substantially as described.

2. The angular plow U, having its upper end divided into strips or braces, substantially as herein shown and described.

160,593. WHIFFLETREE. August Graf and Wilhelm Graf, Burnett Junction, Wis. [Filed Jan. 19, 1875.]

Brief.—The arms that support the wings and the jointed connecting-rods are secured to the hub by hook-bolts, which pass through the arms, and embrace a circular wire that is placed in a groove at the back of the hub-disk.

1. The hub-disk D of a wind-wheel, combined with the hook-bolts g, projecting radial arms E, circular wire h, and jointed levers G, all arranged so that the hook-bolts will rigidly secure the arms E and the wire h to the disk D, substantially as herein shown and described.

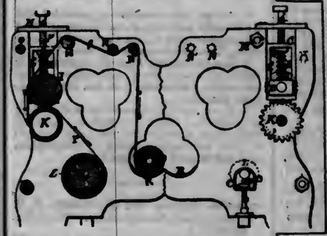
160,594. DEVICES FOR BENDING HORSE-SHOE-BARS. Robert Hale, Minneapolis, Minn., and Jas. B. Johnston, Chicago, Ill. [Filed Feb. 23, 1875.]

Brief.—A series of formers of different sizes, constituted of a solid hub and a number of dividing-plates; a rectangular projection, by which it may be clamped in a bench-vise; bridge-pieces that span the grooves at one end, under which to insert the end of the blank; and, in addition, a bar with a socket in one end, by which the blank may be handled and bent around the former.

The combination of the plates A, provided with the lugs B and ledge c, with the lever L, substantially as and for the purpose set forth.

160,595. POTATO-DIGGING MACHINES. Thomas Head, Copestown, Beverly Township, Wentworth County, Canada. [Filed Dec. 15, 1874.]

Brief.—A turn-plow is provided with an elevated cutter and spoon on the extreme end of the share, the space for the mold-board being occupied with gratings, reaching backward and upward from the share, to which they are separately pivoted; the upper ends being connected by a free bar jointed to a crank, which gives the bars an oscillating motion. The digger is designed to be attached to the tail-end of a mowing-machine after the cutter-bar has been removed, and motion is given to the shaker by the same means that give motion to the cutters.

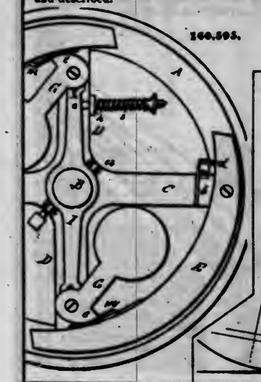


160,593.

The combination, in a potato-digging machine, substantially as described, of shaking grated mold-board B with outside cutter D, a continuation of which forms the spout C, substantially as described.

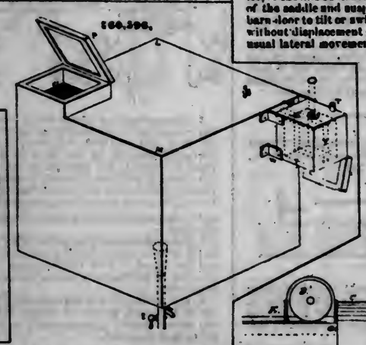
160,596. CLOTH-PRESSING MACHINES. W. Hebdon, Boston, Mass. [Filed Dec. 15, 1874.]

Brief.—The press-paper is in a continuous sheet, and is wound with the fabric onto the accumulating-roller, which is made in the form of a cylinder, adapted to be heated by steam or hot water. A yielding pressure-roll bears upon the cloth, and an adjustable brake gives the required tension.



In a cloth pressing and papering machine, the combination of the accumulating-cylinder K and yielding pressure-roll I, with the basket B, and guide rods or rollers M N N', adapted to supply and guide the cloth to the accumulating-cylinder, and the roller L, having the adjustable brake or yoke e, adapted to supply paper to the accumulating-cylinder, the brake creating the necessary tension, all being arranged and operating substantially as and for the purpose set forth.

160,595. GOVERNORS FOR HORSE-POWERS. J. D. Hoebner, Norristonville, Pa. [Filed Jan. 21, 1875.]



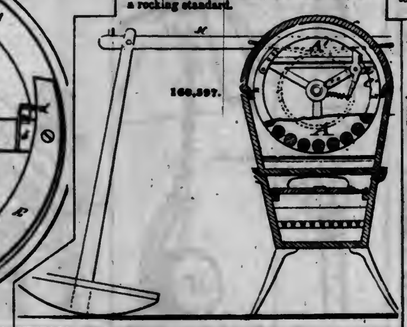
Brief.—As the speed increases the weighted arms are thrown out, causing the shoes to bear on the stationary rim, producing friction to retard the machine.

1. The stationary circle or casing A, arranged as described, in combination with the revolving shoes E E, substantially as shown and described.

160,595.

160,596.

160,596.



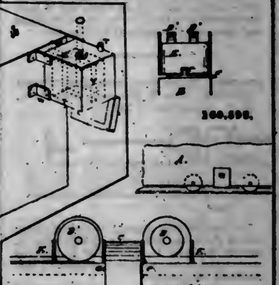
160,597. ICE-MAKING APPARATUS. Wm. Hood, San Francisco, Cal. [Filed Oct. 22, 1874.]

Brief.—To make a vacuum in the upper reservoir, fill the lower one with a non-drying oil; close cock I; pump oil into upper reservoir until it is full; shut the man-hole; open I; the oil passes into lower reservoir; shut cock L. To form ice, shut U; nearly fill W V T with cold water; fill Y with boiling water and close it; open stop-cock R. The rapid evaporization of boiling water in Y into vacuum in upper reservoir freezes water in W V T.

The combination, in an ice-making apparatus, substantially as described, of a vacuous reservoir, L M N, the receptacle Y for the water to be vaporized into the vacuum in L M N, connecting-pipe N, having stop-cock R, and the reservoir W V T, containing the water to be frozen into ice, and surrounding the receptacle Y.

160,597. WASHING-MACHINES. G. Huntington, Toronto, Canada. [Filed Jan. 4, 1875.]

Brief.—A drum for containing the clothes has a reciprocating motion by a pulley on the shaft, operated by a cord, horizontal bar, and a rocking standard.

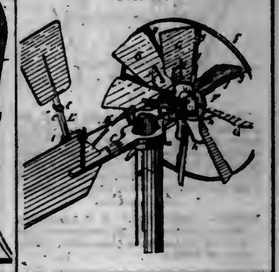


160,597.

In a washing-machine, the combination of the vibrating rocker-standard G, horizontal bar H, cords I, pulley J, and drum A, all combined and operating as shown and described.

160,598. DOOR-HANGERS. Wm. Johnston, Shelby, N. Y. [Filed Feb. 25, 1875.]

Brief.—A movable truck carries on each side rollers, which run upon a T-rail. The two parts of the truck are connected by an arched saddle or bridge. The hanger has arms for screwing it to the door, and terminates in a suspending-hook fitted to the saddle of the truck. Slots in the truck enable it to fit over and drop down upon the T-rail, and by its forward or backward movement clear away snow, ice, or the like obstructions. The peculiar form of the saddle and suspending-hook allows the barn-door to tilt or swing out from the bottom without displacement or interference with its usual lateral movement.



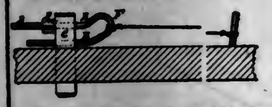
160,598.

1. The movable double case or truck E, connected by saddle or bridge c, and carrying the single rollers D, or the double rollers D', in combination with the T-rail F, when the case is slotted, to drop down upon the rail and clear the track of obstructions, all substantially as and for the purpose specified.

2. The hanger C, having hook c, in combination with, and fitted to, saddle c of the movable double case or truck E, whereby a tilting movement is secured for the bottom of the barn-door, all substantially as described and shown, for the purpose set forth.

160,599.

160,600. WIND-WHEELS. J. M. Kauffman, Goshen, Ind. [Filed Feb. 6, 1875.]

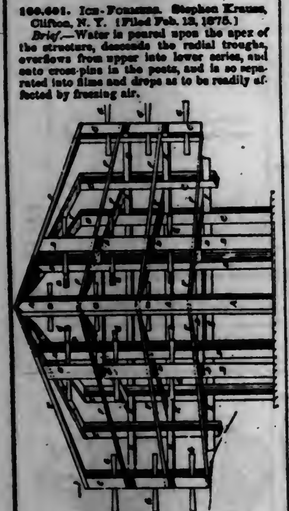


Brief.—The vanes are connected to automatic adjusting devices, which compensate the varying velocities of the wind; also, in mounting the vanes by hinging them at one edge to radial arms projecting from a central hub, and in the devices for adjusting the position of the vanes, so as to produce uniformity of speed in the wheel, whatever may be the velocity of the wind.

1. In a wind-wheel, the vanes G, hinged at their edges to the radial arms *f*, in combination with slip-joints *j*, shifting-hub h, having radial arms *h'*, and the regulator, substantially as described.

2. The combination of hinged vanes G, arms *h'*, shifting-hub h, having diagonal hole 1 in the end thereof, and disk 3, provided with inclined pin 2, substantially as and for the purpose set forth.

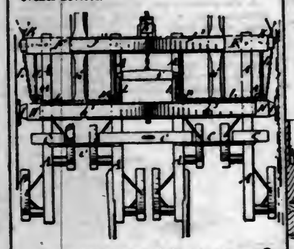
3. The combination of lever *k*, rod *o*, regulating wing-vane L, revolving about rod *c* as an axis when said rod vibrates, rod K, and the adjustable vanes of a wind-wheel, arranged and operating substantially as described.



160,609. PIANO STRINGING AND TUNING DEVICES. Wm. F. Koerring, New York, N. Y. [Filed Nov. 7, 1874.]

The combination of the U-shaped adjusting device F, having the screw-threaded leg E, parallel guide-leg E, and the nut D, with the piano-string A and stationary rest-pin C, substantially as specified.

160,601. ICE-FORMERS. Stephen Krauss, Clifton, N. Y. [Filed Feb. 13, 1875.]



Brief.—Water is poured upon the apex of the structure, descends the radial troughs, overflows from upper into lower series, and onto cross-pins in the posts, and is so separated into films and drops as to be readily affected by freezing air.

The combination of the posts A B C, the cross-bars D E, two, three, or more tiers of spools, F, and the pins or cross-bars G with each other, in substantially the manner herein shown and described, for forming ice rapidly by silently dividing a small stream of flowing water while exposed to the air, as set forth.

160,602. CULTIVATORS. P. F. Landphere Mason, (Mervin P. O.,) Ill., assignor to himself and Dolson Jones, same place. [Filed Jan. 18, 1875.]

Brief.—The machine, as shown, is intended to cultivate both sides of two rows of plants. The frame is longitudinally sectional, and a portion may be removed, making a single-row cultivator; or, if provided with two extra wheels and spindles, two single-row cultivators are produced. Improved draft and steerer devices.

1. The combination of the two tongues C, the cross-bars F, connected by the bars *f'*, braces *f''*, and stay-bolt *f'''*, the two axles H connected together by the block *h'*, bar or plate *h''*, braces *h'''*, and stay-bolt *h''''*, the crank-axle arms J, and the wheels J, to adapt the machine for use as a three-horse two-row cultivator, or as one or two two-horse single-row cultivators, substantially as herein shown and described.

2. The combination of the pivoted draft-bars K, the rods or chains L, the guide-pulleys M, and the steerer N, with the cross-bars F and the axles H, substantially as herein shown and described.

3. The combination of the cross-bar C, having its end parts carved or arched with the two pairs of beams A, substantially as herein shown and described.

160,603. UMBRELLA-HANDLES. Ephraim Layman, Brooklyn, E. D., N. Y., assignor to Layman & Ankner, same place. [Filed Dec. 22, 1874.]

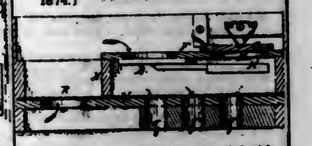
Brief.—The sections, united by the concealed screw, have an annular groove upon one end, into which passes a cylinder upon the end of the next section, which prevents their being turned.

1. The handle made of the sections *a b*, united by the internal concealed screw *c*, and provided with a socket at one end, as set forth.

2. A handle having the short cylinder *d* inserted at one end into a circular groove in the sections *a b*, and at the other end entering a similar groove in the next length, in combination with the connecting-screw *c*, as set forth.

160,604.

160,605.

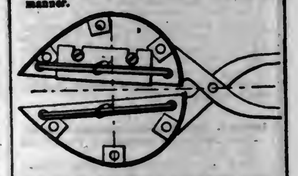


160,606. RUBBER-DAM TRENCH-WEIGHTS. Theodore G. Lewis, Buffalo, N. Y., assignor to the Buffalo Dental Manufacturing Company, same place. [Filed Nov. 16, 1874.]

Brief.—The usual rubber dam is held down in place by a bell and chain with pointed hook for catching into the rubber.

In combination with a rubber dam, the weight B, hook C, chain C, and pointed hook D, all as and for the purposes described.

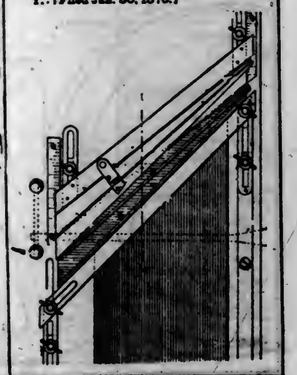
160,607. REED-ORGAN TREMOLOS. John R. Lomas, New Haven, Conn., assignor to B. Shoninger, same place. [Filed Nov. 23, 1874.]



1. An air-tight tremolo-box, provided with a horizontal partition, F, on one side of which is a tremolo-valve, E, and on the other a relief-valve, D, substantially as described.

2. The wire-screen R, or its equivalent, in combination with the air-passages of a reed-instrument, substantially as and for the purposes described.

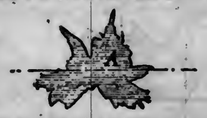
3. In an air-tight tremolo-box a secondary or minor box, adapted to inclose a tremolo-valve, E, by means of the partitions N and F, or their equivalents, acting in combination with the sides of the larger box.



160,608. CHINCH-BUG GATHERERS. B. H. March, Osage Mission, Kans. [Filed Jan. 23, 1875.]

Brief.—This instrument is not unlike the old-fashioned candle-snuffer, with open top armed with supporting-wires. The bugs, when captured, may be destroyed in any convenient manner.

In combination with a pair of box-shears, the frames C C, arranged substantially in the manner and for the purpose set forth.



160,607. APPARATUS FOR CUTTING GOODS ON BIAS. Salomon Mayer, New York, N. Y. [Filed Jan. 30, 1875.]

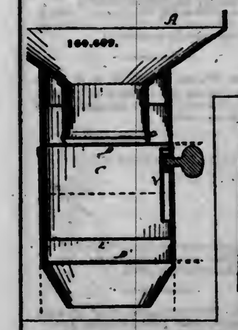
1. An apparatus for cutting goods on bias, composed of a supporting-table, with one or more slots arranged on different bias angles, an adjustable treadle-operated clamp-piece, and adjustable gage-pieces corresponding to the angle of the slots, the whole being constructed and operated substantially as and for the purpose set forth.

2. The combination, with the adjustable base gage-piece, of one or more detachable gage-pieces, corresponding to the angles of the different slots in the table, for setting the goods to any required bias, as specified.

160,608. MANUFACTURE OF SHEET-WAX FOR FLOWERS. Mary Jane McColl, Hoboken, N. J. [Filed Jan. 4, 1875.]

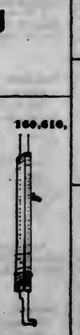
1. The process herein described of producing, for the manufacture of artificial flowers, sheet-wax with different patterns of leaves or other designs, of uniform thickness with the surrounding parts, consisting, essentially, in first cutting out the patterns or leaves from cakes of wax of suitable colors, embedding the same into heated cakes of different colors, and then cutting the combined cakes performed, when cool, into thin sheets, substantially as and for the purpose described.

2. As a new article of manufacture, sheet-wax having embodied therein wax-patterns of leaves or other designs, differing in color from the surrounding parts or body, but of uniform thickness with the same, substantially as and for the purpose set forth.



3. Sheet-wax provided with wax-patterns of leaves or other designs, as hereinbefore described and claimed, and having an additional backing or lining of sheet-wax, substantially as set forth.

160,609. DRY-MEASURES. D. M. Mefford, Toledo, Ohio, assignor to American Invention Company. [Filed Feb. 8, 1875.]

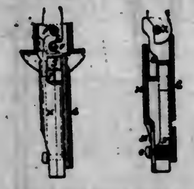


1. In a measuring-can, the shield V, substantially as and for the purposes specified.

2. The measuring-can A, provided with cylinders C and E, valves D and D', shield V, and notted thumb-screw T, substantially as and for the purposes specified.

160,609.

160,610.



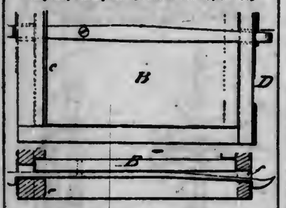
160,610. WATCH-CASE SPRINGS. Jules Meneguy, Brooklyn, N. Y. [Filed Jan. 18, 1875.]

Brief.—A watch-case spring adjustable in a groove in the case-rim.

The watch-case spring, made of uniform thickness, or thereabout, throughout its entire length, in combination with a portion, A, of the case-rim, having the dovetail groove in the inner face of the spring, and being split, as at C, and provided with the clamping-screw, substantially as specified.

160,611. SEED-DROPPERS. E. M. Morgan, Belleville, Ill., assignor to Henry Rentchler, same place. [Filed Oct. 3, 1874.]

Brief.—A seed piston made in two parts, for adjusting the size of the seed-cups, is worked vertically through the bottom of the hopper. These parts are held in position by a bolt passed through the slot in one half and screwed into the other. To the under side of the hopper are attached chambers having chutes discharging toward each other, to secure a uniform line of seed.

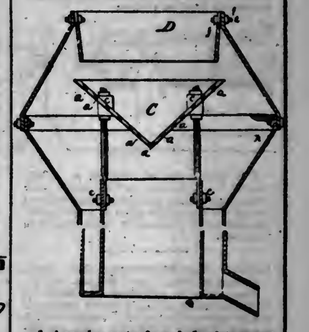


1. A grain-hopper piston, made in two sections, O H, having guides Q, nut N, and slot M to enable them to be clamped by a screw-bolt, O, at different points of adjustment, and thus regulate the size of seed-apertures.

2. The combination, with the piston, of the seed-cup, having grooves T and recess U, as and for the purpose set forth.

3. A seed-cup, having chutes V, discharging toward each other, one below the other, and placed on opposite sides of aperture, as and for the purpose described.

160,612. WAGON END-GATES. Samuel C. Myers, Pana, Ill. [Filed Feb. 13, 1875.]



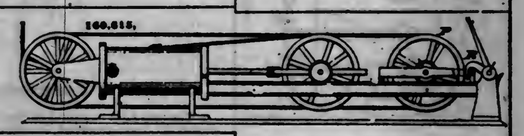
The wagon end-gate B, provided with lateral spring-bar with end catches *b* and *f*, in combination with the recessed side board and guide-strips *e*, the recessed hinged gate D, and the opposite side board, substantially as specified.

160,613. GRAIN-SEPARATORS. Henry Pearce, Cincinnati, Ohio, assignor to Lane & Bodley, same place. [Filed Feb. 23, 1875.]

Brief.—The winding-rope is passed around sheaves—one series stationary, two traveling; one of the last adapted, by a hook-shaft at the end of the ways on which the sheave-carriages run, to be interchangeable with the former function.

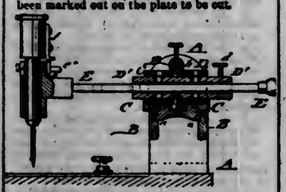
In the described combination with travelers permanently connected with a motor, one or more separable travelers, P, capable of being detached and detained to a stationary position at the will of the operator by means of hooks R, or their equivalent, substantially as and for the purpose set forth.

160,614. SPARK-ARRESTERS FOR LOCOMOTIVES. Chas. S. Osborn and Edwd. Osborn, Newton, N. J. [Filed Sept. 22, 1874.]



1. A spark-arrester formed of a plate or cast metal screen, D, and inverted cone C, when provided with the peculiar perforations *a*, substantially as herein set forth and described.

2. The tapering screen D, provided with the tapering perforations *a* and the bolts *e* and nuts *f f*, operating in slots in the stack and screen as a means of adjustment in the mouth of a smoke-stack, substantially as herein described, and for the purpose set forth.



3. The construction and arrangement of the enlarged upper part of the smoke-stack, when provided with the bolts *g* and nuts h, operating in slots, substantially as shown, and for the purpose set forth.

160,615.

160,612. STENCIL-CUTTERS. P. L. O'Brien, New York, N. Y. [Filed Dec. 28, 1874.]

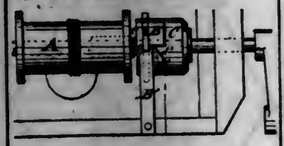
Brief.—The cutter is operated by hand, and made to follow the design which has already been marked out on the plate to be cut.

1. A stencil-cutter constructed of a main or supporting frame, A B, sliding casing C, with pivoted cutter-arm, carrying part D D', adjustable cutter-arm E, and weighted cutter-standard F, having one or two knives attached thereto, the whole to be operated substantially in the manner and for the purpose specified.

2. The sliding frame C, with interior pivoted casing or part D, having diametrically extending guide-recess, in combination with the cutter-carrying arm E, being adjustable by means of set-screws, in such a manner that the cutter arm may be moved in straight, curved, and circular lines, as required for cutting out the pattern, as specified.

3. The weighted cutter-standard F, being guided in the sleeve-shaped end of cutter arm E, and having adjustable shoulder-plate *f*, in combination with the pivoted cam *e* of the cutter-arm, for being raised or lowered within a fixed distance, substantially as and for the purpose specified.

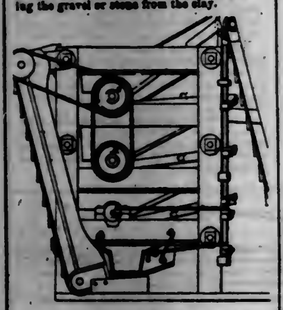
160,616. HINGES FOR SAFE-DOORS, &c. Walter B. Perry, New York, N. Y., assignor of one-half his right to D. W. Thomson, New Haven, Conn. [Filed Jan. 27, 1875.]



160,616.

The combination, with a sash or other door and its jambs, of a gear or gears and one or more rack-bars, the one being secured to the jambs, and the other to the door, to withdraw the door from its seat, as set forth.

160,617. WINDLASSES. Fletcher S. Rowland, Chaplin, Ky. [Filed Aug. 10, 1874.]



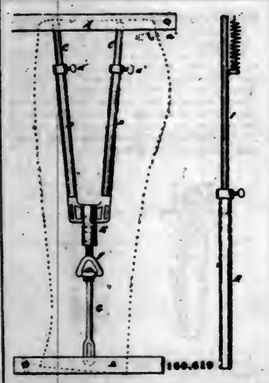
Brief.—The drum shaft terminates at one end in a sleeve-piece working inside another sleeve-piece on the inner end of the winch-shaft. This last piece connects with a corresponding piece, loose on the drum-shaft, but pressed into gear by a spiral spring. When the weight is to descend, a partial back revolution of the winch presses the spring-sleeve against the drum as a brake.

The combination of windlass A, sliding ratchet-box B, pivoted pawl b', clutch C, and friction-spring c, for producing brake action of the ratchet-box on the drum or windlass during descent of platform or other weight, as described.

160,618. CLAY-PULVERIZERS. Daniel Brady, Circleville, Ohio. [Filed Feb. 24, 1875.]

Brief.—Clay is pulverized by means of rollers revolving within a hopper having an elastic bottom, after which it passes through a series of sieves of different mesh, separating the gravel or stone from the clay.

1. The pulverizing-rollers B, in combination with springs or elastic bed for supporting the clay, substantially as set forth.



2. The series of sieves B, in combination with the sieves C, for separating successively the largest and then the smaller stones and the gravel substantially as set forth.

160,619. PANTALOONS-STRETCHERS. John D. Ryan, New York, N. Y. [Filed Sept. 30, 1874.]

1. The combination of the extension-rods C, tubes D, screw-socket E, swiveled screw F, and rod G, with the clamps A B, substantially as herein shown and described.

2. The combination of the extension-rod I and tube H, with the clamps A B, substantially as herein shown and described.

3. The combination, in a pantaloons-stretcher, of the spring J, and the extension-rod and its tube, said spring being arranged substantially as described, to operate in the manner set forth.

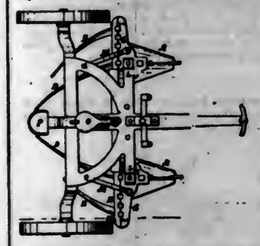
1. The turn-table C, pivoted in the center of platform B, and supported by rollers c, in combination with the weight or counter-balance l, substantially as shown.

2. The combination of the spring t, lever u, and the ratcheted lever s with the cylinder D and wheel W, substantially as described.

3. The combination of the slats 2, blocks 1, rods 3, having right-and-left-handed screws and nuts, substantially as shown.

4. In a wind-wheel without a vane, the wheel W, placed at an angle, so that it will never squarely face the wind, in combination with a spring or weight for returning it to position after having been turned sidewise by the wind, substantially as shown.

5. In a windmill, the combination of a derrick or supporting-frame and a turn-table having a cylinder that supports the wheel placed out beyond the edge of the derrick, whereby the wheel is made to revolve over the center of the derrick, substantially as shown.



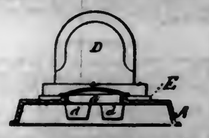
6. The turn-table C, revolving around the center of the derrick, in combination with the cylinder D, provided with stops 5, arm 4, with a cord, substantially as described.

160,620. WINDMILLS. Peter Shockley and Harrison W. Bolender, Orangeville, Ill. [Filed Feb. 4, 1875.]

Brief.—A self-regulating wheel made in sections, and supported upon a cylinder mounted upon a turn-table, rotating around the center of a platform on the top of a suitable frame or derrick. The shaft to which the wheel is attached is slightly turned to one side, so as not to be perpendicularly over the platform. There is no vane, and a spring attached to the turn-table serves to bring the wheel back into the wind after the force that has carried it out of the wind has ceased to operate.

160,621. CORRUGATED HORSE-HOE AND PLOWS. Albt. D. Simons, Windsor, Conn. [Filed Jan. 26, 1875.]

Brief.—Shovel-plows and hoe-blades curved inward, suspended beneath and in front of the axle, held down to their work by springs, and the whole raised and held above the ground by a lever.



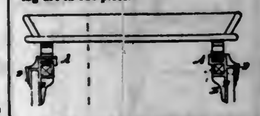
1. The arched beam C, having horizontal arms B, in combination with the guide-clamps G, plows A, and hoe-blades D, substantially herein described.

2. The arched beams C, with the plows and hoes attached as described, and the guide-clamps G, in combination with the arched support J, rods L braces M, and stude N, substantially as shown and described.

3. The combination of cultivators A D, arched beam C, lever O, and spring-catch P with the truck-frame and tongue, substantially as set forth.

160,622. GRAVE-COVERS AND MONUMENTS. Robert H. Sipes, Everett, Pa. [Filed Feb. 13, 1875.]

Brief.—Metallic plates are placed beneath the marble stones, to prevent discoloration of the same.



1. In a tombstone, the combination of a metallic plate, E, with a marble head or foot stone and a cast-iron grave-cover, A, substantially as and for the purpose specified.

2. In a grave-cover, the recessed parts d, adapted to protect pins e from the moisture of the soil, substantially as specified.

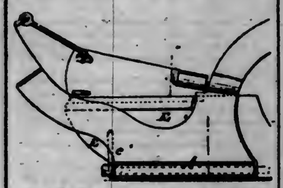
160,623. WAGON-SEATS. W. H. H. Shellbaker, Chicago, Ill. [Filed Aug. 7, 1874.]

Brief.—The seat-support and spring-bearing are in one piece.

A spring-bearing bracket composed of the bearing A and arms D, cast in one piece, as and for the purposes specified.

160,624. TILTING CHAIRS. C. F. Spencer, Cleveland, Ohio. [Filed Feb. 20, 1875.]

Brief.—The slotted frames attached to the seat move on the rollers attached to the leg-frame, and the chair can be tilted or inclined either forward or backward as pleasure.



The frame B, having the vertical arms provided with rollers b, in combination with the frames A, having the curved slots in which the rollers operate, and the flanges a for securing them to the chair-seat, substantially as and for the purpose described.

160,625.

160,626. SIDE-HILL PLOWS. C. H. Stratton, Moorestown, Pa. [Filed Dec. 19, 1874.]

Brief.—The mold-board proper turns beneath the land-side. A wing pivoted to the beam turns above, and forms on either side the upper section of the mold-boards.

In hill-side plows, a mold-board, made in two longitudinal reversely-tapered sections, E F, as shown, the former turning under and the latter over the land-side, as and for the purpose specified.

160,627. PRESSES. Chas. S. Swan, Tomaree, DE. [Filed Oct. 17, 1874.]

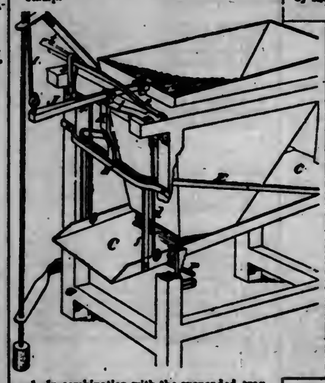
Brief.—The hay is compressed to some extent in the beater-case. It then passes into a horizontal press-case, where it is acted upon by a follower worked by toggle-jointed bars, which complete the pressing.

1. The combination of a beater case, C, and beater H with the press A B, substantially as specified.

2. The combination of the block L, pawl O, catch P, and spring R with the rope M and the drum K, substantially as specified.

3. The combination of the lever T with the sweep J and shaft I, the sweep is also employed to turn the drums E F, substantially as specified.

4. The part W of the beater-case, having a removable front, X, and arranged on pivots Y, for dumping the hay into case B, substantially as specified.



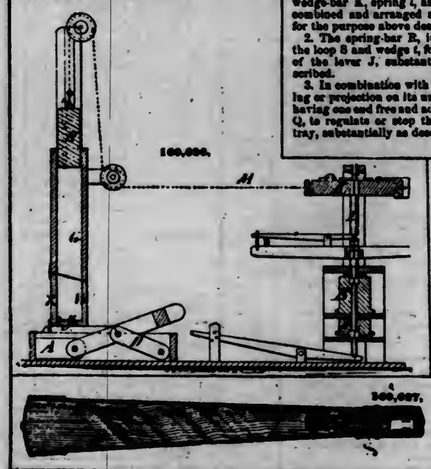
160,628. HANDLES FOR UMBRELLAS, PARASOLS, &c. Geo. W. Tucker, Waterbury, Conn., assignor to American Ring Company, same place. [Filed Feb. 2, 1875.]

1. As a new article of manufacture, the handle for umbrellas, parasols, or whips, made of crystallized tin-plate varnished in imitation of pearl, substantially as and for the purposes set forth.

2. A handle for umbrellas, parasols, or whips, made of a tube of crystallized tin-plate, varnished in imitation of pearl, and retained upon a wooden stock or stick by the metallic tip cap e and bead f, substantially as set forth.

160,629. ORE-PENDERS. James Tullock, Sonora, Cal. [Filed Oct. 10, 1874.]

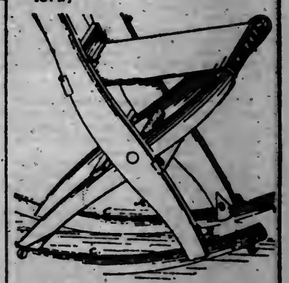
Brief.—When the stamp descends the tappet pushes down the link, lever, and wedge. This wedge enters between the fixed bar and the U shaped bar, the ends of which are attached to the further part of the table, and thrusts the latter back. The wedge is lifted by a spring, when the table is returned by a spring until stopped by the bar. The ore is thus jolted from the hopper and fed to the stamp.



1. In combination with the suspended tray C, with its U-shaped bar E, supported at its front end by standards f, and the fixed horizontal bar N, the lever J, with its depending wedge-bar K, spring l, and tappet-rod L, all combined and arranged substantially as and for the purpose above described.

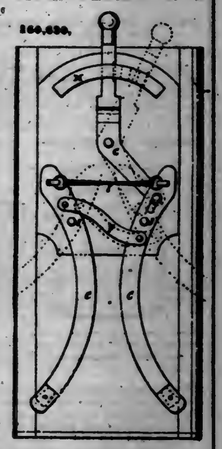
2. The spring-bar E, in combination with the loop S and wedge t, for regulating the lift of the lever J, substantially as above described.

3. In combination with the tray C, having a lug or projection on its under side, the bar P, having one end free and adjusted by the wedge Q, to regulate or stop the movement of the tray, substantially as described.



160,630.

160,631.



160,632. FOLDING ROCKING-CHAIRS. Geo. O. Wellman, Salem, Mass. [Filed Sept. 7, 1874.]

In a folding-chair, the combination and arrangement of the folding rocker C, pivoted to the standard A, and secured at the front end by the hook E.

160,633.

160,634. POCKET-BOOK SAFETY ATTACHMENTS. Edwin G. Wheeler, Winona, Minn. [Filed Jan. 4, 1875.]

Brief.—The projecting arms prevent the withdrawal of the book from the pocket.

1. The combination of the arms C, connecting-bar F, and lever G with a pocket-book, constructed and arranged substantially as specified.

2. The combination and arrangement of spring I, arms C, connecting-bar F, and lever G, substantially as specified.

3. The combination of arms C, connecting-bar F, lever G, and ratchet-bar H, substantially as specified.

4. The combination of arms C, connecting-bar F, lever G, ratchet-bar H, and the base-plate B, substantially as specified.

160,635. SEED-BOXES. Geo. B. Wheeler, New York, N. Y. [Filed Dec. 8, 1874.]

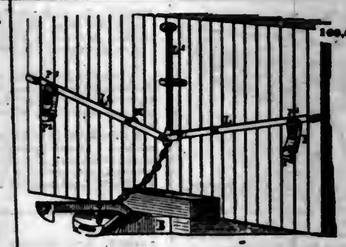
The combination, with the perforated cover B of the spice or dredge box A, having the headed pin b', of the plate C, made imperforate, and provided with the key-shaped slot c, as shown and described.

160,629. EARTH-AUGERS. Elisha Whitney, Marysville, Cal. [Filed Feb. 20, 1875.]

Brief.—The cutting portion is formed of a single flat bifurcated piece of metal, having the points curved in opposite directions. A spring-hinged reamer is located to the side of the cylinder. The shaft-coupling is a square socket and shank, held in place by a spring-pin.

1. The auger-bit composed of the single flat piece of metal H, bifurcated and having the bifurcations pointed and curved divergingly, to form the knives I I, in combination with the hollow cylinder A, as set forth.

2. The reamer C, composed of a quadrilateral section of a hollow cylinder, sharpened at one edge, and hinged at the other by a spring-hinge, D, to the interior of the hollow cylinder A, and having its cutting-edge projecting from the rectangular opening B, substantially as and for the purposes hereinbefore set forth.

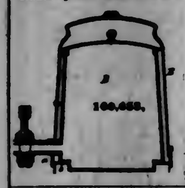


3. The bit-stock J, having its socket K provided with the hole L, in combination with the lateral spring M, provided with the pin N, substantially as set forth.

4. An earth-auger composed of the hollow cylinder A, having the reamer C secured to the interior thereof by the spring-hinge D projecting from the rectangular opening B, the bit-tube G, auger-bit E I I, and the bit-shaft H, constructed and operating as and for the purposes hereinbefore set forth.

160,629.

160,630.



160,631.

160,632. COFFEE-URNS. Horace C. Wilcox, West Meriden, Conn. [Filed Feb. 11, 1874.]

The base a, constructed with a seat, b, and the inner vessel B, provided with a faucet, D, and fitted to the mild cast b, combined with the removable cans E, constructed with its top closed and bottom open, so as to set over said inner vessel and rest upon said base, substantially as herein set forth.

160,632.

160,633.

160,634. STUD-FASTENINGS. Sallé Escherias, San Francisco, Cal. [Filed Dec. 10, 1874.]

The button A, constructed with the shank b and concentric disks f and f, the latter centrally pivoted on said shank, the rotating sleeve a, spring c, and notched rim, substantially as described.

160,635. CAR-COUPLINGS. David L. Adams, Buffalo, N. Y. [Filed Aug. 8, 1874.]

1. The draw-head B, having the horizontal link-aperture D within, and the inclined catch-plate C, with the pin-hole E, above the buffer-surface O', the inclined catch-plate extending transversely across, and projecting over, the sides of the draw-head B, (one of the same being reduced in width below the apex of the inclined catch-plate C,) and engaging with the hook F, pivoted within lugs F' on the top of the draw-head B, all combined substantially in the manner and for the purpose set forth.

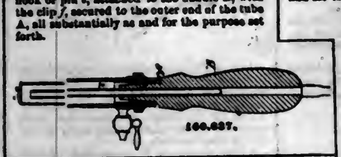
2. The combination, with the levers L L', supported upon studs N, with capability of vertical and horizontal movement, and the rod L², also capable of horizontal and vertical motion, of the stops F, provided with catches F', all constructed to operate substantially as and for the purposes described.

3. The draw-head B, with the inclined catch-plate or shoulder O on a level with or projecting above, and extending transversely across and projecting over, one or both of the side plates or walls of the draw-head B, and having lugs F', for supporting the pivot of the hook F, formed above the draw-head B, substantially as and for the purpose described.

160,636. CUFF-HOLDERS. Henry B. Adams, New York, N. Y. [Filed June 26, 1874.]

Brief.—Secures the cuff in position with respect to the sleeve of the coat or dress.

The cuff-holder consisting of the spring-arms A and disk B, constructed and arranged substantially as described and shown, and for the purpose set forth.



160,636.

160,637. CURLING-IRONS. Jas. M. Baxter, Camden, N. J., assignor of one-half his right to J. D. Oppenheimer, Philadelphia, Pa. [Filed Feb. 11, 1875.]

1. In a curling-iron, the tube A, closed at its outer end and provided with a waste-cock, d, in combination with a detachable handle, B, adapted to the inner end of the said tube A, and provided with a pipe, e, all substantially as and for the purpose set forth.

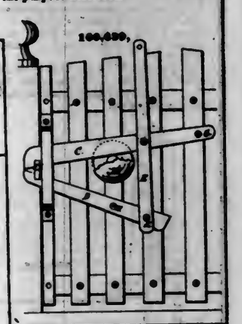
2. The combination, in a curling-iron, of the hook or pin e, attached to the handle B, with the clip f, secured to the outer end of the tube A, all substantially as and for the purpose set forth.

160,637.

160,638. LATHES FOR TURNING IRREGULAR FORMS. Jos. Beaudry, Ottawa, Canada, assignor of one-half his right to T. G. Courcelles, same place. [Filed Dec. 3, 1874.]

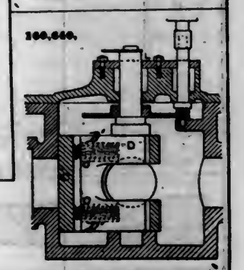
Brief.—An automatically-acting back-rest sustains the material while under the action of the revolving cutters.

1. The expansible support or rest consisting of the disk d, having the sliding arms c' mounted thereon, and the disk e, provided with studs which enter slots in the arms, as shown and described.



2. In combination with the rotary frame, provided with the rotary centers or arbors e, having ratchet-wheels m attached, one or more dogs, n, attached to the main frame, and operating as described to turn the blanks and present their different faces to the cutter automatically.

3. The knives or cutters, provided with lips p', substantially as and for the purpose described.



4. In combination with the main frame A and the rotating frame C, the frame H, provided with the adjustable bar r and adjustable pointer s, substantially as and for the purpose described.

160,640. VALVES FOR STREET WATER-MAINS. John Bird, Jersey City, N. J. [Filed Oct. 20, 1874.]

The combination, with the intersecting branches of a street water-main, of the valve-stem D, having the lateral arms D' D', provided with recesses a in their outer ends, the loose segmental valve having the rectangular vertical opening, in which the valve-stem works, and the springs O, arranged in the recesses in the arms of the valve-stem, and pressing the valve outwardly, substantially as and for the object specified.

160,641. OPERA-CHAIRS. George W. Borel, Philadelphia, Pa., assignor to Robt. Wood, same place. [Filed Mar. 13, 1875.]

A chair in which a tilting seat, D, having two pins at each edge, is combined with two frames, each having a horizontal or slightly-inclined slot, m, and a slot, n, inclined downward and forward, and forming an acute angle with the slot m, said angle having its opening toward the front of the chair, all substantially as set forth.

160,642. WHEELS FOR VEHICLES. J. H. Bloy Boykin, Gadsden, Tenn. [Filed Feb. 3, 1875.]

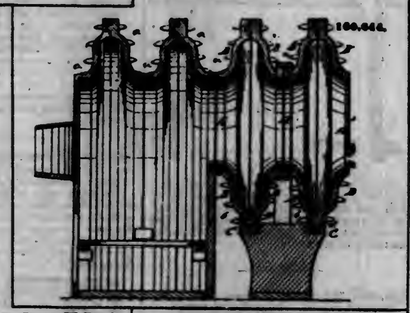
1. The combination, with the separate hub ends c c, of a box, b, provided with ribs or bars f, of less length than the said box, and to fit into grooves g in the hub ends, substantially as and for the purpose described.

2. The combination, in a wheel having separate hub ends c c, and a frame of spokes, of a box, b, having ribs f, to pass through notches h in the bearing ends of the spokes, and into the grooved hub ends, whereby the box is fastened alike with the spoke-frame and the hub ends, as described.

160,643. CHAIR-SEATS. Chas. Brown, New York, N. Y. [Filed Feb. 19, 1875.]

Brief.—The wood veneer and woven fibrous material are coated with glue and pieced together, with the wire-cloth between them. The three layers are then submitted to pressure sufficient to press the woven fibrous material through the interstices of the wire, and cause it to adhere to the wood.

A fabric for seats and backs of chairs and other articles, composed of wood veneer, wire-cloth, and woven fibrous material in combination, substantially as shown and described.



160,644. HOT-AIR FURNACES. W. Burrows, Brooklyn, N. Y. [Filed Feb. 18, 1875.]

Brief.—To furnish much radiating-surface.

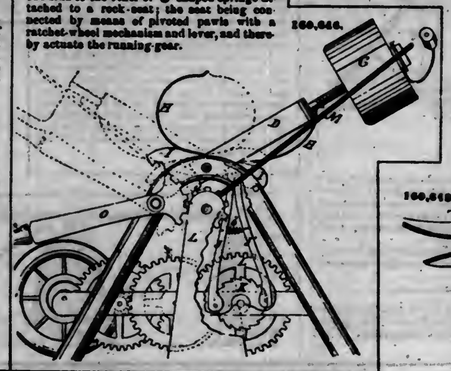
1. The combination, in a furnace, of the rear sections, each having hub A, projections a, and concave flanges forming the open spaces between the flanges, all substantially as and for the purpose set forth.

2. The combination of the rear furnace-sections, each consisting of the hub A, concave flanges B, and the rims C C, having projections a, grooves b, and beads d, all substantially as and for the purpose set forth.

160,644.

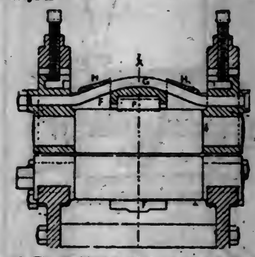
160,645. HOES. Jas. N. Burton, Warnerville, Ga. [Filed July 20, 1874.]

Brief.—The eye of the hoe and flange to which the blade is attached are in one piece, and the flange is provided with a groove to receive the upper edge of the blade, which fits into it upon both sides, and is held by a single rivet at the lower end of the flange.



The combination of the swell D and shield C with a groove between the parts, and connected to the eye B with the hoe-blade A, having a V-shaped notch, a, and fitted between the two parts D and C, substantially as and for the purposes set forth.

160,646. MOTORS. John M. Cowen, Franklin, Tenn. [Filed Feb. 23, 1875.]

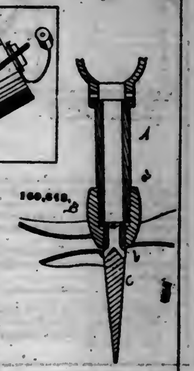


Brief.—A weight is attached to a pivoted support, which is intermittently shifted from one side to the other of C-shaped springs attached to a rock-seat; the seat being connected by means of pivoted pawls with a ratchet-wheel mechanism and lever, and thereby actuate the running-gear.

160,646.

160,647. METAL-BENDING MACHINES. J. C. Chapman, Passaic, N. J. [Filed Sept. 28, 1874.]

Brief.—Bending-rolls supported at their centers, to give stiffness, by saddles having friction-rolls, the saddles being stayed or supported by tension-rod G and supplemental stays H



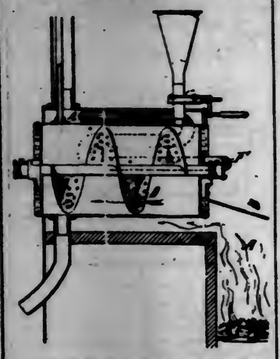
1. The combination of the support or saddle F, having friction-rolls F' and rod G, with the frame of a metal-bending machine, to support the bending rolls, as described, and for the purposes set forth.

2. The combination, with the supports or saddles F, having friction-rolls, the truss-rod G, and the frame of a metal-bending machine, of the supplemental stays E, substantially as and for the purpose described.

160,648. EARTH-AUGERS. Frederick J. Clarke, Mount Pleasant, Iowa. [Filed Feb. 20, 1875.]

Brief.—The point and hollow shaft are both detachable, and screw into a hub, so as to lock each other. The air-openings terminate just behind the flanges, and are protected thereby from entrance of dirt. The locking arrangement enables these holes to be accurately adjusted to the correct position.

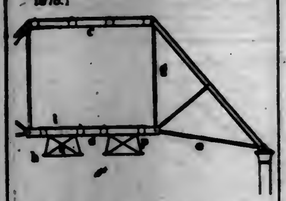
160,648.



1. The detachable point C, screwing into the chuck or hub B, and the hollow shaft A, screwing into the same chuck, so as to lock each other, in combination with said chuck and cross-bar b, substantially as and for the purposes set forth.

2. The combination and arrangement of the hollow shaft A, detachable point C, provided with openings *a' a'*, which are protected by flanges *c c*, and the cross-bar *b* of the auger-blades, substantially as shown and described.

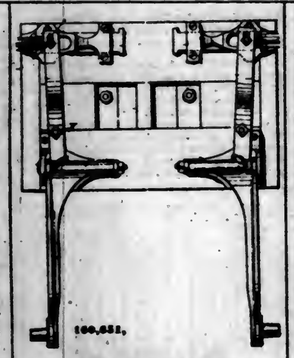
160,649. ORE-ROASTING FURNACES. Jacob H Clark, Philadelphia, Pa., assignor to G. Sturges and Jacob H. Clark, same place. [Filed July 2, 1874.]



Brief.—An ore-roaster, heated externally by the fire, has heated air forced into it through a pipe coiled around the retort, so as to be exposed to the fire. A perforated screw-conveyor provided with teeth stirs up the ore, and conveys it from the hopper end of the retort to the discharge-pipe *f*, the perforations permitting the heated air to pass readily through the retort and oxidize the sulphur, &c. A pipe passing up the stack conveys the fumes from the retort to suitable condensers.

1. A desulphurizing apparatus in which are combined a furnace, A, a retort, B, arranged within the said furnace and containing a screw-conveyor, D, and a pipe, F, coiled around the retort within the furnace, and from which a blast of hot air is forced into and through the said retort, all substantially as specified.

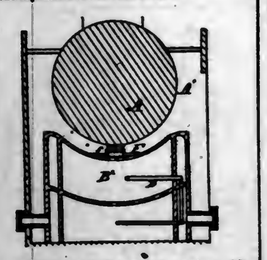
2. The screw-conveyor D, constructed substantially as described, with perforations *t* and projections or points *u*, for the purpose specified.



160,650. ELEVATED RAILWAYS. John B. Cornell, New York, N. Y. [Filed Feb. 3, 1875.]

1. In elevated railways, the truss formed of the inclined struts *b*, the horizontal compression member *c*, tie-rod *c d e*, and suspension-rods *g*, the suspension-rods *g* being far enough apart, in effect of the passage of railway-trains between them.

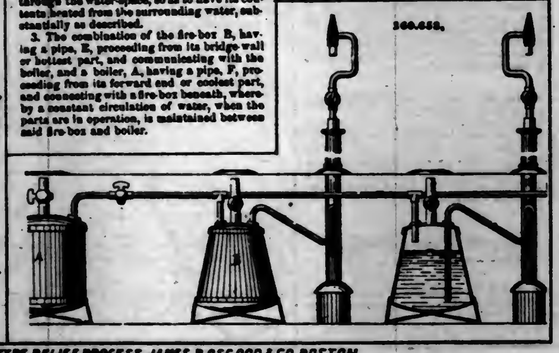
2. The rails A, suspended from the longitudinal supporting-girders *l* by the suspension-bars *p*.



160,651. SHIFTING SEATS FOR CARRIAGES. John F. Cost, Bellefontaine, Ohio, assignor to Miller Brothers, same place. [Filed Nov. 21, 1874.]

As an improvement in convertible carriages, a shifting front seat, attached by hinged front legs, and provided with rear legs, which can be advanced and retracted instantaneously by the elevation and depression of the seat, substantially as set forth.

160,652. WATER FIRE-BOXES. J. De Bolt, Philadelphia, Pa. [Filed Nov. 7, 1874.]



Brief.—A cast-iron water fire-box in one piece is provided with feed-water pipes, by which means the water is heated before entering the boiler. Circulation is kept up by pipes from the rear of the boiler to the rear of the fire-box, and the front of the boiler to the top and front of the fire-box.

1. The water fire-box, cast in one piece, with open front and hollow, stay-bolted or webbed side and bridge walls, and made independent of the boiler, substantially as and for the purpose set forth.

2. In combination with the water fire-box, having hollow walls for the reception of water from the boiler, the feed-pipe D passing through the water-space, so as to have its contents heated from the surrounding water, substantially as described.

3. The combination of the fire-box B, having a pipe, E, proceeding from its bridge-wall or hottest part, and communicating with the boiler, and a boiler, A, having a pipe, F, proceeding from its forward end or coolest part, and connecting with a fire-box beneath, whereby a constant circulation of water, when the parts are in operation, is maintained between said fire-box and boiler.

160,653. APPARATUS FOR SUPPLYING OIL TO LAMPS. Richard V. de Ostrom, Jersey City, N. J. [Filed Aug. 13, 1874.]

Brief.—A separate reservoir for holding compressed air in reserve has communications with a series of oil-cisterns which have outlets to burners. The air, when turned on from time to time, presses and holds the oil up to the burners. Improvement on Patent No. 140,515, July 15, 1873.

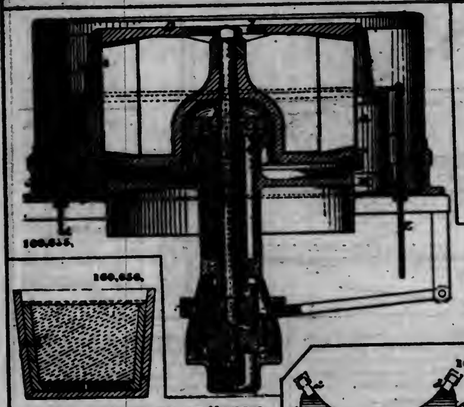
The combination, with a street-lamp post having a burner, of one or more oil-cisterns having discharge-pipes emanating from the oil-space of the same, and leading to the burner or burners, said cistern or cisterns being connected by an air-supply pipe having a stop-cock, said pipe extending from an air-chamber for holding compressed air located at a suitable distance from the cistern or cisterns, the compressed air being reasonable at will from its chamber into the oil cistern or cisterns, and serving to force the liquid oil to the burner or burners, substantially as described.

160,654. PRINTERS' GALLEYS. Alex. T. De Puy, New York, N. Y., assignor to R. Hoe & Co., same place. [Filed Mar. 2, 1874.]

Brief.—A tube of metal with two of its sides right angular, having a core of wood, is used for making the rails of galleys, triangular parts being cut from the inner side of the tube, leaving the outer edge uncut, and the tube then bent to form the corners, the joint being covered by the uncut metal.

A printer's galley, the metallic rail of which is formed of a continuous tube mitered and bent at its corner, substantially as described, and for the purpose set forth.

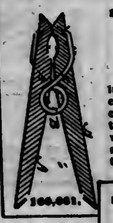
160,655. CENTRIFUGAL SUGAR-MACHINES. John O. Donner, New York, N. Y. [Filed Oct. 2, 1874.]



Brief.—The revolving basket containing the sugar-molds has an outer curtain, to pass any liquid down its interior surface. The green sirup and the white cleansing liquor are each passed into separate gutters, successively and at pleasure. Rotating radial wings within the basket draw air into and expel it from the basket through its contents.

1. The combination, with the revolving basket or perforated cylinder, of externally-arranged inner and outer gutters, and a partition separating them, essentially as and for the purposes herein set forth.

2. The movable partition or cam F, having guides L, and constructed to rise and fall, in combination with the inner and outer gutters J H and the revolving basket or perforated cylinder A, substantially as specified.

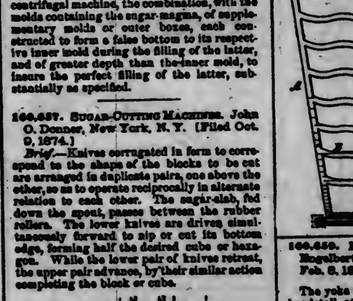


3. The combination, with the revolving basket or perforated cylinder A, of the shield or curtain E, substantially as specified.

160,655.

160,645.

160,656.



160,661.

160,656. APPARATUS FOR THE MANUFACTURE OF HARD SUGAR. John O. Donner, New York, N. Y. [Filed Sept. 15, 1874.]

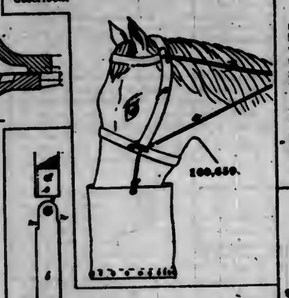
In the manufacture of hard sugar by the centrifugal machine, the combination, with the molds containing the sugar-magma, of supplementary molds or outer boxes, each constructed to form a false bottom to its respective inner mold during the filling of the latter, and of greater depth than the inner mold, to insure the perfect filling of the latter, substantially as specified.

160,657. SUGAR-CUTTING MACHINES. John O. Donner, New York, N. Y. [Filed Oct. 9, 1874.]

Brief.—Knives corrugated in form to correspond to the shape of the blocks to be cut are arranged in duplicate pairs, one above the other, so as to operate reciprocally in alternate relation to each other. The sugar-slab, fed down the spout, passes between the rubber rollers. The lower knives are driven simultaneously forward to nip or cut its bottom edge, forming half the desired cube or hexagon. While the lower pair of knives retreat, the upper pair advance, by their similar action completing the block or cube.

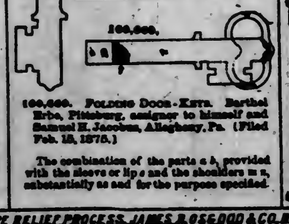
The combination of duplicate sets or pairs of knives, arranged the one pair above the other for alternate operation on the sugar slab, as described, and with the cutting-edges of the knives formed by corrugations, having sloping sides and shaped to correspond with the cubes or block to be cut, essentially as herein set forth.

160,658. SHIRT-BOSOM SUPPORTERS. Jas. S. Edmunds, Princeton, Ky. [Filed Feb. 23, 1875.]



Brief.—An adjustable shirt-bosom supporter.

1. A shirt-bosom supporter consisting of elastic longitudinal metallic strips A A' A, connected by ribs B and plates C D, constructed in the manner and for the purpose described.



2. In combination with a shirt-bosom supporter, constructed as described, the buttons *d' e* on the under side, and the cord *d'*, as and for the purpose set forth.

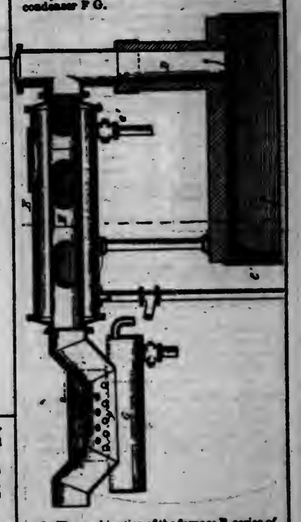
3. The nets *a' a' a'* on the middle strip A', as and for the purpose specified.

4. The projections *d* on the ends of the plates C D, to fit into metallic or other pockets of the shirt, as and for the purpose described.

160,659.

160,660.

160,660. FOLDING DOOR-KEYS. Barthel Erbe, Pittsburg, assignor to himself and Samuel E. Jacobus, Allegheny, Pa. [Filed Feb. 15, 1875.]

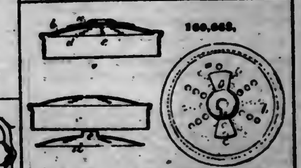


The combination of the parts *a A*, provided with the sleeve or lip *c* and the shoulders *m n*, substantially as and for the purpose specified.

160,661. CLOTHES-PINS. Geo. K. Farrington and Bradford S. Potter, Bloomington, Ill.; said Farrington assignor to said Potter. [Filed Dec. 14, 1874.]

The combination, with the clamps *A A*, having inclined slots *x x* and grooves *d d*, of the coiled spring B, forming the fulcrum for the clamps, and having its ends crossed and extending through the slots *x x*, the tips of the wire being bent and pointed to catch into notches formed on the exterior front portion of the clamps, all substantially as set forth.

160,662. METALLURGIC FURNACES. John Fair, San Francisco, Cal. [Filed Dec. 16, 1874.]



Brief.—The fumes pass from the furnace into the air-chambers; thence to the tortuous condenser, kept cool by its water-jacket, and finally beneath the concave sprinkler of the condenser F G.

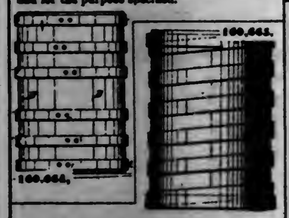
1. The combination of the furnace B, series of air-chambers C, and the condenser E, having induction and eduction pipes, and communicated with the air-chambers by a flue, D, substantially as described, for condensing and separating the volatilized precious metals, as set forth.

2. In combination with the condenser E, the condenser F, consisting of a semi-annular chamber, perforated on the under side, and supported over a receiving-trough, G, for the purpose of condensing the mercurial vapors by subjecting the same to a shower of cold water, substantially as described.

160,663. DREDGING-BUCKETS. Jos S Field, Brooklyn, N. Y. [Filed Dec. 22, 1874.]

160,663.

1. The perforated cover *b* of the dredging or spice box, provided with a central hole receiving an open projection, *c*, that is bent up from the sheet metal of the turning plate *d*, which projection is bent over the sheet metal of the cover to attach the turning plate thereto, substantially as set forth.



2. The spice-box having a perforated cover and a turning plate to open and close said perforations, and provided with a button, *n*, which is set into and soldered to the edges of the opening in the turning plate *d*, substantially as set forth.

160,664. BARRELS. Henry M. Fitzhugh, Bay City, Mich. (Filed Jan. 16, 1875.)

Brief.—The barrel is formed without bilge, and compressed at the time the hoops are applied, the ends of the hoops being fastened together and to the barrel by screws.

1. The combination, with heads D D, of straight staves E and constricted bands C C or set between the ends of a barrel, as and for the purpose described.

2. The combination, with a barrel, of a head, B, having overlapping ends fastened to the barrel by a screw extending into the wood, as and for the purpose specified.

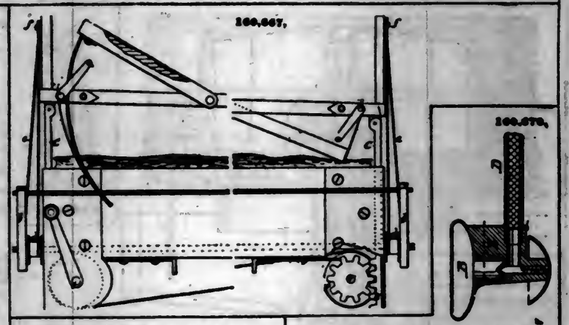
160,665. BARRELS. Henry M. Fitzhugh, Bay City, Mich. (Filed Oct. 10, 1874.)

Brief.—The barrel is formed without bilge, compressed, and then surrounded by a hoop, which passes spirally from end to end.

The described combination, with two heads of staves having straight as well as parallel sides, and a spiral band, in the manner and for the purpose set forth.

160,666. HATS AND CAPS. P. Goldmann, New York, N. Y. (Filed Feb. 19, 1875.)

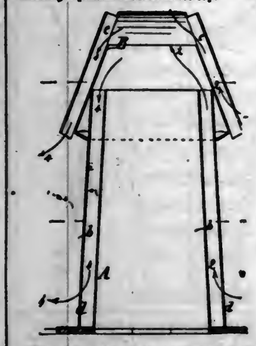
Brief.—Covers the "insignia" attached to the chin-strap of a cap by a spring-slide and hook, the latter being attached to the strap proper.



The combination, with the band B, of a spring-slide, *c*, a stiffening-strip, *e*, a retaining device, *h*, and a sleeve, *g*, for concealing the end of the spring-slide when the same is drawn out, all constructed and operating substantially as shown and described.

160,667. INVALID-BEDSTEADS. Jas. Goodwin, Lennoxville, Canada. (Filed Feb. 2, 1875.)

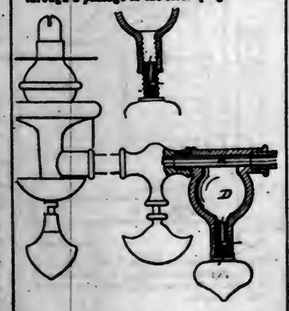
1. The combination of a tick-stretching frame, D, with the elevating-posts C, connected by means of joints or hinges, for the purpose of changing the inclination of the entire frame, substantially as described.



2. The combination, with an invalid-bed, of two radial arms at the head and foot of the bed, and a rod connecting the ends of the same, and adapted to be placed in the bed of the sheet, so that when actuated with a rotary motion the patient is turned from one side of the bed to the other, substantially as described.

3. The combination of a shaft, *a*, arms *b*, connecting-rod *g*, pulleys *d* and *f*, and cords *c*, for the purpose of operating a sheet attached to the rod *g*, substantially as described.

160,668. CHIMNEY-CAPS. James Gorton, New York, N. Y. (Filed Dec. 17, 1874.)

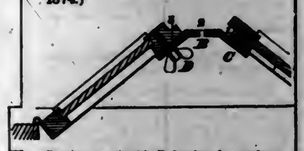


Brief.—The outer air-passages are designed to increase the draft of the central flue by creating a partial vacuum at its top.

The central flue A, having upon its sides independent or separated lateral flues *b*, each having at its lower end an opening, *d*, in combination with the top B, consisting of two truncated pyramids, having the separated air-chambers *e e*, substantially as described, whereby currents of air are induced up and down the lateral flues or passages and the air-channels, in the manner herein described.

160,669. VAPOR-BURNERS. Allen F. Gray, Boston, Mass., assignor to himself and S. S. Gray, same place. (Filed Oct. 20, 1874.)

Brief.—A single piece of wire, looped in the middle, is attached as a spring-fastener centrally to the lower edge of the blind, its free ends engaging alternately with suitable pins or catches on the window-sill and side of the house; either end of the spring serving as a handle to manipulate the device, the whole of which is covered up and concealed when the blind or shutter is closed.

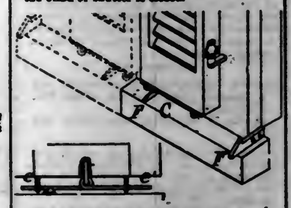


The water-trap D, in combination with a vapor-burner, all substantially as and for the purpose described.

160,670. VAPOR-BURNERS. S. S. Gray, Boston, Mass., assignor to himself and Allen F. Gray, same place. (Filed Oct. 20, 1874.)

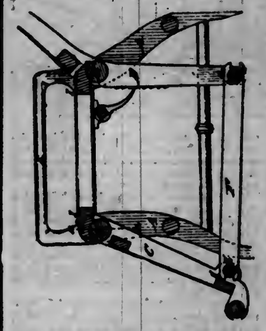
Brief.—A wing-connection between the cup and the tube for conducting heat.

The combination, with the cup B and feed-tube D, of the wing E, connecting the cup and tube, substantially as and for the purpose described.



160,671. SHUTTER-BOWERS. Jos. B. Hand, New York, N. Y., assignor to himself and S. Lockwood, same place. (Filed Oct. 12, 1874.)

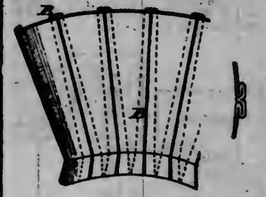
The bar or shackle B, having flat surfaces 1 2 3 at different angles on its back, and a perforation and notches, 4 5 6, formed in its respective portions corresponding with the flat surfaces, and countersunk, as described, in combination with wood-screws C D, for pivoting and fastening the shackle, the fastening-screw D having a thumb-head, by which to manipulate it, substantially as and for the purposes herein set forth.



160,672. SHUTTER AND BLIND FASTENERS. Chas. B. Haynes, Worcester, Mass. (Filed Dec. 30, 1874.)

Brief.—A single piece of wire, looped in the middle, is attached as a spring-fastener centrally to the lower edge of the blind, its free ends engaging alternately with suitable pins or catches on the window-sill and side of the house; either end of the spring serving as a handle to manipulate the device, the whole of which is covered up and concealed when the blind or shutter is closed.

The blind-fastener described, consisting of the wire spring C, looped in the middle and secured at that point to the lower edge of the blind, and having free ends *e e* engaging with the catches F and F', one of which holds the blind closed, and the other open, when constructed, arranged, and operating substantially in the manner described and shown, for the purpose set forth.

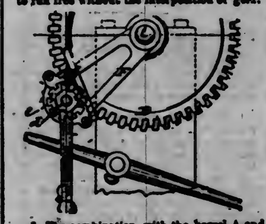


160,673. RECLINING-CHAIRS. Nathan E. Hill, Cincinnati, Ohio, assignor to John K. Coolidge, Nathan E. Hill, and E. C. Coolidge, same place. (Filed Sept. 10, 1874.)

The combination, in a reclining-chair, of the front and rear fixed rounds E E', connecting the side frames A, the back D, and the foot-piece C, pivoted directly upon the tenons of the fixed rounds, the removable seat I, having front and rear grooved rails fitting the rounds, and disconnected from the back and foot-piece, and the rods F, having slotted ends embracing the lower rounds of the back and foot-piece, all substantially as shown and described.

160,674. SHEET-METAL BUCKETS. C. Hoff, Cincinnati, Ohio. (Filed Jan. 13, 1875.)

Brief.—The body of the vessel is strengthened and shaped by flattened folds.

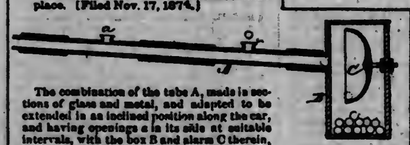


1. The lapped bucket-body B, formed from a rectangular piece of sheet metal, in the manner set forth.

2. The ribbed and flattened fold or lap *b b' b''*, substantially as and for the purpose set forth.

160,675. WINDLASSES. Martin G. Imbush, Brooklyn, N. Y. (Filed Feb. 4, 1875.)

Brief.—The windlass-barrel is operated by differential gear upon the barrel, and pinions carried upon a revolving yoke. By means of the loose pinion, sleeve, and catch the gear can be released from the barrel, permitting it to run free without the interposition of gear.

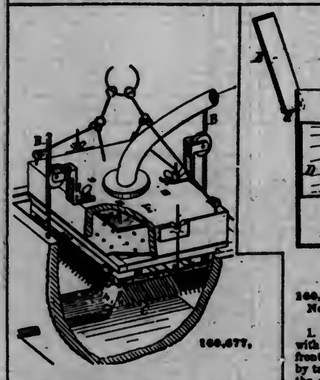


1. The combination, with the barrel A and its shaft or axle C, of the revolving yoke F, the shaft *d*, the pinions *e f*, the wheel D, fast on the barrel-shaft, and the fixed wheel or circular rack E concentric therewith, substantially as specified.

2. The combination of the loose sleeve *e* on the shaft *d*, the stop or catch *h*, for connecting the sleeve with said shaft, the revolving yoke F, the pinions *e f*, the rotating wheel D, the fixed wheel or circular rack E, and the barrel A, essentially as described.

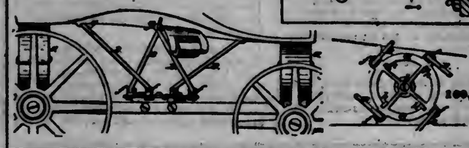
3. The stop or catch *h*, in combination with the revolving yoke F, loose on the barrel-shaft C, the shaft *d*, the pinion *f*, the fixed wheel or circular rack E, and the wheel D, with which the catch locks, substantially as specified.

160,676. FARE-BOXES. Charles G. Imley, Philadelphia, Pa., assignor to the American Car-Fare-Register Company, same place. (Filed Nov. 17, 1874.)



The combination of the tube A, made in sections of glass and metal, and adapted to be extended in an inclined position along the car, and having openings *a* in its side at suitable intervals, with the box B and alarm C therein, so that as balls are dropped into the openings they will gravitate to the box and sound the alarm, all substantially as set forth.

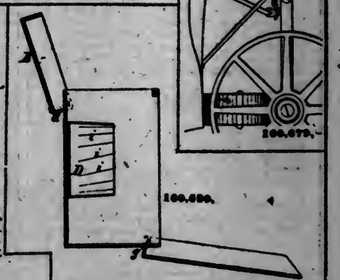
160,677. METHODS AND APPARATUS FOR DYEING WOOL ON SHEEP-SKINS. Alex. Jack, Barnet, Vt. (Filed Dec. 11, 1874.)



Brief.—The sheep-skin is attached, at its edges, to the under surface of an air-chamber, for the purpose of keeping it cool in the act of dyeing the wool. Air is received through the top of the chamber upon a distributing-plate; then passes through a perforated plate down onto the skin. The air-chamber is provided on the outside with brackets and rollers, which run on guide-rods fixed to the sides of the dye-vat, and is thus kept in a horizontal position, and the wool is evenly dyed.

1. An air-chamber, F, constructed and operating substantially as described, in combination with a dye-vat, A, for dying wool on the skins, as herein specified.

2. The combination of guide-brackets and pulleys H H on the air-chamber, with guide-rods B B on the vat, substantially as and for the purpose herein specified.



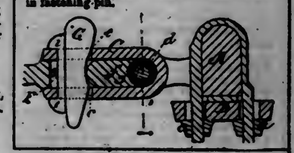
160,678. VEHICLE-SPRING EQUALIZERS. N. Jackson, Higginsville, N. Y. (Filed Sept. 9, 1874.)

The equalizing device for vehicles, consisting of the reach wheel or disk *c*, having a metal bearing-bed and stay-guides A, and the oblique rods B, connecting the latter with the body for joint action with the springs, substantially as set forth.

160,679. VEHICLE-FENDERS. N. Jackson, Higginsville, N. Y. (Filed Jan. 20, 1875.)

The combination of the body of the vehicle, the downwardly-projecting bracket *c*, and the roller *d*, to protect both the body of the vehicle and the equalizing device, as set forth.

160,680. HAT-BOXES. Gustav L. Jaeger, New York, N. Y. (Filed Dec. 17, 1874.)



1. A box provided with a hinged cover and with a drop-front, both the cover and the drop-front being connected to the body of the box by tapes or other devices extending through the sides of the body, and through the side flanges of the cover and of the drop-front, substantially as shown and described.

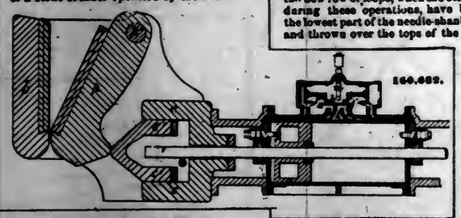
2. The combination, with the body of a box, of the top or cover B, hinged to the box, and having the rear flanges *d* cut away, so that the top or cover can be opened and support itself in such position, substantially as described.

3. The combination, with a box, of a cylinder, D, secured in the interior of the box, and constructed with a series of incisions or slits, *i*, substantially as described, whereby the said cylinder is adapted to receive and hold articles of different sizes and shapes, as set forth.

160,681. TRILL-COUPLINGS. Edwin Jarrell, Thorntown, Ind. (Filed Feb. 20, 1875.)

Brief.—Locked by elasticity of the rubber collar forcing head of thill-iron against recess in fastening-pin.

1. In a thill-coupling, the locking wedge-key G and the key F, having lugs i, in combination with the coupling-strap C and shaft E, substantially as specified.

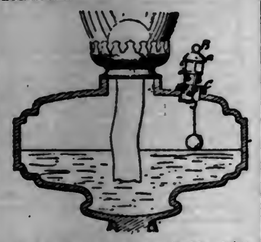


2. The combination, with the key F and locking-key G, of the rubber sleeve or spring d, substantially as and for the purpose set forth.

3. The shaft E, having slot g, the coupling-strap C, having slots e, keys F G, bolt c, and its encircling rubber d, combined substantially as specified.

160,682. APPARATUS FOR CRUSHING STONE. Saml. Henry Johnson, Stratford, England. [Filed Feb. 17, 1875.]

Brief.—As piston approaches hydraulic cylinder the plunger on the piston-rod enters hydraulic cylinder and forces water against the ram, which presses forward the pivoted crushing-jaw. Whenever there is excessive pressure, water escapes through weighted valve. Each loss of water is rectified on the return of the piston by suction from an outer water-tank through S, which is covered by a valve opening inward. Piston may loosely ride its rod between stops, when, moving a little sooner than the rod and plunger, a sudden blow instead of gradual pressure is injected. Pivoted jaw may be returned by a spring.

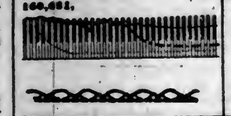


The combination, substantially as hereinbefore set forth, of a steam-piston, a plunger directly connected therewith, a hydraulic cylinder in which the plunger works, a ram also working in said cylinder, and the movable jaw of a stone-breaker operated by the ram

160,682.

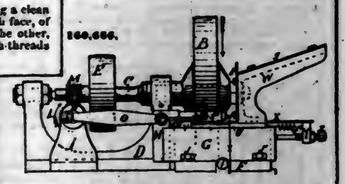
160,683. LAMPS. Frederic Kampfe, New York, N. Y. [Filed Oct. 1, 1874.]

Brief.—In case the lamp be upset, the valve is held in position by the bent arm of the pendulum, thus preventing outflow of oil. Should an explosion of the gases within the bowl take place, the yielding weight of the pendulum-bob permits the valve to be forced from its seat.



1. The valve B, having the shoulder *f* and spring-arms *h*, constructed with inclined shoulders *e*, in combination with the pendulum E, having at its upper end a hook, *h*, for engaging with the shoulder *f* on the valve should the lamp upset, substantially as and for the object specified.

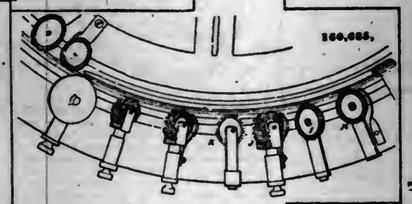
2. The valve B, constructed with the flanged head or cap *a*, rings *c d*, and the spring-arms *h*, having the inclined shoulders *e*, in combination with the tube C, having the valve-seat *c'*, substantially as and for the purpose described.



160,684. KNIT FABRICS. John Kent, New York, and Henry Lesson, Locust Valley, N. Y.; said Lesson assignor to said Kent. [Filed Nov. 3, 1874.]

An improved knitted fabric having a clean knitted face on one side, and a plush face, of similar or of different material, on the other, and in which no portion of the plush-threads appear on the knitted face thereof.

160,684.



160,685.

160,685. KNITTING-MACHINES. John Kent, New York, and Henry Lesson, Locust Valley, N. Y.; said Lesson assignor to said Kent. [Filed Nov. 3, 1874.]

Brief.—The "plush-looping wheel" lays a thread to form plush or fleece behind two needles, and in front of one as the cylinder revolves, and the next wheel presses it down below the points of the beards. An ordinary loop-wheel then presents another or binding thread to and under the beards of the needles, and the "plush-blending" wheel, which is a combined landing, knocking-over, and presser wheel, closes the needle-beards, and brings up the first or plush thread, and throws it over the tops of the needles, freeing it entirely therefrom, and connecting it with the binding-thread, which remains looped upon the needles. The main knitting-thread is then introduced, and, being manipulated in the ordinary way, forms, together with the binding-thread, the new row of loops, when the old ones (which, during these operations, have been kept at the lowest part of the needle-shanks) are raised and thrown over the tops of the needles.

The combination of the plush-looping wheel H, plush-blending wheel K, and wheels I and J, each constructed and arranged to operate as described, with an ordinary circular-frame knitting-machine, substantially as and for the purposes herein specified.

160,686. MACHINES FOR BEVELING THE EYES OF NEEDLES-BLANKS. Saml. C. Kingman, Bridgeport, Conn. [Filed Feb. 9, 1875.]

Brief.—Pivoted to the reciprocating slide G is a lever, which carries a bar the under surface of which is covered with leather. As the slide moves forward it carries with it, against the action of a spiral spring, another slide, X. As G retreats, X is thrown forward by its spring, and forces one blank from the hopper under the leather-covered bar, by which it is carried forward past the emery-wheel, being, in consequence of the friction of the leather-covered surface, revolved during its transit.

1. In combination with the revolving grinding-wheel B, spindle C, endless screw M, worm-wheel L, shaft K, crank N, and connecting-rod O, the angle-block H, reciprocating slide G, stud *d*, pivoted lever P, spring T, friction-bar Q, slide-bearing F, and stationary plate U, all constructed, arranged, and operated for the purpose of revolving the hereinbefore-described wire blanks and presenting the ends of the same to the face of said revolving grinding-wheel, substantially as and in the manner and for the object set forth.

2. In combination with the reciprocating slide G, angle-block H, stud *d*, pivoted lever P, friction-bar Q, and stationary plate U, the hopper W, reciprocating plate X, spring *e*, block Y, and screw Z, all constructed, arranged, and operated for the purpose of receiving and supplying blanks for and to the plate U, substantially as and in the manner and for the object set forth.

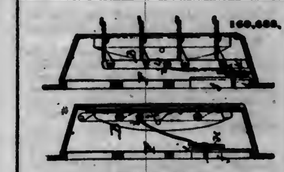
3. The combination of the hopper W, reciprocating plate X, block Y, spring *e*, screw Z, plate U, bearing F, reciprocating slide G, angle-block H, pivoted lever P, swinging bar Q, friction-surface leather R, spring T, screw S, connecting-rod O, crank N, shaft K, bearing I, bearing J, worm-wheel L, endless screw M, spindle C, bearing D, pulley E, with the revolving grinding-wheel B, all constructed, arranged, and operated substantially as and for the purpose specified.

160,687. WASH-BASINS. John H. Kinsman, Salem, Mass., and Friend W. Smith, Bridgeport, Conn. [Filed Jan. 26, 1875.]

Brief.—The stopper is connected by a chain with a weight underneath the stand, the chain passing through a hole in the stand, so that when the stopper is removed from the aperture in the basin the weight will pull it to one side out of the way.

The combination, with a wash-stand or basin having a waste-pipe leading from its bottom, of the plug or stopper D, chain *a*, passing through an aperture in the stand, and a weight, E, fastened to the lower end of the chain, substantially as and for the purposes herein set forth.

160,688. AIR-REGISTERS. Geo. Lawrence, Williamsburg, Brooklyn, N. Y. [Filed Dec. 28, 1874.]



Brief.—The curved ends of the strap act as springs to hold the fans at any desired angle between an open and closed position.

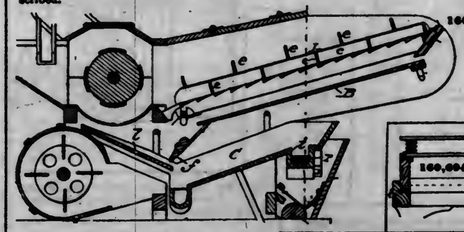
1. The combination, with the fans C and grating F, of the slide G, the buckle H, and the connecting bar or strap J, formed with the spring or elastic branches *j j*, substantially as and for the purpose shown and described.

2. The plates B, formed with the arch-shaped notches *b*, in combination with the straight-edged flanges *a a'* of the fan-frame, substantially as shown and described.

3. The flanges *a*, beveled or inclined downward toward the outer sides of the frame, in combination with the notched plates B and the pivots *c* of the fans, substantially as and for the purposes shown and described.

160,689.

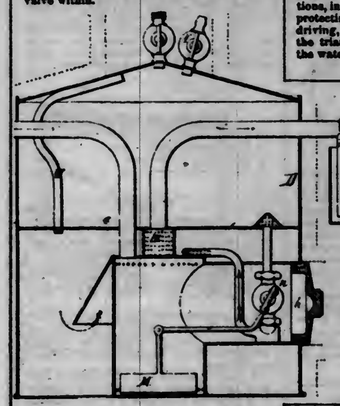
160,689. GRAIN TREASURERS AND SEPARATORS. David Lippy, Mansfield, Ohio, assignor to John S. Hymyer, same place. [Filed July 20, 1874.]



Brief.—A sheet-metal strip covers the upper edge of the rake-bars, and also forms teeth thereon. The chute-boards and delivery-spout have special clearing devices.

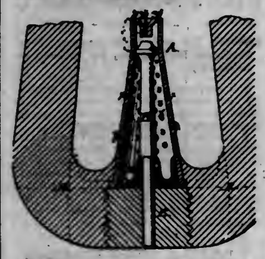
1. The bars *c*, having secured to their upper edges the metal strips I, bent at intervals to form the teeth *c*, substantially as described.

2. The wing *f*, arranged to rotate in the space between the ends of the delivery-boards E and *i*, for the purpose of preventing the material from becoming clogged, substantially as described.



3. The notched board *r*, pivoted at its rear end in the spout *i*, attached to the shoe C, with its opposite end connected to and operated by the incline *m*, substantially as shown and described.

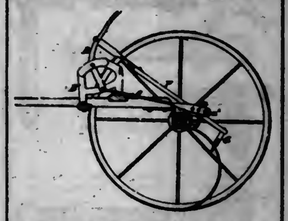
160,689.



160,690. CARBURETTERS. Jos. F. Lockwood and Geo. E. Lockwood, Philadelphia, Pa. [Filed Jan. 15, 1875.]

Brief.—A detachable plug is secured to the side of the case, to afford easy access to the valve within.

The combination, in the carburetor, of the chamber G, the branch G' of the same, extending to the casing D, and closed by a detachable plug, h, the valve-chest *e* contained within said branch, and the float M connected to the valve of the chest, all as set forth.

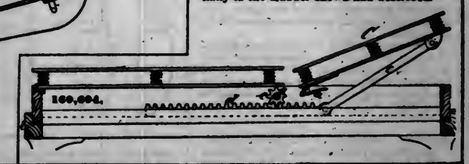


160,691. CHAMBERS OF FIRE-ARMS AND ORDNANCE. Thomas Mac Nell, Brooklyn, N. Y. [Filed Feb. 6, 1875.]

The combination of the perforated air-chamber A, and a firing device, B, constructed to ignite the charge at the extreme front end of the air-chamber, and prevent the fire from passing back into the same, substantially for the purposes herein set forth.

160,692. HORSE HAY-RAKES. Benj. Mellinger, Mount Pleasant, Pa. [Filed Dec. 16, 1874.]

Brief.—Devices whereby the rake-head and closer are operated simultaneously, and the rake-teeth securely held in working position.



The devices for operating the rake, consisting of the frame B', having stop-hook C, bent lever E, connecting-rod A, bifurcated at the end, and provided with adjusting-holes *a'*, the branched rods F, and cleaner G, all combined and arranged substantially as and for the purpose described.

160,693. INVALID BEDSTEADS. J. Michel, New York, N. Y. [Filed Dec. 24, 1874.]

The combination of hooks or straps *a*, studs *b*, hinged braces *c*, and sliding rack-bars *d*, with the head-piece C of a bed or mattress, and with the frame A supporting said mattress, all constructed and operating substantially in the manner shown and described.

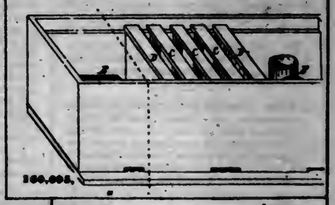
160,694.

160,694. DRIVE-WELL STRAINERS. W. C. Macomber, Minneapolis, Minn., assignor, by mesne assignments, to the Minneapolis Manufacturing Company, same place. [Filed Mar. 11, 1873.]

Brief.—The guards are formed in a triangular or V shape, and suited to the tube so that they extend directly over the perforations, in such a manner that while effectually protecting the wire-gauze in the process of driving, the rapidly-receding lines or sides of the triangular guards afford ready access of the water to the perforations.

160,695.

The triangular or V-shaped guards *F F*, constructed and applied substantially as described, for better protecting the wire-gauze covering the slots in the well-tube, and permitting a free ingress of water to the tube, as set forth.

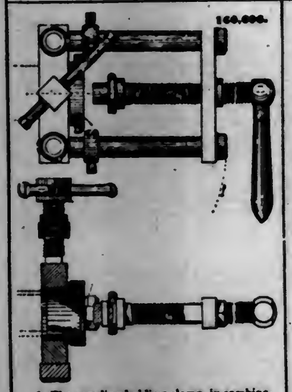


160,695. BEE-HIVES. Nelson C. Mitchell, Indianapolis, Ind. [Filed Feb. 26, 1875.]

Brief.—Formed of movable comb-frames, having air-tight partitions, which may be raised from the bottom of the hive by means of lugs, to allow passage-way for bees to pass under perforated sliding platforms situated at the bottom of the hive, upon which are placed jars, honey-boxes, or other receptacles for surplus honey.

1. The herein-described bee-hive, consisting of the comb-frames C, partitions D, provided with the rubber or woolen strip *b* and legs *a*, sliding platforms *c*, and boxes and jars E, when the several parts are arranged to operate substantially as herein described, and for the purpose set forth.

2. In a bee-hive constructed as herein described, the partition D, provided with the woolen or rubber strip *b* and legs *a*, substantially as and for the purpose set forth.



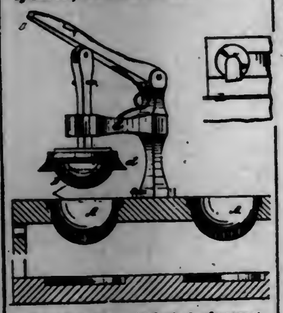
160,695.

160,696. ATTACHING HOSE TO HOSE-COUPLINGS. Andrew J. Morse, Boston, Mass. [Filed Feb. 6, 1875.]

Brief.—In order to attach the hose to the coupling-ring, a metal tube is placed inside the hose, and expanded to clamp the hose between said tube and ring.

160,696.

1. The coupling-holding clamp, in combination with a movable expanding-disk, and a supporting-frame for the screw or shaft of the expanding-disk, the expander being adapted to move through or into the inner ring of the coupling, substantially as described.



2. The combination, with the clamp, of the pivoted links and screw-bar to support and adjust the shaft or screw of the expanding device, substantially as described.

3. The combination, with the clamps, of links and adjustable gripes for holding the coupling against end movement, substantially as described.

4. The combination, with the clamp adapted to receive and hold the tubular binding-ring *p*, and the clamping-ring *s*, to center and hold the inner ring *r*, of the shaft or screw, and the loose expanding disk or ring, substantially as described.

160,697. LEMON-PRESSER. H. Newberger, Fort Wayne, Ind. [Filed Nov. 16, 1874.]

Brief.—The squeezer is provided with a circumjacent curtain, to prevent the juice flying up and out, and to exclude dust.

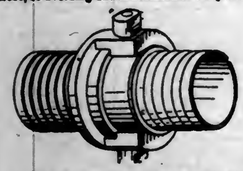
The combination, with basin A, of a squeezer, D, provided with circumjacent flexible curtain *d*, as and for the purpose specified.

160,698. CLOTHES-SPRINKLER. W. Olson, Sacramento, Cal. [Filed June 20, 1874.]

Brief.—Within an elastic cylinder, having a tapering tube and a perforated nozzle, is a coil-spring having a plate attached thereto at each end, to force the cylinder out into its proper form after it has been compressed.

160,699.

The interior coil-spring G and plates H H, in combination with the elastic cylinder A, tapering tube D, and sprinkler E, substantially as and for the purposes herein set forth.



160,699. BOILER-TUBE EXPANDERS. Orestes Fagan, Philadelphia, Pa. [Filed Dec. 26, 1874.]

1. The mandrel B of a boiler-tube-expanding tool, made in two parts, *b* and *b'*, so as to permit the removal of the smooth from the threaded part, for the purpose specified.

2. A screw-threaded mandrel, B, of a boiler-expanding tube, having its smooth part connected with the threaded part, so that while the latter is held in engagement with the body, said smooth part is free to revolve, so as to present a rolling friction-surface for the rollers, substantially as shown and described.

160,700. HOSE-COUPLINGS. Wm. Painter, Baltimore, Md. [Filed Dec. 22, 1874.]

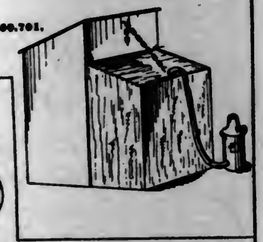
Brief.—A semi-annular flange and recess on one part receives a terminal flange on the other part. A locking-finger eccentrically pivoted in a rotating ping in the receiving part applies to the rear face of the terminal flange on the entering part, moving and bearing in a line parallel to the direction of the hose, so avoiding undue abrasion of the parts.

1. In a hose-coupling the members of which are connected and disconnected by a lateral movement thereof, the combination, with the receiving member, of locking-fingers, arranged to move to and from the rear surface of the flange of the entering member in lines practically at right angles to said surface, substantially as described, whereby undue abrasion of the flange and locking-finger at their points of contact is obviated, as specified.

2. The combination of the wrench-ping and finger, mounted on a spindle eccentrically located in the wrench-ping, substantially as described.

3. The combination, with the wrench-ping and finger, of the cam-block, substantially as described.

160,701. APPARATUS FOR REMOVAL OF NIGHT-SOIL. Wm. Painter, Baltimore, Md. [Filed Dec. 22, 1874.]



Brief.—A canvas screen is attached to the outer wall of the privy, inclosing the door. A charcoal deodorizer consumes the offensive gases evolved during the operation of removal, or they are passed into a conductor to rise above the building. Said conductor contains a disinfectant.

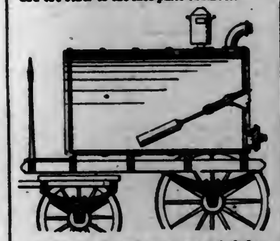
1. A portable stench-screen for use in the operation of removing night-soil and other offensive matter from privies, &c., composed of inclosing walls and a roof, and provided with devices for sustaining the same closely adjacent to the outer wall of a privy, substantially as described, whereby the workmen and transit-receptacles are wholly inclosed during the transfer of the offensive matter, as set forth.

2. The combination, with a portable stench-screen, of a stench-conductor, substantially as described, whereby the offensive vapors incident to the removal of night-soil and other matter may be prevented from creating a nuisance, as set forth.

3. The combination of a portable stench-screen, a stench-conductor, and a deodorizing apparatus, substantially as described.

160,701.

160,702.



160,702. DISCHARGE-GATES FOR NIGHT-SOIL TANKS. Wm. Painter, Baltimore, Md. [Filed Dec. 22, 1874.]

The combination, with a flanged neck, of a gate-plate hinged thereto on a pintle, which is in a line at right angles to the plane of the opening at the mouth of the neck, a swinging-hook clamp, and a clamping-screw, substantially as described.

160,703. MEASURING-INDICATORS FOR NIGHT-SOIL TANKS. Wm. Painter, Baltimore, Md. [Filed Dec. 22, 1874.]

Brief.—A tight joint is made between the tank and the lever by means of a flexible tube, one end of which is secured to the lever, and the other to the face-plate chamber.

1. A measuring-indicator composed of a face-plate chamber, an indicating-lever, a float, and an elastic tubular connection for securing the lever to the neck of the chamber, substantially as described.

2. The combination of an indicating float-lever and face-plate with a ball-hook arranged to engage with the outer end of the indicating-lever and maintain the float in an elevated position, substantially as described.

3. The combination, with a vibrating float-lever, of an elastic tube, which serves as a packed flexible joint-connection, substantially as described.

160,704. FOOT-PIPES FOR SUCTION-HOSE. Wm. Painter, Baltimore, Md. [Filed Dec. 22, 1874.]

A curved foot-pipe provided with a cleaning-surface, substantially as described, whereby a cleaner may be readily thrust across the induction-aperture, and the foot-pipe readily cleared of extraneous matter, as set forth.

160,704.

160,705.

160,705. IMPLEMENTS FOR BINDING GRAIN. William A. Patterson, Juniata County, Pa. [Filed Nov. 5, 1874.]

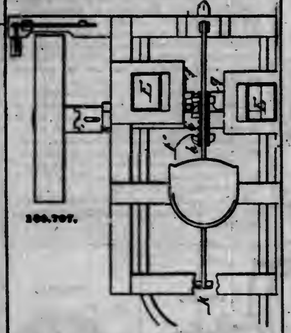
Brief.—The cord or band, previously prepared, is caught in a slot in the lever, and the opposite end passed over the lever, and by it forced down, so as to make the two ends of said band meet.

1. The lever A, having mortise *a* and slot *a'*, and band *a''*, and pin-hole *a'''*, as and for the purpose described and shown.

2. The lever A, in combination with the pin B, which has the hole *b* in the head, and looped cord *b'*, secured in the hole, as and for the purpose described and shown.

160,706. WASHING-MACHINES. Thos. Patterson, Princeton, Ill., assignor to himself and Enos G. Matson, same place. [Filed Aug. 28, 1874.]

Brief.—A series of funnel-shaped cups with cross-bars at their openings are secured to a frame of radial bars that are swiveled to an operating-standard

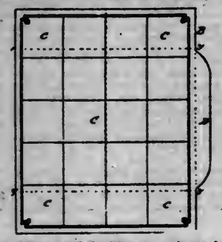


The swiveled pounding-head C, carrying a number of dirt-expellers B B, the latter being constructed of funnel shape, air-tight, and with cross-bars I I, as herein shown and described, for the purposes set forth.

160,707. SEED-PLANTERS. Herbert B. Pennypacker, Phoenixville, Pa. [Filed Dec. 10, 1874.]

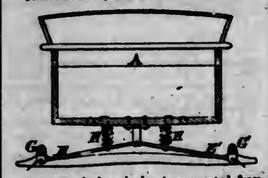
Brief.—To the longitudinal beams, and in front of the axle, are two hoppers having spouts, the whole being held in suitable frames. One of these hoppers is for seed, the other for fertilizers. They have slides, forced back by projections on the cam-wheel, which revolves with the axle. Through the lower portion of the fertilizer-hopper revolves the axle, to serve as an agitator. To the front cross-beam is attached a bar, which extends rearwardly, and is provided with a hoe for covering the seed. Motion is imparted to the bar by contact with the projections on the cam-wheel.

1. The combination, in a seed-planter, substantially as described, of the pivoted hoe K, the disk F, and its projections *l l* for elevating the said hoe, and the adjustable rods *p*, for determining the extent of the downward movement of the same, all as and for the purpose set forth.



160,707.

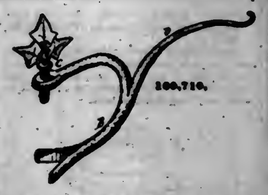
2. The combination, substantially as described, of the seed-receptacle E, and its slides *f* and *f'*, with the disk F, and its cams *h* and *h'*.



3. The fertilizer-receptacle H, the bottom of which is formed partly by the axle D and partly by the sliding plate *g*, substantially as and for the purpose set forth.

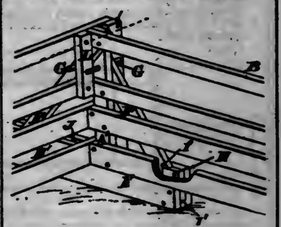
160,708. COMBINED ENVELOPES AND LETTER-SHEETS. August Peterssohn, Washington, D. C. [Filed Feb. 17, 1875.]

A folio provided with manuscript and advertising spaces, disposed as shown, and adapted to be folded in the manner described, so that when folded and fastened the manuscript portions are completely concealed, as hereinbefore set forth.



160,709. SPRING-VEHICLES. Jas. H. Phœnix and John Curtis, Cincinnati, Ohio. [Filed Jan. 18, 1875.]

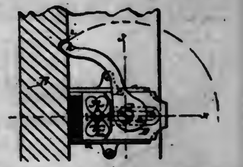
A wagon bed or body, A, supported from the under sides of side spring-bars G G' by the conjoined action of the rigid cross-bars E E', which are hinged in pairs both to said spring-bars and to the body, and of the interposed springs or cushions H, substantially as and for the purposes set forth.



160,710. WINDOW-BRACKET HOOKS. N. Plympton, Easton, Mass., assignor to Bradley & Hubbard, West Meriden, Conn. [Filed Jan. 7, 1875.]

160,710.

The herein-described bracket, consisting of a supporting-arm, D, the bifurcated base B, and the clamping-screw C, substantially as described.



160,711. PORTABLE FENCES. H. Prickett, Edenton, Ohio. [Filed Dec. 5, 1874.]

The excavated and blocked sill H *h* H' *h'* I I' J, removable, notched, and perforated braces F *f* *g*, and plan G, in combination with the removable panels A, A', B, and I, as and for the purpose specified.

160,712. SASH-HOLDERS. Louis Quitman, Norwalk, Conn. [Filed Jan. 26, 1875.]

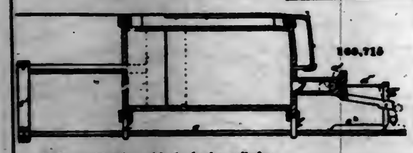
Brief.—The slotted sliding plate working in a larger flanged plate, giving novelty of construction, and the end of the lever, when reversed, engaging with notches in the sash, and locking the device.

The combination of the flanged plate C, angular sliding plate D, having slot *b*, box G, rubber H, and cam-lever E, having projecting end *h*, and secured by the screw *d*, all used with a window-sash and a window-frame, B, having notch *i*, substantially as set forth.

160,713. PERFUME-FOUNTAINS. Emil Rath, Hoboken, N. J. [Filed Jan. 29, 1875.]

Brief.—By alternately depressing the plunger, and then allowing it to rise by the action of the spring, the liquid contained in the bottle is sucked into the barrel, and then forced out in fine jets through a rose-head secured to the plunger.

A perfume-fountain composed of a bottle or flagon, A, having secured in its neck a barrel, B, in combination with the plunger C, suction-pipe D, spring *a*, valves *b b*, button or finger-piece *c*, and spout *e*, all constructed and operating substantially as shown and described.

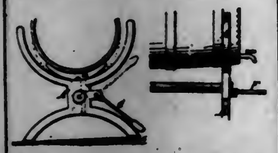


160,714. DENTAL PLATES. Geo. Van Nest Relyea, Belleville, Canada. [Filed Jan. 20, 1875.]

Brief.—The thin soft-rubber disk commonly secured in a recess in the upper side of a dental plate is provided upon its upper surface with small independent vacuum-cells, to assist in giving it a firm hold.

The flexible disk B, having a number of independent vacuum-cells in its palatal surface, combined with the chamber *b* in the plate A, substantially as described.

160,715. RELIEF-VALVES FOR AIR AND STEAM BRAKE CYLINDERS. Leonard P. Rider and Wm. H. Shillito, Pittsburg, Pa. [Filed Jan. 26, 1875.]



1. In combination with the brake-cylinder, a valve operated from the piston-rod through suitable intermediate mechanism, that will cause the first part of the return stroke of the piston to open the valve and allow of a free escape of the compressed air, substantially as specified.

2. In combination with the brake-cylinder, the valve *d*, weighted lever E, and cam-rod *e*, the cam-rod being relatively connected to the piston-rod, substantially as and for the purpose specified.

160,716. RACKS FOR BARRELS. C. F. Eighty, Newcastle, Pa. [Filed Jan. 20, 1875.]

Brief.—The rear support has a vertical recess for the admission of a piece, which is raised by means of a lever pivoted to the support, when it is necessary to tilt the barrel.

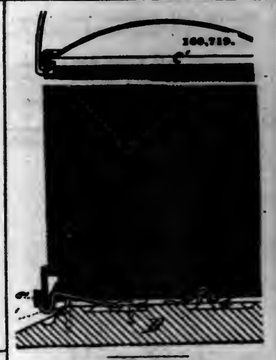
1. The combination of the two supports A A', connecting-rod B, piece *e*, and operating-lever C, substantially as shown and described.

2. The support A for the front end of the barrel, provided with a pivoted swinging stand, F, for the support of the measure, substantially as set forth.

160,717. CAR-BRAKES. Edwd. J. Roberts, Ashland, Ky., assignor to himself, A. John Bell, and Edward M. Norton, same place. [Filed Jan. 13, 1875.]

Brief.—Allows the brakes to be applied by uncoupling of the cars. Proportions brakage to degree of crowding. Enables engineer by pressure of foot to allow or prevent automatic action. Momentum of train regulates and restrains itself, whether advancing or receding.

1. The combination of the tender-buffer I, rigidly secured to shank I', having slots *l l* and spring-bolt K, as and for the purpose set forth.



2. The combination of head I, slotted shank I' *l l*, spring M, spring-bolt K and trundle J, substantially as and for the purpose set forth.

3. In combination with a longitudinally-adjustable bumper, the series of carriage-buffers G, the slotted rods P Q, the pin R, and the draw-bars F, which extend the full length of their respective cars, and which operate on the braking mechanism at the middle of their strokes, substantially as and for the purpose set forth.

4. The combination of a longitudinally-adjustable bumper with a draw-bar, capable of being shifted to full or to half stroke, pin R on said draw-bar, and brake-levers P, whose free ends have the double-incline slot Q, substantially as and for the purpose set forth.

5. The combination of double-incline slotted lever P and braking apparatus S T U V W X *s*, substantially as set forth.

6. The combination of double-headed drawbar D F D, tappets I, and buffers G H *g*, as set forth.

160,718. CURTAIN-FIXTURES. C. P. Ross, Allentown, Pa. [Filed Oct. 13, 1874.]

Brief.—In one end of the roller is made a circular recess to receive a hollow cylinder, which is formed with a circumferentially-grooved pulley on its outer end. The cylinder and pulley are bisected longitudinally, forming two equal halves. A spindle placed longitudinally in said cylinder projects in an annular recess in the outer side of the pulley. On the inner side of the pulley the cylinder is enlarged, forming a hollow hub with an interior straight side. Within this hub the spindle has shoulders formed on it. A curved arm with a hook at one end is fastened in the hollow hub by a pin passing through an elongated slot in the other end. The outer side of the hooked end is beveled, so that when the hook is caught by either of the shoulders and drawn over, it will wedge between said spindle and the straight side within the hub, and hold the curtain in position.

In combination with the weighted curtain E and curtain-roller A, the bisected cylinder B, having hub *b*, with interior straight side *b'*, and pulley C, the slotted sliding curved hook *d*, and stationary shaft D, with shoulders *p*, all constructed substantially as and for the purpose herein set forth.

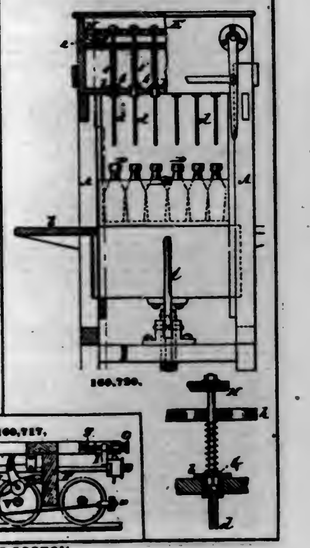
160,719. FLY-TRAPS. Chas. B. Bukgabee and Horace Clarke, Mount Pleasant, Iowa. [Filed Feb. 20, 1875.]

1. The spring-supports E, substantially as shown and described, in combination with cylinder A, as and for the purpose set forth.

2. The bottom plate D, provided with groove *d*, springs E, and staples *c*, substantially as shown and described.

3. The springs E and staples *c*, in combination with the base D and cylinder A, substantially as shown and described.

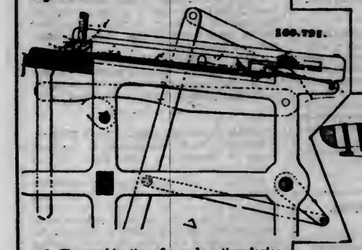
4. The combination of the bottom plate D, springs E, staples *c*, and hooks *e'* with the wire-cloth cylinder A and cone *a*, all constructed and operating as shown and described.



160,720. BOTTLING-MACHINES. Fredrick T. Ryberg, New York, N. Y. [Filed Feb. 4, 1875.]

Brief.—A rising and falling bottle-rack with a filling-reservoir above, having a number of simultaneously-operating valves within it, and seats for said valves in its bottom; also downwardly-projecting filling-tubes below it. There is also a means for adjusting and operating the valves, and for raising the bottle-rack to enter the filling-tubes down within the bottles.

1. The combination of a rising and falling bottle rack or receiver, B, with the filling-reservoir E, the valves G therein, connected to operate in common, the valve-seats *b* in the lower portion of the reservoir, and the filling-tubes *d*, substantially as specified.

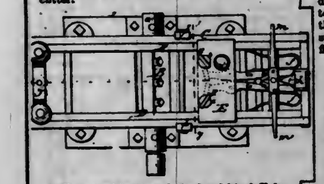


2. The combination of the follower H with the separately-adjustable valves G connected therewith, the cams *e* and springs *s*, or their equivalents, the valve-seats *b*, the reservoir E, and the filling-tubes *d*, essentially as described.

3. The combination of the trundle C or lever C, the rising and falling bottle-rack B, the filling-tubes *d*, and the collectively-operating valves G within the reservoir E, substantially as shown and described.

160,721. PNEUMATIC PAPER-FEEDERS. S. Schofield, Providence, R. I. [Filed Sept. 3, 1874.]

Brief.—The pneumatic bar is attached to the rear end of the oscillating registering-table, and from the suction-orifices in its under side extend pins, which penetrate the upper sheet as it is drawn from the pile, and push away those underneath it. Reciprocating grippers carry the sheet over the registering-table, whence it is delivered to the printing-cylinders. The height of the pile-table, on which the bank of paper is held, is automatically regulated.



1. The combination of an exhausting device with a holding-pin, substantially as described, for separating sheets of paper by and through the simple act of suction.

2. The rising and falling registering-table C, provided at its upper or back end with the suction-bar or paper-lifting device B, for operation in common, substantially as specified.

3. The combination, substantially as herein specified, of a paper-lifting device and a griper-carriage with a pivoted registering-table and a pile-carrying table, having its height automatically increased or regulated at intervals by the action of the said registering-table.

160,722. MACHINES FOR TAPERING THE TENONS OF SPOKES. William M. Sharpsteen, Mechanicsburg, Pa. [Filed Jan. 26, 1875.]

Brief.—The spokes are held in a reciprocating frame, dressed and tapered by a rotating cutter.

1. The combination of the head-block E, levers G G, jaws *b b*, springs *f f*, and set-screws *d d*, substantially as and for the purposes herein set forth.

2. The adjustable plate *h*, with wedge-shaped projection *i*, in combination with the levers G G, as and for the purposes herein set forth.

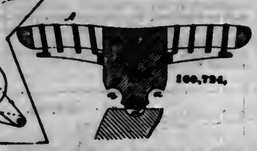
3. The levers *m m*, with arms *a a*, in combination with the levers G G and projections *p p*, as and for the purposes herein set forth.

4. The combination of the adjustable cross-bar *t*, thumb-screws I I, rest J, and screw *v*, as and for the purposes herein set forth.

5. The combination, with the revolving cutter-head B, of the reciprocating frame or carriage D, having the devices herein described for adjusting and holding the spoke to be faced and tapered, substantially as herein set forth.

160,723. HASPS. F. W. Smith and F. Egge, Bridgeport, Conn. [Filed Jan. 19, 1875.]

Brief.—Improvement on Beall's patent of December 5, 1874. The cutter-head, when adjusted at any required angle, is locked to prevent displacement during the cutting operation.



In combination with the hinged hasp A, the shield C, extending outside of the hasp, as and for the purposes set forth.

160,724. PEA-CUTTERS. Wesley J. Squires, Waterbury, Conn. [Filed Feb. 6, 1875.]

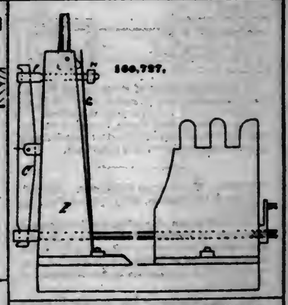
Brief.—A shield is attached to or forms a part of a hasp, for the purpose of preventing the insertion of any instrument to pry open the shackle of a padlock when the same is attached to the staple.

In combination with the adjustable head A, constructed with the shank B and the recesses *a* therein, and the shaft E, the axis of which is parallel with the axis of the head, constructed with a cavity, *d*, the disk F, on one end of the said shaft, with a spring beneath, and a head, *f*, on the other end, constructed to engage or disengage the post D, substantially as described.

160,725. TOOL-HANDLES. Hiram Staples, Battle Creek, Mich. [Filed Feb. 6, 1875.]

Brief.—The tool is secured to the handle-straps by a wedge driven between them, which forces them into the outer ends of the mortise through the tool.

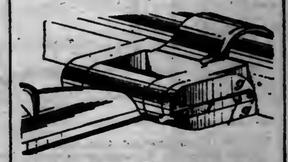
The means for attaching a tool to its handle, consisting of the elongated mortise in the tool, the straps with enlarged ends, to which the handle is secured, and the wedge, all constructed and arranged substantially as specified.



160,726. ALKALINE FOR SOAP. I. N. Stern, Keokuk, Iowa. [Filed Jan. 8, 1875.]

A compound for making soap, consisting of caustic soda and common salt, combined in the proportions and in the manner substantially as specified and described.

160,727. PEGGING-JACKS. John J. Stewart, Sargentville, Me. [Filed Aug. 27, 1874.]

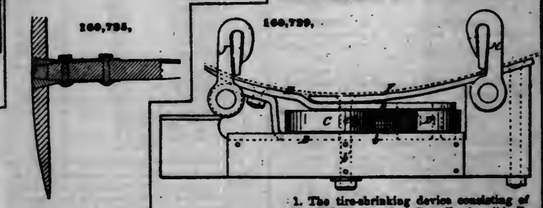


Brief.—Improvement on applicant's Patent No. 152,533, consisting of a spring to properly adjust the pivoted toe-support.

In a pegging-jack, the lever C, rods D F, nuts H E, and spring G, combined to operate substantially as and for the purpose described.

160,728. THILL-COUPLINGS. S. M. Strader, Madison, Ind. [Filed Jan. 16.]

Brief.—Bolt held in place by plate provided with spring catch and projecting corner, to prevent accidental displacement while allowing easy removal.

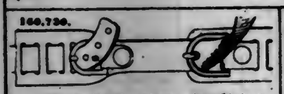


1. In combination with a sliding bolt for fastening the thill-iron to the axle-clip, the pivoted plate G, having prominent portion *f* for binding against the face of the axle, so as to prevent the complete elevation of the plate by accident, substantially as set forth.

2. The combination of the spring-catch I with the pivoted plate G and bolt F, substantially as and for the purposes set forth.

160,729. TIRE-SHRINKERS. Daniel Strattan, Cassopolis, Mich., assignor of one-half his right to Jos. Graham, same place. [Filed Dec. 26, 1874.]

Brief.—The two limbs of the bed-bar are slotted to accommodate the cam-axis and the roll, and the jaws of each pair of clamps are disconnected except by the axis, in virtue of which they, with their wedge, accommodate themselves to the contractile movement of the tire and its bed, and also may be turned over outward to facilitate the placing and removal of the tire.



1. The tire-shrinking device consisting of the cam C, having the offset E, the slide B, with its roller D, the fixed tire-support F, and the pivoted arms H J, constructed and arranged for joint operation substantially as described.

2. The pivoted wedge-holding arms H J, in combination with the slide B and the fixed tire-support F, substantially as described, and for the purpose stated.

160,730. CARTRIDGE-BELTS. David Taylor, U. S. A., assignor to himself and T. Ewing, Tucson, Ariz. [Filed Nov. 18, 1874.]

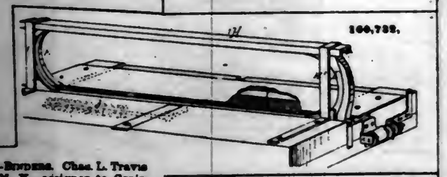
Brief.—A narrow strip is laced through slots in the belt, and the slips which hold the cartridges are secured to the narrow strap by means of end extensions, instead of by rivets, as ordinarily.

160,720.

1. The combination of cross-slotted belt A, the interlacing-strap B, and clamps C D E, arranged as and for the purpose described.

2. A cartridge-belt clamp, having lower extensions D bent back wardly to attach them firmly to the strap, as shown and described.

160,721. HYDRAULIC PACKINGS. John F. Taylor, Charleston, S. C. (Filed Feb. 13, 1875.)



Brief.—The cup-ring, of leather, is supported by a ring of rubber formed to fit it loosely, and secured to it on the outer side by rivets, for the purpose of holding it in position, and compensating inequalities in the thickness of the leather.

The combination of the leather cup-ring with the India-rubber ring contained within the leather ring, and fastened thereto by rivets or their equivalents, substantially as and for the purpose described.

160,721.

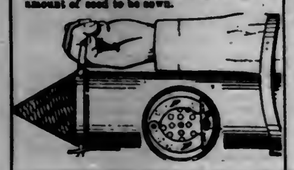
160,722.

160,722. GRAIN-BINDERS. Chas. L. Travis Great Valley, N. Y., assignor to Grain-Binder Company, Fremont, Ohio. (Filed Feb. 12, 1875.)

1. The grooved compressing-slides E, provided with the spurs e', whereby they are adapted to pick up the ends of the bands and to pass them in opposite direction around the bundle, substantially as described.

2. The compressing-slides E E provided on their inner adjacent faces with the oppositely-diverging grooves a, for guiding the opposite ends of the prepared bands in their movements around the bundle, as described.

3. The grooved compressing-slides E, in combination with the double-grooved guide-rail H, for guiding the ends of the bands and passing them by each other, substantially as described.



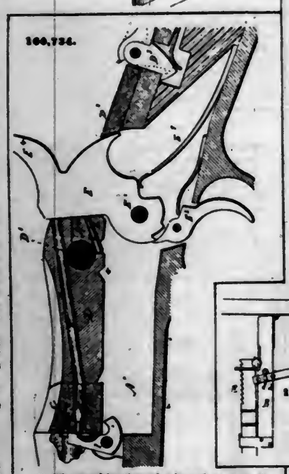
4. The compressing-slides E, provided with the grooves a e', the latter of varying depth, as described, whereby they are adapted, in connection with the grooved guide-rail H, to not only pass the ends of the bands around the bundle in compressing the same, but also to untie or tie said ends, substantially as described.

5. The combination, with the compressing-slides E, of a receptacle or passage-way for the prepared bands, through which said bands are conveyed to the compressing-slides.

6. The compressing-slides E, in combination with racks F F', for actuating the same, as described.

160,724. SEED-SOWERS. Alex. Walker, Mornington, assignor of one-half his right to George Sutherland, Listowell, Canada. (Filed Dec. 18, 1874.)

Brief.—To one end of a tubular seed-box, susceptible of attachment to the operator's arm by suitable handles, is hinged a perforated cap, over which is placed a cone of wire-cloth, into which the seed falls for distribution. Within the hinged cap, in rear of the cone, is pivoted a pair of cut-offs, for regulating the amount of seed to be sown.



1. The seed-holder A, attachable to the arm of the operator by a strap, and provided with a handle, C, to be seized by the fingers of the operator when sowing, in the manner set forth.

2. The seed-holder A, having a perforated cap, D, and wire-cloth cone E, as and for the purpose set forth.

3. The cut-offs F, pivoted to the cap D, and held adjustably by the clamp G and screw H, as and for the purpose set forth.

160,724. BREECH-LOADING FIRE-ARMS. Eli Whitney, New Haven, Conn. (Filed Dec. 31, 1874.)

1. The combination of a barrel open at the breech, a vertically-sliding breech-piece, a lever pivoted in rear of said breech-piece, the forward arm of which is in connection with said breech-piece, the other arm extending in the rear of the pivot above the frame, the arrangement of the parts being substantially such as described, whereby the raising of the rear arm of the said lever throws down the said breech-piece to open the barrel, and returning said lever raises the said breech-piece to close the barrel.

2. The combination of a barrel open at the breech, a vertically-sliding breech-piece, provided with a loose firing-pin, a lever pivoted in rear of said breech-piece, the forward arm of which is in connection with said breech-piece, and provided with an auxiliary firing-pin, the other arm extending to the rear of said pivot above the frame, the arrangement of the said pivot being such relatively to the said vertically-sliding breech-piece that the shortest distance between said pivot and the forward or closing surface of said breech-piece is when the breech is closed, and that the arc described by the forward end of the lever in opening the breech will cause said forward end of the lever to retreat from the breech-piece, substantially as described.

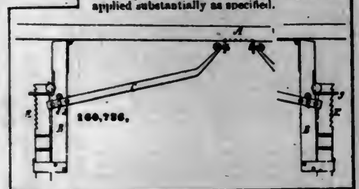
3. The combination of a barrel open at the breech, a vertically-sliding breech-piece, provided with a loose firing-pin, a lever pivoted in rear of said breech-piece, the forward arm of which is in connection with said breech-piece, and provided with an auxiliary firing-pin, the other arm extending to the rear of said pivot above the frame, the arrangement of the said pivot being such relatively to the said vertically-sliding breech-piece that the shortest distance between said pivot and the forward or closing surface of said breech-piece is when the breech is closed, and that the arc described by the forward end of the lever in opening the breech will cause said forward end of the lever to retreat from the breech-piece, and the forward end of the lever in opening the breech will cause said forward end of the lever to retreat from the breech-piece, the arrangement of the said pivot above the frame, the arrangement of the said pivot being such relatively to the said vertically-sliding breech-piece that the shortest distance between said pivot and the forward or closing surface of said breech-piece is when the breech is closed, and that the arc described by the forward end of the lever in opening the breech will cause said forward end of the lever to retreat from the breech-piece, substantially as described.

4. The combination of the breech-closing lever D D^1, the bridge A^1 in rear of the forward part of the lever, the pivot of the lever taking its bearing on said bridge, substantially as described.

5. The combination of the breech-closing lever D D^1, the bridge A^1, spindle L in said bridge, and the hammer E, with its mainspring and trigger, substantially as described.

160,725. BASE-HOLDERS. John B. Wilford, Philadelphia, Pa., assignor to H. Bradford and H. Hamburger, same place. (Filed Jan. 19, 1875.)

Brief.—A double-cam rocker arranged within a case, and provided with suitable lever and spring, is attached to and combined with a friction pressure-plate in such manner as to diminish friction, and secure correct and reliable action of the pressure-plate, moving this latter with uniform force against the window-frame, to hold the sash in desired position.



1. The cam-rocker c, jointed to the pressure-plate d, and acting between the fixed surfaces 4 and 5 of the case and the said pressure-plate, substantially as set forth.

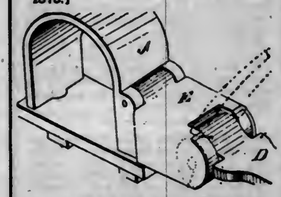
2. The lever m and spring o, in combination with the rocking cam c and pressure-plate d, substantially as specified.

160,726. CHIMNEY-STAGING BRACKETS. F. Willard, Milford, Mass. (Filed Jan. 12, 1875.)

The described chimney-staging bracket, or combination of the bar A, its ears b b, and braces C C with the legs B B and the adjustable feet D D, provided with the brackets g g and stop-racks E E, all being arranged and applied substantially as specified.

160,726.

160,727. COPING FOR WALLS. Joseph C. Wright, Monocacy Furnace, Pa. (Filed Jan. 9, 1875.)

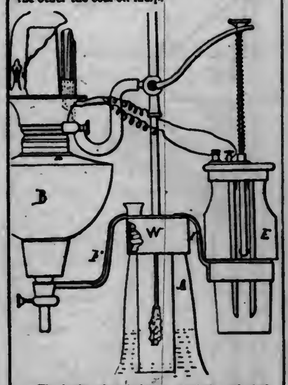


Brief.—A cast-iron coping in sections, provided with rabbets and locking-notches, to hold the contiguous ends together, and having dovetailed studs placed vertically in the walls, to secure the ends of the sections to the same.

1. Sections A, having rabbets e, and locking-notches f f, for holding their contiguous ends together, substantially as described.

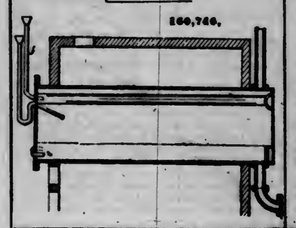
2. The combination of studs C with sections A and wall B, for holding the coping firmly upon the wall, substantially as set forth.

160,728. TRILL-COUPLINGS. Geo. Wright, Old Point Comfort, Va. (Filed Feb. 10, 1875.)



1. The combination, in a thill-coupling, of a locking-cap having flanges f f with a shaft-iron having projections e e', for locking the same, substantially as set forth.

2. The combination of clip A and hinged metal cap E, provided with recessed side pieces for retaining the bolt, with shaft-iron D, having projections e e' to lock the cap when said iron is raised, all substantially as set forth.



160,729. HYDRO-ELECTRIC LAMPS. Wm. H. Zimmerman, Chestertown, Md. (Filed Jan. 11, 1875.)

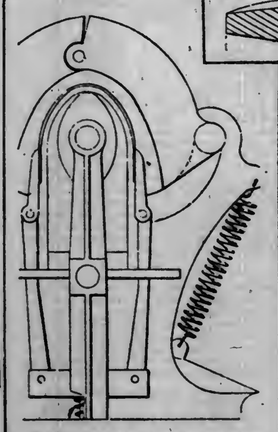
Brief.—Lamp is lighted by a flame of hydrogen gas, which is itself ignited from a platinum wire rendered incandescent by passage of electric current. The gas-generating reservoir forms the base of the apparatus, and a frame extending from it supports on one side the battery for generating the electricity, and on the other the coal-oil lamp.

The hydro-electric lamp, consisting of a bell-low base or pedestal, A, for forming the Döbereiner apparatus, the coil-oil lamp B, the battery E, and the supporting-frame W I F, all combined and arranged substantially as and for the purpose described.

160,746.

160,730. HYDRAULIC RAMS. Geo. Wright, Old Point Comfort, Va. (Filed Feb. 10, 1875.)

1. A retort, provided with one or more chambers for receiving water and deoxidizing material, in combination with a pipe, f, communicating with a water-reservoir and with said chambers, as set forth.



2. A retort, provided with a chamber or chambers for receiving water and retaining deoxidizing material, combined with an oil-pipe to deliver the oil directly upon the bottom of the retort.

3. The retort, its steam-generating and deoxidizing chambers, combined with the oil-pipe k and gas-pipe h to inject the gas into the retort at the point where the oil falls upon the bottom thereof, as and for the purpose set forth.

4. A retort, in the body of which are formed channels arranged to leave intervening portions consisting of one thickness of metal, as and for the purpose set forth.

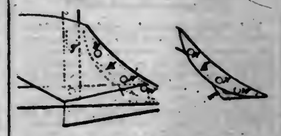
REISSUES.

6,219. APPARATUS FOR CRIMPING THE STIFFENINGS OF BOOTS AND SHOES. J. W. Hatch, Rochester, N. Y. Patent No. 117,027, dated Aug. 1, 1871. (Filed Feb. 23, 1875.)

1. In a machine for crimping heel-stiffenings, the combination of a heel-form with a crimping mechanism, the parts being adapted to yield with relation to each other, substantially as described.

2. The combination, with the heel-form, of the stiffening-holder and crimping-jaws, adapted to operate substantially as described.

3. In a machine for crimping heel-stiffeners, a heel-form, a holder, and crimping apparatus, substantially as described, adapted to move with relation to each other, to turn the entire edge of the stiffener from the outside toward the center of the heel-form, substantially as described.



4. The combination, with the heel-form, of the crimping-jaws and gage for the turned edge of the stiffening, substantially as described.

5. In the process of forming heel-stiffeners, first impinging the stiffener against the heel-form at the edge where the stiffener is to be bent, then forcing or wiping the edge of the stiffener from end to end, from its outer side over the edge, and converging toward the center of the heel-form, whereby the flange is turned and crimped, substantially as described.

6. The combination, with a heel-form, of a yielding holder to hold the stiffener to the heel-form and adapt itself to the thickness of the stiffening, substantially as described.

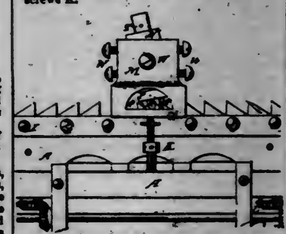
6,220. PLOWS. John Lane, Chicago, Ill., assignor, by mesne assignments, to Hapgood & Co., St. Louis, Mo. Patent No. 111,854, dated Feb. 14, 1871. (Filed Feb. 20, 1875.)

Brief.—The standard, land-side bar, share, and mold-board are connected by means of a curved angular piece, perforated for receiving the securing-bolts.

1. The plow-block K, V-shaped in cross-section, and formed as described, to have affixed thereto the land-side, share, mold-board, and standard.

2. The removable plow-block K, perforated at g, N, W, and m, whereby to it is bolted the standard at g, the land-side bar at m, the share at W, and the mold-board at N, arranged substantially as and for the purposes shown.

6,221. CAR-SPRINGS. Jas. C. Pickles, Wilmington, Del., assignor of one-half interest to J. P. Hayes. Patent No. 152,264, dated July 7, 1874. (Filed Oct. 17, 1874.)



1. A coiled edge-rolled spring, the inner edge of which is of greater vertical thickness than the outer edge, substantially as set forth.

2. An edge-rolled spiral spring, composed of a single metallic bar of varying thickness in transverse section, substantially as set forth.

3. An edge-rolled spiral spring, having one edge of greater vertical thickness than the other, substantially as set forth.

6,222. SAW-SWAGING MACHINES. Levi W. Pond, Eau Claire, Wis., assignor to himself and the Eau Claire Lumber Company, same place. Patent No. 102,310, dated Apr. 26, 1870. (Filed Feb. 13, 1875.)

Brief.—Two blocks, one at each end of the machine, adjustable as to height by screws actuated by gearing, support the saw, and screws J actuate two pieces that clamp the saw; and the tool-carriage M is movable along ways H, which, fastened at each end by screws I, may be sprung to any desired curvature, convex or concave, to suit any saw, by the screws K.

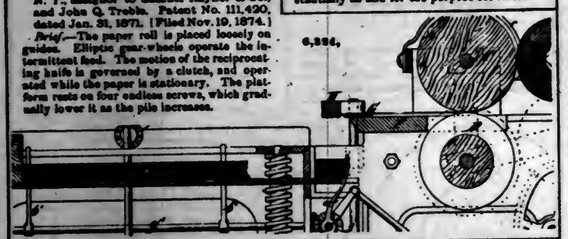
1. In a machine for swaging saw-teeth, an adjustable and yielding tract, combined with a movable carriage for supporting the swage or jointer, substantially as described.

2. The adjustable blocks O, in combination with the frame A and a yielding tract, substantially as and for the purposes specified.

3. A saw-swage composed of the carriage M, stock N, clasp P, blocks Q, R, and S, pin T, and set-screw W, substantially as specified.

6,223. MACHINES FOR GRINDING ROLLS OR ROLLERS. J. Morton Poole, Wilmington, Del., assignor to himself, Wm. T. Porter, and Thomas S. Poole. Patent No. 79,663, dated July 7, 1868. (Filed Jan. 20, 1875.)

6,226.



1. A grinding-machine for grinding rolls or rollers cylindrically true, said machine having its grinding-wheels operating with counter-threads, and sustained by a suspended support on a reciprocating carriage, to which all transverse movement, which imperfections in the machine create, is confined during the contact of the grinding-wheels with the roll or roller being ground, substantially as described.

2. A revolving roll or roller, which finally becomes the cylindrically true roll or roller, as a guide for the grinding-wheels during the operation of said wheels of grinding off the imperfections of the surface of said roll or roller, substantially as described.

6,236. MACHINES FOR CUTTING PAPER OR OTHER MATERIALS. James Ball, Brooklyn, N. Y., assignor to Samuel Raynor & Co., and John Q. Trebbs. Patent No. 111,420, dated Jan. 31, 1871. [Filed Nov. 19, 1874.]

Brief.—The paper roll is placed loosely on guides. Elliptic gear-wheels operate the intermittent feed. The motion of the reciprocating knife is governed by a clutch, and operated while the paper is stationary. The platform rests on four endless screws, which gradually lower it as the pile increases.

6,236.

1. The guides *c*, supporting the gudgeons of the roll of paper or other material, and allowing said roll to adjust itself laterally in accordance with the guides *c* of the feed-cylinder, combined to operate substantially as described.

2. The wheel *d*, with plain segment *f*, segmental step *g*, and wheel *e*, and the elliptic wheels *h i*, combined and operating together, in relation to the feed-cylinder, substantially as and for the purpose described.

3. The knife H, in combination with the rod *t*, disks *u*, worm pinion *k*, sleeve or clutch *l*, teeth *r s*, groove *v*, pin *q*, and cam-groove *s*, substantially as and for the purpose set forth.

4. The combination of the two knives G H, both being situated in horizontal planes, the knife G forming the continuation of the platform over which the material to be cut is fed, the cutting-edges of both knives being recessed to conform to the shape of the sheets to be cut, substantially as described.

5. The pin *o*, projecting from the lever *w*, and the notched disk *p*, operating together, in combination with the stop mechanism of the knife, substantially as and for the purpose described.

6. The platform I, having its edges bearing on the inner portions of the threads of the endless geared screws K, combined substantially as described, so that an empty platform may be substituted for the loaded platform.

7. The combination of the bearers *a' b'* and gages *d' d'* with the platform I, substantially as set forth.

6,265. STEREOTYPE-PLATE HOLDERS. Ariel Cass, New Haven, Conn., assignor to R. Hoe & Co., New York city. Patent No. 94,110, dated Apr. 24, 1869. [Filed Feb. 26, 1875.]

1. A stereotype-block, consisting of a number of quadrats, a beaded plate-holding block, F, and the plate-holding block B, carrying an adjustable bevel, whereby, when the said furniture is locked in a chase, the stereotype-plate may be detached therefrom, substantially as described, and for the purpose set forth.

2. The stereotype-plate holding-hook and its actuating-nut, constructed substantially as described.

3. The combination of the plate-holding jaw or hook A, having a screw-threaded opening in its cheek, with its actuating-screw D seated in bearings in a supporting block, substantially as described.

6,266. PRINTERS' GALLEYS. Alex. T. De Puy, New York, N. Y., assignor to R. Hoe & Co., same place. Patent No. 60,151, dated Dec. 4, 1866; reissue No. 3,066, dated Aug. 4, 1868. [Filed Feb. 26, 1875.]

Brief.—Flanged metal strips are attached to the wooden rails of galleys by corresponding grooves in the rails, so that the inner surface of the lining is not perforated.

1. In a printer's galley, the combination of the edge-rail and its metallic facing or lining by means which secure their union and leave the metallic facing or lining smooth, or free from perforations or similar interruptions, substantially as and for the purpose set forth.

6,234.

2. The metallic facing or lining of the edge-rail or ledge of a printer's galley, secured thereto by means of a flange or flanges, so that the point of securement shall be in rear of the face, thus leaving the latter smooth or uninterrupted by any fastening device.

3. An edge-rail for a printer's galley, having a metallic facing secured thereto behind the plane of its face, substantially as described, and for the purpose set forth.

6,267. PRINTERS' GALLEYS. Alex. T. De Puy, New York, N. Y., assignor to R. Hoe & Co., same place. Patent No. 93,422, dated Aug. 10, 1869. [Filed Feb. 26, 1875.]

Brief.—The rails of the galleys are composed of a metal tube filled with wood or composition, and are secured to the base-plate by screws from the under side, or by solder.

1. A printer's galley constructed with an edge rail or ledge, formed from a tubular metallic rod secured to the base-plate, substantially as described.

2. A printer's galley constructed with a tubular metallic edge rail, ledge, or rib, having a wooden or equivalent core or filling, which provides a suitable bed or bearing for the threads of the screws which secure it to the base-plate, substantially as described.

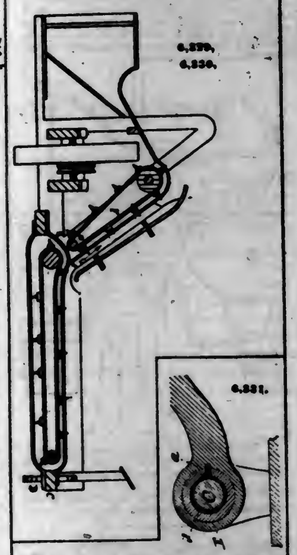
3. In combination with the mitered ends of the tubular edge rail or rib, the angle-braces or ties for uniting the corners, substantially as described.

6,268. GAITER-BOOTS. Calvin Hersome, Boston, Mass. Patent No. 145,801, dated Dec. 23, 1873. [Filed Nov. 21, 1874.]

The combination, with a fastening-strap passing from the vamp or instep-piece around the back of a shoe, of a cheek or stop to limit the vertical play of the strap.

6,232. HARVESTERS. Chas. W. Marsh and William W. Marsh, Sycamore, Ill. Patent No. 21,207, dated Aug. 17, 1858; reissue No. 1,710, dated July 5, 1864; reissue No. 2,014, dated June 27, 1865; extended seven years. [Filed Feb. 3, 1875.]

1. The secondary band of rakes F, consisting of toothed slats extending across on the under side of a slotted platform, the teeth protruding through the slots, in the manner described, and used in connection with a binders' grain-receptacle, substantially as and for the purposes set forth.



2. The carved or bent deflector *t*, forming a part of the cover, in combination with the grain-elevating mechanism and grain-receptacle, whereby the upward direction of the grain will be changed toward the receptacle, substantially as set forth.

6,233. HARVESTERS. Chas. W. Marsh and William W. Marsh, Sycamore, Ill. Patent No. 21,207, dated Aug. 17, 1858; reissue No. 1,710, dated July 5, 1864; reissue No. 2,014, dated June 27, 1865; extended seven years. [Filed Feb. 3, 1875.]

1. The combination of the binders' stand on the outside of the drive-wheel, and a grain-carrier on the opposite side, with the intermediate drive-wheel, elevator, and grain-receiver, all arranged in line, substantially as and for the purposes specified.

2. In combination with the binders' stand on the outside of the drive-wheel, and a grain-carrier on the opposite side, and the intermediate drive-wheel, elevator, and grain-receiver, arranged in line therewith, the elevated binders' tables, one in front and one in rear of the axis of the drive-wheel, substantially as described.

6,235, 6,236.

6,231.

6,231. THILL-COUPLINGS. Geo. F. Smith, Plantsville, Conn. Patent No. 149,535, dated Apr. 7, 1874. [Filed Dec. 8, 1874.]

1. The combination of the internal cylinder E, with elastic material *d*, and the shaft-eye A, the cylinder being divided, and a portion of it extending outward into the elastic material, substantially as and for the purpose described.

2. The combination of the internal cylinder E, and elastic material *d* with the shaft-eye A, the cylinder extending into connection with the shaft-eye, substantially as described.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON

OFFICIAL GAZETTE

OF THE

United States Patent Office.

VOL. 7.—NO. 11. TUESDAY, MARCH 16, 1875. PRICE { $6,00 per year—single. $5,00 per year in clubs.

The OFFICIAL GAZETTE is published on Tuesday of each week, from the United States Patent Office. The subscription price for 1875 is six dollars per year for single subscribers; five dollars per year to clubs of not less than five sent at one time, and which will be mailed free of postage to separate addresses if desired. Subscriptions will commence and terminate with the year. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

COMMISSIONER'S DECISIONS.

THOMAS A. EDISON.—*Question of title.*

[*In the matter of the applications of Thomas A. Edison, assignor, &c., Nos.* 94, 95, 96, 97, 98, 99, and 100, *for Letters Patent for alleged* "IMPROVEMENTS IN DUPLEX TELEGRAPHS," *filed September* 1, 1874.—*Decided March* 20, 1875.]

In determining to whom a patent shall issue, where assignments have been made, the Commissioner of Patents must be governed by the record. He cannot regard mere equitable claims, but must issue the patent to the person or persons having the legal title, the requirements of the Office having been complied with.

An instrument purporting to convey inventions not yet *in esse* is not an assignment, but only an executory contract.

An applicant is estopped from contradicting his deed of assignment, but an estoppel by deed arises alone upon a recital of a particular fact.

It would seem that where, in enforcing specific performance of a contract to assign an interest in a future invention, equity may (after the invention has been perfected and patented) carve out an undivided interest in the patent, a valid assignment to a third party will afterward take effect upon the interest remaining in the patentee.

THACHER, *Commissioner:*

Prior to the filing of these applications the following assignment was sent to the Patent Office and recorded August 29, 1874, in Liber K[18], p. 62, Transfers of Patents.

Articles of agreement made and entered into this nineteenth day of August A. D. 1874, by and between Thomas A. Edison, of Newark, in the State of New Jersey, and George B. Prescott, of the city and State of New York, witnesseth—

Whereas said Edison has invented certain improvements in duplex telegraphs, for which he has executed or is about to execute applications for letters patent of the United States, and such applications are numbered 94, 95, 96, 97, 98, 99, and 100, and are dated August 19, 1874, and said Prescott is entitled to an equal interest in the same and others hereafter mentioned.

Therefore, in consideration of the premises and the sum of one dollar in hand paid, the receipt whereof is hereby acknowledged, the said Edison has sold and assigned, and does hereby set over and convey unto the said George B. Prescott one undivided half part of the right, title, and interest, of every character, in, to, under, and connected with each and all the aforementioned inventions and letters patent on the same, when granted, and authorizes and requests the Commissioner of Patents to issue the said letters patent to Thomas A. Edison and George B. Prescott, as the assignees of said Edison, for the use and behoof of themselves and their legal representatives. And whereas the said Edison has also invented other improvements in duplex telegraphs, the descriptions of which have been lodged with George M. Phelps for the purpose of models being constructed, it is hereby agreed that such inventions are included in this patent agreement, and that, when the applications for patents are made, the patents to be granted in accordance herewith, and that the said Edison shall sign the required papers therefor.

This transfer is made on the following terms and conditions, which are hereby made part of the consideration in the premises:

1. That both of the parties shall have an equal undivided interest in all letters patent of the United States, or of any foreign countries, which may be granted for all or any of said inventions, or of any future improvements thereon made, by either party, and of all extensions and reissues of any such letters patent.

2. That whereas Edison has heretofore expended $1,125 for models and patent fees, the benefit of which he contributes to the common interest, and waives reimbursement of that sum, or of any part of it, Prescott hereby agrees to pay solely and without contribution from Edison, all the future expenses and cost of specifications, drawings, models, Patent Office fees, and patent solicitors' and agents' fees, and all other charges incident to the procuring of letters patent for any of said inventions.

3. That neither of said parties will sell, assign, or otherwise dispose of the whole or any part of his interest in said inventions or letters patent therefor, or any of them, without the written consent thereto first obtained of the other party.

4. That neither of said parties will himself manufacture, use, or sell, nor grant licenses, nor the right in any way to any other party, to manufacture, use, or sell any of the said inventions, or any improvements thereof, or any machine embodying, or article containing any of said inventions or improvements, or protected by any of said letters patent without the written consent first obtained of the other party.

5. No sale of any of the said inventions, and no license or right to make or use the same, in any way, shall be made or given, except at a price to which both parties agree in writing, and all net profits shall be equally divided between the parties hereto.

6. The covenants and provisions of this agreement, binding either of the parties hereto, shall also bind his executors, administrators, and assigns.

In witness whereof the said parties have hereunto set their hands and seals the day and year first above written.

THOMAS A. EDISON. [L. S.]
Witnesses: GEORGE B. PRESCOTT. [L. S.]
HAROLD SERRELL,
LAMUEL W. SERRELL.

In accordance with this assignment the applications were entered in the Office, as made, by "Thomas A. Edison, assignor of one-half his right to George B. Prescott, of New York city;" and, under the usual practice of the Patent Office, the patents would have been issued, in accordance with the request contained in the assignment, to Edison and Prescott, as assignees of Edison. Before the examination of the applications had been completed, George Harrington presented to the Commissioner of Patents a petition, bearing date January 23, 1875, praying that the patents might issue to Edison and himself, as assignees of the former, on the ground that the following assignment, recorded May 6, 1871, Liber U[13], p. 412, Transfers of Patents, conveyed to him an interest in these inventions.

Whereas I, Thomas A. Edison, of the city of Newark, State of New Jersey, for certain valid and valuable considerations to me in hand paid, and in further consideration of certain covenants

and stipulations to be fulfilled by George Harrington, of Washington, District of Columbia, did stipulate and agree to invent and construct for the said Harrington full and complete sets of instruments and machinery that should successfully and economically develop into practical use the Little or other system of automatic or fast system of telegraphy, and subsequently to improve and perfect such instruments and machinery by adding thereto, from time to time, such further inventions as experience should demand and my ability as an inventor and electrician might suggest and permit; and furthermore to prepare or cause to be prepared the necessary description-papers, the model and drawings requisite to obtain patents for all such inventions and improvements, the said inventions and improvements to be the joint property of the said Harrington and myself, and the patents to be issued to the said Harrington and myself in the proportionate interest of two-thirds to said Harrington and one-third to myself; the whole to be under the sole control of said Harrington, to be disposed of by him for our mutual benefit in the proportions hereinbefore recited, in such manner and to such extent as he, the said Harrington, should deem advisable, with power to sell, transfer, and convey the whole or any part of the rights and titles in and to any or all of said inventions and improvements, as also of the patent or other rights arising therefrom. And the said Harrington having faithfully fulfilled all of the covenants and stipulations entered by him,

Now, therefore, be it known that, in consideration thereof and of the sum of one dollar to me in hand paid, I, Thomas A. Edison, of the city of Newark, State of New Jersey, do, by these presents, hereby assign, set over, and convey to him, the said Harrington, two-thirds in interest of all my said inventions, including therein all my inventions of mechanical or copying printers, and of all the patents for all such inventions and printers, whether already issued, applied for, or to be hereafter applied for, and of all and whatsoever of my inventions and improvements made or to be made, and of all the patents that may be issued therefor, that are or may be applicable to automatic telegraphy mechanical printers.

And whereas I am desirous of obtaining the co-operation and assistance of the said George Harrington in disposing of my said one-third interest, as before recited, and for the purpose of united and harmonious action in negotiating for its use or its sale and transfer by or to others in conjunction with his own and in such free and unrestricted manner as will tend to success, and for the sum of one dollar to me in hand paid, the receipt whereof is hereby acknowledged. Now, therefore, be it known that I, Thomas A. Edison, of the city of Newark, State of New Jersey, have constituted and appointed, and by these presents do constitute and appoint, George Harrington, of the city of Washington, District of Columbia, my true and lawful and only attorney, irrevocable, with power to substitute for me and in my name, and in such manner as he may think best, to sell, transfer, and convey all of my rights, titles, and interest in and to any and all of my said inventions, and the improvements thereto, whether made or to be made, and to sell, transfer, and convey all of my rights, by patent or otherwise, arising therefrom already made and obtained, and all such as may hereafter be made or obtained, and to execute in full any or all the necessary papers and documents requisite for the transfer of title, and to invest in other parties full and legal ownership therein, hereby divesting myself of and investing him, the said Harrington, with all the powers necessary in the premises, fully and completely, to carry out the purposes and intentions herein set forth, hereby fully confirming all that my said attorney may or shall do in the premises as fully as if done by me in person, and requesting the Commissioner of Patents to recognize him as such attorney.

In witness whereof I have hereunto set my hand and affixed my seal, in the city of Newark, this 4th day of April, 1871.

T. A. EDISON. [L. s.]

In presence of—
A. D. COBURN,
A. B. CANDEE.

A letter of even date with this petition was also received from Edison, stating that the assignment to Prescott was made under an erroneous impression, and requesting the issue of the patents to Harrington and himself.

The issue before the Commissioner is, to whom shall the patents be granted? In determining this question, the Commissioner must be guided entirely by the record. He has not the authority of a court to consider evidence, outside the record, as to outstanding equities. The only question that he can decide is, who on the record possesses the *legal* title to these inventions? He must issue the patents accordingly, if the requirements of the Office, in such cases provided, have been complied with.

In the investigation of this matter I have come to the conclusion that it is not necessary for the Commissioner to determine whether the assignment from Edison to Harrington, dated April 4, 1871, covers these inventions or not. However this question may be decided finally, there is no evidence that the inventions described in these applications were in existence at the time this instrument was executed. It is not even claimed by Harrington that they were. He simply says that there is no evidence they were not then in existence. But in a court of equity, one of the first requirements made of Harrington would be to prove affirmatively that Edison had perfected these inventions when he executed the assignment of April 4, 1871. In the absence of such proof the probabilities must guide. These are all against the existence of the inventions at that time. The applications were filed more than three years after the date of the assignment. The first record made by Edison in the Patent Office in any way connected with these inventions was some time in 1873, when he filed his first caveat relating to duplex telegraphy. It is also worthy of notice in this connection that Edison is a very fertile inventor, as the great number of patents obtained by him within the last few years conclusively shows. The present applications extend a series, commenced not long ago, to the number of one hundred. It must be remembered, too, that there has been great activity in inventions relating to telegraphy for a number of years past, and sharp competition has existed between inventors of various improvements. It is incredible, under these circumstances, that an inventor like Edison should allow such valuable improvements to lie three or four years after completion without applying for patents. In the absence of positive evidence on this point, I must follow the presumption, which in this instance is so strong as to amount almost to a certainty, that the inventions described in these applications were not *in esse* when the agreement was made between Edison and Harrington. Admitting, then, that this deed includes these inventions in unmistakable terms, no legal title in them passed thereby to Harrington; the instrument has the force only of an executory contract. (*Gibson* vs. *Cook*, 2 Blatchf., 144; *Curtis on Patents*, 4th ed., sec. 183, Note 2, p. 206.)

The *legal* title to these inventions, then, was entirely in Edison at the time he executed the assignment to Prescott, and he alone had the right to convey any interest in the inventions, or patents granted therefor. This right he exercised with all due formality when, in 1874, he conveyed an entire half-interest in the inventions to Prescott. Whether this was done in violation of an outstanding contract is not material to the present discussion. Prescott became the legal assignee of Edison, and, upon the execution of the assignment of 1874, Edison and Prescott became the possessors of the *legal* title to the entire inventions. This conclusion is controlling in effect, for Edison is estopped from contradicting his deed of assignment to Prescott. It is hardly necessary to cite authorities on this point, and I will only refer to *Van Rensselaer* vs. *Kearney et al.*, (11 How., 297,) and *Bowman* vs. *Taylor*, (1 Webster's Patent Cases, 292.)

It may be alleged, however, that the same doctrine should be applied to the deed of Edison to Harrington of 1871, and that then the rule that an "estoppel against an estoppel setteth the matter at large" would operate. But an estoppel arises alone upon a recital of a particular fact. Speaking of a mortgage-deed, "There is," said Lord Tenderden, delivering the judgment of the court in *Doe d. Jeffreys* vs. *Bucknell*, (2 B. and Ad., 278,) "a want of that *certainty of allegation* which is necessary to make it an estoppel. Lord Holt lays it down in *Salby* vs. *Kidley*, (1 Show., 59,) that *general recital* is not an estoppel, *though recital of a particular fact is.*" (*Doe* vs. *Oliver*, 2 Smith's Leading Cases, Hare & Wallace's Notes, 7th Am. ed., 656.)

The deed in question does not point out, either by recital or description, any particular invention or patent. It is vague in its terms and executory in its nature, and, for the latter reason, as well as for its uncertainty, an estoppel cannot be considered as arising thereupon. (*Doe* vs. *Oliver*, Ibid, 673.)

The discussion of this case might rest here, I believe, with perfect certainty that, if the necessary formalities have been observed, the Commissioner must necessarily order the patents to issue to Edison and Prescott. But I am still more strongly confirmed in this opinion by the fact, as I believe, that Prescott is the owner of *some* interest in the inventions, whatever effect may be given to the Harrington contract. If a court of equity shall hereafter carve out a two-thirds interest in the patents granted and give it to Harrington, the deed of Edison to Prescott will still take effect upon the lesser interest, if the grantee chooses to enforce it. (1 Sugden on Vendors, 347; *Brown* vs. *Jackson*, 3 Wheaton, 453; *Waters* vs. *Travis*, 9 Johns., 450; *Turnbull et al.* vs. *Weir Plow Co.*, 7 OFFICIAL GAZETTE, 173.) Whether in this contingency Prescott can enforce the contract to the full extent of the one-third interest remaining in Edison, or whether the terms and conditions of the grant are such that it can be enforced only to the extent of one-half Edison's remainder, is immaterial. Upon the record before me, Prescott, in my opinion, has an indefeasible right to *some* interest in the inventions described in the applications. This fact makes the necessity of joining Prescott with Edison as the sole possessors of the *legal* title to the inventions still stronger.

The only question left is to determine whether in the assignment to Prescott such formalities have been observed as will authorize the Commissioner to issue the patents to Edison and Prescott, as assignees of the former. On this point it is only necessary to say that the assignment is in the very words of the form which has been sent out by the Patent Office for years past in its annual official edition of "Rules of Practice." The practice has been invariable in such cases to issue the patents to the assignees, whenever assignments in this form are put on record prior to the issue. I see no reason whatever for departing from this rule in this instance. In the absence of any decision by a higher tribunal invalidating patents thus granted, I think the Commissioner should follow the practice which, so far as my knowledge extends, has never been questioned heretofore.

The applications are remanded to the Principal Examiner, and, when ready for issue, the patents will be granted to Edison and Prescott, assignees of Edison.

DECISIONS OF THE COURTS.

U. S. CIRCUIT COURT, SOUTHERN DISTRICT OF OHIO.

WILLIAM W. PELTON AND HIRAM TAYLOR *vs.* GARDNER WATERS, JOSEPH J. STARR, AND CHARLES D. JOHNSON.

[*In equity.—Before* EMMONS *and* SWING, *J. J.—December*, 1874.]

The general rule is that the *first* in a series of applications for a patent is the one on which the patent, when granted, depends.

If, between the first and a second application for a patent, the patentee has manifested an actual intention to abandon the first, his patent will have relation to the last one only. His actual intention severs the proceeding.

W. and T., having filed applications for patents showing substantially the same device, at the respective dates March 31 and April 21, 1868, were rejected. T. persisted in his claim, and upon appeal secured his patent; while W. amended his application, excluding from his claim the common device, and thus, without appeal, obtained a patent of narrow scope. Subsequently, learning of T.'s patent, he filed a second application, broad enough to include the device previously omitted, and, in the consequent interference proceedings with T., was adjudged the prior inventor, and thereupon obtained a broad patent: *Held*, in a suit brought by T. against W., that W.'s second application was the commencement of a *new proceeding*, and that alone upon which the patent granted in pursuance of it depends; and, therefore, that the presumption, as regards priority of invention, was with T.

The accidental making of an improved article, in a single instance, without knowledge on the part of the producer of how to accomplish it, or to produce another like it, is not invention. (Letters patent for "Improvement in Lubricators," granted to Hiram Taylor, June 23, 1868, sustained.)

STATEMENT OF FACTS.

[Gardner Waters filed an application for letters patent for an "Improvement in Lubricators," March 31, 1868. On the 21st of April, 1868, Hiram Taylor made an application for a patent for substantially the same improvement. Both applications were rejected by the examiner. Waters narrowed his claim, and thereupon received a patent of limited scope; but Taylor persisted in his claim, and upon appeal secured his patent, which was issued to him June 23, 1868.

When Waters learned that a patent had been issued to Taylor with a "broad claim," he filed a second application, asserting therein a claim for the invention substantially as covered by the Taylor patent, and demanded an interference. This was granted him; and, upon the final appeal to one of the judges of the Supreme Court of the District of Columbia, he was adjudged the prior inventor; and accordingly letters patent were issued to him June 29, 1869.

The present suit under the Taylor patent had been begun in November, 1868, complainant's testimony being duly taken after the issue was joined.

In December, 1869, defendants filed an amended and supplemental answer, claiming that Waters was the first inventor, and setting up the interference decision.

Issue was joined upon this answer, and testimony for defendants, and rebutting proofs for complainants, taken and filed in 1870.

The hearing was had at the October term of 1874.

At the hearing the defendants objected to a certified copy of an application for a patent made by the complainant, Taylor, in September, 1867, which, it was claimed, described the device in controversy, on the ground that the copy of the application referred to drawings as being a part of the original application, no drawings, however, being attached to the copy. The objection was sustained by the court.]

[*Reuben Syler*, for complainants.
E. W. Kittridge, for defendants.]

EMMONS, *Circuit Judge*, delivered the opinion of the court.

The patent of the complainant, Taylor, antedates that of the defendant, Waters, and he is entitled to the presumption that his invention is novel.

This presumption is of importance only where the testimony is conflicting, and any considerable doubt is involved as to who is the first inventor. It is of but little consequence in this case. It has, however, been much argued.

The defendant insists that his application was made earlier than that of the complainant, and therefore his patent is to have relation to the date of its filing. As a general rule, this is undoubtedly true.

We do not intend to question, or even qualify, any of the cases on the subject, which we recently considered and applied in the case of the *Dental Vulcanite Co.* vs. *Willis*. These judgments assert several exceptions to the application of the rule.

If, intermediate the first and second application, the patentee manifests an actual intention to abandon the first, his patent will have relation to the last one only. His actual intention severs the proceeding. The law deems the first application terminated and as bearing no relation to the patent, which rests solely on the last one.

A withdrawal of a first application, and the reception of the fee paid back from the department, under the statute, is also a severance of the proceedings. The application so withdrawn is not deemed part of any proceeding, under a subsequent proceeding for a patent.

These are but illustrations of exceptions to the general principle, which deems the first in a series of applications for a patent as that upon which a patent depends.

We think the case before us comes within the reason of these exceptions.

Under the first application of the defendant he actually received a patent, after having amended his specifications so as to exclude the present device. We think this action wholly terminated the first proceeding. It was ended in the accomplishment of its object. The decision of the department was acquiesced in, and its final judgment obtained.

The subsequent application in such circumstances must be deemed the commencement of a new proceeding, and as that alone upon which the patent granted in pursuance of it depends.

This last application was subsequent to that of complainant's patent; and, as they are both for precisely the same device, the presumption is in favor of priority of invention on the part of complainant.

The complainant swears that in the fall of 1866 he cast an impervious joint upon the neck of a bottle. He proves his statement by a blacksmith, who came to present an account, and saw such a bottle in his shop; and the complainant's brother testifies that he also saw it at a subsequent period.

If his rights depended upon our adopting the theory that he completed his invention at that time, by such means, we should dismiss the bill. Positive as the testimony is, the fact of success at a period so early is too inconsistent with his subsequent conduct, manifestly evincing an entire ignorance of the thing we think he subsequently invented. Such singular stories are incident in nearly all these controversies in reference to priority of invention.

Parties frequently prove the making of some fixture which is destroyed; of some model which is lost; and some conversation which has never been acted upon sufficiently early to antedate his opponent. We could give many reasons why we fear the history of this caster-bottle finds its origin in the fact that the defendant in his testimony places his discovery about a year earlier than we think it was invented by any one.

Far more satisfactory and convincing is the proof that the complainant, in the latter part of 1867 and subsequently, was making and vending, in large quantities, the patented device. The defendant's agent, Pelton, who was selling at that time a different article for the defendant, in the fore part of 1868, bought of the complainant a number of lubricators of the kind in question, to supply the place of an inferior article, manufactured by the defendant, which he had sold for him, and which, on account of their leaking had to be supplied by a better.

It is needless to recapitulate the proofs; they are abundant and uncontradicted to show that, from the latter part of 1867 forward, the complainant was in the full manufacture and sale of the patented device. There is no satisfactory evidence of its invention before that date. It is with this concession that we grant him a decree.

To overcome this case and prove the defendant to be a prior inventor, he himself swears that, in the latter part of 1866, he too made an impervious joint upon the neck of a glass globe, tested it with steam, and placed it upon the cross head of an engine, where it worked successfully, as he proves by Henderson, the colored engineer, for three successive years. The witnesses, Reynolds and Phillips, with more or less confirmation, sustain Henderson.

We are absolved from the duty of contrasting this proof with other unquestioned facts in the case, for the purpose of ascertaining whether it was not 1867 instead of 1866 that this successful lubricator was made because the defendant's own statement as a witness renders it wholly unnecessary. He says, most explicitly, that, though he did succeed accidentally in making one close joint upon the neck of that single globe, he tried in vain, for five months thereafter, to make another. He says he broke many bottles in the attempt; that he did not even partially succeed but in a single instance during the five months; and that one leaked so badly it was unfit for use. It was not until 1868 that he learned how to produce a close joint; and, at a time considerably after complainant was publicly manufacturing them. The accidental making of this one joint without any knowledge on the part of the producer of how to accomplish it, with utter inability on his part to produce another like it, is not invention. His ignorance was so complete concerning the mode of its production that he himself swears he not only did not attempt their manufacture, but laid aside a large stock of material during this period for the making of a wholly different article. These he did manufacture and put upon the market through Starr & Pelton, his agents. He not only had not invented a close joint, but he had so little hope of success that he prepared extensively for the making of a different and inferior lubricator. In these circumstances a single fortuitous success is by no means invention, within the protection of the patent law. He not only did not, and could not, give it to the public, but he did not possess it himself. It might as well be claimed that he that should be carrying three bottles in a basket, which being accidentally broken, their contents mixing in unknown quantities upon the earth makes some useful compound, and enters upon a series of experiments for the purpose of ascertaining, if possible, its relative proportions, but who does not succeed in doing so until after another has successfully completed the discovery, can antedate him by proof of the casualty by which he saw the same thing produced. When the defendant saw the first bottle on the cross-head of the engine, without any knowledge of the mode by which he could make another, he stood in no other relation to it, as far as the patent law is concerned, than if it had been placed there by somebody else.

It is not necessary to consider the many other facts in the case which tend to show that the defendant in fact obtained his knowledge of the device from the complainant. We refer to a few of them only, as illustrating the rightfulness of the principle we apply to the defendant's testimony. When Pelton, his agent for the sale of a different manufacture, as late as 1868, presented the defendant with one of the complainant's lubricators, he pronounced it impracticable. He said they could not be profitably made, and that Pelton did not know how many bottles must necessarily be broken by the complainant in making his lubricator.

Other analogous proofs exist. We refer to these single instances only, to show the inconsistency of treating that man as an inventor who is so discouraged by his own failures, and the repeated breaking of his bottles, that he pronounces the attempt impracticable, and is himself at that time manufacturing a different and poorer article nearly a year and a half after the mysterious production of the close joint which the Court is asked to believe was placed upon the cross-heads in 1866.

We think the presumption of the law arising from the anterior patent of the complainant, is consonant with the inference of the fact to be drawn from the testimony.

The complainant was the first inventor of the lubricator described in his patent. The accidental making of one in 1866 by the defendant, if every thing occured precisely as he swears it did, is not invention in any sense. There can hardly be said to be a conflict of testimony in reference to the fact, that the complainant for many months before the defendant did so, manufactured and put these articles on the market.

There may be a decree for the complainant in the usual form.

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date March 16, 1875.]

8,206.—Aquariums.—JOSEPH W. FISKE, New York, N. Y. Application filed February 26, 1875. Term of patent 7 years.

8,207.—Mustard-Bottle.—JACOB GULDEN, New York, N. Y. Application filed December 11, 1874. Term of patent 3½ years.

8,208.—Carpet.—ALFRED HEALD, Philadelphia, Pa., assignor to HUGH MCCALLUM, ORLANDO CREASE, ANDREW J. SLOAN, and WILLIAM MCCALLUM, same place.—A'. Application filed February 15, 1875. Term of patent 3½ years.

8,209.—Gauntlet.—BYRON G. SHULTS, Johnstown, N. Y. Application filed January 2, 1875. Term of patent 3½ years.

8,210.—Perfumery-Bottle.—GUSTAVUS STORM, Philadelphia, Pa. Application filed February 8, 1875. Term of patent 3½ years.

TRADE-MARKS REGISTERED DURING THE WEEK.

[Each Certificate bearing date March 16, 1875.]

2,287.—Perfumery.—WILL B. DORMAN, Georgetown, Mass. Application filed January 13, 1875.

"'CHAMPAGNE COLOGNE,' arranged as shown in the accompanying engraving, with the figure of a low broad perfume bottle or jug, with a handle on each side, and supporting an elephant which stands with feet close together upon the stopper."

2,288.—Cooking-Stove.—MARCUS L. FILLEY, Lansingburg, N. Y. Application filed December 23, 1874.

"'TEXAS GIRL.'"

2,289.—Medicine.—BONFIELD GORRELL, Hopewell, Md. Application filed March 9, 1875.

"'S. B.—75—1 D.'"

2,290.—Cigars.—HARNED & Co., Brooklyn, N. Y. Application filed March 5, 1875.

"side view or representation of the so-called East River bridge."

2,291.—Medicine.—JOHN F. HENRY, CURRAN & Co, New York, N. Y. Application filed February 13, 1875.

"Elaborate device. 'Dr. Wm. Hall's Balsam;' a female seated near the seashore; implements of agriculture and husbandry; an Indian pointing to distant object; a half-draped female figure with arm encircling the neck of American eagle, &c."

2,292.—Flour.—THOMAS C. JENKINS, Pittsburg, Pa. Application filed November 16, 1874.

"'White River.'"

2,293.—Prong Hoes.—REISIG & HEXAMER, New Castle, N. Y. Application filed January 25, 1875.

"'Hexamer's Prong Joy-Hill Hoe.'"

2,294.—Cigars.—A. SCHUNEMAN & Co., Detroit, Mich. Application filed March 4, 1875.

"'Commercial Traveler.'"

2,295.—Lubricating-Oils.—WILLIAM C. STILES, Jr., Volcano, W. Va. Application filed February 23, 1875.

"'Zero.'"

2,296.—Soap.—THE KENDALL MANUFACTURING COMPANY, Providence, R. I. Application filed March 8, 1875.

"'HOME.'"

2,297.—Deviled Entremets.—WILLIAM UNDERWOOD & Co., Boston, Mass. Application filed October 25, 1870.

"Picture of a red devil, monogram, &c."

2,298.—Burning-Fluid.—BUCKLEY A. ROSE, Urbana, Ohio. Application filed November 26, 1870.

"'Rose Burning-Fluid,' in conjunction with an illustration of a rose."

2,299.—Liniment.—ELFRET MAATMAN, St. Louis, Mo. Application filed March 6, 1875.

"the figure of a bell."

2,300.—Fertilizers.—THE PATAPSCO GUANO COMPANY, Baltimore, Md. Application filed March 1, 1875.

"'Patapsco Ammoniated Soluble Phosphate.'"

2,301.—Chemical for Dyeing.—WEEKS & DUPEE, Boston, Mass. Application filed October 18, 1871.

"'Aurantine.'"

APPLICATION FOR EXTENSION.

UNITED STATES PATENT OFFICE,
Washington, D. C., March 22, 1875.

On the petition of JOHN HASELTINE, of Boston, Mass., authorized by act of Congress approved February 18, 1875, praying for the extension of a patent granted to him on the 25th day of March, 1856, for an Improvement in Water-Wheels,

It is ordered that the testimony in the case be closed on the 11th day of May next; that the time for filing arguments and the Examiner's report be limited to the 21st day of May next; and that said petition be heard on the 26th day of May next.

Any person may oppose this extension.

J. M. THACHER, *Commissioner.*

INDEX OF INVENTIONS PATENTED MARCH 16, 1875.

	Class No.	No. of Patent.
Acid from borate of lime, obtaining boracic, F. Formhals	35	160,761
Advertising medium, C. H. and H. F. Torsch	54	160,971
Air compressors, relief apparatus for, G. H. Reynolds	2	160,956
Alarm, burglar, M. E. Lasher	24	160,918
Alloy, bronze, S. Doubleday	99	160,885
Anatomical specimens, jar for, J. M. Maris	156	160,926
Anvils, casting steel faced, J. Donovan	33	160,816
Atomizer, C. Weed	98	160,892
Awning, C. J. Trumper	102	160,973
Bag, rubber coated, W. D. Grimshaw	84	160,897
Barrel barrow, J. H. Brown	31	160,810
Barrel crozing machine, Steel and Munson	40	160,966
Bed bottom, P. C. Ingersoll	62	160,913
Bed bottom, E. W. Tucker, (reissue)	62	6,338
Bed bottom, spring, E. P. Bennett	62	160,809
Bedstead, C. Snyder	62	160,963
Bedstead, wardrobe, R. G. McClure	62	160,833
Beer vent, J. W. Spahn	40	160,847
Bill holder and separator, combined, A. M. Lockhart	146	160,780

	Class No.	No. of Patent.
Bird food holder, S. E. Tompkins	170	160,853
Blacking for boots, &c., C. Alvord	16	160,741
Blind stop, G. Woodward	24	160,805
Boiler feeder, F. McGuire	148	160,930
Boilers, feed water heater for steam, H. N. Waters	148	160,979
Book clip, H. T. Dunlap	146	160,886
Boot or shoe tip, Merrill and Hoitt	16	160,835
Boots, &c., blacking for, C. Alvord	16	160,741
Bowling alley, A. A. Hamlin	143	160,900
Box, sheet metal, W. C. McGill	136	160,834
Brick, mold for angle, J. H. Mathes	20	160,832
Bridle bit, J. P. Hisley	72	160,772
Brush, W. A. Megraw	24	160,933
Bucket ear, J. D. Field	136	160,818
Buckle, J. Hudson	23	160,912
Buckle, trace, J. P. Hisley	74	160,909
Burial caskets, composition for coating, C. H. Mulligan	39	160,784
Burner for the manufacture of lamp black, gas, P. Neff	107	160,787
Burner for the manufacture of lamp black, gas, P. Neff	107	160,789
Burner, gas, E. Evans	64	160,758
Burner, waste gas, P. Neff	64	160,785
Burners, automatic lighter for gas, E. L. Megill	64	160,932
Can for mixing paint, W. W. Thayer	107	160,852
Cap, traveling, A. Schwarz	76	160,844
Car coupling, W. Green	122	160,822
Car coupling, M. Kurtzeman	122	160,779
Cars, signal light for railroad, Burnham and Strong	120	160,871
Car starter, D. D. Hardy	122	160,769
Car truck, railroad, A. Gilman	122	160,821
Car wheel, S. B. Chapman	122	160,814
Cars, device for moving railroad, B. F. Phelps	121	160,839
Cars, &c., with endless traveling devices, clamp apparatus for connecting street, W. Eppelsheimer	122	160,757
Carriage, child's, R. Kreter	31	160,917
Carriage painter's easel, A. G. Rykert	31	160,959
Carriage spring, J. Enders	31	160,857
Carriage top, C. Heergeist	31	160,905
Carriage top support, A. Goodyear	31	160,894
Cart, dumping, J. J. Adgate	31	160,861
Cartridge, metallic, F. W. Freund	32	160,763
Casting steel faced anvils, J. Donovan	33	160,816
Chair, J. V. Meigs	62	160,934
Chair, folding, G. E. Whitmore	62	160,985
Chair, tilting, W. Gardner	62	160,764
Chair, tilting, R. W. Myers	62	160,943
Clamp, S. Kuh	29	160,778
Clamp, S. Rydbeck	29	160,960
Cloth shearing machine, I. L. Holmes	37	160,825
Clothes drier, L. Whipple	91	160,980
Clothes pin, O. F. Porter	91	160,840
Clothes pin machine, J. W. Millet	175	160,783
Coal hod, E. W. Byrn	154	160,873
Coke, machine for crushing, C. Glazier	61	160,765
Compress, A. A. Lelievre	156	160,830
Cooler, beer, B. A. Stevens	19	160,796
Corks, device for removing wire fastenings from, G. A. Potter	88	160,950
Corpse cooler, C. Hoff	39	160,910
Corpse cooler, C. O. Peck	39	160,948
Cotton chopper, T. C. Burnham	43	160,811
Cotton chopper, Mickle and Dearring	43	160,937
Cotton planting attachment to harrows, S. H. Wade	133	160,975
Cotton worms, machine for distributing compounds for destroying, W. T. Willie	63	160,986
Curtain fixture, H. E. Busch	62	160,872
Cutlery, handle for, O. W. Taft	44	160,909
Digger, potato, M. W. Knox	114	160,776
Drill chuck, J. O. Reilley	100	160,954
Drill, corn, J. B. Ludlow	133	160,923
Drill for well boring, J. M. May, (reissue)	124	6,337
Egg beater, M. Cline	88	160,815
Ejector, fluid, G. Westinghouse, Jr	118	160,803
Elevator, J. B. Sweetland	79	160,850
Elevator, stump, J. M. Bachelor	79	160,866
Elevator, stump, J. H. Barnes	79	160,808
Engine, compound, C. E. Emery	150	160,817
Engine governor, steam, Judson and Cogswell	69	160,774
Exercising machine, A. M. Allen	143	160,863
Farm box, M. M. Murray	63	160,942
Faucet, bottling, A. C. Meyer	1	160,936
Fire arm, breech loading, E. Burt	18	160,748
Fire arm, breech loading, D. Couner	18	160,880
Fire arm, breech loading, F. W. Freund	18	160,762
Fire arm, breech loading, C. A. King	18	160,915
Fire arm, breech loading, J. Lee	18	160,919
Fire arms, sight for, F. W. Freund	55	160,819
Fire arms, stock for, J. V. Meigs	55	160,935
Fire plug or hydrant, D. Minich	167	160,941
Gaiter, compress, J. W. Tutewiler	16	160,854
Game board, O. A. Gill	143	160,820
Gas from hydrocarbon liquids, apparatus for the production of, F. G. Voigt	27	160,799
Gate, swinging, F. Raymond	52	160,842
Glue drier, S. T. Swasey	26	160,797
Grain band, C. L. Travis	74	160,972
Grain drill, B. Kuhne	133	160,829
Grain, unloading and dumping, J. B. Whitcomb	79	160,984
Grate, J. Byington	154	160,813
Grate, parlor, G. W. Walker	154	160,856
Harness clip, F. Conway	73	160,751
Harrow, W. T. McGhee	73	160,929
Harvester, M. L. Gorham	74	160,895
Harvester, C. D. Shrader	74	160,845
Harvester rake, I. Dodenhoff, (reissue)	74	6,339
Harvester rake, A. A. Henderson, (reissue)	74	6,336
Heater for steam boilers, feed water, H. N. Waters	148	160,979
Hooks, manufacture of snap, A. B. Conde	23	160,879
Ice creeper, A. L. Willis	16	160,804
Jack, lifting, J. J. Adgate	79	160,860
Jar for anatomical specimens, J. M. Maris	156	160,926
Jewelry, die for making metallic bases for, G. Stetter	86	160,967
Kettle for heating or cooking by steam, G. W. Walker	154	160,857
Key ring, H. Tilden	23	160,970
Kiln, brick, R. F. Marshall	20	160,927
Knob, door, S. Hiler	93	160,908
Knob rose, S. Hiler	93	160,907
Lamp, Storey and Lewis	90	160,848
Lamp extinguisher, W. H. Zimmerman	90	160,988
Lamp pendant, E. Stevens	90	160,968
Lampblack, gas burner for the manufacture of, P. Neff	107	160,787
Lampblack, gas burner for the manufacture of, P. Neff	107	160,789
Lampblack, manufacture of, Faics and Neff	107	160,759
Lampblack, manufacture of, P. Neff	107	160,786
Lampblack, manufacture of, P. Neff	107	160,788
Lantern, L. F. Betts	90	160,744
Lath sawing machine, P. W. Hart	174	160 903
Lath sawing machine, M. S. Norton	174	160,838
Lathe centers, machine for grinding, M. R. Lemman	100	160,921
Leather, finishing, J. H. Radey	92	160,841
Leather seams, machine for pressing, J. W. Hatch	16	160,770
Limekiln, Cole and McCulloch	153	160,878
Liquids, drawing effervescent, Malmström and Dummer	1	160,925
Lock for doors, &c., H. Wiun	93	160,859
Lock, seal, J. N. Smith	93	160,962
Loom for weaving suspender webbing, C. H. Chapman	95	160,749
Loom shuttle, M. Safford	95	160,843
Lubricating can, L. F. Betts	87	160,745
Mains, machine for tapping, J. J. Quinn	167	160,952
Mangle, H. Tamme	91	160,851
Mantels, apparatus for marbleizing, R. J. Howdon	54	160,911
Measuring instrument, distance, W. F. Harrach	42	160,823
Meat chopper, A. Nittinger, Jr	25	160,944
Metal, machine for shearing, Walsh and Dutot	119	160,858
Mill, disintegrating, G. B. Davids	57	160,884
Mill, disintegrating, J. M. Hendricks	57	160,771
Mill spindle, R. S. Cathcart	57	160,874
Millstone balance, J. A. Althouse	57	160,864
Millstone bush, R. S. Cathcart	57	160,875
Mower, lawn, H. C. Crowell	75	160,822
Mowing machine, A. B. Allen, (reissue)	74	6,332
Music leaf turner, F. G. Johnson	102	160,926
Neck tie, A. J. Adams	38	160,806
Needle book, F. Swan	38	160,849
Nut lock, J. J. Adgate	14	160,862
Ornament, personal, F. C. Kiergaard	54	160,828
Pan forming machine, G. A. Bowers	136	160,747
Pantaloons, &c., J. W. Davis, (reissue)	38	6,335
Paper bag machine, H. S. Merrill	109	160,782
Paper clip, W. V. Perry	146	160,949
Paper drier, Hatch and Smith	108	160,824
Paper pulp engine, M. R. Boujn	108	160,746
Parasol and whip, combined, J. Perrins	165	160,791
Pen and pencil case, G. W. Mable	146	160,934
Picture frame hanger, Dobbs and Brayton	63	160,754
Piers, construction of, Milroy and Butler	82	160 938
Pile driver, steam, T. T. Loomas	82	160,781
Pistol stock, W. L. Godfrey	55	160,766
Piston, T. S. Davis	151	160,752
Planter and fertilizer distributer, cotton seed, J. B. Legg	133	160,930
Planter, gang corn, S. P. Evans	133	160,889
Plow, J. O. Minor	114	160,836
Plow, steam, J. Fogarty	114	160,760
Pouncing block, H. G. Diabrow	76	160,753
Press, hay, C. Waste	7	160,976
Printing press for dating letters and canceling stamps, rotary, Palmer and Clark	146	160,947
Prism, A. K. Eaton	157	160,756
Projectiles, attaching rings to, J. Vavasseur	105	160,855
Propeller, endless chain, E. E. Everitt	139	160,890
Pump, J. S. Aeh	118	160,742
Pump bucket, chain, A. L. Corey	118	160,881
Pump or motor, rotary, N. Upham	118	160,974
Pumps, sectional bucket for, G. W. Burr	118	160,812
Railway, elevated, L. Lotz	120	160,831
Railway rail joint, J. M. Kenny	120	160,916
Railway rail joint protector, I. Mills	120	160,940
Reversing mechanism, R. B. and J. C. Chapman	87	160,877
Rule, measuring, G. S. Hastings	97	160,904
Sad iron, J. M. McMaster	91	160,931
Sails to spars, metallic roband for attaching, H. B. Stephenson	138	160,795
Sash balance, O. Davis, (reissue)	24	6,334
Saw mill head block, F. N. Whitcomb	130	160,962
Saw mill head block, F. N. Whitcomb	130	160,963
Sawing laths, machine for, P. W. Hart	174	160,903
Sawing laths, machine for, M. S. Norton	174	160,838
Sawing machine, J. Gehr	130	160,892

	Class No.	No. of Patent.
Sawing machine, W. P. Hale	130	160,899
Sawing machine, M. M. Miller	130	160,939
Sawing machine, scroll, J. Hale	130	160,768
Seaming machine, double, F. Kenney	136	160,775
Separator, grain, W. S. Clymans	150	160,750
Sewing machine cording attachment, H. C. Jones	134	160,827
Sewing machine motor, B. C. Chambers	134	160,876
Sheep skins, fleshing, dressing, and finishing, R. Hart	92	160,902
Shirt stud, E. W. Averell	86	160,865
Shoe, A. Ballard, (reissue)	16	6,333
Sifter, ash, F. Anthes	154	160,807
Sign, street, H. S. Finney	146	160,891
Sled, hand, J. B. Monroe	31	160,857
Steam and air brake, J. R. Reniff	122	160 955
Stench trap, R. L. Walker	8	160,800
Still, rectifying, E. F. Prentiss	47	160,951
Stone, machine for channeling and sawing, English and Willard	153	160,888
Stove, W. Doyle	154	160,755
Stove, barrel, J. F. Scholes	154	160,961
Stove, cooking, R. Thomas	154	160,798
Stove fire back, G. W. Herrick	154	160,906
Straw twisting machine, S. Kuh	127	160,777
Sugar cutting machine, G. P. Ockershausen	155	160,945
Sugar, refining, F. O. Matthiessen	155	160.928
Surcingle, H. M. Witter	72	160,987
Table and bed combined, office, D. Walker	62	160,801
Table, ironing, A. C. Gilbert	91	160,893
Table, ironing, S. C. Hamlin	91	160,901
Tenons, machine for relishing, E. A. Rowley	173	160,857
Toy fire arm, E. T. Starr	143	160,965
Valve, check, W. H. H. Bowers	152	160,869
Valve, safety, A. Orme	148	160,790
Valve, steam, J. Johnson	152	160 914
Vegetable washer, J. Brooks	88	160,870
Vehicle axle skein, B. Snyder	31	160,964
Vehicle chafing iron, G. Smith	31	160,793
Vehicle fender, H. M. Curtis	31	160,883
Wagon cover, E. M. Saunders	31	160,792
Wash bench, F. and M. Way	91	160,977
Wash bench, F. and M. Way	91	160,978
Washing goods in the piece, machine for, C. J. Barker	11	160,743
Watch key, ratchet, G. A. Beidler	36	160,867
Water closet, J. H. Gould	8	160,896
Water meter, A. Guthrie	167	160,767
Water proof compound, W. D. Grimshaw	35	160,898
Water wheel, R. R. Royer	168	160,958
Wind wheel, S. and D. Johnson	118	160,773
Windmill, O. B. Blakeslee	118	160 898
Windmill, G. H. Lucas	118	160,922
Windmill, A. and G. Raymond	118	160,953
Windmill, A. H. Southwick	118	160,794
Wood, apparatus for preserving, G. B. Smith	35	160,846
Wrench, J. L. Whipple	100	160,981
Wrench, pipe, H. Otto	100	160,946

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED MARCH 16, 1875.

	Patent No.
Adams, A. J., Neck tie	160,806
Adgate, J. J., Lifting jack	160,860
Adgate, J. J., Dumping cart	160,861
Adgate, J. J., Nut lock	160,862
Aiken, J., assignee	160,949
Allen, A. B., Mowing machine, (reissue)	6,332
Allen, A. M., Exercising machine	160,863
Althouse, J. A., Millstone balance	160,864
Althouse, M. J., assignee	160,953
Alvord, C., Blacking for boots, &c	160,741
Anthes, F., Ash sifter	160,807
Ash, J. S., Pump	160,742
Averell, E. W., Shirt stud	160,865
Bachelor, J. M., Stump elevator	160,866
Ballard, A., Shoe, (reissue)	6,333
Barker, C. J., Machine for washing goods in the piece	160,743
Barnard, H., assignee	160,865
Barnes, J. H., Stump elevator	160,808
Beidler, G. A., Ratchet watch key	160,867
Bell, J. P., assignee	160,836
Bennett, E. P., Spring bed bottom	160,809
Betts, L. F., Lantern	160,744
Betts, L. F., Lubricating can	160,745
Blakeslee, O. B., Windmill	160,868
Bogardus, F. P., assignee	160,883
Bonfield, J. F., assignee	160,747
Booth, C. L., assignee	160,769
Boujn, M. R., Paper pulp engine	160,746
Bowers, G. A., Pan forming machine	160,747
Bowers, W. H. H., Check valve	160,869
Brayton and Dobbs	160,754
Brooks, J., Vegetable washer	160,870
Brown, J. H., Barrel barrow	160,810
Brown, N. G., assignee	160,948
Brown, W. A., assignee	160,753
Brown, Z. C., assignee	160,894
Burnham, R. F., and W. F. Strong, Signal light for railroad cars	160,871
Burnham, T. C., Cotton chopper	160,811
Burr, G. W., Sectional bucket for pumps	160,812
Burt, E., Breech loading fire arm	160,748
Busch, H. E., Curtain fixture	160,872
Bushnell, A. R., assignee	160,845
Butler and Milroy	160,938
Byington, J., Grate	160,813
Byrn, E. W., Coal hod	160,873
Case, J. A., assignee	160,725
Cathcart, R. S., Mill spindle	160,874
Cathcart, R. S., Millstone bush	160,875
Chambers, B. C., Sewing machine motor	160,876
Chapman, C. H., Loom for weaving suspender webbing	160,749
Chapman, R. B. and J. C., Reversing mechanism	160,877
Chapman, S. B., Car wheel	160,814
Clark and Palmer	160,947
Cline, M., Egg beater	160,815
Clymans, W. S., Grain separator	160,750
Cogswell and Judson	160,774
Cohn, L., assignee, (reissue)	6,333
Cole, F., and D. D. L. McCulloch, Limekiln	160,878
Conde, A. B., Manufacture of snap hooks	160,879
Conner, D., Breech loading fire arm	160,880
Conway, F., Harness clip	160,751
Corey, A. L., Chain pump bucket	160,881
Covington, W. J., assignee	160,975
Crane, Breed & Co., assignees	160,905
Crowell, H. C., Lawn mower	160,882
Curran, P. D., assignee	160 836
Curtis, H. M., Vehicle fender	160,883
Davids, G. B., Disintegrating mill	160,884
Davis, J. W., Pantaloons, &c., (reissue)	6,335
Davis, O., Sash balance, (reissue)	6,334
Davis, T. S., Piston	160,752
Dearring and Mickle	160,937
Delamater, C. H., assignee	160,956
Denmead, T., assignee	160,884
Dennis, J. S., assignee	160,744, 160,745
Detroit Stove Works, assignee	160,906
Diebrow, H. G., Pouncing block	160,753
Dobbs, S., and W. M. Brayton, Picture frame hanger	160,754
Dodenhoff, I., Harvester rake, (reissue)	6,339
Donovan, J., Casting steel faced anvils	160,816
Doubleday, S., Bronze alloy	160,885
Doyle, W., Stove	160,755
Dummer and Malmström	160,925
Dunke, C. H., assignee, (reissue)	6,338
Dunlap, H. T., Book clip	160,886
Dutot and Walsh	160,858
Dutton, R., assignee, (reissue)	6,332
Eaton, A. K., Prism	160,756
Edgerton, W. W., assignee	160,929
Emery, C. E., Compound engine	160,817
Enders, J., Carriage spring	160,887
English, N. F., and C. M. Willard, Machine for channeling and sawing stone	160,888
Eppelsheimer, W., Clamp apparatus for connecting street cars, &c., with endless traveling devices	160,757
Evans, E., Gas burner	160,758
Evans, S. P., Gang corn planter	160,889
Everitt, E. E., Endless chain propeller	160,890
Faics, L. S. and P. Neff, manufacture of lamp black	160,759
Field, J. D., Bucket ear	160,818
Finney, H. S., Street sign	160,891
Fogarty, J., Steam plow	160,760
Fordyce, B., assignee	160,836
Formhals, F., Obtaining boracic acid from borate of lime	160,761
Freund, F. W., Breech loading fire arm	160,762
Freund, F. W., Metallic cartridge	160,763
Freund, F. W., Sight for fire arms	160,819
Gardner, W. Tilting chair	160,764
Gehr, J., Sawing machine	160,892
Gilbert, A. C., Ironing table	160,893
Gill, O. A., Game board	160,820
Gillespie, J., assignee	160,902
Gilman, A., Railroad car truck	160,821
Gish, J. C., assignee	160,929
Glazier, C., Machine for crushing coke	160,765
Godfrey, W. L., Pistol stock	160,766
Goodyear, A., Carriage top support	160,894
Gorham, M. L., Harvester	160,895
Gould, J. H., Water closet	160,896
Grain Binder Company, assignee	160,972
Green, W., Car coupling	160,822

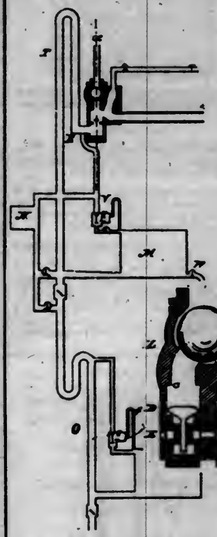
TITLES, DRAWINGS, AND CLAIMS

OF

PATENTS GRANTED MARCH 16, 1875.



160,741. BLACKING FOR BOOTS, &c. Clark Alvord, Binghamton, N. Y. [Filed Jan. 26, 1875.]

Brief.—Compound of paraffine, bees wax, and bone or lamp black.

The composition, for blacking herein described, compounded of the materials substantially as above set forth.

160,742. PUMPS. Jno. S. Ash, Buckingham, Pa. [Filed Sept. 16, 1874.]

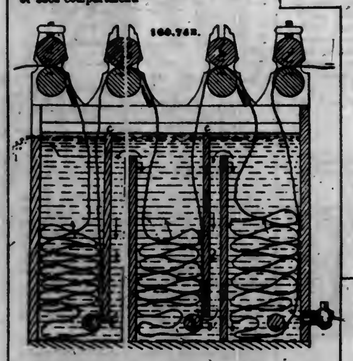
Brief.—A column of water is made to descend alternately through two vertical passages by a ball-valve, which vibrates over them within a common valve-chamber. The vertical tubes have horizontal outlets and pipe-connections (including check-valves) with a water-source below the vibrating ball. By suddenly checking the descent of the water through the vertical passage, the momentum of the column through the outlet-pipe below the ball operates to create a vacuum in the pipe-connection with the water-source below, and, by means of a system of valves and cisterns, to raise the water through it.

1. The passages L L', communicating with a common valve-chamber, for the purpose specified.

2. Ball B or its equivalent, in combination with passages L L', for the purpose of stopping and renewing the flow of liquid through L and L'.

3. The valves D D', in combination with the upper valve-seats C and C', for the purpose specified.

4. The branch G, for the purpose of separating air from a stream of liquid, the flow of which is made intermittent, for the reason specified.



5. The chamber M, combined with tubes B V and E T O, for the purpose specified.

6. The valve arrangement V, consisting of passages A and a, opened and closed by valves e and b, as and for the purpose specified.

7. The chamber E, communicating with M for the purpose specified.

160,743. MACHINES FOR WASHING GOODS BY THE PIECE. Cyrus J. Barker, Lewiston, Me. [Filed Dec. 28, 1874.]

Brief.—Pieces the goods in folds into compartments, through which in a reverse direction water passes from the bottom to the top of such compartment.

1. The combination, with the tank, of the partitions *b*, which do not extend to the top of the tank, and partitions *c*, which do not extend to the bottom of the tank, and arranged with relation to each other substantially as shown and described, whereby the water passes from the top of one compartment into the bottom of the other compartment, as described.

2. The combination, with a tank provided with the partitions *b c*, having alternate top and bottom passages, arranged with relation to each other as shown, of the squeezing-rollers, one set for each pair of intermediate partitions, *b c*, and moving at substantially the same velocity, as and for the purpose set forth.

3. The combination, with the tank-compartments, divided by partitions *b c*, having alternate top and bottom passages, to control the passage of the water, and the fabric-moving rollers, of a water-supply pipe, A, at or near the bottom of the fabric-delivering end of the machine, adapted to maintain a current of water from that end of the tank to the fabric-receiving end of the tank, and over and under the partitions, substantially as described.

4. The combination, with the upper rollers *g*, of the lifting-levers, to permit the introduction of the fabric in folds, as and for the purpose set forth.

160,744. LANTERNS. Lewis F. Bettis, Chicago, Ill., assignor of one-half his right to Joseph F. Dennis and H. N. Wheeler, same place. [Filed May 25, 1874.]

Brief.—Guard-wires rigidly secured to the bottom, and resting upon a spring in the dome, which is provided with vertical slots, to admit the guard-wires and permit their vertical adjustment.

1. In combination, the slotted dome D with the spring E inside, and the guard-wires C C, having their upper ends resting on top of said spring, substantially as specified.

2. The dome D, constructed with the shoulder *a* to receive the bottom of the spring E, and side slots *d* to admit the guard-wires C C, combined with said wires and spring.

3. The guard-wires C C, having their ends connected together, passing through the dome D and secured to the lower frame of the lantern, combined with said dome D, provided with slots *d* to admit said wires, and a spring, E, below said guard-wire, as set forth.

4. In a lantern constructed with the guard-wires C C, rigidly secured at their lower ends to the plate A, upon which the burner B *b* is mounted, a dome, D, with vertical slots to let the guard-wires pass through a spring, E, inside said dome, and operating against said guard-wire to keep said dome depressed, and a bail, G, attached to said guard-wires, combined as set forth.

160,745. LUBRICATING-CANS. Lewis F. Bettis, Chicago, Ill., assignor of one-half his right to Jos. F. Dennis and H. N. Wheeler, same place. [Filed May 25, 1874.]

Brief.—A spout ascends from the bottom of can, braced at top by a smaller pipe of outwardly-tapering form, which has an inner pipe of similar form, plugged by a cork in its middle. This latter pipe, by a pin protruding through a curved slot on the outer pipe, is adapted to revolve for the purpose of tightening and closing all orifices, or the contrary.

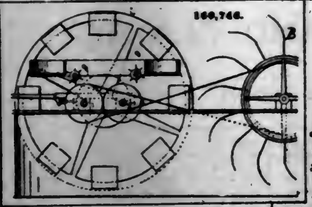
1. The combination of the spout B, the cross-pipe C, and the inner tube D, cut with apertures E G, substantially as specified.

2. The combination of the tapering cross-pipe C, cut with a spiral slot, *i*, and the tapering inner tube D, provided with boss or pin *s* and apertures, substantially as specified.

3. The combination of the cross-pipe C, united to the can, and the spout B, entering the bottom of the can, and discharging through said cross-spout C, substantially as specified.

4. The interior tube D, provided with partition H and apertures E G, substantially as specified.

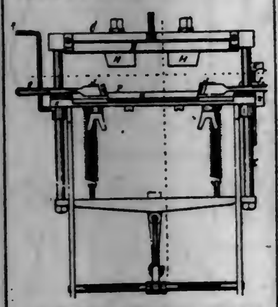
5. In combination with the tapering cross-spout C, provided with oblique slot *i*, and spout B, as described, the interior tapering sleeve D, provided with partition H and apertures E G, and pin *s*, to form a vent and spout for a can, as set forth.



160,746. PAPER-PULP ENGINES. Marcellin R. Boujo, Paris, France. [Filed Nov. 17, 1874.]

Brief.—Patented in France, June 26, 1874. The pulp or half-stuff is kept moving by a wheel with wings or vanes, and is dipped up by a bucket-wheel, poured into a two-winged distributing-trough, and flows thence to toothed cylinders, which distribute it to the crushing-cylinders.

The combination, in a pulp-making machine substantially as described, of the wing-ed wheel B, the cog-wheel C, and the delivering-cylinders, with projections D D', as and for the purposes herein set forth.

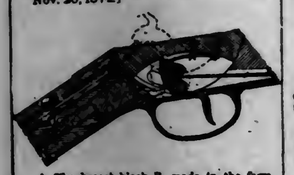


HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON

160,746.

160,747. PAN-FORMING MACHINES. Geo. A. Bowers, Chicago, Ill., assignor to Jos. P. Bonfield, same place. [Filed June 2, 1874.]

Brief.—The sheet of metal is seized between die blocks, while the side is turned up to form one side of the pan by a core-plate arranged on a folding apron. The edge of the sheet is folded over the core-plate to form a groove for the wire, and the corners are folded by levers attached to lower die-blocks.



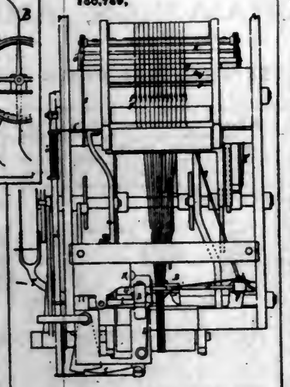
1. In combination with the movable cross-head C and mechanism to elevate and depress the same, the adjustable die-blocks H H J J and tilting core-plate M, as specified.

2. In combination with core-plate M, the forming-brake N, operating as described.

3. In combination with the core-plate M, the adjustable die-blocks H H and J J, provided with the levers O O, all arranged and operated substantially as and for the purpose specified.

4. In combination with the die-block E, provided with the circular groove r, the rabbeted die-block E', operating as specified, whereby the edges of the metal are closed around the wire, as described.

160,748. BREECH-LOADING FIRE-ARMS. Edwin Burt, Washington, D. C. [Filed Nov. 20, 1874.]



1. The breech-block B, made in the form and manner herein described, and for the purpose set forth.

2. The combination herein described of the hammer or striker, catch-spring K, and the breech-block, whereby the breech is opened by half-cocking the arm, and is then left free to be closed by thumb of the operator or the hammer, upon discharge.

3. The arrangement of the lock with the guard, and the attachment of the guard to the receiver, in the manner and for the purposes herein specified.

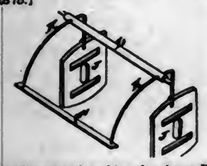
160,749. LOOMS FOR WEAVING SUSPENDER-WEBBING. Charles H. Chapman, Shirley, Mass. [Filed Jan. 20, 1875.]

160,749.

1. The combination of the auxiliary needle E with the main needle D, the lay B, and the shuttle H, all being provided with mechanism for operating them, substantially as described.

2. The combination of the harnesses M, formed with two eyes in each heddle, with the main and auxiliary needles D E, the lay B, and the shuttle H, to operate as set forth.

3. The combination of the shuttle-thread guide L with the needle or needles, the shuttle, and the lay, provided with mechanism for operating them, as set forth.



4. The combination of the shuttle-presser K with the shuttle H and its race G and carrier I, arranged and to operate as described.

5. The stop motion, substantially as described, composed of the series of furcated levers A', the shoulder-bar F, the reciprocating vibrator E, its operative arm e', the latch f, the slide-rod n', shoulder o', the spring o', and the shipper-latch S, all arranged to operate substantially as specified.

6. The shuttle-carrier I, provided with the bearing-horn q, and with the spring p, to draw the carrier toward the shuttle.

7. The shuttle-carrier actuating-levers s, provided with the spring t, to extend from it, as shown, into the notch o in the shuttle-carrier I, for the reception of said lever.

160,750. GRAIN-SEPARATORS. William S. Clymans, Burnt Cabins, Pa. [Filed Jan. 20, 1875.]

The combination of wind board m, levers K on rocking-shaft L, and slides J, as and for the purpose set forth.

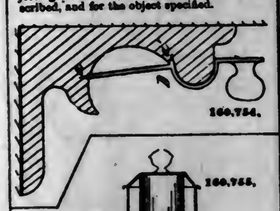
160,751. HARNESS-CLIPS. F. Conway, Buffalo, N. Y. [Filed Apr. 20, 1874.]

A strap-fastener consisting of the strap A, having at one end the catch or hook b, the metal plate B, attached to the ring a, and having the stud e and series of slots c, and the loop C, having the tag d, and encircling the strap and plate, and adapted to slide thereon, as and for the purpose described.

160,752. PISTONS. Thos. S. Davis, Jersey City, N. J. [Filed Feb. 2, 1875.]

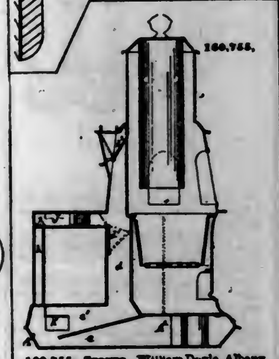
1. The piston constructed with the divided ring A, provided with lugs on its adjacent ends, compressed upon the packing C by means of the bolt or screw, substantially as and for the purpose set forth.

2. The flanged and rabbeted heads, the divided ring, having the lugs on its adjacent ends, the compressing bolt or screw, and the piston-stem, the whole arranged for operation substantially as and for the purpose set forth.



160,753. POUNCING-BLOCKS. Henry G. Disbrow, Newark, N. J., assignor to himself and William A. Brown, Newton, Mass. [Filed Feb. 16, 1875.]

A lint-pouncing block or form, A, composed of cork, substantially as and for the purpose set forth.



160,754. PICTURE-FRAME HANGERS. Socrates Dobbe and Wm. M. Brayton, Rochester, N. Y. [Filed July 2, 1874.]

A picture-frame hanger, consisting of a plate, D, formed with upper and lower projecting teeth a a', as herein shown and described, and for the object specified.

160,754.

160,755.

160,755. STOVES. William Doyle, Albany, N. Y. [Filed Dec. 16, 1874.]

Brief.—The direct draft being closed by the damper near the exit-flue, the smoke dives to the base-chamber, passes to the rear and returns in contact with the bottom of the oven, and ascends between the oven and fire-pot.

By closing the above damper and the one between the oven and fire-pot, and opening the ring-damper situated under the pot-hole, the smoke is compelled to pass back and forth over the oven, and does not dive to the base. By partially closing the latter and partially opening the one between the oven and fire-pot, none of the smoke may be made to circulate entirely around the oven.

1. The combination, with a heating-stove proper, of an oven, located laterally at the rear of said stove, and an ascending flue between the said stove proper and the said oven, and of the flue-chamber J, rear flue h, and return-flue e', to heat the said oven by the hot gases drawn from the combustion-chamber of the stove proper, and passing over the top, down the rear, and beneath the bottom, of the oven, and up the ascending flue, substantially as set forth.

2. In combination with a heating-stove proper and an oven placed laterally from the same, the flues c c and c', or their described equivalents, leading from the flues in the base of the stove proper to beneath the oven, and the flue-chamber J and rear flue h, leading from the combustion-chamber, to conduct one portion of the hot gases in a direction down into the base of the stove proper, and beneath the oven, to heat the same, and another portion over the top of the oven, down its rear, and beneath the oven, and among the hot gases led from the base-flues in the base of the stove proper into the ascending flue d, substantially as set forth.

3. The combination, with the side flues c c beneath the oven and the central return-flue A^3 in the base of the stove proper, of the inclined plates b b, beneath which the hot gases may pass to the flues c d, substantially as and for the purpose set forth.

4. The combination, with the flues c c', leading from the combustion-chamber, and the ascending flue d, located adjacent to the said flues, of the flue-chamber J, provided with the side flues f f and return-flue f', and the damper g', to revert the draft beneath a pot-hole and direct the discharge of the hot gases to the exit-flue through the ascending flue, substantially as and for the purpose set forth.

5. The combination, with the flues f f and return-flue f', of the ring-damper g, working in the flue-chamber J, located in the rear of the ascending flue d and the fire-pot, substantially as and for the purposes set forth.

160,756. PRISMS. Asahel K. Eaton, Brooklyn, N. Y. [Filed Aug. 4, 1874.]

Brief.—A plate of thick crown glass is cemented to one side of a prismatic frame. One end of this plate is polished and cut away at right angles to the side of the plate. By this construction the incident ray of light is twice refracted, and as it passes into the air is again refracted, and assumes a direction coincident with the incident ray.

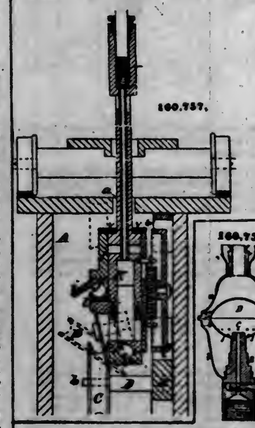
A prism having upon one of its sides a piece of crown-glass, having one or more polished ends, substantially as herein set forth.

160,757. CLAMP APPARATUS FOR CONNECTING STREET-CARS, &c., WITH ENDLESS TRAVELING DEVICES. Thos. Eppelsheimer, San Francisco, Cal. [Filed Aug. 13, 1874.]

Brief.—For connecting street-cars and the like with an endless traveling device.

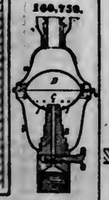
1. The shank G, having the stationary cylinder I, with its fixed jaw J, in combination with the tube A, screw m, and hand-wheel n, and the movable cylinder K with its movable jaw l, substantially as and for the purpose described.

2. In combination with the lower jaw l, the transverse bar O, with its vertical rope-supporting pulleys P, substantially as described.



3. The pivoted spring-lever E, with its arm D, to carry the rope-supporting pulley C, in combination with the wheel Q on the shank G, for lowering the pulley as the shank passes, substantially as specified.

4. The shank G, having an enlargement inside of the tube A, to form a shoulder, V, in combination with the spring U, for the purpose of converting the griping device into a brake, by drawing said shoulder V up against the under side of the top of the tube A, substantially as specified.



5. The spring-latch R, having one end hinged to the platform of the car, and its opposite end engaged with a pin, s, on the shank G, combined to be operated by a cord, t, substantially as and for the purpose described.

6. The projecting flange i on the upper jaw J, substantially as and for the purpose described.

160,757.

160,758.

160,758. GAS-BURNERS. Edwin Evans, Lynn, Mass. [Filed July 7, 1874.]

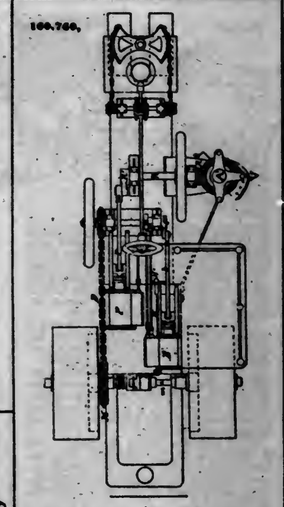
Brief.—The flanges of the lower bell and of the two domes clasped by the flange of the upper bell.

The domes C D, flanged and arranged, and having holes e in the two flanges and applied to the inlet B, all as described, in combination with the bell b, flanged at its larger base, and with the bell c, flanged, and having its flange to clasp around the flanges of bell b, and of the domes, so as to make therewith a tight joint and connect together said bells and domes, all as specified and represented.

160,759. MANUFACTURE OF LAMP-BLACK. Levi S. Fales, Cincinnati, and Peter Neff, Gambier, Ohio. [Filed Nov. 19, 1874.]

The within-described process for making lamp-black from acid oil or the carbonaceous oily residuum combined with sulphuric acid, resulting from the refining of petroleum, consisting in first treating the mass to remove the acid, then burning it in an apartment at a low temperature.

160,760. STEAM-PLOWS. James Fogarty, Newark, N. J. [Filed Oct. 10, 1874.]



Brief.—Two engines or cylinders, distinct in their action and speed—one to drive the plow, the other to propel the carriage. A horizontally-rotating plow elevated, or its depth governed, through a steam-pipe and piston-rod attached to the vertical plow-shaft.

1. The rotating plow V, having the inclined plates V^1 and teeth V^2, combined and adapted to serve as and for the purposes herein specified.

2. In a steam-plow, the independent steam-cylinders B F, with their respective trains of mechanism, combined and adapted, the one to impel the revolving plow, and the other the propelling-wheels, with variable ratios of power and velocity, as specified.

3. In combination with the plow-shaft T and its propelling mechanism, the connected piston and cylinder A^1, with the controlling-valve J, to allow the plows to be raised and lowered at will, in the manner herein set forth.

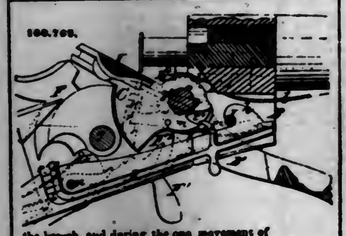
160,760.

160,761. PROCESSES OF OBTAINING BORACIC ACID FROM BORATE OF LIME. Ferdinand Formhals, San Francisco, Cal. [Filed Oct. 16, 1874.]

The described process of obtaining boracic acid from borate of lime, consisting essentially in the treatment of borate of lime, while in suspension, with sulphurous acid, substantially as described.

160,762. BREECH-LOADING FIRE-ARMS. Frank W. Freund, Denver, Colo. [Filed June 10, 1874.]

1. The tail or extension F^1 o, the hammer, extended through the trigger-plate, in combination with the guard-lever D, substantially as and for the purpose described.



2. The nose or cam F^2, formed on the tail of the hammer, in combination with the lever m and the firing-pin M, whereby the firing-pin is moved out before the breech-block is moved, the said pin held out when the breech-block is fully closed, and the breech-block can be moved as much and as often as found necessary without releasing the firing-pin at a point where it will come in contact with the percussion, substantially in the manner and for the purpose described.

3. The slide K, having the stops r^2, for latching the hammer-spring and hammer-trigger, as shown and described, in combination with the breech-block C, notched at r^1, and the hammer-spring O' and hammer-trigger, substantially as and for the purpose set forth.

4. The forked guard-lever $D D^2 D^1$, fastened rigidly upon the extended ends of the pin o, on which the breech-block is hung, in combination with the breech-block C, which is fitted loosely upon the pins, and with a sliding thumb-piece, J, having a coupling-pin, q', attached to it, which pin, at option, is passed into an oblong slot of the pin o, substantially in the manner and for the purpose herein set forth.

5. The combination of the guard-lever D, the hammer F, the breech-block C, the oblong slot q in pin o, and the coupling-pin q', whereby the hammer can be cocked before the breech is opened by the lever which is used to open

160,762.

the breech, and during the one movement of the lever, and the breech can be closed without uncocking the hammer by the back movement of the lever, substantially as described.

6. A guard-lever, forked and connected rigidly by its prongs D' D' to the outer ends of the pin *e*, substantially in the manner described, and for the purpose set forth.

7. The transverse spring-pin *e*, having a holding-catch, *e'*, in combination with the thumb-piece J and its attached pin *g'*, substantially as and for the purpose described.

8. The rectilinear moving cartridge-extractor L, fitted in the guide L', in combination with the spring *l* and the breech-block C, whereby the extractor is operated and held in position without any fastening-pin, as and for the purpose set forth.

9. The extractor having the hook *b'* and the projection *b''*, in combination with the breech-block C, whereby the extractor is secured in place and operated by the breech-block, substantially as and for the purpose described.

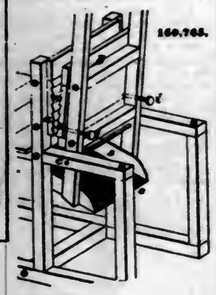
10. The trigger-plate, constructed with a hook, *h*, on its forward end, in the manner specified, in combination with the permanent pin I, supported in the cheek-pieces of the breech, and, in turn, supporting said cheek-pieces against inward and outward pressure, whereby, while facilities for readily removing the trigger-plate and replacing it, by the removal of a single pin in rear of the pin I, are afforded, the cheek-plates are stayed firmly against any tendency to warp or spring, either outward or inward, during the hardening process and while in use, substantially as described.

11. The combination of the lever spring-stop *g'* with the socketed and notched pin *g* of the hammer, and with the trigger-pin *a*, substantially as and for the purpose described.

160,763. METALLIC CARTRIDGES. Frank W. Freund, Denver, Colo. [Filed Feb. 4, 1874.]

1. A cartridge-shell made, substantially as described, of one piece of metal, with a small powder-tube, C, between a fire-tube and a main powder-chamber, D.

2. A cartridge-shell made, substantially as described, with a thin hard-metal portion, D, and a thick soft-metal portion, A B.



160,764. TILTING CHAIRS. Wm. Gardner, New York, N. Y. [Filed Dec. 20, 1874.]

1. The frame D, upon which the chair-seat is mounted by an axis, C, upon which swing a series of plates, A A, arranged, with their interposed pieces of rubber or springs B B, in the form of the arc of a circle, held in place by the said frame and the pendant *c*, substantially as and for the purpose set forth.

2. The plates A A, with the projections or toes *a a*, in combination with the springs B B, axis C, frame D, and pendant *c*, substantially as and for the purpose set forth.

160,765.

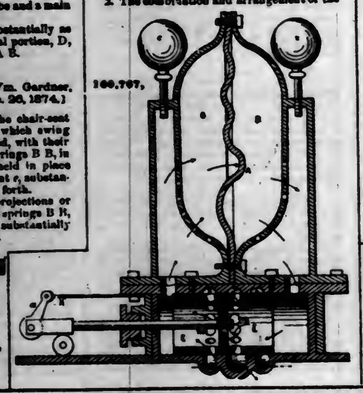
160,765. MACHINES FOR CRUSHING COKE. Charles Glazier, Indianapolis, Ind. [Filed June 18, 1874.]

The combination of the adjustable jaw *a*, set-screws *f f*, frame B, and sieve *s*, all constructed and arranged substantially as and for the purpose set forth.

160,766. PISTOL-STOCKS. Wm. L. Godfrey, New York, N. Y., assignor to himself and Jas. W. Godfrey, same place. [Filed Mar. 4, 1875.]

1. A pistol-stock constructed of composition or plastic material, in combination with a metallic framing entirely surrounding and affixed to the edges of said stock or the cheek-pieces thereof, substantially in the manner and for the purpose described.

2. A composition pistol-stock having a metallic strengthening-plate, substantially as and for the purpose described.



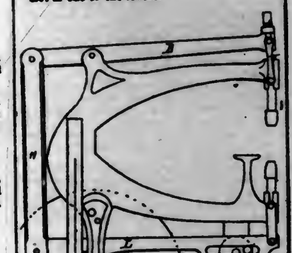
160,767. WATER-METERS. Alfred Guthrie, Chicago, Ill. [Filed July 20, 1874.]

Brief.—Air-chambers communicate with the water-chambers on each side of the diaphragm, to assist the back pressure of the water, when the diaphragm has reached the limit of its movement in either direction, to shift the valve. The valve receives the force of the water directly upon a central partition, and is held in place by the spring while the diaphragm is moving.

1. The combination and arrangement of the measuring-chambers B B, the diaphragm A, and the air-chambers C, operating essentially as and for the purposes herein set forth and described.

2. The combination and arrangement of the

160,767.



valve E with the pitman G and spring H, for the purposes substantially as herein set forth and described.

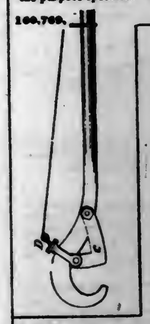
3. The combination and arrangement of the hollow valve B, with its ports *n n*, and wall *c*, with its surrounding inlet-channels *p p*, and discharging-channel *q*, as and for the purposes herein set forth and described.

4. In a fluid-meter, the valve E, arranged to be operated by the direct force of the fluid upon its face, substantially as herein set forth and described.

160,768. SCROLL-SAWING MACHINES. Jos. Hale, Somerville, Mass. [Filed Mar. 20, 1874.]

Brief.—The saw is strained between two vibrating levers, which receive their motion from a crank, the pin of which works in a slot in one of the levers.

In a fret-saw, the combination of the crank K M, slotted arm E, link H, and arm D with the links E B', slides F P', and adjusting-rod T, all constructed and operating together, substantially as described, and for the purpose set forth



---

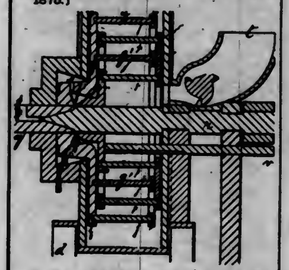
160,769. CAR-STARTERS. Dexter D. Hardy, Delavan, Ill., assignor of two-thirds his right to Chas. L. Booth and John R. Stone, same place. [Filed Jan. 4, 1875.]

Brief.—The branches of the pivoted cam are connected by a yoke, to which the tripping-cord is attached.

In a car-starting device the two cams C hinged to the outer sides of and so as to turn above the lever A, and secured together by the yoke or clevis D, substantially as and for the purpose specified.

160,769.

160,770.



160,770. MACHINES FOR PRESSING LEATHER SHAPES. Jesse W. Hatch, Rochester, N. Y. [Filed Dec. 22, 1874.]

Brief.—The seam, in passing between the convex and concave faced rolls, is flattened, and at the same time the stock upon each side of the seam is straightened and stretched laterally upon each side of the seam, producing uniform tension upon the stitching, removing wrinkles, &c.

In a seam-pressing machine, the combination, with the convex and concave faced rollers B B', situated one on a fixed axis the other on movable shaft, said both having a positive and equal rotation, of the set-screws *s s* above the movable shaft, and the adjusting-screws *f f* with springs *d d* below the shaft, for the purpose of giving elasticity to the rollers and gaging them to different thicknesses of leather, all substantially as and for the purpose described.

160,771. DISINTEGRATING-MILLS. J. Moore Hendricks, Philadelphia, Pa., assignor to the Philadelphia Disintegrating-Mill and Manufacturing Company. [Filed Feb. 20, 1875.]

1. The combination of the fixed portion *e* of the mill-casing with cages *j* and *p*, when attached, respectively, to the opposite parts of a shaft formed in two portions or sections, *g* and *r*, of which one section is concaved or hollowed out at its inner end, to form a socket for the inner or contiguous end of the other section, in the manner and for the purpose substantially as set forth.

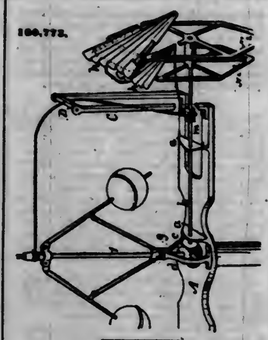
2. The bridge *v*, in combination with the cages, when said bridge is constructed in the corrugated or gridiron form, substantially as set forth.

3. The combination of the two sections *g* and *r* of the shaft, the oil-induction apertures *s*, the oil-receptacles *f''* and *f'''* in the hub of the cage *j*, and in the casing, respectively, and the oil-induction apertures *s''* and *s'''*, in the manner and for the purpose substantially as set forth.

4. The diagonal strengthening and grinding bars *w*, in combination with the other parts of the cages, respectively, in the manner and for the purpose substantially as set forth.

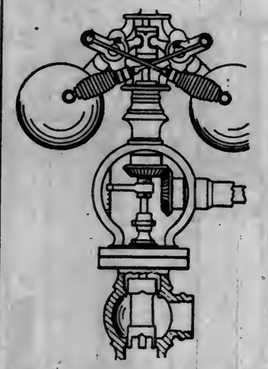
160,772. BRIDLE-BITS. John Peter Hisley, Syracuse, N. Y. [Filed Mar. 2, 1875.]

The combination of a cheek-piece and snap-hook cast in one piece with a detachable mouth-piece.



160,773. WIND-WHEELS. Saml. Johnson and David Johnson, Carlisle, assignors of one-third their right to Geo. W. Haworth, Hartford, Iowa. [Filed Aug. 25, 1874.]

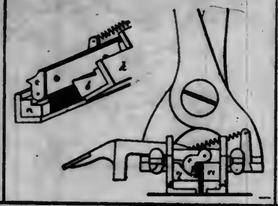
Brief.—This wind-wheel has skeleton frames and two series of pivoted fan-tail sails, in combination with the cone, frame, shaft, gear-wheel, and collar linked to sails; also, a rock-shaft with governor mounted upon a spindle having a gear-wheel, whereby the wheel is self-adjusting in relation to the force of the wind, and self-regulating in maintaining uniformity of speed



1. A wind-wheel composed of skeleton frames Nos. 1 and 2, and the two series of pivoted fan-tail sails A, substantially as described, and for the purposes specified.

2. The base A, having bearers *a a* and *d*, and frame C, in combination with the shaft h, gear-wheel *c*, collar *m*, linked to sails A, and the rock-shaft D, and the governor mounted upon the spindle *f*, having a gear-wheel, *g*, substantially as described, and for the purposes specified.

160,772.

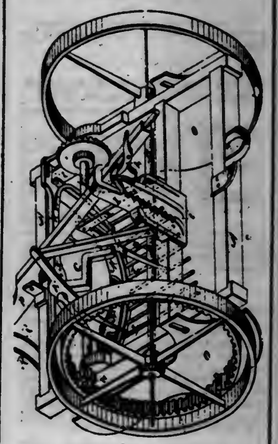


160,774. STEAM-ENGINE GOVERNORS. J. Judson and W. A. Cogswell, Rochester, N. Y.; said Cogswell assignor to said Judson. [Filed July 2, 1874.]

The combination, with the governor-balls and arms connected with the valve-rod, of the pivoted cranks and springs, each attached at one end to the ball and at its other end to the crank, substantially as described, and for the purposes specified.

160,775. DOUBLE-SEAMING MACHINES. F. Kenney, Hartford, Conn., assignor to himself, J. A. Case, and J. G. Rathbun, same place. [Filed Apr. 24, 1874.]

Brief.—To the holding-jaws of a seaming-machine are attached rectangular shoes, vertically adjustable, by means of which the bending-bar is accurately adjusted to the height of the edge of the metal to be folded. The shoes are held in adjustment by thumb-screws. To the rear end of the concaved jaw is attached a transverse rib, the end of which holds under the edge of the vertically-folded metal, so holding and guiding the tool in its work

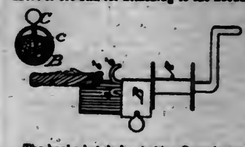


1. The adjustable gages *h i*, when used in combination with the bars *a b* and the former-bar *c* in a seaming-machine, constructed substantially as herein described.

2. The guiding and holding piece *q*, attached to the bar of a seaming-clamp, substantially as and for the purpose described.

160,776. POTATO-DIGGERS. M. W. KNOX, Sheridan, N. Y. [Filed Feb. 16, 1875.]

Brief.—The tongue is pivoted to the forward end of the frame, which is supported upon a pair of wheels, one of which is supplied with a cog-gear. The tongue extends to the rear of the frame, and is provided with a pawl and ratchet for elevating and depressing the digging apparatus, which consists of an ordinary digging-blade provided with an oscillating semicircular shaker, with jointed fingers, striking from front to rear alternately by means of a double crank-shaft.

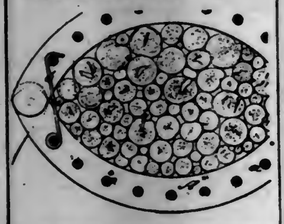


1. The adjustable side guards O, arranged in combination with the main frame A of a potato-digger, substantially as and for the purpose described.

2. The tongue F, provided with hooks R R, and pivoted to the frame A, in combination with spring-pawl *h*, frame I with rack *i*, and main frame A, supporting the potato-digging apparatus, as and for the purpose specified.

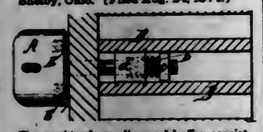
3. The semicircular riddle or shaker L and oscillating arm K, having one end extended and provided with slot *s*, in combination with the double crank-shaft O, bevel-gears J *h*, cogged rim D, and jointed fingers E H, all as and for the purpose set forth.

160,777. STRAW-TWISTING MACHINES. Sol Kuh, Jefferson, Iowa. [Filed Aug. 31, 1874.]



Brief.—For twisting straw and other material into bands or rope, a rotating shaft carries one or more hooks, to which the material is attached, and also a tubular holder and clamp, to receive such material as may be too short or too stiff for attaching to the hooks.

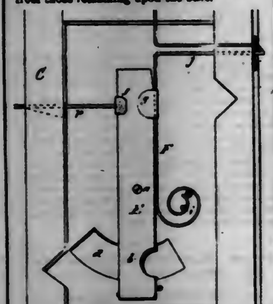
The hooks *h*, tubular holder B, and clamp-screw C, applied on a crank-shaft, A, as and for the purpose set forth.



160,778. CLAMPS. Sol Kuh, Jefferson, Iowa. [Filed Aug. 31, 1874.]

Brief.—The upper and lower hinged segments are made internally extensible, for firmly holding corn stalks, brush wood, &c., while being cut to a uniform length.

The laterally-extensible holder composed of two jointed sections, A A', substantially as specified.



160,779. CAR-COUPLINGS. M. Kurtzeman, Shelby, Ohio. [Filed Aug. 24, 1874.]

The combined coupling and buffer consisting of the draw-head A, the draw-bar C, draw-spring D, and buffer-springs E, as shown and described.

160,780. COMBINED BILL HOLDERS AND SEPARATORS. Alex. M. Lockhart, Pittsburg, Pa. [Filed Jan. 26, 1875.]

Brief.—Attaches a spring-slip to a suitable base-piece, to hold the bill-blanks thereon, and provides said base with a pivoted spring lever, carrying a bent arm, which overlaps the upper surface of the base, and which can be operated either from beneath or at one side thereof, so as to hold one or more blanks separate from those remaining upon the base.

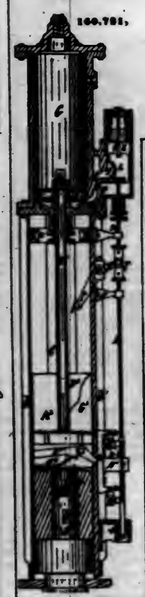
1. The combination, with a suitable bill, invoice, or memoranda holder, of a separator, substantially as and for the purpose set forth.

2. The combination, with a suitable bill, invoice, or memoranda holder, of a separator consisting of an operating-lever, E, and spring-rod F, substantially as described.

3. The combination with the lever E and spring-rod F, of the supplemental side lever H, substantially as and for the purpose set forth.

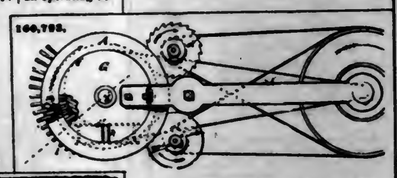
4. The separator herein described, consisting of the spring-rod F, main operating-lever E, guide g, the lever E being notched or cut away, as shown at h, and provided with a guide strip or stop, C, substantially as specified.

5. The separator, consisting, substantially, of said piece A, having slot or opening d, strips C C', the same formed with recesses n o and slots m p, main operating-lever E, guides f g, spring-rod F, supplemental lever H, and the upper side piece B, the whole combined to operate in connection with a suitable bill, invoice, or memoranda holder, as set forth.



160,781. STEAM PILE-DRIVERS. Thomas T. Loomis, Chicago, Ill. [Filed Jan. 23, 1873.]

Brief.—The guiding-plate which holds the pile-head is loosely attached to the hammer-frame, so that any lateral strains may not be communicated to the hammer-frame, but are taken up by the leaders. Adjustable boxes are used in the coupling of the connecting-rod and valve-stem, loosely fitted into transverse mortises, so as to admit of a lateral movement, to prevent springing of the valve-stem and coupling-rod by the angular movement of arm p', giving an easy parallel motion.



1. The detachable grooved plate F, loosely attached to the frame E, in combination with the grooved hammer A', arranged substantially as and for the purpose specified.

2. In combination with lever p', valve-stem M, coupling-rod M', and coupling F, the adjustable boxes t t and bolt r', all operating as specified.

160,781.

160,782.

160,782. CLOTHES-PIN MACHINES. John W. Millet, Johnstown, N. Y., assignor of one-half his right to Louise B. Pettyjohn, same place. [Filed Aug. 14, 1874.]

Brief.—The pins, fed to a hollow disk, are slotted by a saw, and then by a cam shoved out of the channel.

1. The combination, in a clothes-pin slotter, of the rotary disk A, cam i' on plate G, hopper K, operating with the saw d, as set forth.

2. The combination, with the saw d, rotary disk A, cam i', and hopper K, of the beveling-disk e, with knives r, all constructed and arranged to operate as set forth.

160,783.

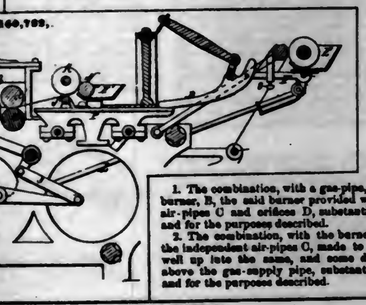
160,783. WASTE-GAS BURNERS. Peter Neff, Gambier, Ohio. [Filed Jan. 26, 1875.]

Brief.—The pipes supply air centrally to the chamber of the burner, and do not readily allow the downward escape of gas. The burning gas issuing from the orifices will ignite that issuing from the top of the burner when it has been extinguished by the wind.

160,784. COMPOSITIONS FOR COATING BURIAL-CASKETS. Chas. H. Mulligan, Brooklyn, N. Y. [Filed Jan. 5, 1874.]

A composition for coating burial-caskets, consisting of asphaltum, coal-tar pitch, sand, and mineral oil, in about the proportions specified, and for the purpose substantially set forth.

160,785.



160,785. PAPER-BAG MACHINES. Herbert S. Merrill, Cambridge, Mass. [Filed Dec. 11, 1873.]

Brief.—The web has one of its folded edges carried up over the supporting-roller into contact with the paste-roll, which is supplied by an intermittingly reciprocating fountain-roller. The reciprocating severing-knife is so hung as to travel a short distance with the periphery of the roller on which it cuts.

1. In a machine for making paper bags from a continuous strip of paper, the following instrumentalities, to wit: a passing mechanism for pasting the paper prior to its entrance into the former, in which mechanism the paste-distributing wheel, moving conjointly with the paste-box, and, without being withdrawn from said box, is intermittently brought into contact with, and removed from, the paper, substantially in the manner and for the purpose specified.

2. The cutting mechanism described, consisting of the knife 5, the collar 12, projection 11, collar V, spring 4, roller D', and forked lever F', combined with the pulling-rollers f g, to operate substantially as specified.

160,786.

160,786. CAR-COUPLINGS. Peter Neff, Gambier, Ohio. [Filed Jan. 26, 1875.]

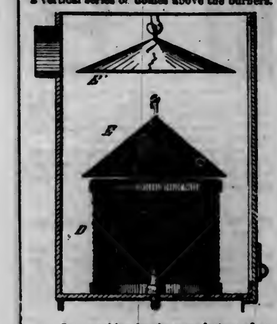
Brief.—The combination of a spring-bolt, a spring-lever, and a pivoted hook, with a link, substantially as and for the purpose described.

160,786. MANUFACTURE OF LAMP-BLACK. Peter Neff, Gambier, Ohio. [Filed Nov 21, 1874.]

The process herein described of making lamp-black or carbon-black from carbonaceous gases and crude petroleum, dead oil, or oily residuum combined with sulphuric acid, produced by refining petroleum, consisting in burning the said gas with the said substance in the same apartment, substantially as and for the purpose described.

160,787. GAS-BURNERS FOR THE MANUFACTURE OF LAMP-BLACK. Peter Neff, Gambier, Ohio. [Filed Jan. 26, 1875.]

Brief.—In the manufacture of lamp-black, an inverted burner surrounded by a flanged dome.



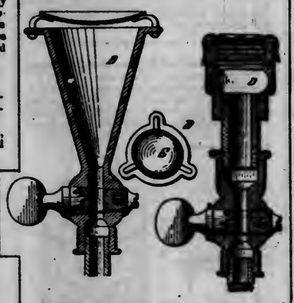
1. The combination, with a dome, D, of an inverted burner, C, substantially as and for the purpose described.

2. The combination, with a dome, D, of an inverted burner, C, with a wide open mouth, c, substantially as and for the purpose described.

3. The combination, with an inverted burner, C, and dome D, of a flange, d, substantially as and for the purpose described.

160,788. MANUFACTURE OF LAMP-BLACK. Peter Neff, Gambier, Ohio. [Filed Jan. 26, 1875.]

Brief.—From natural gases as they issue from the earth, lamp-black is formed by burning it in one or more chambers, each having a vertical series of domes above the burners.



1. In a machine for the manufacture of carbon or lamp-black, the combination with the burners B of the domes or bells E E', placed one above the other, substantially as and for the purposes described.

2. The combination, with the burner or burners B, of the wire-gauze envelope D, and one or more bells or domes, E E', &c., substantially as and for the purpose described.

3. The combination, with one or more cells, A, provided with burners B, the bells or domes E E', &c., and with or without the wire-gauze envelope D, of a series of apartments, into which the products of combustion pass after leaving the cell or cells, substantially as and for the purpose described.

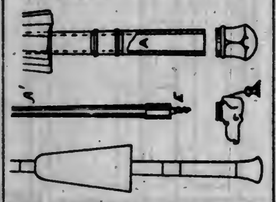
160,789. GAS-BURNERS FOR THE MANUFACTURE OF LAMP-BLACK. Peter Neff, Gambier, Ohio. [Filed Jan. 26, 1875.]

Brief.—A diminished gas-stem, a burner having a wide open mouth, and a removable deflecting-disk.

1. The combination, with the wide open mouth C of the burner for use in the manufacture of lamp-black, of the removable deflecting-disk D, substantially as and for the purposes described.

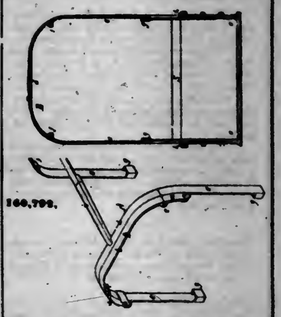
2. In a burner for use in the manufacture of lamp-black, the combination of a diminished orifice or stem, A, through which the gas is fed, a wide open mouth, D, from which it is burned, and a deflecting plate or disk, E, placed directly over the mouth thereof, substantially as and for the purposes described.

160,790. SAFETY-VALVES. Alex. Orme, Chicago, Ill. [Filed May 19, 1873.]



Brief.—An adjustable ring is secured to the valve-seat, to regulate the area of opening for escape-steam.

1. In combination with the valve-seat B', and valve F provided with the angular face f', the adjustable ring D', having the angular face f, as specified.

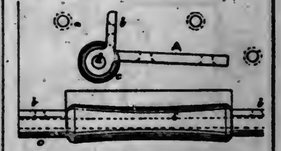


2. The valve F, provided with the flange e e, in combination with seat B', spindle C', spring G, and nut J, all operating as specified.

160,791. COMBINED PARASOLS AND WHIPS. John Perrine, San Francisco, Cal. [Filed Nov. 5, 1874.]

As a new article of manufacture, a parasol having a hollow handle, A, with screw-thread C, and the whip-extension A' having the screw E, the whole adapted and arranged for use as a parasol or whip at will, substantially as described.

160,792. WAGON-COVERS. Edward M. Saunders, Saugus, assignor to himself and Edwd. K. Wilson, Newton, Mass. [Filed Jan. 12, 1875.]

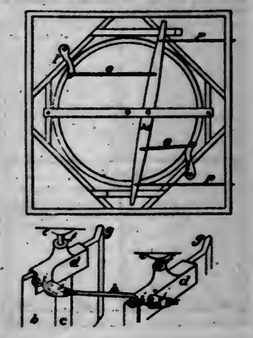


160,792.

1. The hood-bow D, composed of the three parts a b c, hinged together and to the uprights e e, in combination with the cover-bow A, composed of the three parts d e d, hinged together, so that when the bow D is turned up against the bow A the parts a c of both bows may be locked upon the parts b d thereof, as set forth.

2. The uprights or posts E E, provided with the hooked projections h, in combination with the bow A, B, or C, composed of the arch d and the two uprights e e, hinged to said arch, and provided with the sockets g g, all as set forth.

3. In combination with the bows A B C, the top brace H at the crowns of the arched parts d d d, all as and for the purpose specified.



160,793. CHAFING-IRONS FOR VEHICLES. Gilbert Smith, San Francisco, Cal. [Filed Nov. 5, 1874.]

In combination with a concave roller, c, the plate A, provided with the upwardly-projecting lugs or angle-irons b and bearing-arms, whereby the roller is held firmly in position, substantially as specified.

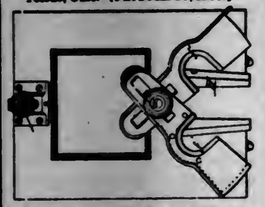
160,794. WINDMILLS. Albt. H. Southwick, San Francisco, Cal. [Filed Feb. 2, 1875.]

Brief.—The wheel is surrounded by a series of overlapping shutters, which are mounted on suitable bearings, and are so connected together that they can be simultaneously and correspondingly opened and closed, for the purpose of regulating the speed of the wheel by gaging the quantity of wind admitted to it.

1. The shutters A, having the metal blading or slats d secured to each end, substantially as and for the purpose described.

2. The overlapping shutters A, having their inner or overlapped edges g bent, or otherwise constructed at an angle to the shutter, substantially as and for the purpose described.

3. The rod p, and connecting-rods h, in combination with the shutters b and arms t, substantially as and for the purpose above described.

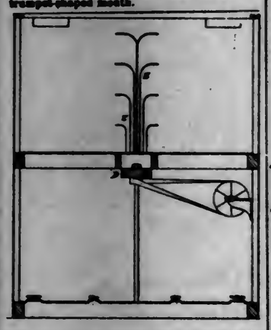


4. The centrally-pivoted lever M, having its ends connected by rods o with the crank-arms t, which are secured to the upper end of the projecting gudgeons K, in combination with the cords p, substantially as and for the purpose described.

160,794. METALLIC ROBANDS FOR ATTACHING SAILS TO SPARS. Howard B. Stephenson, Boston, Mass., assignor to C. Houghton, same place. [Filed Jan. 21, 1875.]

The metallic reband A, constructed with hook B and eye C, substantially in the manner described, and for the purposes set forth.

160,795. BEND-COOLERS. Benj. A. Stevens, Toledo, Ohio. [Filed Jan. 30, 1875.]

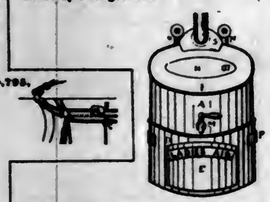


1. The faucet-clamp composed of sections independently adjustable both longitudinally and sidewise, substantially as and for the purpose set forth.

2. The combination of the slotted cooler-door, through which the faucet projects, the sectional slotted clamp, and the set-screw, these members being constructed and operating substantially as set forth.

160,797. GLUE-DRYING. Saml. T. Swasey, Salem, Mass. [Filed Jan. 30, 1875.]

Brief.—Air is uniformly distributed through the mass to be dried by a series of concentric pipes of varying height, each having a trumpet-shaped mouth.



1. In an apparatus for drying glue, as herein described, by currents of heated air, the combination and arrangement of the steam chamber and drying-room, and their connections, substantially as set forth.

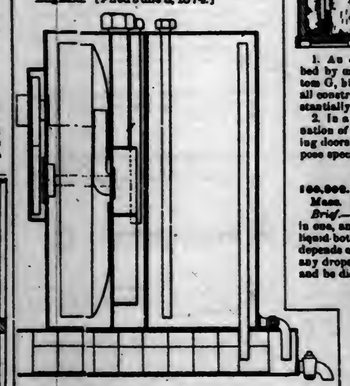
2. In an apparatus for drying glue, the hot air pipes K, arranged to deflect and divide the currents of heated air, substantially as shown and described.

160,798. COOKING-STOVES. Robt. Thomas, Toronto, Canada. [Filed Dec. 7, 1874.]

Brief.—An annular grate surrounding a dome for heating an oven underneath, and surrounded in turn by a reservoir for heating water. The dome is internally ribbed, and has a cold-air-supply pipe. The draft is controlled by a flanged cover.

160,798.

1. The combination and described arrangement of the oven D, the annular grate Q surrounding an unperforated dome, the water-vessel A surrounding the fire-chamber, and the top F, as shown and described.



2. The oven D, as constructed with a dome, C, ribbed internally and closed except at its bottom, and in combination therewith, all as shown and described, and for the purpose set forth.

3. In combination with the oven D, constructed as shown and described, the cold-air pipe W leading into the central oven-heating dome C, all as set forth.

4. The combination of the draft-doors P P, the top F, adjustable flanged or ribbed cover H, raised flue S, and its chimney G, all as shown and described.

5. The annular water-vessel A surrounding the annular fire-chamber, and provided with the top M and the pipes N N, all combined as shown and described, and for the purpose set forth.

160,799. APPARATUS FOR THE PRODUCTION OF GAS FROM HYDROCARBON LIQUIDS. F. G. Voigt, 36 Grafton Road, Kentish Town, England. [Filed June 3, 1874.]

1. The hereinbefore-described generator-chamber, consisting of the combination of a series of compartments to be partially filled with hydrocarbon liquid, and a series of separate mixing-chambers, these members being constructed and operating in combination, substantially as hereinbefore set forth, whereby the air is caused to pass first through one of the liquid-chambers, and over the surface of the liquid to take up vapor, then through an air-chamber to thoroughly commingle the vapor and air, then through a liquid chamber again to take up more vapor, then through another mixing-chamber, and so on through the series.

2. The generator-chamber constructed, as hereinbefore set forth, with the liquid and mixing chambers, through which the air or partially formed gas alternately passes, in combination with the air vessel divided into compartments, and revolving within the chamber a', designed to be partially filled with hydrocarbon liquid, and the pipe c, connecting the chamber a' and the generator-chamber, for the purposes specified.

160,800. STENCH-TRAPS. Robt. L. Walker, Boston, Mass. [Filed Feb. 10, 1875.]

Brief.—A globe composed of two semi-spherical disks connected together by annular flanges. The disks are connected to the pipes by joints. There are fixed cross-bars in the pipes. These bars are provided with holes, forming ways in which the guide-rod works; and on this rod, within the disks, there is fixed a hollow globe, composed of thin sheet metal, to render it as light as possible, and still maintain the requisite strength.

The stench-trap described, the same consisting of the disks A B, globe F, rod G, and bars H, constructed and arranged to operate in combination with the pipes C C', substantially as and for the purpose specified.

160,801. OFFICE TABLES AND BEDS COMBINED. D. Walker, Newark, N. J. [Filed Feb. 8, 1875.]

1. An office-table made convertible into a bed by means of the hinged top A, bed-bottom C, hinged leaf J, and folding doors D D, all constructed, arranged, and operating substantially in the manner described.

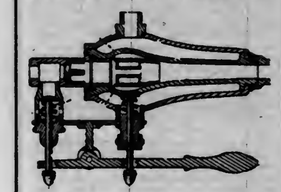
2. In a combined table and bed, the combination of the bed-bottom C, leaf J, and folding doors D D, in the manner and for the purpose specified.

160,802. ATOMIZERS. Chas. Wood, Boston, Mass. [Filed Feb. 3, 1875.]

Brief.—The air and liquid tubes are inclosed in one, and all arise from the stopper of the liquid-bottle. The fluid-tube, at its extremity, depends over the end of the air-tube, so that any drops forming may fall out by gravity, and be dispersed by the air-tube.

1. The combination, with the bottle and a fluid-tube rising therefrom, and bent or curved substantially as described, of an atomizing-tube arranged below the overhanging liquid-tube, and adapted to discharge the fluid as a spray, in a direction inclined to the length of the bottle, or the main portion of the tube, substantially as described.

2. The combination, with the bottle, of an atomizer of a fluid-tube having its extreme or outlet end *a* depressed with relation to the remaining portion of the tube, substantially as described, to prevent the flow of the liquid along the outer side of the tube to the bottle, substantially as described.

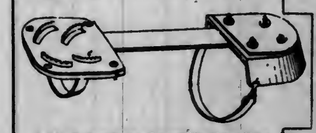


3. The combination, with the bottle-stopper and the inclosing tube rising therefrom, of the liquid-tube and atomizing-tube, arranged inside the inclosing tube, but projecting from it at top, substantially as shown and described.

4. In combination, the neck *g*, connecting-pipe *i*, stopper *f*, inclosing tube *e*, liquid-tube, and atomizing tube *a*, substantially as described

---

160,803. FLUID-EJECTORS. Geo. Westinghouse, Jr., Pittsburg, Pa. [Filed Dec. 24, 1874.]



Brief.—A central jet and an annular jet concentric with the former act at different points on the outgoing column of air. The central jet is obtained by means of a T-tube inserted within the air-nozzle. Two valves loosely engage with an operating-lever—one for letting on steam, the other to restore atmospheric pressure in the exhaust-pipe.

1. In an ejector device, the combination of a central jet-nozzle, an annular jet-nozzle, and an intermediate annular exhausting-chamber, each jet-nozzles being arranged with their discharge-openings one somewhat in advance of the other, whereby the force of the escaping steam shall act at successive points or in different planes on the outgoing column of fluid, substantially as set forth.

2. The valves *c c*, seated by spring-pressure and opened by opposite movements of a common lever, in combination with an ejector-nozzle and check-valve, substantially as set forth.

160,804. ICE-CREEPERS. A. L. Willis, Philadelphia, Pa. [Filed Feb. 5, 1875.]

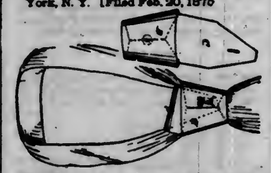
1. In an ice-creeper, the combination of two disks, united by a longitudinally self-adjusting elastic and flexible band, projecting points beneath to bite the ice, and straps for securing said disks to the foot, substantially as described.

2. In an ice-creeper composed of two disks, one for the heel and one for the sole, the combination of separate straight points for the heel with curved serrated ridges for the sole, substantially as described.

3. In an ice-creeper, the curved serrated ridge-plate O', stamped up or formed in one piece, having a curved set or ridge of pointed teeth, and base-plates for securing it to the disk, substantially as described.

160,805. BLIND-STOPS. Gilman Woodward, Providence, assignor of one-half his right to Jas. A. Matteson, Johnston, R. I. [Filed Feb. 9, 1875.]

Brief.—A pivoted thumb-piece is combined with the connecting-rod in such manner that when the thumb-piece is crowded back the rod serves to lock the blind-slats by bearing against the thumb-piece on a line behind the center of its revolution. There is also a ratchet arrangement with connected case, the ratchets acting additionally on the thumb-piece, and being locked automatically by an interposed spring.

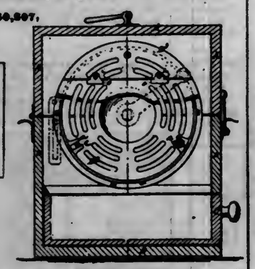


160,805.

1. The locking device consisting of the pivoted thumb-piece D, in combination with the connecting-rod E, made and operating substantially as described

2. The blind-slat fastener and adjuster, substantially as herein described, consisting of the case A, pin B, spiral spring C, thumb-piece D, rod E, and ratchets *b a*, operating as and for the purpose specified.

160,806. NECK-TIES. Alden J. Adams, New York, N. Y. [Filed Feb. 20, 1875.]



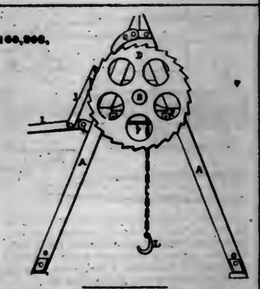
The combination of a flap, C, provided with a hook or other fastening with the body of a cravat-slide, B, substantially as herein shown and described, to prevent it from slipping upon said cravat, as set forth.

160,807. ASH-SIFTERS. Frederic Anthes, New York, N. Y., assignor to Theodore Wenk and Samuel Leber, same place. [Filed Nov. 7, 1874.]

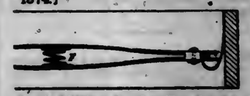
1. In an ash-sifter, the slotted or open-work sections provided with slotted lugs *a*, in combination with the circular end parts having clamping bolts and nuts *c*, as shown and described.

2. The combination, with the cylindrical ash-sifter having lugs *a* and keeper F, of the detachable section D', provided with projections *i* and the slotted sliding bolt E, as and for the purpose specified.

160,807.



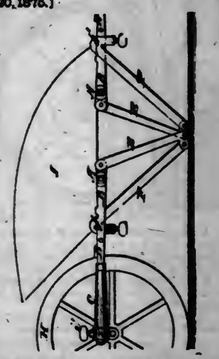
160,808. STUMP-ELEVATORS. J. H. Barnes, Baltimore, Md. [Filed Feb. 17, 1875.]



Brief.—Two upright timbers, converging to an apex, supported on flat feet, are braced horizontally by another piece, on which are shoulders, to lock them together. This piece sustains a vertical ratchet-wheel and pawl, operated by a catch-link and a lever.

The tie-beam F, having shoulders M M N N, the frame A A, and sills B B, in combination with ratchet-wheel D, pawl C, lever I, and link J, operating as described.

160,809.



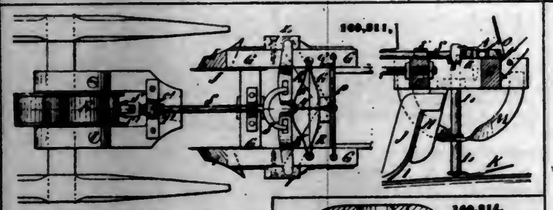
160,809. GRAIN BED-BOTTOMS. Edward P. Bennett, Elkland, Pa. [Filed Dec. 28, 1874.]

In a bed-bottom, the slats E, each notched at the ends, and having a spiral spring, F, interposed between the divided parts composing its body, in combination with the cross-rods D and the springs , having eyes C, and curved to adapt them for attachment to a bedstead, as shown and described.

160,810. BARREL-BARROWS. Jas. Harding Brown, Porter's Mills, Wis. [Filed Feb. 20, 1875.]

1. The combination of the two cross-bars A, the four side bars B, the handles C, the pivoted hanging side bars E, and the adjustable braces F, substantially as shown and described.

2. The combination of the wheel H, provided with the sockets I, and set-screws F, with the handles C at one end of the barrow-frame, substantially as shown and described.

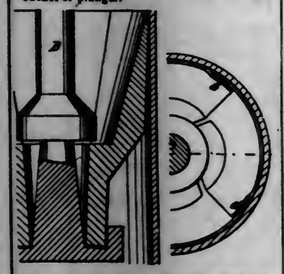


3. The combination of the body J, with the barrow-frame A B C E F, substantially as shown and described.

4. The combination of the triangular block G, with the hanging side bars E, of the barrow-frame A B C E F, substantially as shown and described.

160,811. COTTON-CHOPPERS. T. C. Burnham, Waco, Tex. [Filed Aug. 10, 1874.]

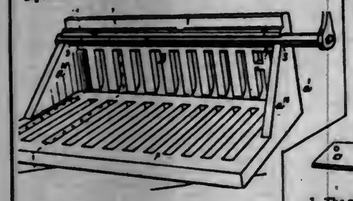
Brief.—A thrashing frame is connected by a draft-rod to the main frame. Vertical shafts, carrying horizontal knives, are pivoted on the former, and their bent arms meet above the main frame. A forked rod extends forward from the arms, having a roller, which travels in the channeled edge of a wheel, revolving with the main axle. This wheel has irregular projections, which operate the shafts, to open the cutting-knives and leave hills. A spring throws them back to position.



160,911.

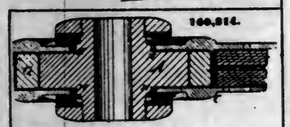
1. The combination of the horizontal knives K, the vertical shafts L, having inwardly-projecting arms formed upon their upper ends, and the spring E with each other, and with the frame G, that carries the plows, substantially as herein shown and described.
2. The combination of the rods or chains N and armed shaft O P Q with the shafts L, forked rod S, and wheel E, and with the frame G, substantially as herein shown and described.

160,912. SECTIONAL BUCKETS FOR PUMPS. George W. Burr, East Line, N. Y. [Filed Feb. 6, 1875.]



Brief.—A bucket made in sections, which are so constructed that they pack tightly together when the bucket is raised, and loosen or contract, when it is lowered, the same being connected with the plunger-rod by means of a cap grooved to receive the sections of the bucket or plunger.

1. A pump-bucket composed of sections arranged to expand to the barrel by the weight of water raised, and contract in descending, substantially as shown and described.
2. A sectional pump-bucket having the sections lap onto each other, substantially as seen at D, for the purposes described.
3. The cap or grooved flange C on the rod B, substantially as shown and described.

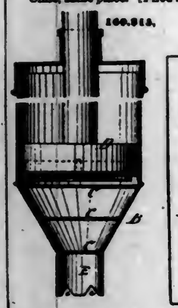


160,913. GRATES. Justin Byington, Wilmington, Del. [Filed Feb. 17, 1875.]

Brief.—In order to remove clinkers and the like from the horizontal grate, the swinging front portion is forced inwardly, thus leaving a space between the two portions for inserting a poker.

The combination, with the stationary horizontal grate A and open vertical front frame *a'* and sides *a''* *a''*, of the inwardly-swinging front grate B, substantially as herein before set forth and described.

160,914.



160,915. CAR-WHEELS. S. B. Chapman, New York, N. Y. [Filed Feb. 13, 1875.]

1. The combination of metallic ring E, with wooden sections D D, substantially as and for the purpose set forth.
2. The combination of metallic band F, with sectional tread D E D and rubber ring G, substantially as and for the purpose set forth.

160,916. EGG-BEATERS. Martin Cline, Chicago, Ill., assignor to himself and Wm. J. Cline, same place. [Filed Sept. 19, 1874.]

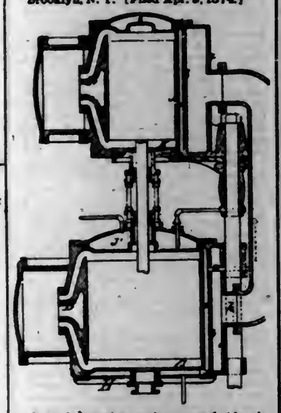
160,916.

160,918.

The combination, in an egg-beater with cylinder A and handled piston D, of the nozzle B, tapered, provided with varying diaphragms C, and having end-notched rest E *e*, as shown, and for the purpose specified.

160,916. CASTING STEEL-FACED ANVILS. John Donovan, Carpentersville, Ill. [Filed Dec. 12, 1874.]

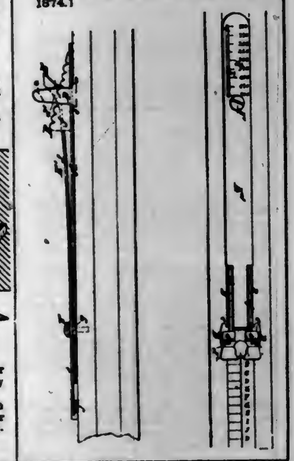
Brief.—A steel plate is placed in the mold, and the body of the anvil cast upon it.



160,916.

1. The wire loop in the horn of the plate, for keeping it in place in the mold, substantially as specified.
2. Constructing the face-plate concave on the side receiving the iron, to compensate for the greater shrinkage of the iron in the middle, substantially as specified.

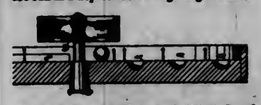
160,917. COMPOUND ENGINES. C. B. Emery, Brooklyn, N. Y. [Filed Apr. 9, 1874.]



1. An independent casing, secured at longitudinal joints to a steam-cylinder, with end joints covered by plates or cylinder-covers to form a jacket, &c., substantially as described.
2. The combination of a chamber, *c*, forming a portion of the steam-jacket system of a steam-engine, with a depressed chamber, as at J', by means of a pipe, *a*, led to the former, substantially in siphon shape, from the bottom of the latter, whereby the supply of steam to the former will carry with it the condensed water from the latter, substantially as and for the purposes specified.
3. In an engine, where two cylinders are arranged in the same line, the bonnet or bottom K opening into the smaller, in combination with the intermediate stuffing-boxes and the cylinder-cover of the larger cylinder, substantially as and for the purposes specified.

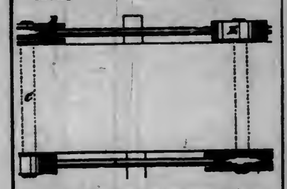
160,918. BUCKET-EARS. James D. Field, Blue Rapids, Kans. [Filed Sept. 26, 1874.]

A bucket-ear formed of a single piece of sheet metal, and having a fold, B, perforated to receive the hooked end of the bail, all substantially as described.



160,919. SIGHTS FOR FIRE-ARMS. Frank W. Freund, Denver, Colo. [Filed Oct. 19, 1874.]

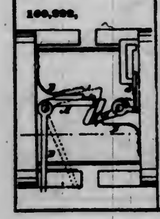
1. The sight for a fire-arm, having a spring-tail, in combination with a stepped support having a tail, and with a guide, the sight and support being united together by a suitable fastening, F, and the supports being constructed and arranged to move in and out under the sight, and in its movement caused to adjust the sight to a higher or lower position with respect to the top of the barrel, substantially as and for the purpose described.
2. The guide D, constructed with step-shoulders *a b* for the sliding stepped support, and with stop projections *a i* for the spring-sight, substantially in the manner and for the purpose described.
3. The spring-tail of the sight, constructed with the shoes *g g'*, in combination with the slotted tail of the stepped supports, substantially in the manner described.
4. The tail B' of sight B, having an index thereon, and slotted at *b'*, in combination with the indicator *i* on tail A of support B, substantially as and for the purpose described.
5. The gun-sight arranged to rise and fall in a guide which has steps *a a*, and constructed with a holding-tooth on its under side, in combination with a stepped support, the notches in which prevent the slide from moving back or forward unless the sight is raised high enough to clear the tooth from the highest parts of the partitions forming the notches, as and for the purpose herein described.



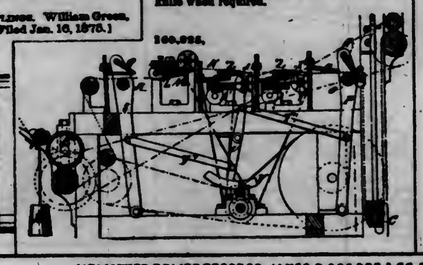
160,920. GAME-BOARDS. Owen A. Gill, New York, N. Y. [Filed Jan. 30, 1875.]

Brief.—The cup on the end of the handle is revolved, and a ball dropped therein. When the speed has sufficiently decreased the ball falls through the perforated bottom, and the efforts of the holder are directed to landing the ball in a depression having a high number.

The combination of rimmed disk A C and handle B, rigidly attached, as shown, the former having recesses *a*, and the latter a perforated wheel, D, as and for the purpose specified.



160,921. RAILROAD-CAR TRUCKS. Alonzo Gilman, Lewiston, Idaho. [Filed Nov. 14, 1874.]

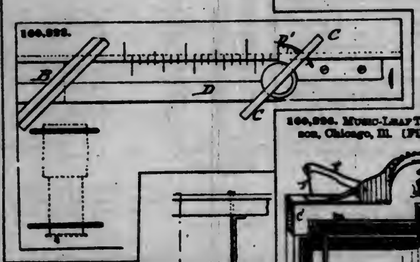


1. The combination of the car-axle, double-flanged wheel D, and flat-tread wheel E, said wheels being applied to opposite ends of the axle, as set forth.
2. The combination of the car-axles, double-flanged wheels D D, and flat-tread wheels E E, similar wheels being diagonally opposite, as set forth.

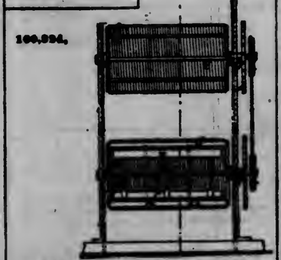
160,922. CAR-COUPLINGS. William Green, Ryde, England. [Filed Jan. 16, 1875.]

160,922.

160,924.



The combination, with a hook, A, supported by a rear spring, B, of the lever D, rod *d'*, and pin *d*², substantially as and for the purpose specified.



160,923. DISTANCE-MEASURING INSTRUMENTS. William F. Ekermeh, Chicago, Ill. [Filed Nov. 30, 1874.]

The combination, with a telescope, of a reflector, E, placed at an angle of forty-five degrees thereto, and a reflector, C, adjustably pivoted in relation to reflector E, and provided with the index D', and mounted on the graduated sliding piece D, substantially as and for the purpose described.

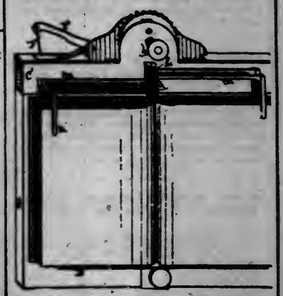
160,926.

160,924.

160,924. PAPER-DRESSES. Jonathan Hatch and Guilford Smith, Windham, Conn., assignors to Smith, Winchester & Co., same place. [Filed Jan. 30, 1875.]

Brief.—The journal of the fan-blower rests within the journal of the drying-cylinder.

The bats J J, spider-heads K K, rolls L, and rags M, combined with the spirally-wrapped wires to form a drying-cylinder.



160,925. CLOTH-SEAMING MACHINES. I. L. Holmes, Saco, Me. [Filed Jan. 26, 1875.]

Brief.—The feeding mechanism is regulated by an automatic device, to give an even tension to the cloth, and gripping-jaws are so arranged and connected with the stopping mechanism as to be operated by a seam in the cloth, and stop the revolving cutters until the seam is carried through the machine. The stationary blade is placed in pivoted arms, so that it can be moved away from the revolving knife when required.

160,926.

1. The combination of the take-up roll C, with the feed-roll A and the drawing-roll E, the former being geared to run faster than the latter, substantially as specified.
2. The clutch-pulley F, belt-shifter lever F, sliding bar G, and stops G' and H, combined with the take-up roll and the feed-roll, substantially as specified.
3. The gripping-jaws N O and Q R, rock-frames P and S, connecting-rod T, rock-lever U, and cam V, combined with the cutters of a cloth-shearing machine, and the shifting clutch-pulley for driving the revolving cutters, substantially as specified.
4. The combination, with the rotary cutter, of stationary blade-supports, arranged on pivots A', to rise up for cleaning the machine, as described.

160,926. MUSIC-LEAF TURNERS. F. G. Johnson, Chicago, Ill. [Filed Jan. 19, 1875.]

1. The combination, with the desk A, of the adjustable book-support B, strips *a a*, clamp-screw *b*, nut *c*, and tongue *c*, substantially as and for the purpose set forth.
2. The plates D C', bar D, provided with the racks *f f*, the shaft *g*, spur-gear B, ratchet G, lever F, pawl *e*, stop *p*, pinions *h*, and arms *m*, in combination with the desk A, substantially as and for the purpose set forth.

160,927. CORDING ATTACHMENTS FOR SEWING-MACHINES. Hamilton C. Jones, Brooklyn, N. Y. [Filed Jan. 11, 1875.]

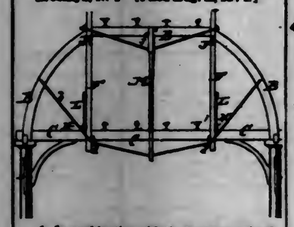
The presser-foot A, having guides *b*, recess *c*, and notches *d*', in combination with downwardly-flanged guide-plate B, having the hook-edged spring *d d'* and flat tapering tube-extension B', all constructed substantially as and for the purpose specified.

160,928. PERSONAL ORNAMENTS. Frederik C. Kiergaard, Philadelphia, Pa. [Filed Jan. 19, 1875.]

As a new article of manufacture, personal ornaments composed of prepared fish-scales and wires, combined and arranged to represent flowers and leaves, substantially as described and shown.

160,822. GRAIN-DRILLS. Benjamin Kuhns, Dayton, Ohio. [Filed Feb. 4, 1875.]

Brief.—The oscillating bar, to which one portion of the drag-bars are attached, has slotted arms, which rise above the frame and engage with projections, by which it is allowed to move back and forth as metal supporting-bars, to change the drill-tubes from a single to a double rank.



1. In a grain-drill, an oscillating bar, to which a portion of the drag-bars is attached, the point of resistance to the longitudinal movement of which is placed above the frame of the machine, the bar being provided with slotted arms or plates, whereby it is allowed to move in a horizontal plane, instead of through the arc of a circle, when changing the beam from a single to a double rank, or the reverse, substantially as described.

2. The combination of the oscillating bar C, having upon its ends slotted arms D D, the brackets D', the frame A A, the fixed bar, to which a portion of the drag-bars are attached, and the bars B B, upon which the oscillating bar is supported, the parts being constructed and arranged substantially as and for the purpose set forth.

160,823. CORSET-BRACE. Auguste A. Lallemand, Chateau, near Paris, France. [Filed Aug. 22, 1874.]

The position or surgical bandage herein described, consisting of sheets of a spongious or pervious material and an interposed layer of *Parma*-*crispus* muslage, substantially as herein described, for the purpose set forth.

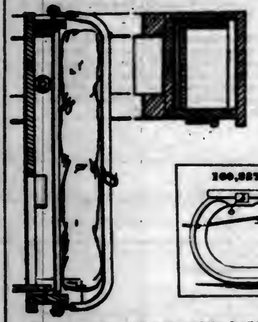
160,824. ELEVATED RAILWAYS. L. Lois, Brooklyn, N. Y. [Filed Aug. 11, 1874.]

1. In combination with the transverse chord C, a superposed arch, E, the central pendant c, and boat braces b b, all arranged substantially as described.

2. The arch E, combined with the chord C, for supporting four lines of railroad-track, said arch being on top, and there combined with the pendant f and V-shaped brace g, substantially as specified.

3. The uprights F F, combined with the arches E, the chords C, braces a b f, and uprights F' and M, substantially and for the purpose herein described.

160,825. MOLDS FOR ADOBE-BRICK. J. H. Mathes, Elliot, Mo. [Filed Oct. 31, 1874.]



1. The described mold for molding bricks, composed of the bed a, having the ledges b, and the separate pattern-mold A, having the openings f through the same, of the configuration substantially as shown.

2. The described mold for molding bricks, composed of the bed a, having the ledges b, and the separate pattern-mold B, having the openings f through the same, of the configuration substantially as shown.

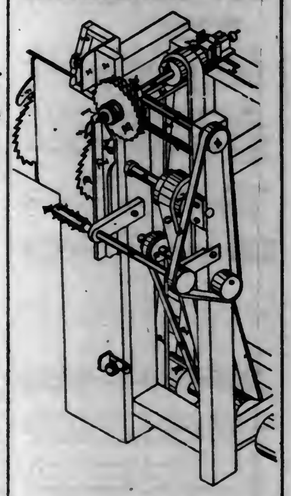
160,826. WAREROOM-BEDSTEADS. Robt. G. McClure, Jamestown, Ohio. [Filed Oct. 3, 1874.]

Brief.—The rigid straps prevent the bedding from bulging when the bed is turned up into a vertical position.

The straps D, rigid in the middle, flexible at each end, and provided with end loops, in combination with a bed-bottom, for the purpose specified.

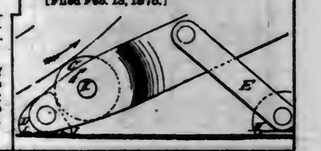
160,827. HAND-SLEDS. James B. Monroe, Newburg, N. Y. [Filed Sept. 3, 1874.]

Brief.—The sled is adapted to be drawn either end foremost.



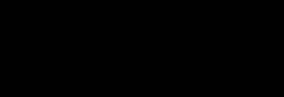
1. The double-ended runners g, formed in one piece with the supports i, in combination with the cross-bars a b and seat-board h, substantially as set forth.

2. A hand-sled having the double-ended runners g, perforated bars a, seat-board h, eye or staple c, and rope n, all combined substantially as shown and described.



160,828. MACHINES FOR SAWING LATHS. Mason S. Norton, Bangor, Me., assignor to James E. Harriman, same place. [Filed Jan. 19, 1875.]

Brief.—A series of saws upon a vertical arbor act in connection with a pair of saws upon a horizontal arbor in bolting the material and reducing it to laths.



The combination of the bolting-saws C D with the gang-saws E, double adjustable box T, rolls H I, and gages F Y, to form a machine for sawing laths, all as shown and described, and substantially as and for the purpose hereinbefore set forth.

160,829. DEVICES FOR MOVING RAILROAD-CARS. Benj. F. Phelps, Kansas City, Mo. [Filed Feb. 12, 1875.]

160,830. SMOKY-METAL BOXES. William C. McGill, Washington, D. C. [Filed Feb. 2, 1875.]

Brief.—The blank is cut and folded to form a box of a single piece of metal.

A box constructed of a single piece of metal, cut and folded as shown and described, and provided with the cap C, as set forth.

160,831. BOOT OR SHOE TIPS. Hollis W. Merrill and James W. Hoitt, Lynn, Mass. [Filed Aug. 24, 1874.]

As an improved article of manufacture, a boot or shoe tip composed of rawhide permeated throughout with a suitable color, substantially as and for the purpose specified.

160,832. PLOWS. John O. Minor, Bedford, Iowa, assignor of nine-tenths his right to P. H. Oxley, John P. Bell, Burson Fordyce, A. J. Littlejr, Simon Wright, J. T. King, P. D. Curran, W. A. Webb, and D. Griffith. [Filed Apr. 26, 1874.]

Brief.—A second beam is attached to a common plow, with both couplings rigid, but having the capacity for vertical adjustment, adapting it for a tarn-plow and a subsoiler.

1. The perforated plate d on the front end of the beam B, in combination with the block a on the beam A, and the adjustable coupling devices c h i on the central portions of the beams A and B, substantially as shown and described, and for the purposes specified.

2. The loop or bearing e on the beam A, and having the groove e', in combination with the loop h on the beam B, having the slide b' carrying the set-screw k, substantially as described, and for the purposes specified.

160,833. HAND-SLEDS. James B. Monroe, Newburg, N. Y. [Filed Sept. 3, 1874.]

Brief.—The sled is adapted to be drawn either end foremost.

1. The double-ended runners g, formed in one piece with the supports i, in combination with the cross-bars a b and seat-board h, substantially as set forth.

2. A hand-sled having the double-ended runners g, perforated bars a, seat-board h, eye or staple c, and rope n, all combined substantially as shown and described.

160,834. MACHINES FOR SAWING LATHS. Mason S. Norton, Bangor, Me., assignor to James E. Harriman, same place. [Filed Jan. 19, 1875.]

Brief.—A series of saws upon a vertical arbor act in connection with a pair of saws upon a horizontal arbor in bolting the material and reducing it to laths.

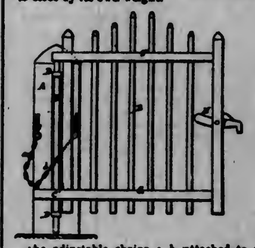
The combination of the bolting-saws C D with the gang-saws E, double adjustable box T, rolls H I, and gages F Y, to form a machine for sawing laths, all as shown and described, and substantially as and for the purpose hereinbefore set forth.

160,835. DEVICES FOR MOVING RAILROAD-CARS. Benj. F. Phelps, Kansas City, Mo. [Filed Feb. 12, 1875.]

A machine for lifting and moving railroad-cars, consisting of the lever B, friction-wheel C, fulcrum-bars E, and crabs D and G, arranged substantially as and for the purposes described.

160,836. CLOTHES-PINS. Otis F. Porter, Bridgeport, Conn. [Filed Nov. 7, 1874.]

Brief.—Two strips of wood are secured together with an elastic block in the middle of their length by a wire band.

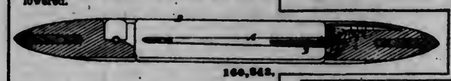


A new article of manufacture, consisting of two strips, A A, having end bevel B, an intermediate elastic block, C, and a wire band, D, that surrounds the strips and block, as shown and described, to form a double clothes-pin.

160,837. PROCESSES OF FINISHING LEATHER. John Henry Radey, Philadelphia, Pa. [Filed Jan. 19, 1875.]

The process for finishing leather, consisting in dubbing, whitening, waterproofing, dubbing and whitening leather, in the order, manner, and for the purpose as specified.

160,838. SWINGING GATES. F. Raymond, Cleveland, Ohio. [Filed Jan. 11, 1875.]



Brief.—The gate, with its hinge-rod, rises as it is swung by the operator, by means of chains which are attached to the heel-post, and descend and connect with the extended lower rail of the gate, thus causing the gate to close by its own weight.

The adjustable chains c b, attached to a projection of the bottom rail of the gate B, and also to the post A, in combination with the bracket C D, and rod E, for the purpose of automatically closing the gate, as set forth.

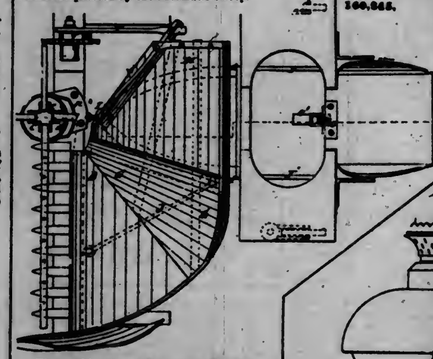
160,839. LOOM-SHUTTLES. Mark Sedford, Melrose, assignor to himself and Percival D. Richards, West Medford, Mass. [Filed Nov. 17, 1874.]

Brief.—To expand the bows of a split spindle for the purpose of securely holding the cop. A wedge-shaped piece is placed between the bows and rotated by means of a cam-piece, in the groove of which the head of the expander works as the spindle is raised or lowered.

160,842.

In the loom-shuttle, the combination of the split spindle A, with the rotary expander B, and piece b provided with the cam-groove f, all constructed and arranged to operate together, as and for the purpose specified.

160,844. TRAVELING-CAPS. A. Schwarz, New York, N. Y. [Filed Aug. 4, 1873.]

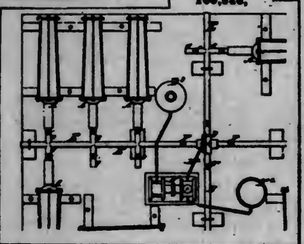


As an improvement in traveling-caps, the cross-band or face-protector D of the caps C, which leaves narrow openings a for the eyes and mouth, substantially as and for the purposes described

160,845.

160,845. HARVESTERS. Chas. D. Shrader, Lancaster, Wis., assignor to himself and Allen R. Bushnell, same place. [Filed Dec. 26, 1874.]

Brief.—As the cut grain is swept upon the elevated platform in reach of the binder, it is there compressed by the automatic sweep.

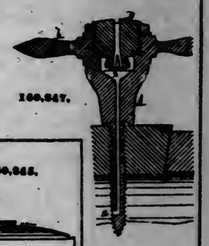


The combination of the sweep W and connecting-rod V, provided with a slot and pin, the wheel T, and cam U, having the form described, whereby the sweep is operated to compress the gavel against the rear side of the platform, as set forth.

160,846. APPARATUS FOR PRESERVING WOOD. Geo. B. Smith, Philadelphia, Pa. [Filed Sept. 2, 1874.]

The combination of the pipe E, having branches, and provided with cocks F and c, the conesve heads A A, applied upon one of the ends of the logs, and an engine or pump connected with a supply-tank, whereby the wood-preserving material may be applied at will to a train or parts of a train of logs, or to a single log, and the power concentrated on one log or diffused through a train or a number of trains or logs, as circumstances may require, substantially as and for the purpose set forth

160,846.



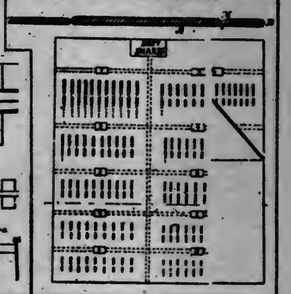
160,847. BEER-VENTS. Joseph M. Spahn, Chicago, Ill. [Filed Nov. 10, 1874.]

Brief.—A hollow screw-pointed plug provided with arms, and a detachable screw-plug, to which is attached a valve of rubber.

The combination of the hollow screw-pointed plug A, provided with the arms b, with the plug B and membrane c, substantially as described.

160,847.

160,848.

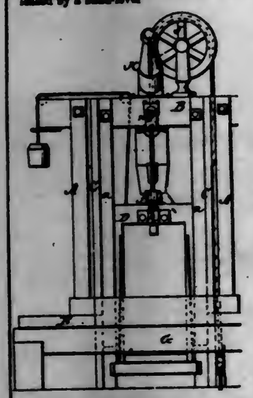


160,848. LAMPS. Albt. G. Storey and Thos. J. Lewis, Brooklyn, N. Y. [Filed Jan. 14, 1875.]

Brief.—The tube is provided with cap having gauze covering and inner perforated plate, gauze partition, and series of perforations below said partition.

1. In a lamp, the combination of the tube B, extending within the lamp-vessel, and cover A, provided with the gauze top E and perforated concave plate F, substantially as herein specified.

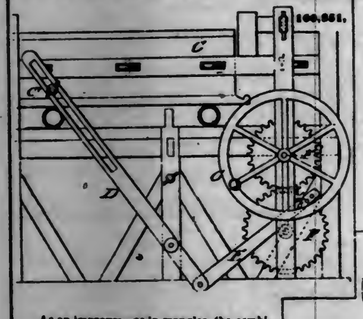
2. The tube B, provided with the gauze partition D and series of perforations C, combined with the screw-cap A E F G, all arranged as a part of a lamp, substantially as and for the purposes herein specified.



160,849. NEEDLE-BOOKS. F. Swan, New York, N. Y. [Filed Jan. 4, 1875.]

As an article of manufacture, a needle-book consisting of jointed covers A A, numbered sectional pads D, and partition H, constructed and arranged substantially as and for the purpose specified.

160,850. ELEVATORS. Jerome B. Sweetland, Pontiac, Mich. [Filed Aug. 29, 1874.]



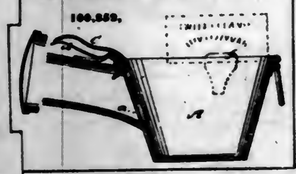
Brief.—The platform-framing is adapted to be shifted from floor to floor as the building progresses. On reaching its elevator the platform locks itself on a spring-hook, and is released by a hand-lever

1. The combination of the trestles A A, cross-beam B, vertical planks C C, strips a a, and bed-planks E E, supported upon the joists G G, with the vertical guides C' C', arranged between the floors of a building, so that the frame may be moved from floor to floor, and the carriage may be elevated and guided through the floors, substantially as set forth.

2. The combination, with the beam H, of the hook L hinged thereto, the arm m, spring k, and trip-lever K, for securing and releasing the carriage D at will, substantially as set forth.

160,851. MANGLES. Henry Tamms, Bartlett, Ill. [Filed Feb. 5, 1875.]

As an improvement in mangles, the combination of a balanced and weighted pressure-box, C, with the slotted and fulcrumed levers D, connecting-rods E, crank-wheels F, and actuating cog-wheel F', and crank-wheel mechanism G, for the purpose of reciprocating and tilting easily and rapidly the pressure-box by the rotary motion of the crank-shaft, substantially as shown and described.



160,852. CASES FOR MINING PAINTS. W. W. Thayer, New York, N. Y. [Filed Dec. 19, 1874.]

Brief.—The can is provided with a hollow handle, forming a receptacle for the turpentine. The handle communicates by a vent-hole and issuing-orifice, which are closed and opened by a hinged spring-valve.

1. A marking-can, consisting of a mixing-vessel, a reservoir-handle, having orifices a b, and a spring-pressed valve, C, as and for the purposes specified.

2. The combination of sleeve c on handle and vessel A, having recess c' in its upper edge to hold the brush, in the manner described.

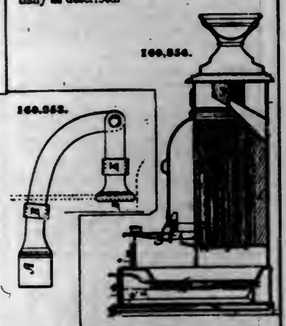
160,853.

160,854. BIRD-FOOD HOLDERS. Samuel E. Tompkins, Sing Sing, N. Y. [Filed Nov. 14, 1874.]

1. The combination of holding-jaws A and attaching-jaws D, constructed and arranged to temporarily attach to a bird-cage and hold a lump of food, substantially in the manner described.

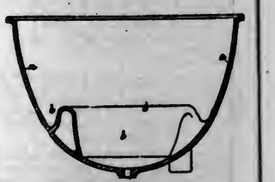
2. The jaws A, slide B, jaws D, and slide E, combined and arranged substantially as specified.

3. The jaws A, pivoted to the jaws D, substantially as specified.



160,855. CONCEALED GAITERS. J. W. Twinwriter, Indianapolis, Ind. [Filed Feb. 26, 1875.]

Brief.—Flaps are formed on the tops of the front and back quarters of a Congress gaiter, which cover the upper edge of the elastic gore, and prevent it from wear and injury.

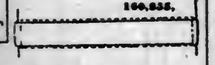


A gaiter constructed as shown and described, having the front and back quarters, with the flaps A and B adapted to lap over and meet centrally above the upper part of the elastic gore, substantially as and for the purpose specified.

160,856.

160,857. KETTLES FOR HEATING OR COOKING BY STEAM. Geo. W. Walker, Malden, Mass. [Filed Feb. 24, 1875.]

Brief.—The liquid contents pass from the depression around the steam-chamber, through the channel at the side, into the bottom of the kettle.



The boiler a, combined with the segmental steam-chamber b, constructed and arranged substantially as and for the purpose specified.

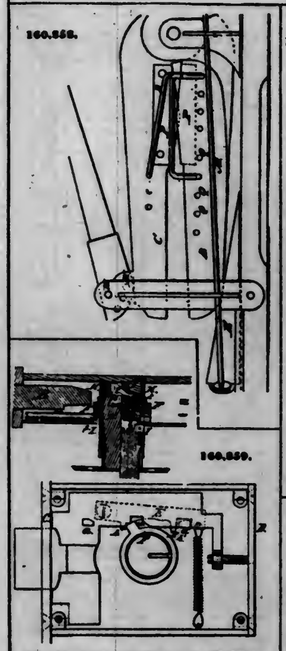
160,858. MACHINES FOR SHEARING METAL. John Walsh and Jas. Dutot, Newton, Iowa. [Filed Dec. 12, 1874.]

Brief.—The shears are both vibratory on the same axis. A sliding wedge under the free end of the lower shear serves to adjust it as to height, and a cam-lever held in a stirrup attached to the frame actuates the upper blade. The knives are, in the direction of their length, of an obtuse V shape, the salient points being at the middle.

160,855.

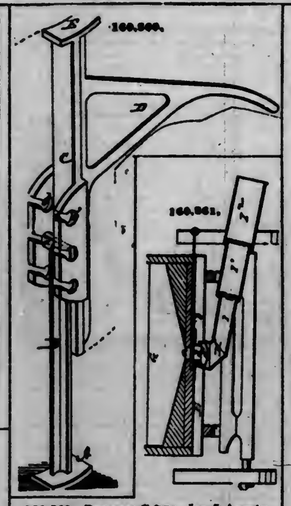
1. In combination with a shears for cutting metal, the wedge E, substantially as and for the purposes described.

2. The guide-piece L, in combination with the lower jaw B and wedge E, for the purposes described.



3. The combination, with levers B C, of knives P P inclined upwardly from the heel, as shown and described, so as to bring the thickest bolts, rods, or bars nearest to the fulcrum of levers.

160,859. METHODS OF ATTACHING RINGS TO PROJECTILES. Josiah Vavasseur, Bear Lane, Southwark, England. [Filed July 31, 1874.]



Brief.—Rings are pressed into grooves by compression.

The hereinbefore-described method of inserting a soft-metal ring in the groove of a projectile by reducing the diameter of the ring, in the manner substantially as set forth.

160,858.

160,860.

160,861.

160,859. LOCKS FOR DOORS, &c. H. Winn, Shelburne, Mass. [Filed June 26, 1872.]

1. The curvature of one or more of the tumblers *t t t t*, combined with one or more of the inclined surfaces s s' on part T, and with shell N.

2. A face-plate, C, and back plate D, made interchangeably adjustable to either end of the lock, as described, for the purposes described.

3. The combination of one or more inclined surfaces, s or s', on the stationary shell H, with the fence and shell N for the purposes described.

4. The combination, with the teeth b on the fence, of one or more of the inclined surfaces c c' on the teeth d d' of the ring F, arranged as described.

5. A tumbler having one or more of the inclined surfaces e e', combined with a part, T, as described, when the one partakes of the rotary motion of the key, while the other does not, and when said tumbler and part are arranged to react the one upon the other, and restore said tumbler by the reaction of said part, and of one of said inclined surfaces.

6. The combination of a bolt-operating device, thrown into connection with the rotating shell by the entry of the fence into the fence-notches in the tumblers, with said fence and shell, and with a system of tumblers, which have a motion while being set substantially recilinear with the key's axis, and which have fence-notches set simultaneously by key in position to receive the fence, all combined with the key, and operating as described.

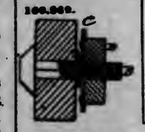
7. The combination, with tumblers partaking of the rotary motion of the key, of an inclined surface to restore them.

160,860. LIFTING-JACKS. Jos. J. Adgate, Stevensville, N. Y. [Filed Feb. 18, 1875.]

The combination of the standard B, having base A, with the bar C, having bearing-piece E and handle D, the two parts being provided with connecting devices, substantially as described, for adjusting one part up or down upon the other, substantially as herein set forth.

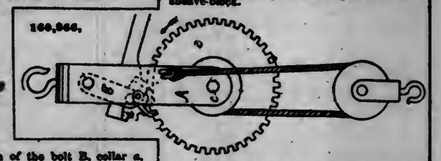
160,861. DUMPING-CARTS. Jos. J. Adgate, Stevensville, N. Y. [Filed Feb. 24, 1875.]

1. The combination of a telescopic conducting tube or trough, attached by a swivel-joint with the bottom of a coal-vehicle, substantially as and for the purposes set forth.



2. The combination of the hopper-shaped body G and a telescopic conducting tube or trough attached under the same by a swivel-joint, substantially as and for the purposes set forth.

3. The combination of the hopper-shaped body G, having opening c, with slide b, swivel *d d'*, elbow H, jointed to the swivel, and the telescopic conducting-tube I I' I', all constructed substantially as and for the purposes set forth.

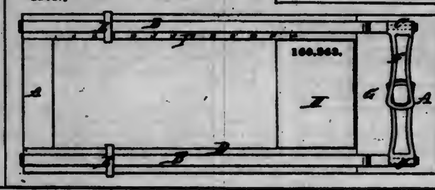


160,862. NUT-LOCKS. Joseph J. Adgate, Stevensville, N. Y. [Filed Feb. 18, 1875.]

Brief.—A spring-plate is interposed between the nut and a washer of less diameter. The nut is provided with a projection at each corner of its bearing-surface, which enter indentations in the spring-plate arranged outside the bearing-surface of the washer.

160,862.

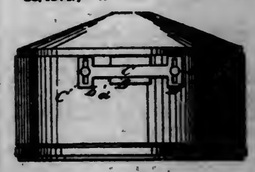
160,866.



The combination of the bolt B, collar a, plate a' washer C with indentations d, and the nut D with corner lugs or projections b, substantially as and for the purposes herein set forth.

160,863. EXERCISING-MACHINES. Arthur M. Allen, New York, N. Y., assignor to Mary S. Allen, same place. [Filed Jan. 20, 1875.]

160,867.



160,863.

1. In an exercising-machine, the combination of the frame A, spring bar or bars B B, slides E, and handles F, arranged and adapted to operate substantially as described.

2. The combination of the frame A D, spring-bar B B, slides E, handles F, and board or boards H, substantially as described.

160,864. MILLSTONE-BALANCES. John A. Althouse, New Harmony, Ind. [Filed Nov. 26, 1874.]

The vertically-adjustable T-shaped slotted strap C, in combination with the horizontally-adjustable weight B, provided with the groove *a'*, substantially as described.

160,865. SHOE-STUDS. Edwd. W. Averell, New York[illegible] N. Y., assignor of one-fourth his right to Horace Barnard, same place. [Filed Feb. 1, 1875.]

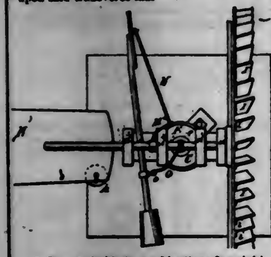
1. The circular spring-fastening of a stud or button, provided with a groove or depression in the heel, to keep the end of the spring in place, substantially as described.

2. In a spring-fastening for a stud or button, the combination of a cheek, a circular spring fastened in the plane of its circle, a detached point, and a groove or depression, substantially as and for the purpose described.

160,866. STUMP-EXTRACTORS. Joseph M. Batchelor, Foxcroft, Me., assignor of one-half his right to Cyrus Hill, same place. [Filed Jan. 20 1875.]

Brief.—Revolving within the sides of a downward-bent strap are a drum and toothed-wheel, actuated by a segment of a pinion on the end of a lever, which is pivoted to a link slung to the strap. One end of the rope is fastened to the strap, and its other end to the drum, intermediately passing through a hook sheave-block.

In a lifting-machine, the combination of the drum d, attached gear g, fulcrum-link p, hanging-lever f, portion t, and pawl j, all arranged in a suspended strap, A, and operating substantially as herein set forth and shown.



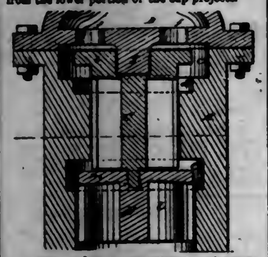
160,867. RATCHET WATCH-KEYS. George A. Beidler, Philadelphia, Pa. [Filed Feb. 20, 1875.]

Brief.—A watch-key in which the spring-handle grasps firmly the wheel on the head of stem, to make the requisite ratchet connection.

The spring bow or handle C, provided with tips *b b*, in combination with the ratchet wheel *a* on the key-stem B, substantially as and for the purposes herein set forth.

160,868. WINDMILLS. Owen B. Blakeslee, Rankin, Ill. [Filed Feb. 2, 1875.]

Brief.—The combination of a weighted rotating tail-vane, with a swinging transverse fan, which is pivoted so as to swing through a certain arc independently of the frame of said wheel, whereby the tail-vane is turned edge to the wind by the force of the wind upon said transverse fan.

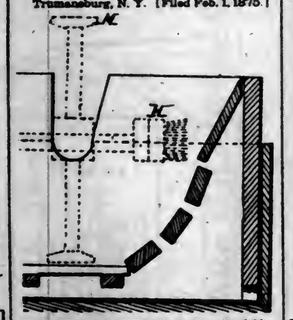


1. In a windmill, the combination of a weighted rotating tail-vane with a swinging transverse fan, which is pivoted so as to swing through a certain arc independently of the frame of said mill, whereby the tail-vane is turned edge to the wind by the force of the wind upon said transverse fan, substantially as and for the purpose set forth.

2. In a windmill, the weighted rotating tail-vane H, in combination with the swinging transverse fan I, arm M, rod N, and rope O, whereby the wind-wheel may be thrown entirely out of the wind and held in that position, as and for the purpose set forth.

160,869. CHECK-VALVES. W. H. H. Bowers, Franklin, Ky. [Filed Mar. 4, 1875.]

Brief.—An auxiliary valve of equal area with the outer surface of the main valve is attached to the latter for the purpose of relieving the pump of back pressure. The valve is unbalanced by forming a recess in the upper surface of the main valve equal in depth to the stroke of the same, into which a stem from the lower portion of the cap projects.

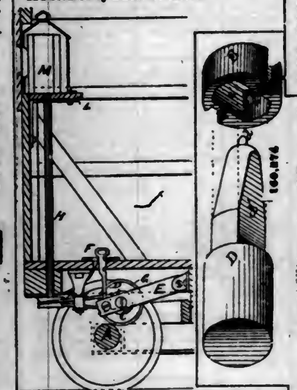


1. The valve C, having wings *h*, and recess *a* in the top, in combination with the part B', having stem *g*, and the valve-box A, with recesses *c d*, substantially as and for the purpose specified.

2. The valve C, in combination with lower detachable portion D and the valve-box A, with recess *c*, substantially as and for the purpose described.

3. The valve C, with wings *h* and recess *a*, in combination with the part B', with stem *g*, lower portion D, and the valve-box with recesses *c d e*, as and for the purpose set forth.

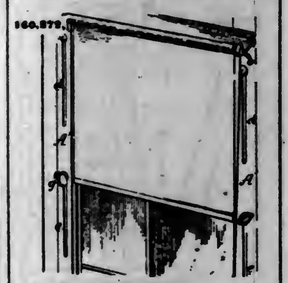
160,870. VEGETABLE-WASHERS. J. Brooks, Trumansburg, N. Y. [Filed Feb. 1, 1875.]



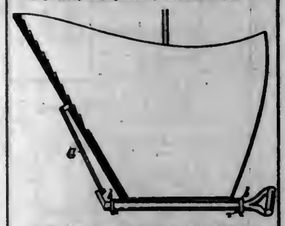
1. In a potato or vegetable washer, the yielding or self-adjusting spring-pressed brushes, substantially as and for the purpose described.

2. The combination of the revolving shaft F, spring-pressed yielding brushes H, and agitating arms or blades M, substantially as herein shown and described.

3. In a potato-washer, the combination of the shaft F, brushes H, and agitators M, with the hinged top section B, base section A, and the removable potato receptacle or crate C, substantially as herein set forth.



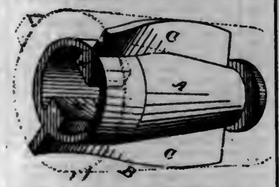
160,871. SIGNAL-LIGHTS FOR RAILROAD-CARS. R. F. Burnham and W. F. Strong, Charleston, S. C. [Filed Feb. 12, 1875.]



Brief.—A friction-wheel mounted in a swinging frame under the car is connected by a belt to the pulley of an upright shaft, on the top of which shaft is mounted a lantern. Rotative motion is imparted to the lantern by dropping the frame, so as to bring the friction-wheel in contact with the car-axle. When this is not desired, the frame may be raised and secured by a hook or catch.

The combination of the axle A, wheel C, beam E, pulleys D and I, band K, handle F, shaft H, and lantern M, as and for the purposes described.

160,872. COAL-HODS. Edward W. Byrn, Washington, D. C., assignor to himself and T. F. Rea, same place. [Filed Mar. 1, 1875.]



1. The combination, with a coal-hod, of a reciprocating slide, having its face wrought into transverse forwardly-inclined ridges, which form the bottom of the channel through which the coal is discharged, substantially as and for the purpose described.

2. The combination, with a coal-hod, of a rock-shaft having at one end a handle for tilting the hod and rocking the shaft, and at the other a crank for converting the rotary into a rectilinear motion, substantially as described.

3. The rock-shaft D, provided with a suitable handle, in combination with the connecting-rod G and the reciprocating slide H, substantially as and for the purpose described.

160,874. MILL-SPINDLES. Rodney S. Cathcart, Cincinnati, Ohio, assignor of one-half his right to Straub Mill Company, same place. [Filed Jan. 26, 1875.]

Brief.—Devices whereby the runner oscillates freely, without interfering with the motion of the spindle.

1. In combination with the hollow balance-rynd A, provided with the radially inward-projecting lugs *a'* and *a''*, and with the spindle D, having the flattened portion *d'*, the driver E, fitted loosely upon said spindle, and provided with recesses *e* and *e'*, which embrace said lugs *a'* and *a''*, substantially as and for the purpose shown.

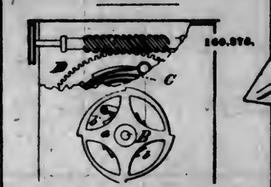
2. In combination with the spindle D, provided with the flattened portions *d'* and *d''*, and shoulders *d'''* and *d''''*, the driver E having a central slot, *e'*, which embraces said spindle and the lugs *a'* and *a''* that bear upon said shoulders, substantially as and for the purpose set forth.

3. The combination of the combined eye and rynd A, *a*, *a'*, and *a''*, B, C, and C, the spindle D, *d*, *d'*, and *d''*, and the driver E, *e*, *e'*, and *e''*, substantially as and for the purpose specified.

160,879. CURTAIN-FIXTURES. H. B. Busch, Philadelphia, Pa., assignor to S. T. Lloyd and R. L. Lloyd, same place. [Filed Oct. 26, 1874.]

The combination of a shade-roller, and a rigid frame consisting of stripe A A' A'', carrying both the roller and a cord-retainer, *b*, and having slots *d e*, for the passage of screws by which the frame is secured to the face of the window-frame, all as set forth.

160,876. MILLSTONE-BUSHES. Rodney S. Cathcart, Cincinnati, Ohio, assignor of one-half his right to Straub Mill Company, same place. [Filed Jan. 26, 1875.]



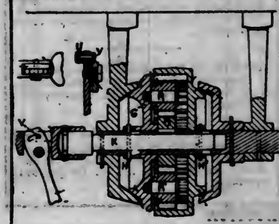
Brief.—Devices whereby the bearings for the spindle are afforded such freedom of motion from a vertical line as to enable them to conform automatically to any variations in the line of the spindle.

1. The combination of the follower H, provided with the lugs *h* and *h'* and concave disk *h''*, with the box-section I, having a recess, *i*, that corresponds to and receives said disk, said disk and recess forming a ball-and-socket bearing between said parts, substantially as and for the purpose specified.

2. In combination with each box-section I, provided upon its outer side with the convex recess *i*, the follower H, having upon its inner side the concave disk *h''*, and made radially adjustable toward or from the spindle, substantially as and for the purpose shown.

3. The casing A, provided with the cavity B and cover C, the wedges E and E, the nuts F and F, the screws G and G, the followers H, *h*, *h*, and *h'*, and the box-sections I *i*, all constructed as shown, and combined with each other, the spindle D, and the fixed stone of a grinding-mill, substantially as and for the purpose set forth.

160,876.



160,876. SEWING-MACHINE MOTORS. Benj. C. Chambers, Shady Plain, Pa. [Filed Dec. 19, 1874.]

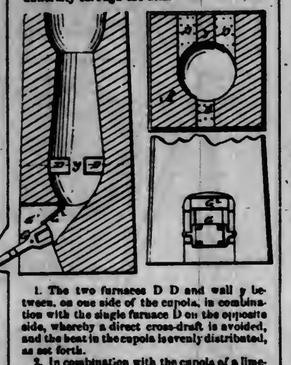
Brief.—A shaft has a pedal-wheel on each end, to wind on it a spiral spring attached thereto, and to a worm-wheel on such shaft.

In a mechanical motor, provided with the spring C, shaft B, ratchet *b*, and pawl *b'*, the winding-wheels *a a* attached to said shaft and constructed with steps projecting from and formed on their peripheries for the foot of the operator, as shown and described.

160,877. REVERSING MECHANISMS. Rufus B. Chapman, Cambridgeport, Mass., and John C. Chapman, Passaic, N. J. [Filed Nov. 10, 1874.]

Brief.—A single pulley rotates always in the same direction between two friction-disks, and, revolving with the shaft, the other independent of the shaft, but fastened to the bracket by means of the gearing within the pulley, which can be shifted alternately from contact of one disk to the other, the shaft is instantly reversed, while the driving-pulley continues to revolve.

1. The combination of a single driving pulley with two frictional disks, one fastened to the shaft and the other independent of it and fixed or stationary, and intermediate mechanism for reversing the motion, substantially as described.



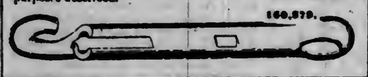
2. The combination, with a driving-pulley mounted between two frictional disks, as described, of a shipping-rod concentric with the shaft, as and for the purposes set forth.

3. In combination with the disk G and driving-pulley, as described, one or more pistons between the pulley and the shaft, as and for the purposes set forth.

4. In combination with the shipping-rod E and its T-head, the friction-plate U of elastic material, and the binding-screw V, as and for the purposes set forth.

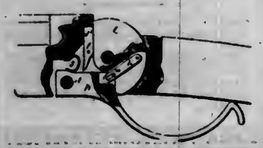
160,878. LINSEED-LIFE. Frederick Cole and David D. L. McCulloch, Kankakee, Ill. [Filed July 20, 1874.]

Brief.—The "draw" is governed by two doors, the lower one having a projecting lever, and the upper one being hinged in such manner as to give way to any unusual obstruction. The furnaces and their dividing-walls are so situated as to distribute the heat uniformly through the kiln.



1. The two furnaces D D and wall *y* between, on one side of the cupola, in combination with the single furnace D on the opposite side, whereby a direct cross-draft is avoided, and the heat in the cupola is evenly distributed, as set forth.

2. In combination with the cupola of a lime-kiln, the door G^2, hinged at its top, and the door G, provided with extended arms, and pivoted under the hinged door G^2, substantially as and for the purposes set forth.



160,879. MANUFACTURE OF SNAP-HOOKS. Alonzo B. Condo, Trumansburg, N. Y. [Filed Aug. 13, 1874.]

1. In the manufacture of snap-hooks and analogous articles, the process of casting the main or body portion with its hook in a distorted position, substantially as described, whereby the finishing up of the socket by machinery is rendered possible, as set forth.

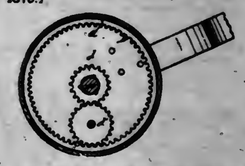
2. In the manufacture of snap-hooks and analogous contrivances, first japanning the castings, and subsequently putting them together with the inserted spring, and retaining the parts together by bending the hook into line with the bolt, substantially as and for the purposes described.

160,880. BREECH-LOADING FIRE-ARMS. D. Conner, Meriden, assignor to Eli Whitney, New Haven, Conn. [Filed Oct. 31, 1874.]

1. In a breech-loading fire-arm, the combination of the breech-piece C, swinging in the plane of the barrel and constructed with the shoulder *b*, the lever D, connected to the breech-piece by a slotted link, L, and constructed with the shoulder *b'*, the lever D, connected to the breech-piece by a slotted link, L, and constructed with the shoulder *f*, corresponding to the shoulder *b*, substantially in the manner described.

2. The combination, with the barrel of a fire-arm, of the breech-piece C, swinging in the plane of the barrel and constructed with the shoulder *b*, the lever D, connected to the breech-piece by a slotted link, L, and constructed with the shoulder *f*, corresponding to the shoulder *b*, the extractor P, and the spring S, substantially in the manner and for the purpose specified.

160,881. CHAIN-PUMP BUCKETS. Aaron L. Covey, Ypsilanti, Mich. [Filed Jan. 23, 1875.]



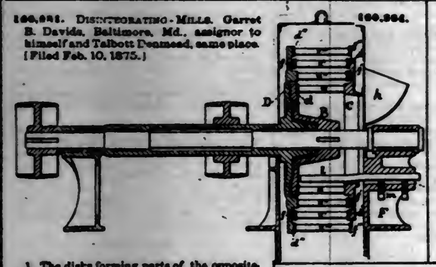
Brief.—The bucket is of rubber, of the form shown, and is clamped between two plates. By turning the screw the rubber is expanded.

1. In a bucket for chain-pumps, the rubber herein described, formed of the disk A and bell A', with offset *x*, all in one piece, as herein set forth.

2. The rubber A, formed with the oval top A' and projection *x*, in combination with the bell-shaped cap D, screw B, plate E, ball G, and nut *b*, all arranged as shown, and for the purpose set forth.

160,882. LAWN-MOWERS. H. C. Crowell, Erie, Pa., assignor of two-thirds his right to F. Jarecki, same place. [Filed Feb. 10, 1875.]

1. In a lawn-mower, the combination of the fly wheel or wheels with the main axle in the described relation to the flanged driving-wheel, substantially as and for the purpose set forth.



2. The flanged driving-wheel B, in combination with the fly-wheel C, gear-disk D, and the planetary gearing, all inclosed within and protected by the flanges of the wheel, substantially as shown and described.

160,883. FENDERS FOR VEHICLES. Henry M. Curtis, Ypsilanti, Mich., assignor to himself and F. P. Bogardus, same place. [Filed Oct. 16, 1874.]

A wooden wheel-fender having attached to its upper side and outer edge a border or frame, B, as described.

160,881. DISINTEGRATING-MILLS. Garret B. Davids, Baltimore, Md., assignor to himself and Talbott Desmead, same place. [Filed Feb. 10, 1875.]

1. The disks forming parts of the oppositely-revolving cages of disintegrating-mills, provided with re-enforcing rings, substantially as and for the purpose specified.

2. The cage of the mill, consisting of the recessed or rabbeted disk D d^2, pins c' c'', and rings f f'', in combination with the cage consisting of the disk B d, pins c, disk C d^1, pins c', and ring f, the two cages being mounted and running independently upon oppositely-revolving shafts, substantially as herein set forth.

3. The combination of the disk B, mounted upon its solid shaft, and disk D at the end of its hollow shaft, the projecting hub of the disk D entering the recessed hub of disk B, substantially as herein specified, for the purpose of balancing the mill as set forth.

4. In a disintegrating-mill having oppositely-revolving cages, as herein specified, the combination of the frame F, having the opening i, knife or breaker l, and set-screws m, substantially as herein shown, admitting of the vertical adjustment of the said knife or breaker, for the purpose specified.

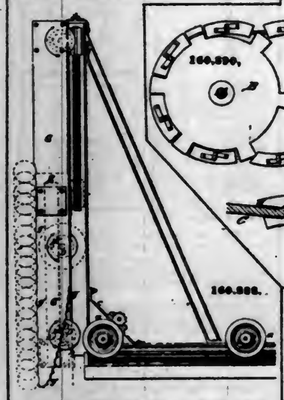
160,882. BRONZE ALLOYS. S. Doubleday, Baltimore, Md. [Filed Oct. 20, 1873.]

A composition for bronze, consisting of copper, glass, antimony, tin, spelter, and lead, in the proportions herein described.

160,883. BOOK-CLIPS. Henry T. Dunlap, Galesburg, Ill. [Filed Jan. 2, 1875.]

The book-clip constructed, as described, of arms A, bent at their central parts e, as shown and described, and hinged to each other by means of a spring, B, with which they are combined and operate substantially as described, and for the purpose specified.

160,884. CARRIAGE-SPRINGS. Jos. Enders, Louisville, Ky. [Filed Jan. 18, 1875.]



1. The swinging crank-bars F F, in combination with the springs E E, brackets G G G, and body K, constructed to operate substantially as and for the purpose set forth.

2. The steel bar D, inserted in the side bar C, and the brass-rod H, by which it is supported, combined and constructed to operate substantially as and for the purpose set forth.

160,885. MACHINES FOR CHANNELING AND SAWING STONE. Nathan F. English, Hartland, and Cyrenius M. Willard, Pittsford, Vt., said English assignor to said Willard. [Filed Feb. 17, 1875.]

Brief.—The saw, armed with cutting-points at the forward cutting edge, and on its rounded cutting end, is adjustably connected by guide-blocks thereon fitting corresponding guides upon the frame, the latter of which are connected with cranks and mechanism, by means of which motion is communicated to the saw, which is capable of being fed downward by any suitable mechanism.

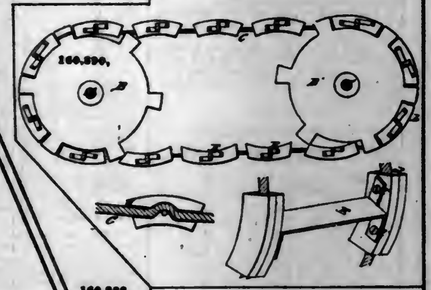
1. The combination, in a machine for channeling or sawing stone, of the revolving cranks d^1, connecting-rod F', guide-bar E, and saw G, whereby each cutting-point is caused to cut upon the line of a given circle exclusively its own, substantially as described.

2. The saw G, constructed as described, in combination with the revolving cranks d^1 and their operating devices, as and for the purposes described.

3. In a machine for channeling in stone, the saw G, having its penetrating end g'' narrow in width, circular in form, and armed with diamonds or other hard substance for cutters, in combination with the revolving cranks d^1, as and for the purposes described.

4. In a machine for channeling in stone, the combination of the saw G, having the motion as set forth, with a mechanical device, whereby the saw is fed down to cut a channel into the rock, substantially as described.

5. The mode of channeling or sawing of stone by the saw G, in which each of the cutting-points in cutting describes a circle that is independent of that cut by any other point in the saw, substantially as described.



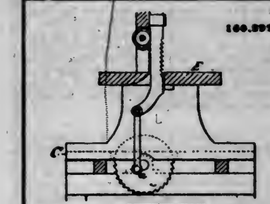
160,886. GANG CORN-PLANTERS. Silvanus P. Evans, Ash Ridge, Ohio. [Filed May 18, 1874.]

Brief.—Adjustably secured to the frame in rear of the seed-delivering tubes are covering-plows, turning downward and inward at their lower ends, for forming a ridge over the seed deposited.

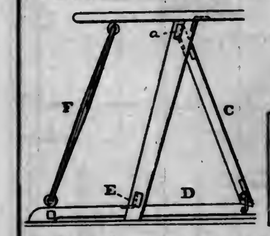
In a corn-planter, the slotted bars K, plate I, and vertically-adjustable clevis I', in combination with the seed-spouts G, as shown and described.

160,890. ENDLESS-CHAIN PROPELLERS. H. B. Everitt, Philadelphia, Pa. [Filed Aug. 8, 1874.]

The improved chain-propeller, consisting of the cables C, grooved lugs d, transverse paddles E, and grooved spur-wheels B B', constructed and combined substantially as shown and described.



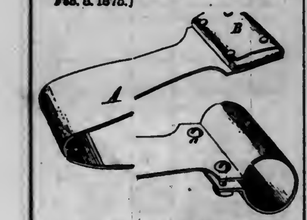
160,891. STREET-SIGNS. Hiram S. Finney, Detroit, Mich. [Filed Feb. 18, 1875.]



The sign-holder for lamp-posts, consisting of the ring A, with two or more horizontal integral arms, C, having dovetail seats a a', and the separate angle holders D D', secured to the arms by the dovetail seats and screw-bolts f, as set forth.

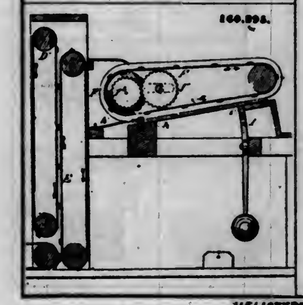
160,892. SAWING-MACHINES. John Gehr, Clear Spring, assignor to himself and Jos. R. Haines, Green Spring Furnace, Md. [Filed Nov. 23, 1874.]

The combination, with the tables C E placed at different altitudes, of the single shaft A, operating a jig-saw and a rotary saw at one side of the crank d, as and for the purpose specified.



160,892. IRONING-TABLES. A. C. Gilbert, Philadelphia, Pa. [Filed Feb. 6, 1875.]

1. The legs B, connected at top by the supporting cross-bar a, and at bottom by the cross-bar E, in combination with the legs C, jointed to the cross-bar a, the legs B, resting on the floor outside of the base, and the cross-bar E, resting on said base, substantially as and for the purpose set forth.



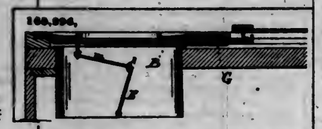
2. The board A, in combination with the legs B C and base D, and with the end rods F, substantially as and for the purpose set forth.

160,894. TOP-SUPPORTS FOR CARRIAGES. Andrew Goodyear, Albion, Mich., assignor to Zebulon C. Brown, same place. [Filed Feb. 9, 1875.]

1. As a new article of manufacture, the spring A, provided with a clamping device at one end, and a pad, B, at the other end, substantially as and for the purpose specified.

2. The spring A, having a clamping device at one end, in combination with the pad B B' c, substantially as and for the purpose specified.

160,895. HARVESTERS. Marquis L. Gorham, Rockford, Ill. [Filed Nov. 4, 1874.]



Brief.—An intermediate carrier is constructed so as to vibrate horizontally, to change the point of delivery of the grain

1. The pivoted vibrating frame H, having carrier F working therein, in combination with the carriers O D E and receiver G of a grain binder, substantially as described.

2. The weighted pendent arm I, with the segmental gear i thereon, and rack i', in combination with the vibrating frame H and its endless carrier F, substantially as described.

3. The hand-lever h^1, spring-catch h^2, toothed plate h^3, connecting-rod h^4, and arm h', in combination with the vibrating frame H and endless carrier F, as and for the purpose described.

4. In a machine for harvesting and binding grain, the carrier-frame H, with its endless carrier F, movably supported on the machine, so as to vibrate thereon, whereby the flow of the unbound grain is changed in its direction of delivery, substantially as and for the purpose described.

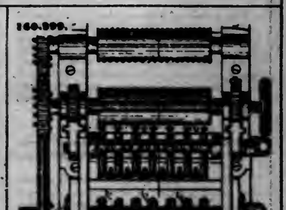
160,896. WATER-CLOSETS. John H. Gould, Hudson, N. Y. [Filed Aug. 27, 1874.]

Brief.—The sliding bar is pushed back by a thumb-piece, carrying with it the slide which uncovers the sink. The ratchet or cogged plate appended to the under surface of slide-plate winds up the coil of spring, and closes the cylinder-plate by means of connecting-rod, thus effectually excluding the foul air during the use of the closet.

The slide B, operated by means of the ratchet-plate G, in combination with ratchet-wheel D, spring a, rod m, and cylinder-plate E, the whole constructed and operated substantially as and in the manner described.

160,897. RUBBER-COATED BAGS. Wm. D. Grimshaw, Rocky Hill, N. J. [Filed Jan. 25, 1875.]

A water-proof bag coated with rubber, and having its edges cut, lapped, and united by the coated surface, by which the lapped parts are rendered homogeneous with the body of the bag, as a new article of manufacture, as herein described.

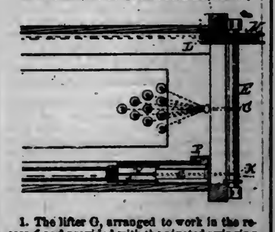


160,898. WATER-PROOF COMPOUNDS. Wm. D. Grimshaw, Rocky Hill, N. J. [Filed Jan. 25, 1875.]

Brief.—Coats textile fabrics with a composition consisting of caoutchouc, whiting, sulphur, oxide of zinc, lamp-black, and asphalt.

The composition herein described, in which lamp-black is combined with cleaned and masticated rubber, benzine, whiting or chalk, oxide of zinc, asphaltum, and sulphur, substantially in the proportions herein stated, for use in waterproofing fabrics, as described.

160,899. SAWING-MACHINES. William P. Hale, Brockport, N. Y., assignor to the Hale Manufacturing Company, Port Huron, Mich. [Filed Mar. 27, 1874.]

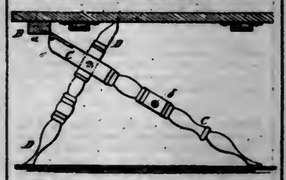


Brief.—The saw guides are tubular, thus allowing the constant lubrication of their bearings upon the saw.

1. As a means for lubricating saws, the hollow guides or projections E, furnished with leather or other suitable material, through which the oil is to exude or percolate.

2. In combination with the hollow guides or projections, a hollow shaft furnished with holes communicating with the interior of the guides, substantially as and for the purpose described.

160,900. BOWLING-ALLEYS. A. A. Hamlin, New York, N. Y. [Filed Jan. 29, 1875.]



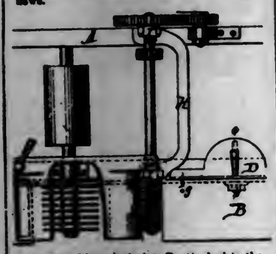
1. The lifter G, arranged to work in the recess f, and provided with the pivoted swinging arms g' g'' and cord K, substantially as shown and described.

2. The combination of the cord I, purchase-wheel M, and windlass E with the cord C, connected with the pins, and the cord K, connected with the lifter, whereby the pins are set up and the balls lifted and returned by one and the same operation, substantially as shown and described.

3. The spring-board P, constructed and arranged to operate as shown and described, for the purpose specified.

160,901. IRONING-TABLES. S. C. Hamlin, Ypsilanti, Mich. [Filed Sept. 15, 1874.]

The combination of the ironing-board A, having notches x x, the cross-bar B, with inclined surface a a, the hinged legs C C, united by round b, and the legs D D, pivoted to the legs C, all constructed and arranged as set forth.



160,902. PROCESSES OF FLESHING, DRESSING, AND FINISHING SHEEP-SKINS. Richd. Hart, Gloversville, N. Y., assignor of one-half his right to Jas. Gillespie, same place. [Filed Sept. 12, 1874.]

Brief.—This process forms an imitation grain-surface upon skins from which the original grain-surface has been removed.

The process of dressing sheep-skins consisting essentially in immersing the skins, first, in a compound of alum water and flour, oatmeal and water, and, after a suitable period, in a compound of urine, soap, soda, salt and water, and oat-meal, flour and water, the skins being suitably manipulated meanwhile, substantially as described, for the purpose specified.

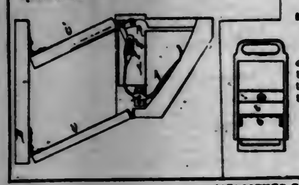
160,905. MACHINES FOR SAWING LATHS. Philo W. Hart, Camden, N. Y. [Filed July 6, 1874.]

Brief.—The table is made vertically adjustable, and is provided with a transversely-moving gage, and the feeding-rolls are made capable of angular adjustment with relation to the saws.

1. The table or bed-plate B, attached to the frame A by bolts working in slots *c*, so that it may be vertically adjusted, and having the elongated slot *e* and openings *g*, in combination with the right-angled gage-plate D, having the leg *d*, adapted to the slot *e*, and the pins *f*, adapted to the holes *g* in the adjustable guide-table, all substantially as herein shown and described.

2. The yoke E, extending transversely across the frame A, and having at each end a standard, I, in which the feed-rollers have their bearings, said yoke being adjustably attached to the frame, whereby the feed-rollers can be caused to revolve in a plane parallel to the planes of revolution of the saws, or obliquely thereto, substantially as described, for the object specified.

160,906. MEASURING-RULES. O. S. Hastings, Granby, assignor to himself and F. S. Johnson, Plainfield, Conn. [Filed July 2, 1874.]



Brief.—Claims economy in the consumption of ivory in the manufacture of measuring-rules.

A measuring-rule composed of strips of ivory secured permanently together, or of strips of ivory and wood or rubber, so combined that the ivory shall be on the outside for receiving the graduations, all as set forth.

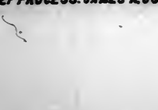
160,907. CARRIAGE-TOPS. Charles Heergeist, Cincinnati, Ohio, assignor to Crane, Breed & Co., same place. [Filed Feb. 18, 1875.]

Brief.—Top supported on swinging, whether up or down.

In a vehicle, the combination of top B, swinging bars C C, crank-shaft D O *g*, and spring F *f*, substantially as and for the purpose set forth.

160,908. FIRE-BACKS FOR STOVES. George W. Herrick, Detroit, Mich., assignor to Detroit Stove-Works, same place. [Filed Dec. 10, 1873.]

Brief.—Air is admitted to the space in rear of the fire-back through the sides of the stove.



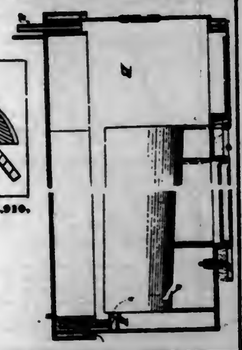
The fire-back A, consisting of a plate, constructed as described, to form an air-space with the back of a cooking-stove, bearing a series of frusto-pyramidal studs on its surface, said studs being arranged in lines, so that those of one line shall be opposite the intervals of those in another line, substantially as and for the purposes set forth.

160,908.

160,909. KNOB-ROSES. Selah Hiler, New York, assignor to William Irwin Martin, Brooklyn, N. Y. [Filed Aug. 10, 1874.]

Brief.—A thin ornamental film of metal is secured at the back of a glass rose, and a cushion of leather is fitted in a recess, also located at the back. This cushion lessens the liability of breakage.

1. A rose made of glass, with a film of metal applied to the back thereof, and protected by a suitable coating, substantially as set forth.

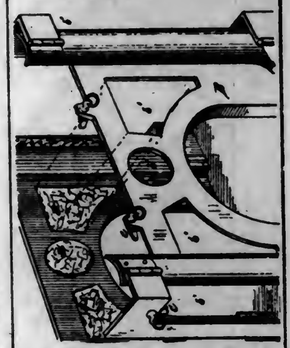


2. A rose made of ornamental glass, and recessed at the back, in combination with a washer of leather or similar material that fills, or nearly so, the space within such recess, substantially as set forth.

160,910. COOPER-COOLERS. Charles Hoff, Cincinnati, Ohio. [Filed July 17, 1874.]

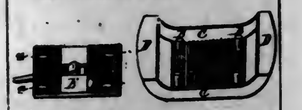
Brief.—The several adjustable parts are fitted with water-joints for rendering them air-tight, also of draining the water which forms in the ice-chamber, and causing it to fill and keep full the lower joint of the preserver, while a pipe leading from said joint prevents it from overflowing

1. In combination with bed A and case B, the liquid-trough *a*, constructed substantially in the manner and for the purpose specified.



2. The bed A, case B, and liquid-trough *a*, in combination with ice-chamber *b'*, and pipes E and *e'*, substantially as and for the purpose specified.

160,910.



160,911. APPARATUS FOR MARBLEIZING MANTELS. Robert J. Howdon, Cincinnati, Ohio. [Filed Dec. 8, 1874.]

Brief.—The mantel is marbleized by dipping or splashing. The detachable frame acts as a shield to prevent certain portions from receiving the marbleizing material.

In the process of marbleizing mantels, the detachable frame B *b'*, provided with the clamps C, the whole constructed and operating substantially as and for the purpose specified.

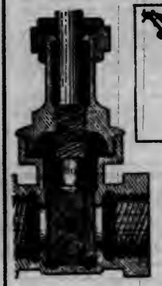
160,912. BUCKLES. John Hudson, Detroit, Mich. [Filed Oct. 21, 1874.]

1. The combination of the plate A, having the studs B, with the compression-plate E, having the holes *a* and tongue *b'*, as shown.

2. The combination of the plate A, having the studs B, with the compression-plate E, having the holes *a* and tongue F, both of said plates being corrugated, as shown, for the purpose of holding the straps rigidly in place, as set forth.

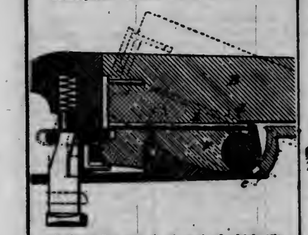
3. The combination of the plate A, having the studs B, sides C, and loops D, of the compression-plate E, having the holes *a* and tongue F, all as and for the purpose set forth

---



160,913. BED-BOTTOMS. Platt C. Ingersoll, Green Point, Brooklyn, N. Y. [Filed Dec. 10, 1874.]

1. The combination of the slats C, bars D, and loops or staples E, substantially as described, the latter being constructed and arranged to embrace and bear upon the slats, and to be adjusted along them, as and for the purposes described.

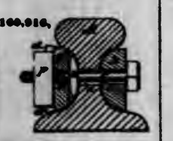


2. The strips J of leather or other fabric, in combination with the slats C and loops or staples E, substantially as and for the purpose shown and described.

160,914. STEAM-VALVES. John Johnson, Brooklyn, N. Y. [Filed Dec. 7, 1874.]

A valve, as made with two independent disks or gates, having upon their inner faces inclines, in combination with an intermediate operating mechanism, consisting of a suitable frame, swiveled or otherwise connected to the valve-stem, and provided upon its upper half with an incline projection or wedge, and carrying upon its lower half a loosely fitting wedge, substantially as set forth.

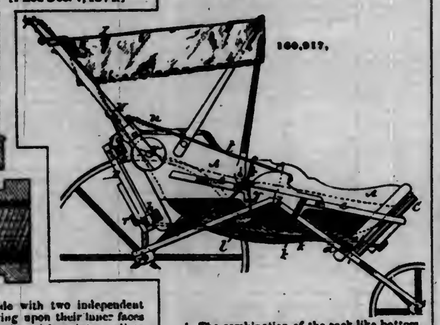
160,915. BREECH-LOADING FIRE-ARMS. Chas. A. King, Meriden, Conn., assignor, by mesne assignments, to Charles Parker, same place. [Filed Feb. 5, 1875.]



1. In a fire-arm the barrel of which tilts up at the breech, the collar E, constructed with a connection to the frame other than the pintle, substantially as described.

2. In a fire-arm the barrel of which tilts up at the breech, the recesses R in the frame around the pintle, substantially as and for the purpose described.

160,916. RAILWAY-RAIL JOINTS. Joseph M. Kenny, Blairsville, Pa. [Filed Jan. 27, 1875.]

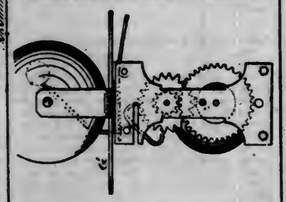


Brief.—The depression in the fish-plate holds the nut from turning, the same being drawn into place by turning the bolt head. The transverse piece on the bolt, lying in the space, is entered through the transverse slot, and turned so as finally to lie across it, its object being to assist the nut in confining the joint.

The combination of the bolt C, having the locking-bit E, with the plates B and B', the latter having spaces *c* and *d*, and the nut F, substantially as and for the purpose described.

160,917. CHILDREN'S CARRIAGES. Rudolph Kreter, New York, N. Y. [Filed Dec. 30, 1874.]

Brief.—Collapsible lengthwise and crosswise, so as to be easily folded and carried from point to point.

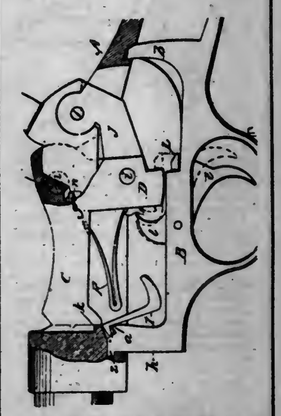


1. The combination of the sack-like bottom G and hinged sides A A, composed of rigid sections, and hinged ends B C, also composed of rigid sections, substantially as and for the purpose set forth.

2. The cord *f* and spring *s*, in combination with the sack-like bottom G and the back and front pieces B C, in sections, hinged together at *g g*, and united with the sides by hinges *h*, substantially as set forth.

3. The catches *w*, in combination with the pivoted supports fi H, the cords *t*, springs *u*, and hinged sides A A, constructed in sections, substantially as set forth.

4. The cords *t h*, in combination with hinged sides A A and hinged ends B C and flexible bottom G, substantially as set forth.



160,918. BURGLAR-ALARMS. M. H. Lasher, Champaign, Ill. [Filed Jan. 18, 1875.]

1. The combination, with a burglar-alarm operated by clock-work, of the pivoted lever G or its equivalent, extending on both sides of the alarm, and arranged to stop and start the clock-work, so that the alarm can be used with any door, whether opening to the right or left, as herein set forth.

2. The combination, with the clock-work, of a burglar-alarm, of the pin *i* on the rock-shaft of the hammer, and the pivoted lever, provided with the lug or bar A, substantially as and for the purposes set forth.

160,919. BREECH-LOADING FIRE-ARMS. James Lee, Milwaukee, Wis. [Filed May 9, 1874.]

1. The trigger-guard B, attached to the frame A by means of the lip *a* and arm *b*, fitting in corresponding recesses, and secured by the screw D, substantially as set forth.

2. The hammer H, pivoted to the swinging tumbler J, the said parts being constructed and arranged to operate as described.

3. The hammer H, constructed and operating in relation to the firing-pin *g*, so that its nose *n* will be depressed below the firing-pin when pressed forward, as set forth.

4. The trigger *t*, provided with the legs L, in combination with the arms D of the breech-block, for locking the latter closed, substantially as described.

5. The extractor I, arranged to bear on the shoulder *a* during the first part of its movement, and then to change its point of bearing to the strap below, substantially as set forth.

6. The mainspring F, constructed and located in reference to the breech-block and extractor, substantially as described, whereby it operates to elevate the breech-block, to a level with the bore, and also operates on the extractor to make it hold the breech-block open until released.

7. The horizontal projection *k*, extending across the opening in the frame A, below the bore of the barrel, whereby a chamber is formed for the head of the shell in rear of the barrel, with an unobstructed opening above for the escape of the gas, as set forth.

8. The pivot-pin *f*, flattened at the point where the hammer bears against it, in combination with the face *f* of the hammer, whereby the mainspring, operating through the medium of the hammer, serves to keep the pin *f* locked in position, as set forth.

9. The combination of the tumbler J and the trigger *t* with the breech-block C, the trigger having its point arranged to bear against the front end of the tumbler when the hammer is let down, so as to prevent the breech-block from closing entirely, and thus keep the point of the firing-pin below the primer, while the hammer rests thereon, as set forth.

10. A vibrating extractor, constructed to operate substantially as described, whereby its lip or point which is in contact with the shell is made to move in a straight line, as and for the purpose set forth.

160,920. COTTON-SEED PLANTERS AND FERTILIZER-DISTRIBUTORS. J. B. Logg, Rome, Ga. [Filed Oct. 12, 1874.]

Brief.—The seed-box is adjustably secured to the plow beam and standard by a guide-rod on the box working through an eyebolt on the standard, and boot stay-rods extending from the beam to the seed-box. The covering-plows are prevented from falling too low, when the box is adjusted, by pins projecting out from the frame.

1. The means employed for connecting together the seed-planting devices and the plow, consisting of the eye E, guide-rod F, and the curved bars H and H, said parts being constructed and combined in the manner and for the purpose substantially as specified.

2. The covering-plows L L, in combination with the seed-box G, and stops N, substantially as and for the purpose set forth.

160,921. MACHINES FOR GRINDING LATHE-CENTERS. Martin B. Leesman, Hamilton, Ohio. [Filed Apr. 24, 1874.]

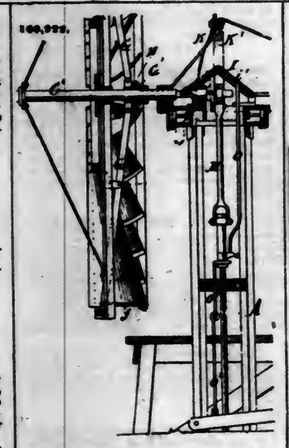
Brief.—A detachable friction-ring is arranged on the face-plate, to communicate motion to the grinding machinery.

1. The detachable driving-ring R, in combination with a center-grinding attachment such as described, substantially as and for the purpose specified.

2. In combination with wheel I, spindle K, wheels H O F, spindle E, and frame A a, the pivoted adjustable bearing D I J, operating substantially as and for the purpose specified.

160,922. WINDMILLS. George H. Lucas, Pekin, Ill. [Filed Feb. 9, 1875.]

Brief.—The wind-wheel and its connections are supported upon the top of the tower, a strong frame-work of wood or iron. The turn-table rests upon a series of rollers, which run upon a circular track fixed upon the top of the tower. The rim and the hub of the wheel are connected by a number of spokes, on which a flanged ring is fastened. The sails turn on studs or journals projecting from their respective ends near their outer rectangular edge, and are tapering in width, and bent transversely upon a regular curve from end to end, so that they are true tapering segments of a hollow cylinder.



1. The combination of the sails E, ring F, links f, levers G, sleeve G', shifter H, and spring K, substantially as and for the purpose specified.

2. The combination of the sails E, ring F, links f, levers G, sleeve G', shifter H, spring K, and the toggle I, and hand-lever P, with intermediate connections, substantially as and for the purposes specified.

3. The sails E, in the form of tapering segments of a hollow cylinder, substantially as specified.

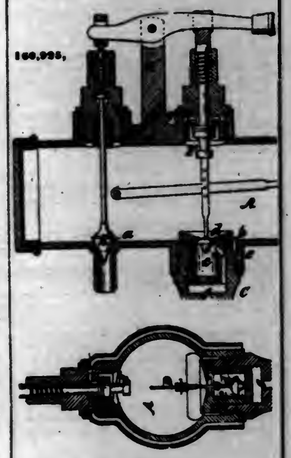
160,923. CORN-DRILLS. James B. Ludlow, Muncie, Ind. [Filed Jan. 30, 1875.]

Brief.—Upon the upper rear end of the opening-plow is formed a discharge, or clearing-finger, that projects into an annular groove in the seed-wheel, for forcing the seed out into the chute.

The clearing-finger *k*, formed on the upper rear end of the drill-opener G, in combination with the dropping-wheel E, provided with seed-cells intersected by an annular groove, as and for the purpose set forth.

160,924. PEN AND PENCIL CASES. George W. Mabie, Brooklyn, N. Y. [Filed Feb. 19, 1875.]

Brief.—The reversible pen-holder sleeve is inserted into the pencil end of the case, between the pencil mechanism and the outer case.



The combination, with the pencil movement, of the reversible pen-holder E, inserted at the pencil end of the outer case A, and entering the latter outside of or over the pencil movement, substantially as shown and described.

160,925. DRAWING EVANESCENT LIQUIDS. Peter E. Malmstrom and Paul E. Dummer, New York, N. Y. [Filed Feb. 8, 1875.]

Brief.—The induction-port passes up in an oblique direction, so that the valve, when it is down, cannot be raised by the force of the inflowing liquid. The induction-valve has a float, whereby the liquid is prevented from rising in said chamber beyond the desired level. The discharge-valve is situated in a cavity formed in the lowest part of the chamber, so that when said valve is raised, all the liquid contained in the chamber is free to discharge.

160,926.

1. The combination of an oblique channel or port, *c*, with the chamber *a*, containing the induction-valve *d*, substantially as shown and described.

2. The combination of a float, E, with the induction-valve *d* and vent-valve F, said vent-valve, when it is depressed, serving to open the induction-valve against the action of its float, substantially as set forth.

3. The combination of a chamber, A, formed as described, with a discharge valve, *h*, vent-valve F, float E, induction-valve *d*, and oblique supply-port *c*, all constructed and operating substantially in the manner shown and described.

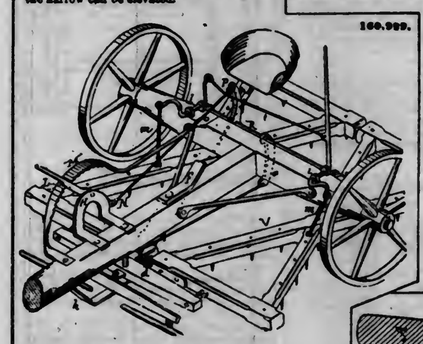
160,927. BRICK-KILNS. R. F. Marshall, Lincomb, Iowa. [Filed Feb. 25, 1875.]

Brief.—One kiln only, or as many as may be necessary, may be used in connection with the single central chimney.

1. In combination with the kiln A, and the chimney B, arranged as described, the trunks or flues A j G J K, and their several valves, substantially as shown and described.

2. The combination of the kilns A, having the partition-walls *g* and openings *f*, with the flues J communicating with the flues K by openings *r* regulated by valves, and the chimney B regulated by the damper *s*, substantially as and for the purpose set forth.

3. The combination, with the flues K K, of the cross-flues N provided with valves *v*, substantially as and for the purpose set forth

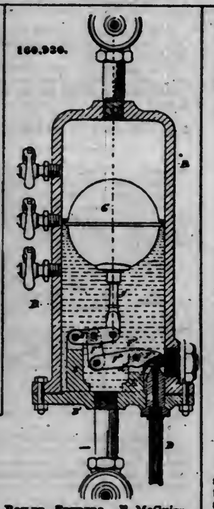


160,928. JARS FOR ANATOMICAL SPECIMENS. John M. Maris, Philadelphia, Pa. [Filed Feb. 23, 1875.]

Brief.—A glass rod rests by its journaled ends in recesses in the edge of the jar. The specimen is secured by cord to this rod, and hence need not be disturbed when the jar-cover is removed.

A specimen jar in which a bar, B, is adapted to recesses in the neck, and arranged in respect to the cover, all substantially as set forth.

160,929. HARROWS. William T. McGhee, Wheeling, Mo., assignor to himself, J. C. Gush, and W. W. Edgerton. [Filed Jan. 16, 1875.]

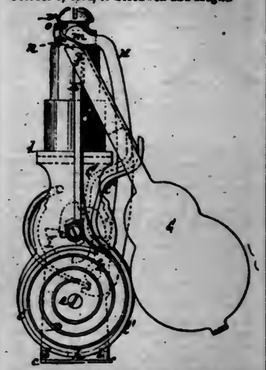


Brief.—The harrow is made in two sections and hinged together in front and rear, and supported upon bearing-wheels by chains rising from their centers and connected to the arms of a rock-shaft, by which means the harrow can be elevated and depressed, and by another lever and rock-shaft either side of the harrow can be elevated.

1. In combination with the frames V V, hinged together at their front and rear ends, the rock-shaft K, provided with the standards S S and arms P *c*, the double-tree *d*, elongated king-bolt *e*, and the lever I, engaging with the rack M, and connected to the arm P by the rope N, constructed and operating substantially as and for the purposes set forth

2. The combination with the frames V V, suspended at their front ends by the double-tree *d* and king-bolt *e*, and at their centers by the standards S S of the rock-shaft R, the crank rock-shafts *i* and *l*, rope *t*, and chains *m m*, substantially as and for the purposes set forth.

160,930. BOILER-FEEDERS. F. McGuire, Toronto, Canada. [Filed Nov. 20, 1874.]



The float G, with connecting-rod *g*, lever F, hinged to the standard E, connecting-link F', and lever F', pivoted on the standard E', and having the shorter arm F' enlarged to form a disk, *f*, in combination with the case B B' and supply-plug D', arranged and operating substantially as and for the purposes specified.

160,931. SAD-IRONS. Jos. M. McMaster, Rochester, N. Y. [Filed Nov. 26, 1874.]

As a new article of manufacture A sad-iron made of clay, with glazed surface and having the openings or recesses *b b*, for the purpose of allowing the moisture to escape from the clay while baking, and the reception of a handle, substantially as described.

160,932. AUTOMATIC LIGHTERS FOR GAS-BURNERS. Edwd. L. Megill, Brooklyn, N. Y., assignor to W. G. Morgan, same place. [Filed Mar. 4, 1875.]

Brief.—Improvement on Patent No. 155,779, October 6, 1874, to Stockwell and Megill.

1. The hammer H, pivoted at *h* and constructed with an inclined face, *m*, in combination with the anvil E, bent, as at *n*, to correspond with the inclined face of the hammer, for explosion of the fulminate on the ribbon D as the latter is fed upward to the burner from the magazine below, substantially as and for the purposes herein set forth.

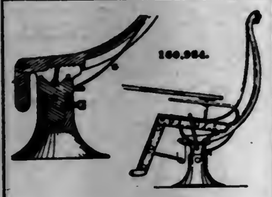
2. The magazine G, formed in part of a spring, G', in combination with one or more feed-wheels, *t*, and constructed to operate with an elastic or yielding pressure between it and the feed wheel or wheels on the fulminate-ribbon introduced between them, essentially as described.

3. The combination of the magazine-cover G, pivoted above to the anvil, as at *f*, and constructed to form, in concert with the anvil E, a guide for the fulminate-ribbon, substantially as specified.

4. The laterally-swinging magazine-cover G, pivoted above, as described, in combination with the spring G' of the magazine, whereby said cover, when being thrown back or open, is made to act upon the spring to enlarge the capacity of the magazine, essentially as and for the purposes herein set forth.

160,933. BRUSHES. William A. Megraw Baltimore, Md. [Filed Sept. 21, 1874.]

Brief.—The head of the brush is provided with a groove, across which the bristles are laid. A strap holds the bristles in the groove, and nails pass through said strap to bind it and the bristles in place.

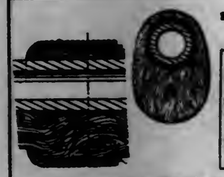


The groove *a* in the brush-block, and the bristles *b* nailed to said block in said groove through the strap or strip *d*, as and for the purpose described and represented.

160,934. CHAIRS. Joe V. Meigs, Lowell, Mass. [Filed May 16, 1874.]

1. The combination of the base, the post mounted thereon, the back-iron pivoted to the front of the post, the seat-frame, the flexible cover connecting the seat-frame and back-iron, and the pawl and rack for adjusting the back-iron and seat-cover independently of the seat-frame, substantially as and for the purpose set forth.

160,924.



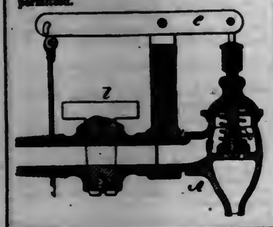
2. The combination of the base, the post, the back-iron pivoted on the post beneath the seat-frame, the rod and rack for adjusting the back-iron, and the spring G, for elevating the back-iron and adjusting the seat-cover, these parts being constructed and operating substantially as and for the purpose set forth.

3. The combination of the seat-frame, the arms secured thereto, the adjustable back-iron, the flexible seat-cover secured to the seat-frame and back-iron, and the foot-rest pivoted to the seat-frame and connected with the back-iron, these parts being constructed substantially as set forth, whereby the back-iron, the seat-cover, and the foot-rest are adjustable independently of the seat-frame and arm-rests.

4. The combination of the seat-frame, the adjustable curved back-iron, bifurcated at its upper end, and the flexible seat-cover extending from the seat-frame to the upper bifurcated end of the back-iron, as described, forming in its continuity a seat, a back-support, and a head-rest, as set forth.

160,925.

160,925. STOCKS FOR FIRE-ARMS. Joe V. Meigs, Lowell, Mass. (Filed May 16, 1874.)



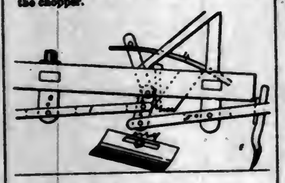
1. A gun-stock or imperfect conductor surrounding a gun-barrel, to prevent burning the hands when the barrel is heated, substantially as set forth.

2. The method herein described of protecting a gun-stock from being injured by heat from the barrel, by means of non-conducting material interposed between the stock and barrel, substantially as set forth.

3. The combination of a barrel, a stock surrounding the barrel, and non-conducting material interposed between the stock and the barrel, substantially as set forth.

160,926. BOTTLING-FAUCETS. A. C. Meyer, Baltimore, Md. (Filed Feb. 9, 1875.)

Brief.—A bottling-faucet and treadle so combined that the operator can control the flow of the fluid with his foot, and have his hands free for use in managing the bottles; also, in combining with the faucet a body or casket containing a cock, by which the flow of the fluid may be shut off, and the removal of the faucet for cleansing or other purposes permitted.



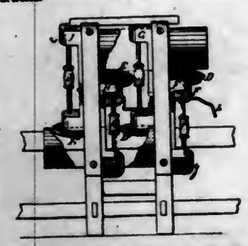
1. In combination with a bottling-faucet, A, a treadle, B, arranged and operating substantially as shown.

2. In combination with a bottling-faucet, A, a casket or body, B, provided with a cock, i, substantially as and for the purpose described.

3. In combination with the spring-faucet A, the lever c, cord g, and treadle k, as shown.

160,927. COTTON-CHOPPERS. John G. Mickle and Fountain F. Dearring, Fosterville, Tenn. (Filed Aug. 15, 1874.)

Brief.—A square block is rigidly secured to the axis. In revolving its corners trip a spring-lever, which connects with and raises the chopper.

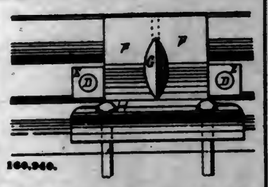


The combination, in a cotton chopper and scraper, of the box K, the levers 1 2 3 5, the spring-bar 4, and the trip 5, all constructed and arranged substantially as described, for the purposes specified.

160,928. CONSTRUCTION OF PIERS. John Milroy, Edinburgh, North Britain, and Jas. Wm. Butler, Willesden, England. (Filed Oct. 16, 1873.)

The mode described of building piers and other structures—that is to say, building a number of tubular sections independently, bringing each section so built to its position above the foundation or lower section, and then lowering the said upper section and securing it in position, all as set forth.

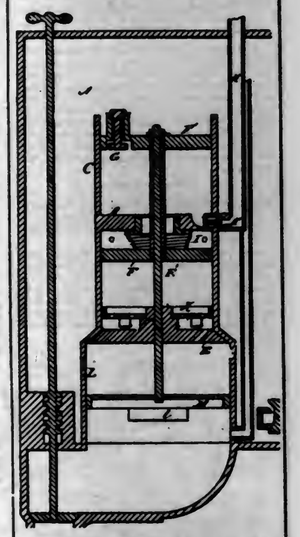
160,929. SAWING-MACHINES. M. M. Miller, Moline, Ill. (Filed Dec. 16, 1874.)



Brief.—A series of adjustable saws are placed diagonally to a traveling carriage, upon which the lumber is placed, for the purpose of forming it into gutters and analogous articles.

The combination of the saws D D' E E', arranged in adjustable bearings F G H I, substantially as described, with a lever, L, substantially as and for the purpose hereinbefore set forth.

160,930. RAILWAY-RAIL-JOINT PROTECTORS. Isaac Mills, Hamilton, Canada. (Filed Aug. 31, 1874.)



160,940.

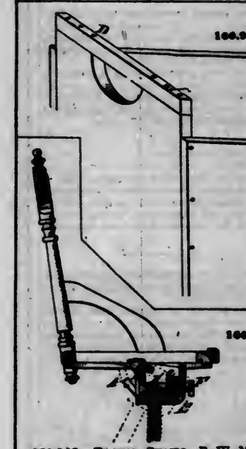
The rails A A, fish-plates C C, secured by bolts D D and nuts E E, and the joist-protector F, the latter being secured in the manner shown, to act as a locking device for the nuts, the whole being combined and arranged to operate as and for the purpose specified.

160,941. AUTOMATIC FIRE-PLUGS OR HYDRANTS. Daniel Minich, Philadelphia, Pa. (Filed Feb. 26, 1875.)

Brief.—Within the hydrant-stock is arranged an air-pump, the piston of which is operated by the water from the main to compress the air within the stock, the air being used to force the water from the hydrant.

1. A fire-plug, hydrant, or pump provided with a cylinder, pistons, and valves for compressing air to be used in forcing the water admitted to the stock, substantially as described.

2. The stock A, holding the cylinder C, having diaphragm D, valve E, and pistons F F', constructed and arranged as described, for the purpose set forth.



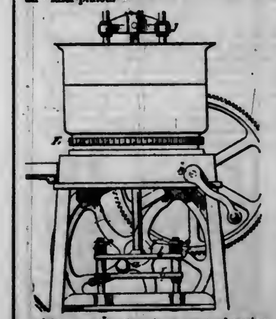
3. The combination, with the stock A, containing the cylinder C, provided with pistons and valves, as set forth, of the branch B and discharge-pipe N.

4. In combination with the cylinder C and branch B, the base L, having an outlet-port, l, for the purpose described.

160,942. FARM-BOXES. M. M. Murray, Cincinnati, Ohio. (Filed Feb. 17, 1875.)

As a new article of manufacture, the box composed of bottom A, sides C C', and notched and slotted flaring ends B D B' D', which extend above said sides, in the manner and for the purposes set forth.

160,942.



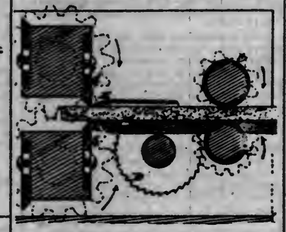
160,942. TILTING CHAIRS. R. W. Myers, New York, N. Y. (Filed Dec. 26, 1874.)

1. The drop or plate A, attached to the chair-seat, in combination with the spring B', receptacle E, with the internal projection or plate e, and an axis, G, having its bearing or bearings attached to the chair-seat, substantially as and for the purpose set forth.

2. The drop or plate A, fastened to the chair-seat, in combination with the spring B', receptacle E e, axis G, having its bearing or bearings connected to the chair-seat, and spring tension-regulating screw F, substantially as and for the purpose set forth.

160,944. MEAT-CHOPPERS. August Nittinger, Jr., Philadelphia, Pa. (Filed Feb. 24, 1875.)

Brief.—An improvement on patent to same inventor, No. 157,213, November 24, 1874. The vertical shaft carrying the knives is flexibly held by cross-arms beneath, between which works a crank-pin on a large wheel, the horizontal shaft through said wheel receiving motion from a primary cogged wheel, which also imparts motion, at the operator's will, through an "idler-pinion."



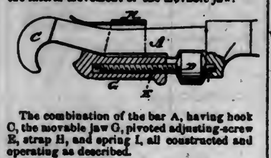
1. The combination, in a meat-chopping machine, having reciprocating knives operated by a crank, of the yielding spring-bar b, attached to or forming part of the knife-rod I, with the bar b', secured to the guide-pins d d.

2. The combination of the cog-wheel E on the chopping-block, the idler-pinion g, and pinion p on the shaft M, with the lever F and spring-bolt F, for supporting and releasing the said shaft.

3. The combination of the spring-bolt Q, the retaining and releasing arm x, and fly-wheel G, having a notch adapted to the bolt, all substantially as set forth.

160,945. SUGAR-CUTTING MACHINES. Geo. P. Ockerhausen, New York, N. Y. (Filed Feb. 2, 1875.)

Brief.—The sugar is passed between press ing-rollers, is held by spring clamps, and is cut by tangential cutters carried by rollers

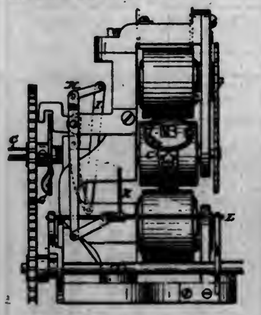


1. The combination of the elastic jaws E E with the elastic feed-rollers C C and the saws D D, substantially as specified.

2. The revolving cutter-heads F F, provided with tangential cutters G G, disposed to cut in a plane back of and parallel, or therewith out, with a plane intersecting the centers of the heads, substantially as described.

3. The combination, with the elastic jaws E E, of the revolving cutter-heads F F, having tangential cutters G G, as and for the purposes herein set forth.

160,946. PIPE-WRENCHES. Henry Otto, Bloomington, Ill. (Filed Jan. 9, 1875.)

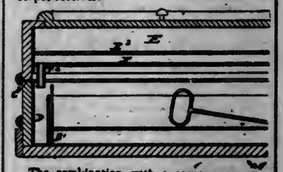


Brief.—The movable jaw bears on an inclined portion of the main bar. The journal of the adjusting-screw serves as a pivot for the lateral movement of the movable jaw.

The combination of the bar A, having hook C, the movable jaw G, pivoted adjusting-screw E, strap H, and spring I, all constructed and operating as described.

160,947. ROTARY PRINTING-PRESSES FOR DATING LETTERS AND CANCELING STAMPS. Timothy G. Palmer, Schultzville, and H. F. Clark, Poughkeepsie, N. Y. (Filed Mar. 10, 1875.)

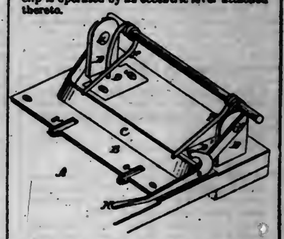
Brief.—A cam-disk on the type-shaft actuates a compound lever, which throws forward a finger to discharge the pointed letter from the open side of the machine. A pawl-rack moving in grooved guide-plates may give intermittent motion to the main shaft.



1. The cam C upon the shaft C, in combination with the compound levers H I, rod L, and discharging-finger K, as described.

2. In combination with the shaft C and ratchet-wheel M, the toothed pawl N and guide O O', as and for the purpose specified.

160,948. CORPSE-COOLERS. Chas. O. Peck, Pittsfield, Mass., assignor to N. G. Brown, same place. (Filed Feb. 13, 1875.)



Brief.—The cooled water flows into and through perforated channels in the drip-floor and underlying troughs, and their outlets, into a water-receptacle, which extends around the corpse-receiver.

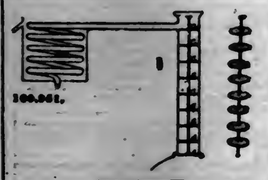
The combination, with a corpse-preserver having a continuous water channel or receiver, D, surrounding the entire corpse-chamber, of the ice-box E, having a continuous bottom, E', extending from side to side, with a series of perforated channels, e, formed therein, and troughs F, provided with tubes F', substantially as described.

160,949. PAPER-CLIPS. William Voorhees Perry, Beaver Dam, Wis., assignor of two-thirds his right to J. Aiken and B. Quaintance, Kokomo, Ind. (Filed Mar. 6, 1875.)

Brief.—Consists of a knife-edged spring-clip, which serves as a paper-cutter, and a slotted plate to hold paper-fasteners. The clip is operated by an eccentric lever attached thereto.

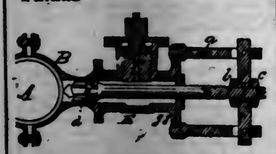
The combination of the board A, slotted base-plate B, metallic plates D D, the angular knife-edged clamp C pivoted thereto, shaft E, springs F F, and the J-shaped lever H, pivoted to the clamp C, all constructed substantially as and for the purposes set forth.

160,950. DEVICES FOR REMOVING WIRE FASTENINGS FROM CORKS. Geo. A. Potter, New London, Conn. (Filed Nov. 5, 1874.)



As a new article of manufacture, a device for removing fastenings from corks of bottles, consisting of the rigid hook b, ferrule B, provided with ears or projections a a, and handle A, constructed as described

160,951. RECTIFYING-STILLS. E. Freeman-Prentiss, Philadelphia, Pa. (Filed Dec. 30, 1874.)



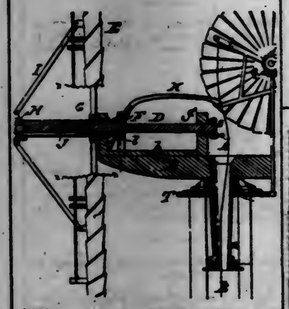
Brief.—A column located between a boiler and condenser contains a series of perforated diaphragms attached to a supporting-rod. This rod, with its diaphragms, is removable, the diaphragms themselves being removable from the rod. The perforations of small size, being punched from above downward, leave a burr on the lower face of the diaphragm.

The rod and perforated diaphragms, in combination with the boiler and column, in the manner and for the purpose substantially as set forth.

160,861.

160,862. MACHINERY FOR TAPPING MAINS. John J. Quinn, Pittsburg, Pa., assignor of one-half his right to Edward T. Jamesson, same place. [Filed Oct. 3, 1874.]

Brief.—A clip-collar formed in two sections (to one of which is attached the sub-main) is permanently secured to the main. A slide, which carries the drilling apparatus, is bolted to a flange on the sub main. Two check-nuts—one above and the other below the bridge—revolve freely with the drill, the feed of the same being effected when the play of the nuts is arrested.



1. The combination of the clip-collar B embracing the main A, the sub-main branch E, having the bevel *g* and flange *g'*, and the valve C with the disk *c*, arms *c*, journal-bearing *c'*, screw D, and check-nuts *b c*, substantially as shown and described, and for the purpose set forth.

2. The threaded journal *b* and check-nut *c*, in combination with the bearing *c'* and threaded drill-shaft D, substantially as shown and described.

160,863. WHEELBARROW. Abel Raymond and Geo. Raymond, Waupun, Wis., assignors of one-half their right to M. J. Althouse, same place. [Filed Jan. 2, 1875.]

Brief.—A rotating frame or turn-table, with a weight on its forward end, and the wind-wheel on its rear end, fixing the pivot; also, the combination of the main wheel, arranged in rear of and fixing the pivot, and a small governing-wheel in front of and at right angles to the main wheel, to assist in keeping the same head toward the wind.

1. In combination with a pivoted frame or turn-table, B, a wind-wheel, E, mounted on its rear end and fixing the pivot, and a counter-weight, G, mounted on its forward end, as shown.

2. In combination with the turn-table B, saving the wheel E mounted on its rear end, as shown, the governing-wheel F mounted in front of the main wheel upon the turn-table, and connected with gearing for rotating the same, substantially as shown and described.

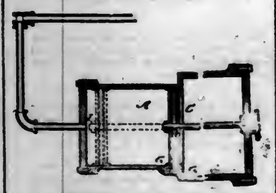
3. In combination with the collar P provided with single lugs *s* the bars I, arranged in pairs and connected to opposite sides of each lug, as shown and for the purpose described.

4. In combination with the rotating grooved collar P mounted on the main shaft, and the turn-table provided with the rib A, the band *l* controling the collar and engaging with the rib, as shown.

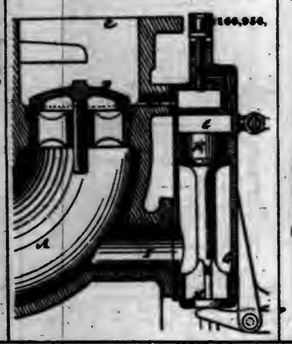
5. In combination with the shaft E and sliding collar H, the shield or cover W attached to the collar, as shown.

6. In combination with the grooved standards or uprights, the bearing-plate *b*, provided with the pipe *g* at its corners, as and for the purpose described.

160,864. DRILL-CHUCKS. John O. Reilley, Jersey City, N. J. [Filed Feb. 16, 1875.]



Brief.—The jaw-piece is slotted at each end, forming elastic jaws, to clasp the drill in two places at the same time, the jaws at the point being closed by means of the conical interior of the shell or cylinder, and those at the rear by means of the conical socket in the stock.



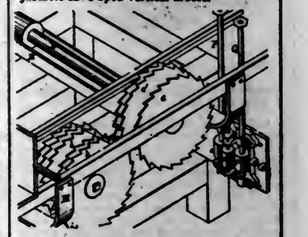
In combination with the chuck-cylinder A and stock B, the jaw-piece C, in one piece, and slotted at both ends, as shown and described.

160,865. STEAM AND AIR BRAKES. James R. Reniff, Bloomington, Ill. [Filed Nov. 23, 1874.]

Brief.—An accidental parting of the coupling allows the air within the smaller cylinder to escape, while the compressed air within the larger cylinder forces the piston over the communicating air-port, and confines the air back of the piston, the movement of the latter, through intervening mechanism, automatically setting the brakes.

The air-chambers A B of unequal diameters, and communicating with each other through a suitable air passage or port, C, in combination with the piston C, acting as a valve to closing and opening said port or passage, substantially as and for the purpose set forth

160,866.



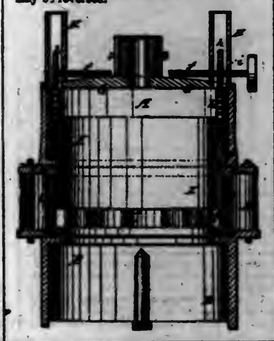
160,866. BELOW APPARATUS FOR AIR-COMPRESSORS. Geo. H. Reynolds, New York, N. Y., assignor of one-half his right to O. H. Delamater and Geo. H. Robinson, same place. [Filed Feb. 2, 1875.]

Brief.—When the pressure in the receiver reaches the required amount, it opens a small valve, that admits air to the top of a weighted valve, which is thereby opened, allowing the air to escape from the delivery-pipe.

The combination, with the feed A, of the check-valve B, the regulating-valve C, controlled by the pressure on the delivery side of the check-valve, the relief-valve H, controlled by the regulating-valve and opening to the atmosphere, and the passage I, substantially as and for the purpose or purposes herein set forth.

160,867. MACHINES FOR RELIEVING TEETH. R. A. Rowley, Williamsport, Pa. [Filed Jan. 16, 1875.]

Brief.—A series of circular saws are secured upon a stationary and an adjustable arbor, for cutting the sides of the teeth and wedges, the shoulders being cut by two adjustable saws upon vertical arbors.



1. The adjustable saw-arbor D, carrying the series of saws *c*, *c'*, and *c''*, diminishing in size as they recede from the saw *c*, in combination with the frame E, slotted support G, and pivoted support F, substantially as and for the purpose set forth.

2. The arbor C, provided with the saws *b b* and the adjustable arbor D, carrying a diminishing series of saws, as described, in combination with the vertical saw-arbors P and Q, with their adjusting mechanism, as and for the purpose specified.

3. The carriage L, provided with the horizontally and vertically adjustable stops *g h*, adjustable stop or stops *i*, and lever *l*, substantially as and for the purpose set forth.

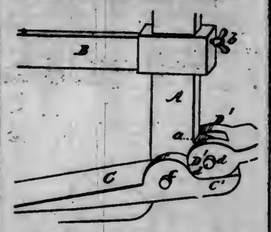
160,868. WATER-WHEELS. B. R. Royer, Ephrata, Pa. [Filed Feb. 9, 1875.]

Brief.—The casing is made of three principal parts—a top flume, bottom flume, and a center curb. The top and bottom flumes are cast exactly alike, each having a flange at the end. The middle part is cast of two annular rings, with triangular connecting-pieces set at an angle, and without any guides. The casing may be reversed.

1. A reversible flumed casing for water-wheels, as herein set forth.

2. The combination of the chutes or curb C, with guides D D, and the flanged flumes A and B, made exactly alike, to form a reversible casing for water-wheels, as herein set forth.

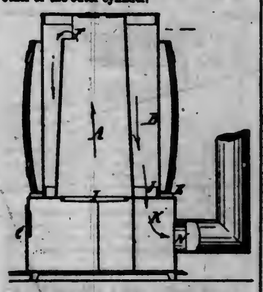
3. The combination, with a water-wheel casing, of the lid G, housings H H, gate I, rack bars *h h*, and shaft *f*, with pinions *i i*, all constructed substantially as and for the purposes herein set forth.



160,869. CARRIAGE-PAINTERS' EASELS. A. G. Rykert, Attica, N. Y., assignor to A. B. Miller, same place. [Filed Jan. 26, 1875.]

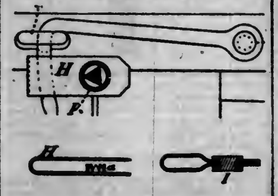
The platform C, constructed in one piece with the pivot-pin *d*, the arms *f f*, having a slot, *j*, adjustable jaw *h*, and eccentric lever *n*, and arms *f' f'*, provided with legs or teeth *g g*, all combined and arranged substantially as specified

160,870. CLAMPS. Brin Erdbeck, Red Wing, Minn. [Filed Aug. 20, 1874.]



Brief.—The forked pivoted jaw of the clamp is adjusted by means of a cam-headed lever operating upon the short arm of said jaw.

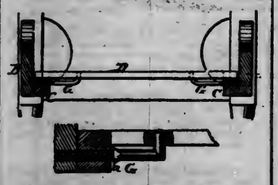
The herein-described carpenter's clamp, composed of the stock A, sliding jaw B *b*, jaw C C', permanently pivoted to one end of the stock, and lever D, also permanently pivoted to the stock, and provided with a cam or eccentric head, D', all substantially as and for the purpose specified.



160,871. BARREL-STOVES. Jas. F. Scholes, Brooklyn, N. Y. [Filed Jan. 12, 1875.]

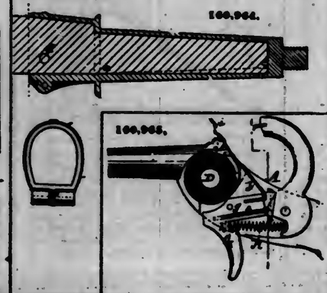
Brief.—The products of combustion are carried first to one side and afterward to the other of the outer cylinder.

The combination, in a stove for barrels, of the central fuel-cylinder A, having the lateral opening F at its top, the cylinder B entirely surrounding the central cylinder, and the base C having the opening or passage J and discharge-chamber K, and shoulder *a* of the base, substantially as described, whereby the products of combustion are caused to ascend the central cylinder, descend the outer cylinder, and pass through the opening J into the discharge-chamber, as and for the purposes described.



160,872. SEAL-LOCKS. J. M. Smith, Jersey City, N. J. [Filed Mar. 9, 1875.]

The sealed fastening described, consisting of the band H, having a hole at each end, and a rivet or tongues, *a*, formed out of the body of the band itself, which are passed through and riveted in the hole *b*, leaving an opening in the center, through which the seal I is entered, and headed down at both sides with any suitable impression, substantially as set forth.



160,873. BEDSTEADS. Chas. Snyder, Belle Plaine, Iowa. [Filed July 27, 1874.]

Brief.—The cross-slats, having perforations *a*, side pieces B B, and side rails C C, in combination with the L-shaped screw-hooks G, with shoulders *a*, said hooks being adapted to secure the side rails to the side pieces, and to hold the cross-slats in position, all as and for the purpose specified.

160,874. AXLE-SKEINS FOR VEHICLES. B. Snyder, Johnson's Corners, Ohio, assignor of one-half his right to J. H. Miller, same place. [Filed Dec. 24, 1874.]

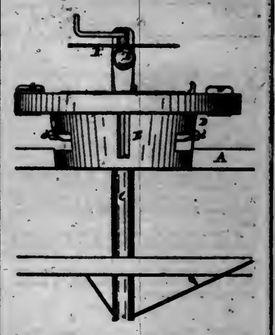
A thimble-skein, tapering from its front to its rear end, and gradually increasing in thickness from its outer to its inner end, and having on its lower inner bearing-surface a flat straight seat for the under side of the wooden axle, substantially as shown and described.

160,874.

160,875. TOY FIRE-ARMS. Hiram T. Starr, New York, assignor to Henry C. Morgan, Brooklyn, N. Y. [Filed Jan. 20, 1875.]

Brief.—A self-cocking pistol is arranged to feed a continuous fulminate ribbon under the hammer, to produce thereby a succession of reports.

1. The stock A of a toy gun or pistol constructed with the cavity D for receiving and holding the coil of fulminate-ribbon, and having its axis parallel with the axes of the hammer and trigger, substantially as herein shown and described.

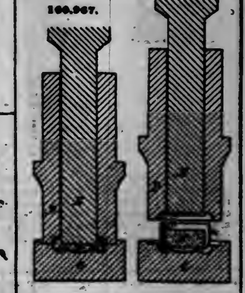


2. The combination, with the toy pistol or gun having a cavity for receiving and holding a coil of fulminate-ribbon, of the elastic strip J, having its upper end arranged to bear on the ribbon, and attached at its lower end to the trigger, by which it is operated for feeding the ribbon, substantially as and for the purpose described.

3. The combination of the cocking pin or spring *p*, arranged to move laterally, but confined vertically, in the slot *s* in the heel *g* of the trigger, and the wedge-shaped projection *m* on the hammer, substantially as and for the purpose shown and described.

4. The spiral spring H, arranged to engage, as described, with the hammer and trigger, and serving as a main spring and trigger-spring, substantially as specified.

160,876. MACHINES FOR CROZING BARRELS. Samuel S. Steel and Rhubel Munson, Martin, Ohio. [Filed Oct. 3, 1874.]



Brief.—The barrel to be crozed is placed in a recess of a bench, and the revolving crozing-tool lowered into its open end.

1. Slides I I', springs *e e*, drum *f*, cord *c*, and lever L, in combination with the head D, in the manner as described, and for the purpose set forth.

2. The combination of the head D; arm B, upright C, gearing R R', cord N, treadle O, and bench A, substantially in the manner as described, and for the purpose set forth.

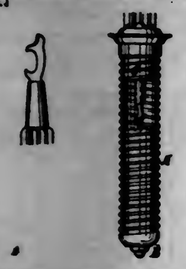
160,877.

160,967. DIES FOR MAKING METALLIC BASES FOR JEWELRY. George Stetter Hoboken, N. J., assignor to Mulford, Hale & Cottle, New York city. [Filed Feb. 6, 1875.]

Brief.—A yielding former is placed in the cup-shaped blank. Through the closing die, which bends over the edges of the blank, works a plunger, (of a diameter to fit accurately the opening in the finished article,) the forcible impact of which upon the former causes it to expand and force the walls of the blank out into intimate and thorough contact with every portion of the mold-surface.

The combination of the female die, closing die, plunger working independently through one of the dies, and the yielding and displaceable former or block, for joint operation, as above and set forth.

160,968. LAMP-PENDANTS. Elisha Stevens, Cromwell, Conn. [Filed Feb 19, 1875.]

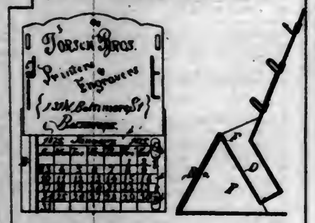


Brief.—The crown is attached to the vertical branches, so as to suspend the shade by means of a flange thereon.

1. The crown B, attached to and between the vertical branches A of the pendant-frame, in combination with the shade C, suspended from said fixed crown, as and for the purpose described.

2. The crown B, connected to the vertical branches A A by the lugs a a of the pendant-frame, in combination with the shade C, having the projecting flanged top c, for suspending it from the crown, substantially as and for the purpose described.

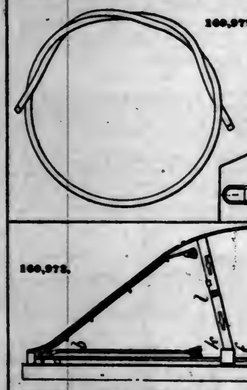
160,969. HANDLES FOR CUTLERY. Owen W. Toft, New York, N. Y. [Filed Jan. 26, 1875.]



An improved article of manufacture, a handle for cutlery or other articles, made of a sheet-metal tube closed at each end, and stiffened and ornamented by fluted or corrugations arranged spirally about the handle, so as to form screw-threads, substantially as and for the purpose described.

160,970. KEY-RINGS. Howard Tilden, Philadelphia, Pa. [Filed Feb. 26, 1875.]

A key-ring formed from a single piece of ductile sheet metal, with the angular opening C and broadened inscription-plate B, said ring being divided at the junction of the broadened inscription-plate and the narrow portion of the ring to form the slit D, as and for the purpose described.

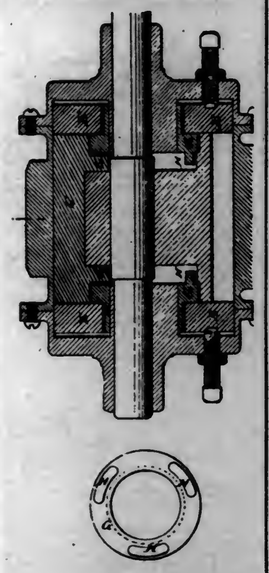


160,971. ADVERTISING MEDIUMS. Charles R. Torsch and Henry F. Torsch, Jr., Baltimore, Md. [Filed Jan 8, 1875.]

An advertising medium, consisting of the board A, pen rack C, card-case D, calendar-holder B a, and supporting wings F, all being constructed and arranged substantially as set forth.

160,972. GRAIN-BANDS. Charles L. Travis, Great Valley, N. Y., assignor to the Grain-Binder Company, Fremont, Ohio. [Filed Feb. 12, 1875.]

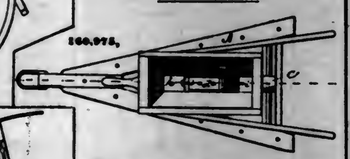
A prepared band made of wood, constructed and adapted for use in binding grain, substantially as described.



160,973. AWNINGS. Charles J. Trumper, Indianapolis, Ind. [Filed Dec. 3, 1874.]

Brief.—The frame is hinged at the angles, and also about the center of the side bars, so that the awning may be shifted to one side or the other, or so that it may be folded up entirely. A hooked clasp is pivoted across the hinged joints at the center of the side bars, to keep them rigid when open.

In a window awning, the loop or hook *f* on a *f*, constructed with the T-shaped rods *m* and *m*, the clasps *l* and *l*, the eyes *f* and *f*, and hinged, substantially as and for the purpose set forth.

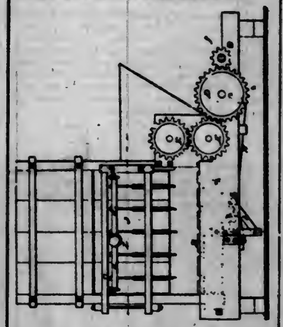


160,974. ROTARY PUMPS OR MOTORS. N. Upham, Athol, Mass. [Filed Nov 30, 1874.]

Brief.—The rotating rings on which the radial pistons bear are provided with projections of size sufficient to move the rings through their connection with the pistons, to avoid the liability of breakage in the connection between the rings and the pistons.

The rotating rings G G, provided with projections H H, in combination with the pistons and revolving cylinder, substantially as and for the purpose described.

160,975.



160,975. COTTON-PLANTING ATTACHMENTS TO HARROWS. Seaton E. Wade, Chapel Hill, assignor of one-half his right to W. U. Covington, Crystal Springs, Miss. [Filed Jan. 26, 1875.]

Brief.—Upon the V-shaped harrow-frame, and wedged in between the beams, is removably secured the hopper by a screw passing through the back and into the standard.

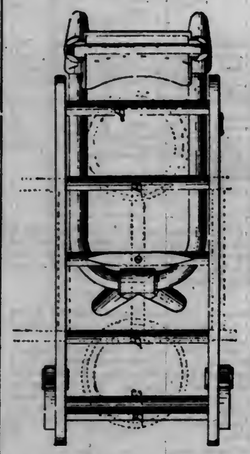
In combination with a V-shaped harrow-frame, the detachable hopper D, wedged in between the bars of the frame at its front, and secured to the upright U at its rear by the screw *a*, and the detachable wheel *d*, with pins *i*, all as set forth.

160,976. HAY-PRESSES. Charles Weste, Galesburg, Ill. [Filed Jan 5, 1875.]

Brief.—The material to be pressed is fed between rollers, and received in layers upon a filler or follower, and is then forced upward into the press-box. The feeding rollers have an intermittent motion, and the filler is caused to ascend and deposit its layer during the intermission of the motion of said rollers.

1. The rollers A A, gear wheel D, having the smooth surface F upon its face or periphery, and gear-wheels E E, in combination with the follower or filler B and press-box X, in the manner and for the purpose herein set forth.

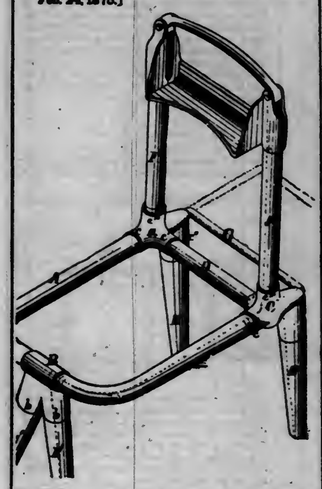
2. The combination of the driver H, with its connecting-levers 1 1 2 2, with the follower or filler B, and arm G, in the manner and for the purpose herein set forth.



3. The bar *a*, pivoted, as described, to the door-frame O, in combination with the holders C C and weighted lever L, in the manner and for the purpose herein set forth.

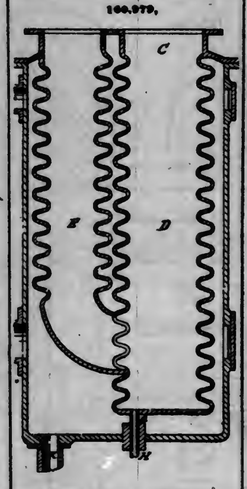
4. In a hay-baling press, the combination of the rollers A A, gear-wheel D, with its smooth surface F on its face or periphery, gear-wheels E E, attached to the shafts or axles of the rollers A A, arm G, secured centrally to the shaft or axle D', driver H, and levers 1 1 2 2, with the filler or follower B, in the manner and for the purpose herein set forth.

1. The before-described wash bench, consisting of the side rails A and A and end rail B, constructed from gas-pipe, and connected with each other, and with the legs E, E', and E'', by means of the couplings B, b, and b, and C, c, c', c'', and c''', substantially as and for the purpose specified.



2. In combination with the wash bench shown, the basket rack G g, contained within said bench, and made longitudinally extensible, substantially as and for the purpose shown.

160,978. WASH-BENCHES. Francis Way and Martin Way, Springfield, Ohio. [Filed Feb 24, 1875.]



A wash-bench, pivoted centrally, and capable of rotation in a horizontal plane upon and around its pivotal bearing, so as to enable the relative positions of its ends to be reversed, substantially as and for the purpose specified.

160,977. WASH-BENCHES. Francis Way and Martin Way, Springfield, Ohio. [Filed Feb. 24, 1875.]

160,979.

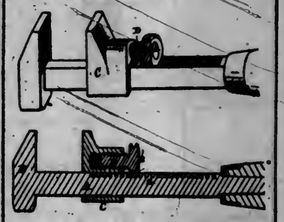
160,979. FEED-WATER HEATERS FOR STEAM-BOILERS. Horatio N. Waters, West Meriden, Conn. [Filed Jan 25, 1875.]

Brief.—The expansion and contraction of the pipes through which steam passes is accommodated by the vertical projection therefrom passing through suitable packing in the bottom of the outer case.

In a feed-water heater, the pipes D and E, attached to and suspended from the cover B, and provided with the downward extension C, the plug H, and reservoir A, all combined, constructed, and arranged as shown and described, to operate as specified.

160,980. CLOTHES-DRIERS. Ira Whipple, Mystic River, Conn. [Filed Feb. 26, 1875.]

Brief.—The frames are formed of wooden slats and galvanized wire rods, with hooks projecting from one side. Two frames are connected together by slotted hinges at the top, and a hinge and stud at the bottom.

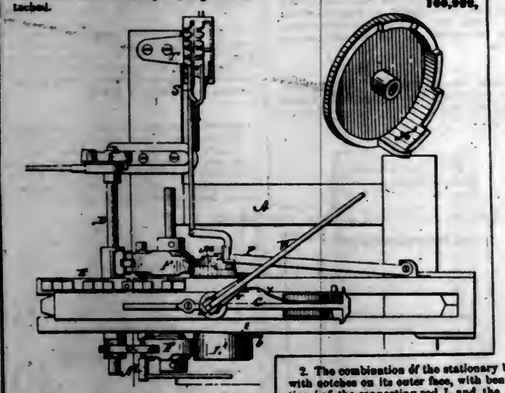


1. The frames A and B, provided with galvanized-iron rods C C, each rod forming at one end a hook, *b*, as and for the purposes set forth.

2. The two frames A B, in combination with connecting devices D D and G, whereby the frames A and B may be opened from one side or opened from the bottom, as and for the purpose set forth.

3. The combination of the frames A B, hinges D D, having slotted or forked leaves *d*' *d*', rod *d*², bolts *f*, and thumb-nuts h h, all substantially as and for the purposes herein set forth.

160,981. WRENCHES. Joe L. Whipple, Paw Paw, Mich., assignor to himself and C. W. Whipple, same place. [Filed Nov. 17, 1874.]



Brief.—The set-screw is tapped into the movable jaw, so that when its head is engaged with the rack on the main bar, the jaw is slightly moved toward or from the article grasped, according to the direction in which the screw is turned.

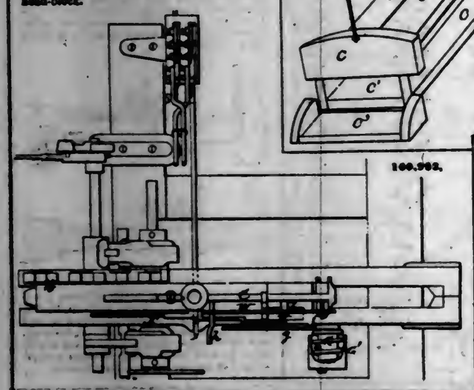
The combination, with the movable jaw C of a monkey-wrench, of the screw D, having the flanged head *b* fastened on one side, and rack *a* on the back of the shank of the wrench, said movable jaw being adapted to any adjustment by said screw, all constructed and arranged as and for the purpose set forth.

160,902. HEAD-BLOCKS FOR SAW-MILLS. F. N. Whitcomb, Amity, N. Y. [Filed Dec. 14, 1874.]

Brief.—A notched cam is employed as a stop to arrest the retrograde movement of the setting jacks at any desired point, and the dogs are thrown from the log by a spring when detached.

1. The combination, with the knee C, rack-bar H, and pinion I, of the counter-shaft K, gear-wheel O, and coiled spring L inclosed within the casing L', substantially as and for the purposes herein set forth.

2. The combination of the arm *b* on the spring-casing L' with the stud *c* on the head-block, as and for the purposes set forth.



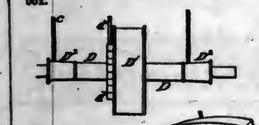
3. The combination of the cam M having notches on its face with the angular lever P and the retracting-knee C, substantially as and for the purposes herein set forth.

4. The combination of the removable stem *w*, having a projecting arm, V, the dog W pivoted to the stem and the spring *x* attached to the knee and bearing against the arm V, all constructed substantially as set forth.

5. The combination of a graduated scale, T, with the hand-lever S, connecting-rod O, angular lever P, and stepped cam M, substantially as and for the purposes herein set forth.

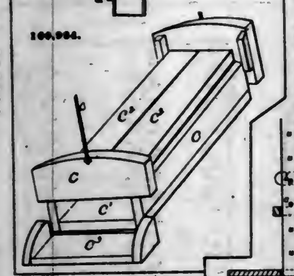
160,903. HEAD-BLOCKS FOR SAW-MILLS. F. N. Whitcomb, Amity, N. Y. [Filed Dec. 14, 1874.]

Brief.—A notched lever is pivoted to the head-block, and arranged in connection with a stop-bar, for the purpose of arresting the retrograde movement of the setting jack, such motion being communicated to it through the medium of a coiled spring attached to the head-block.



1. In combination with a head block, B, and knee C the short shaft *a*, casing C', and coiled spring G, extending up to the side of the knee, and the bar A projecting from said knee, all substantially as and for the purposes herein set forth.

160,905.

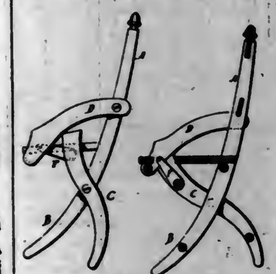


2. The combination of the stationary bar K with notches on its outer face, with bent portion *f* of the connecting-rod I, and the notch *x* in the head-block, all substantially as and for the purposes herein set forth.

160,904. UNLOADING AND DUMPING GRAIN. J. B. Whitcomb, Farmer City, Ill. [Filed Feb. 9, 1875.]

Brief.—The wagon being backed onto a platform, the box, by overhead tackle, is tilted; the grain falling into a box with an inclined bottom and hinged end. This has attached to it two ropes wound onto conical drums (loose outward) on a winch-shaft, to effect simultaneously the elevation and tilting of the box.

160,904.

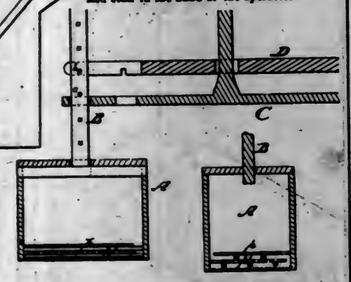


160,902.

1. The portable apparatus for elevating and dumping grain herein described, consisting of the platform A B, frame A' A', self-dumping box C, and elevating mechanism D E F, substantially as and for the purposes described.

2. The hoisting shaft and drum D D' constructed at each end with cone shaped portions or drums D^2 D^2, substantially as and for the purposes described.

3. In combination with the platform A B and elevating shaft D D^2, the trough C, constructed with the inclined bottom C^1, hinged folding sides C^2, and automatic gate C^3, and trough adapted, through the cords *e e* attached thereto and to alternate ends of the cones D^2 on the shaft D, to be elevated to its place, one end slightly in advance of the other, substantially as and for the purposes described.



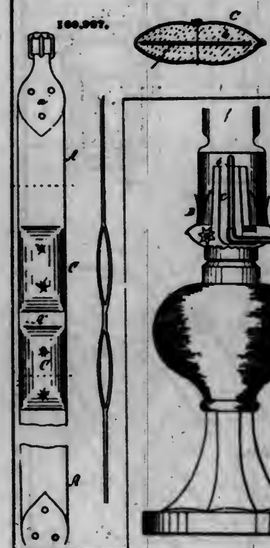
160,905. FOLDING CHAIRS. Geo. E. Whitmore, New Haven, Conn., assignor to the New Haven Folding-Chair Company, same place. [Filed May 2, 1874.]

The combination of the back and legs A B, the cross legs C, pivoted to the legs B, the arm D, pivoted to the back A and bearing upon the legs C, connections F, pivoted to the arms D, and legs C, substantially as described.

160,906. MACHINES FOR DISTRIBUTING COMPOUNDS FOR DESTROYING COTTON-WORMS. Wm. T. Willie, Brenham, Tex., assignor of one-half his right to Wm. H. Thacker. [Filed Mar. 6, 1875.]

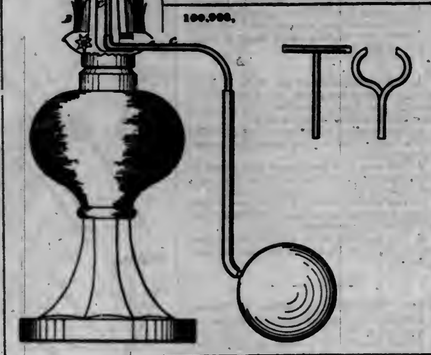
Brief.—The boxes containing the powder to be sifted upon the plants have each a three-fold perforated bottom. A cross-bar rests upon the pommel of a saddle, and the boxes are suspended from it upon each side of the horse, and are adjustable both in width and in height by means of holes and pins. Agitation is given by means of a supplemental bar and staff in the hand of the operator.

1. The boxes A A, suspended, by means of standards B B and pins *c c*, from a cross-bar, C, which is adapted for being secured to a riding-saddle, in combination with the actuating-bar D, substantially as described.



2. The boxes A A, suspended as described and made vertically and laterally adjustable, for the purpose set forth.

160,907. SURCINGLES. Henry M. Witter Worcester, Mass. [Filed Mar. 6, 1875.]

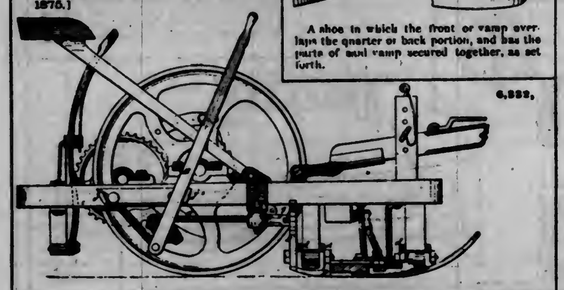


1. A surcingle consisting of the webs A and C, the latter having a double selvage, substantially as described.

2. A woven surcingle having a portion there of woven of single thickness, and other parts of double thickness to receive padding or stuffing, substantially as described.

160,907.

160,908.



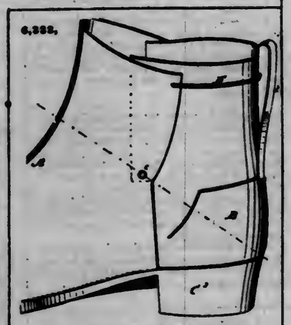
160,906. LAMP-EXTINGUISHERS. Wm. H. Zimmerman, Chestertown, Md. [Filed Feb. 16, 1875.]

1. The combination, with a lamp burner, of an elastic compressible air-chamber and a tube for conducting a current of air to the wick for the purpose of extinguishing the lamp, substantially as and for the purpose described.

2. The combination, with the burner B, of a tube, C, soldered to the same, and a detachable tube, C', having a circumferential row of perforations, *h*, substantially as and for the purpose described.

REISSUES.

6,322. MOWING-MACHINES. A. B. Allen, Tom's River, N. J., assignor, by mesne assignments, to R. Dutton and R. H. Allen. Patent No. 20,226, dated July 24, 1860; extended seven years. [Filed Feb. 10, 1875.]



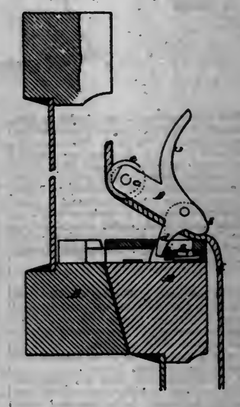
1. A locking lever pivoted on the shoe of a mowing machine, substantially in the manner described, so as to yield as the finger beam is folded up to the main frame.

2. The combination of a finger beam, a hinged shoe, a locking lever pivoted on the shoe, and a stop also mounted thereon, these members being constructed and operating in combination, substantially in the manner described.

3. The combination of a finger beam, a hinged shoe, a lever pivoted thereon, a stop against which the lever abuts, a lifting lever on the main frame, and a chain connecting the lifting lever and locking lever, these members being constructed and operating in combination, substantially as set forth, whereby the locking-lever is first locked partially to lift the divider end of the finger beam, and then yields to allow the finger beam to be folded up to the main frame.

6,323. SHOES. Achilles Ballard, Dublin, Ind., assignor, by mesne assignments, to Leopold Cohn. Patent No. 55,041, dated May 29, 1866. [Filed Feb. 5, 1875.]

6,323.

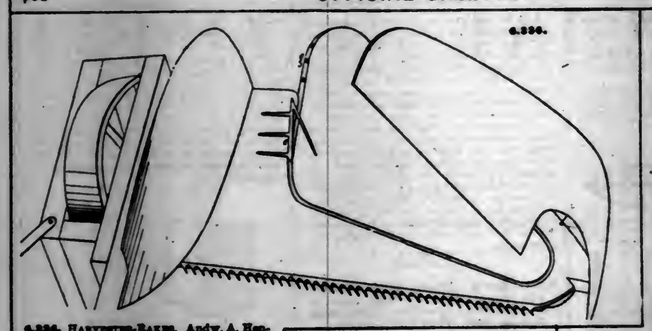


A shoe in which the front or vamp overlaps the quarter or back portion, and has the parts of said vamp secured together, as set forth.

6,322.

6,325. SASH-BALANCES. Obadiah Davis, Battle Creek, Mich. Patent No. 154,587, dated Sept. 1, 1874. [Filed Nov. 2, 1874.]

Brief.—A clamping dog of ordinary construction, having a tongue, finger piece, and gripping portion, with or without an anti-friction pulley, arranged for regulating the cord in raising and lowering sashes, is combined, by means of its projecting tongue, with an ordinary spring-bolt for fastening the meeting rails of the sashes, the two being arranged in such manner as to coact together, the one actuating and controlling the movement of the other.



The dog D, with or without anti-friction pulley *c*, and having tongue *d*, finger-piece *e*, and griping portion *b*, in combination with the locking bolt *g* and spring S, all constructed, arranged, and operating substantially as described and shown, for the purpose set forth.

6,324. PANTALOONS, &c. Jacob W. Davis, Reno, Nev., assignor to himself and Levi Strauss & Co., San Francisco, Cal. Patent No. 139,121, dated May 20, 1873. [Filed Feb. 27, 1875.]

As a new article of manufacture, pantaloons or other garments having their pocket-openings secured at the edges by means of rivets, or their equivalents, substantially in the manner described and shown.

6,326.

6,326. HARVESTER-RAKES. Andw. A. Henderson, Brooklyn, assignor, by mesne assignments, to Walter A. Wood and the Walter A. Wood Mowing and Reaping Machine Company, Hoosick Falls, N. Y. Patent No. 20,604, dated Aug. 14, 1860; extended seven years. (Filed Feb. 1, 1875.)

Brief.—A rake having horizontal or pitchfork teeth is attached at its lower end to an endless chain, which passes around pulleys below the platform, and moves the rake in a circuitous path along a corresponding slit in the platform.

1. An automatic grain-rake, provided with teeth lying parallel with the platform and moving across said platform in rear of the cutters, in combination with a stationary side board, against which the grain is pressed by the rake in being moved to the ground, substantially as described.

2. The combination, with the grain-platform of a reaper, of a rake-head, having substantially horizontal teeth, said head being supported at its lower end and moving in a circuitous path upon the plane or surface of the platform for removing the grain therefrom, substantially as described.

3. An automatic rake, in combination with a platform and mechanism for actuating the rake, located below the upper surface of the platform, the combination being substantially such as hereinbefore set forth.

6,327. DRILLS FOR WELL-BORING. John M. May, Cedar Rapids, Iowa, assignor to L. M. Rumsey and Moses Rumsey, St. Louis, Mo. Patent No. 49,120, dated Aug. 1, 1865. (Filed Feb. 10, 1875.)

1. The combination of the parts E, F, G, and K, forming the swivel, and arranged substantially as herein described, for giving a single or double blow to the drill.

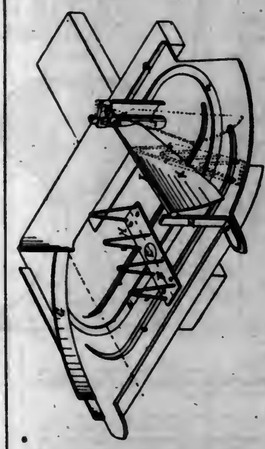
2. The combination of the spring-guide O s s with the drill rod or pipe, as and for the purpose set forth.

3. The screen or strainer of wire-gauze, in combination with a pump drill or tube, substantially as and for the purpose specified.

4. The combination of a screen or strainer with a perforated or cutting guide-flange, A, as and for the purpose set forth.

5. The combination of a screen or strainer with a bit, B or B', as and for the purpose specified.

6,328. END-BOTTOMS. Erwin W. Tucker, Indianapolis, Ind., assignor, by mesne assignments, to C. H. Ducka, New York city. Patent No. 53,706, dated Apr. 3, 1866. (Filed Dec. 28, 1874.)

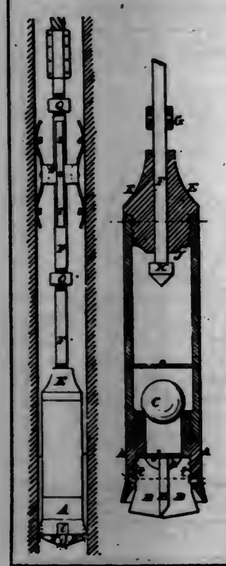


Brief.—The elastic metallic springs between the slats and spiral springs adapt the bed-bottom to yield under pressure at any point. The bed-bottom is pivoted near the foot end in bearings attached to the side rails, and is adjusted at the head end by means of racks and pinions.

1. In a bed-bottom, the combination of an elastic metallic spring, with free ends extending across the bed-bottom, a series of spiral springs secured at their upper ends to said metallic spring, and a rigid cross-bar, to which the lower ends of the spiral springs are secured, substantially as described.

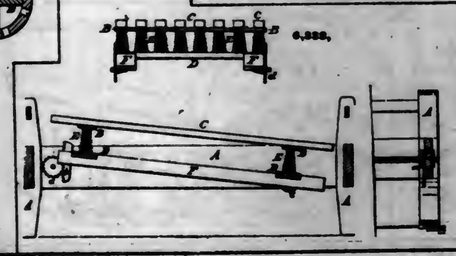
2. The combination of the bedstead A, having bar H and cogs a a, with the bed-bottom, having bars F and rack-bars b b, as and for the purpose set forth.

3. The bars D and bars F, with springs E, in combination with the springs B and rails C, arranged substantially as and for the purposes herein set forth.



6,329.

6,329. HARVESTER-RAKES. Walter A. Wood Mowing and Reaping Machine Company, Hoosick Falls, N. Y., assignee, by mesne assignments, of Israel Dodenhoff, deceased. Patent No. 18,009, dated Aug. 18, 1857; extended seven years. (Filed Feb. 1, 1875.)



1. The grain-platform of a reaping-machine, provided with a guide for controlling the position or angle of an automatic rake moving in an endless path over said platform.

2. An automatic grain-rake, in combination with actuating mechanism located underneath the platform, and a guide on the platform for controlling and changing the angular position of the rake relative to its path, the combination being substantially such as described.

DECISIONS OF THE COURTS.

SUPREME COURT OF THE UNITED STATES.

HENRY J. REEDY, APPELLANT, *vs.* GEORGE SCOTT.

[*In equity.—Appeal from the Circuit Court of the United States for the Southern District of Ohio.—October term*, 1874.]

The surrender of a patent to the Commissioner is an act which, in judgment of law, extinguishes it. It is a legal cancellation of it; and hence the patent can no more be the foundation for the assertion of a right, after the surrender, than could an act of Congress which has been repealed; and it has frequently been determined that suits pending which rest upon an act of Congress fall with the repeal of it. Antecedent suits depend upon the patent existing at the time they were commenced, and unless it exists and is in force at the time of the trial and judgment, the suits fail.

Where a suit in equity under a patent is pending at the time of the reissue, a supplemental bill setting up the reissued patent is not a proper pleading to revive such a suit, as nothing can be recovered, either as damages or profits, for the infringement of the surrendered patent.

The infringement of the reissued patent becomes a new cause of action, for which, in the absence of any agreement or implied acquiescence of the respondent, no remedy can be had except by the commencement of a new suit.

But where the complainant, having reissued his patent pending a suit, set up this fact in a supplemental bill, all the proofs in the case being taken thereafter, and neither the respondent nor the court below made any objection to the irregularity of the pleadings, the irregularity was also disregarded by the court on appeal.

Where the defence against a reissued patent is that it is for a different invention from the original, it cannot be doubted that the latter may be the subject of reference, as to a repealed statute, to aid in the construction of the new patent issued upon the corrected specification.

[*Geo. E. Pugh*, for appellant.
No counsel appeared for respondent.]

Mr. Justice CLIFFORD delivered the opinion of the court.

Patents may be surrendered, in certain cases, in order to obtain a new patent for the same invention, with a corrected specification.

Surrenders of the kind take effect when the amended patent is issued, and from that time the original patent ceases to be operative as a franchise to vest in the patentee the exclusive right to make and use the invention, and vend the same to others to be used.

Such a patent so reissued, together with the corrected specification, it is provided, shall have the same effect and operation in law, on the trial of all actions for causes *hereafter* arising, as though the same had been originally filed in such corrected form.

Surrendered patents cease to be operative when the new patent is issued; from which it follows that such a patent, after the surrender, is not the proper foundation of an action at law or of a suit in equity to recover either damages or profits for the infringement of the invention.

Pending suits are defeated when it appears that the patent on which the suit is founded has been surrendered; nor is a supplemental bill setting up the reissued patent a proper pleading to revive such a suit in equity, as nothing can be recovered, either as damages or profits, for the infringement of the surrendered patent. (*Moffit* vs. *Garr*, 1 Black, 273.)

Reissued patents must be for the same invention as the original patent; but, if the defence be that it is for a different invention, the original patent, though inoperative as a cause of action or to protect the rights of the inventor, is yet admissible in evidence to sustain or disprove such a defence; nor can it be doubted that it may be the subject of reference, as to a repealed statute, to aid in the construction of the new patent issued upon the corrected specification.

Letters patent were granted to appellant on the 9th of June, 1863, for an improvement in hoisting-machines, which is therein represented to be new and useful, and of which improvement the appellant alleges that he is the original and first inventor. Such an inventor of such an improvement, so secured by a valid patent, is entitled, for the term specified, to the exclusive right and liberty of making and using the invention, and of vending the same to others to be used. Pursuant to the patent he claims to enjoy that exclusive right, and he charges that the respondent below, without license, and in violation of his exclusive right, has made, constructed, used, and vended to others to be used, large numbers of hoisting-machines, which are the same in principle and mode of operation as the invention secured to him in his patent; and he prays for an account and for an injunction.

Service was made, and the respondent having failed to appear, the court entered an order that the bill of complaint be taken as confessed. On motion to the court, however, it was subsequently ordered that the complainant have leave to file a supplemental bill, and that the decree *pro confesso* be set aside, and that the respondent may plead, answer, or demur, within thirty days. Under that leave the complainant filed a supplemental bill, in which he alleges that he surrendered the original patent subsequent to the commencement of the suit, and that a reissued patent in due form of law was granted to him *for the same invention*, and he charges that the respondent, since that time, has made, constructed, used, and vended to others to be used, his said invention, without license, and in violation of his exclusive rights as secured by the reissued patent.

Leave having been granted, the respondent appeared and pleaded in bar of the charge contained both in the original and in the supplemental bills, that the parties, after the original bill was filed, entered into an arrangement in writing under their hands and seals, in which they stipulated to submit to Samuel S. Fisher the question whether the machine manufactured by the respondent is or is not an infringement of the complainant's patent, and to abide his decision of the question; that, if he decided that the machine of the respondent does infringe that of the complainant, the former agrees to abandon the manufacture of such machines, and to make no more of the kind in the United States; that, if the arbitrator decided that the machine of the respondent does not infringe that of the complainant, then the latter agrees that his bill of complaint shall stand dismissed at his cost, and that he will not molest the respondent in the manufacture of the machines; that the parties, in pursuance of the agreement, appeared before the person named as arbitrator and submitted the agreed question to him for his arbitration and decision; that the person designated by the parties consented to act as arbitrator, and that, the parties having been fully heard by him, he made and published his decision and award therein in writing, wherein he found and decided, in answer to the question submitted, that the machine manufactured by the respondent is not an infringement of the patent of the complainant for an improvement in hoisting-machines.

Instead of demurring to that plea, or tendering an issue to its allegations, the complainant, under leave, filed what he denominated "a further supplement to his original bill, and amendment to his first supplement." By that pleading he admits that the parties agreed in writing to submit the whole question of infringement to the opinion of the arbitrator; that he, the arbitrator drew up the agreement which they signed, but he avers that he did not understand that the agreement made the further prosecution of the suit dependent upon the opinion to be given by the arbitrator, and alleges that he executed it without consulting his solicitors in the suit, and without knowing the effect of the stipulation; that as soon as he became advised of the nature of the agreement he called upon the arbitrator and informed him that he, the pleader, misunderstood the nature and effect of the agreement, and served him with a notice in writing, revoking all authority and power given him by the instrument.

Still he admits that the arbitrator did proceed in the matter of the reference, and that he did make and deliver an opinion with respect to the infringement of the first claim of the original patent, but he alleges that the arbitrator did not make any award as to the second claim, for the infringement of which, as well as the first, the suit was brought; and he avers that the arbitrator did not award that anything should be done by the parties, that he was not notified of the sittings of the arbitrator, and that no opportunity was given him to call witnesses, or to be heard in person or by counsel, and that neither the infringing machine, nor any evidence of the same, was introduced at the hearing.

Responsive to those charges the respondent refiled his plea to the original bill, and alleged that it is not true that the complainant signed the agreement without understanding its effect, nor that he revoked the power conferred before the arbitrator made and published his decision and award, nor that the complainant was not notified of the sittings of the arbitrator, nor that he was deprived of the opportunity to call witnesses, or to be heard in person or by counsel.

Proofs were taken on both sides, and, the parties having been fully heard, the circuit court entered a decree dismissing the bill of complaint, together with the supplemental bill, and the complainant appealed to this court.

Since the case was entered here the complainant has filed the following assignment of errors: First, That the circuit court erred in holding that the plea of the respondent was true and sufficient with respect to the matters alleged in the supplemental bill. Second, That the said court erred in finding that the equity of the case with respect to the matters set forth in the supplemental bill is with the respondent.

1. All necessity for any discussion of the charges contained in the original bill of complaint is superseded, as the assignment of errors does not impugn, in that respect, or call in question the correctness of the decision or decree of the circuit court. Such an assignment of errors, if it had been filed, would have been utterly unavailing, for the reason that the surrender of a patent to the Commissioner within the sense of the provision, means an act which, in judgment of law, extinguishes the patent. It is a legal cancellation of it, and hence the patent can no more be the foundation for the assertion of a right, after the surrender, than could an act of Congress which has been repealed, and it has frequently been determined that suits pending which rest upon an act of Congress fall with the repeal of it. Antecedent suits depend upon the patent existing at the time they were commenced, and unless it exists and is in force at the time of the trial and judgment, the suits fail. (*Moffit* vs. *Garr*, 1 Black, 273; Curtis on Patents, secs. 399, 342.)

Where the patent expires and is extended pending the litigation, and the infringement by the respondent is continued in respect to the extended patent, a supplemental bill is a proper pleading to prolong the suit, as in that state of the case the complainant may well claim, if he is the original and first inventor of the improvement, to recover of the respondent the gains and profits made by the infringement, both before and subsequent to the extension; but the rule is otherwise where the original patent is surrenderd, as the effect of the surrender is to extinguish the patent, and hence

it can no more be the foundation for the assertion of a right than can a legislative act which has been repealed without any saving clause of pending actions. Consequently the infringement of the reissued patent becomes a new cause of action, for which, in the absence of any agreement or implied acquiescence of the respondent, no remedy can be had except by the commencement of a new suit.

Instances, however, may be found where in such a case the complainant sought his remedy in a supplemental bill, no objection having been made by the respondent, and such examples induce the court to disregard the irregularity in this case, inasmuch as neither the respondent nor the court below appear to have regarded it as a matter of any importance. Instead of that, the complainant was permitted to file a supplemental bill charging infringement as in case of an extended patent; and the respondent, making no objection to the regularity of the bill, refiled the plea which he filed to the original bill of complaint, accompanied with a general denial of every material allegation contained in the supplemental bill, as subsequently amended by leave of the court. Subsequently the proofs exhibited were taken, and the parties having been heard the court entered the aforesaid decree deciding the whole case, as more fully set forth on the record. None of the proofs were taken before the reissued patent was granted, nor until after the supplemental pleadings were completed.

These suggestions are sufficient to show that every irregularity, whether on the one side or on the other, was waived before the decree of the circuit court was entered, and that both parties understood that the question submitted to the arbitrator was whether the machine manufactured by the respondent infringed the improvement invented by the complainant. Conclusive support to that proposition is found in the fact that both parties proceeded, throughout the trial in the circuit court, upon the legal ground that the reissued patent was for the same invention as that embodied in the original patent.

Reissued patents are required by law to be for the same invention as that secured by the surrendered patent, and the complainant expressly alleges in this case that his reissued patent is for the same invention as the surrendered original. Nor can the court take any other view of the case, as neither the original nor the reissued patent is made a part of the record. Clear proof is exhibited that the agreement to arbitrate and the submission in form were both executed before the original patent was surrendered, and that the submission had been signed and delivered before the complainant made any effort to revoke the instrument.

Sufficient has already appeared to show that the arbitrator examined the question submitted to him, and made an award that the machine manufactured by the respondent did not infringe the invention secured to the complainant in his original patent, and that he gave his reasons for the conclusion, which appear to be satisfactory, as far as can be ascertained without the means of comparing the patent of the complainant with the machine of the respondent. Such a comparison cannot be made without such means, nor can the court look out of the record for means to make the comparison.

Attempt is made to avoid the force and effect of the award of the arbitrator, upon the ground that the complainant was misled in signing the agreement, and that he was deprived of the opportunity to summon witnesses and to be heard in person or by counsel; but it will be sufficient to say in response to those suggestions that the proofs exhibited do not satisfactorily sustain the charges. On the contrary, enough appears to convince the court that the agreement is obligatory, and that the complainant is bound to execute the agreement, and to dismiss his bill of complaint, and not to molest the respondent in the manufacture of his machine.

Substantial doubt cannot be entertained that the rule of decision adopted by the arbitrator is correct, if he properly construed the patents. He found that the patent of the complainant was a combination of old ingredients, and that the machine manufactured by the respondent did not contain all the ingredients embodied in the combination patented by the complainant. Nothing is exhibited in the record to show that the arbitrator erred in the construction of the patent; and, if he did not, and his finding as to the character of the machine manufactured by the respondent is correct, it is settled law that his decision is correct. (*Gill* vs. *Wells*, 20 Wall.; *Gould* vs. *Rees*, 15 Wall., 194; *Vance* vs. *Campbell*, 1 Black, 428; *Prouty* vs. *Ruggles*, 16 Pet., 341; *Carver* vs. *Hyde*, 16 Id., 514; *Brooks* vs. *Fiske*, 15 How., 210; *Stimpson* vs. *Railroad*, 10 Id., 329.)

Arbitrators as well as courts are presumed to decide correctly until the contrary appears; and, if the party desires that the decision of such a tribunal shall be re-examined by an appellate court, he must see that the means for such a review is embodied in the record. Neither the patent of the complainant nor any authentic description of the machine manufactured by the respondent is contained in the record, and in the absence of such it must be presumed that the arbitrator construed the patent correctly, and that his finding in respect to the construction and mode of operation of the machine manufactured by the respondent is also correct.

Judging from the character of the assignment of errors, it is presumed that none of these views, as applied to the matters alleged in the original bill, are controverted, and the court here is of the opinion, in view of the previous explanations, that they are equally applicable to the matters alleged in the supplemental bill, for several reasons: First, Because the agreement to arbitrate, and the submission in form, were duly executed before the original patent was surrendered. Second, Because the arbitrator proceeded to examine and to decide the question submitted without any objection from either party growing out of the surrender or reissue. Third, Because the subsequent pleadings and proceedings in the suit show that the surrender and reissue did not have the effect to change the substantial issue in the litigation. Fourth, Because the complainant alleged in his supplemental bill that the reissued patent was for the same invention as that embodied in the original. Fifth, Because the agreement to dismiss the bill of complaint, if executed by a proper decree, must include all the subsequent appendages to it, and would be of itself a decision adverse to the complainant.

Decree affirmed.

EXTENSION GRANTED.

28,470.—Improvement in Sliver-Machines.—Granted to CHAS. C. GRANT, administrator of FREDERICK T. GRANT, deceased, May 29, 1860. Extended by act of Congress, March 3, 1875.

Claim.—The combination of the feed-rolls G G, operated by worms H H and cam L, or their equivalents, and pressure-bars *p p*, for the purposes specified.

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date March 23, 1875.]

8,211.—Statue.—DOMENICO BARSELOTTI and VENANZIO ALLUISI, New York, N. Y. Application filed March 4, 1875. Term of patent 7 years.

2,307.—Fire-Brick.—HARRISON & WALKER, Pittsburg, Pa. Case No. 1. Application filed March 9, 1875.
"word 'CLARION.'"

2,308.—Fire-Brick.—HARRISON & WALKER, Pittsburg, Pa. Case No. 2. Application filed March 9, 1875.
"word 'BENEZET.'"

2,309.—Baking-Powder.—JEWETT, SHEARMAN & Co., Milwaukee, Wis. Application filed December 13, 1872.
"words 'White Lily Baking-powder.'"

2,310.—Tobacco.—THE PIONEER TOBACCO COMPANY, Brooklyn, N. Y. Application filed March 9, 1875.
"words and letters 'Pride of the Port.'"

2,311.—Woolen, Worsted, and Cotton Goods.—THE WASHINGTON MILLS, Lawrence, Mass. Application filed March 8, 1875.
"representation of a shooting-match. The contestants are seen in the foreground, one of them being in the act of firing, while others are standing, sitting, or reclining in various positions around him. In the background is the mark or target. Above the illustration are the words 'Wimbledon Shooting Cloth. Trade-Mark.' Below the illustration are the words 'Washington Mills, Lawrence, Mass.'"

2,312.—Plows.—B. F. AVERY & SONS, Louisville, Ky. Application filed March 9, 1875.
"'WHITE METAL.'"

2,313.—Dentifrices.—CHARLES BULLOCK, Cambridge, Mass. Application filed January 27, 1875.
"symbol of a boy upon a rocky projection, resting upon his knee, and bearing, respectively, in his outstretched right and left hands a package of the preparation and a set of teeth."

2,314.—Lard, Beef-Tongues, Hams, and other Cured Meats.—CHESEBROUGH & BURROWS, Philadelphia, Pa. Application filed March 9, 1875.
"words 'Celebrated Centennial,' and the figure of a bell."

2,315.—Account-Book Paper.—KEITH PAPER COMPANY, Turner's Falls, Mass. Application filed March 12, 1875.
"bands and buckles, so as to make, when placed together upon the packages of paper, a double cross on the top and bottom of each package, while the buckles stand upon the edges of the package, and which bands and buckles may be discovered or recognized by both the sense of sight and feeling."

2,316.—Cigars.—KERBS & SPIESS, New York, N. Y. Application filed March 6, 1875.
"stag's head, in connection with the words 'Dancing Fawn.'"

2,317.—Ribbons.—KIEFER & Co., New York, N. Y. Application filed March 1, 1875.
"S."

2,318.—Prepared Beef and Beef-Tongues.—WHITNEY & Co., Lowell, Mass.
"word-symbol 'COLORADO.'"

APPLICATION FOR EXTENSION.

UNITED STATES PATENT OFFICE,
Washington, D. C., March 22, 1875.

On the petition of JOHN HASELTINE, of Boston, Mass., authorized by act of Congress approved February 18, 1875, praying for the extension of a patent granted to him on the 25th day of March, 1856, for an Improvement in Water-Wheels,

It is ordered that the testimony in the case be closed on the 11th day of May next; that the time for filing arguments and the Examiner's report be limited to the 21st day of May next; and that said petition be heard on the 26th day of May next.

Any person may oppose this extension.

J. M. THACHER, *Commissioner.*

INDEX OF INVENTIONS PATENTED MARCH 23, 1875.

	Class No.	No. of Patent.
Air compressing apparatus, H. J. Bailey	12	161 090
Amalgamator, J. Rutherford	3	161,160
Ammonia, manufacturing, F. M. Lyte	35	161,137
Ash can receptacle, L. F. Winter	154	161,316
Atomizer, C. P. Janes, (reissue)	98	6,345
Awning, window, A. W. Redgrove	109	161,274
Bag fastener, J. A. Danielson	57	161,209
Bale tie, R. Terrell	7	161,074
Bale tie, R. Terrell	7	161,177
Bale tie, R. Terrell	7	161,178
Barrel making machine, J. Martin	40	161,251
Basins, setting, J. Stevenson	8	161,291
Battery, galvanic, J. Leiter	50	161,246
Bed bug trap, J. L. Hawkins	62	161,032
Bedstead, cot, O. Howe	62	161,234
Bedstead fastening, W. Merritt	62	161,141
Berth, swinging, J. Michel	138	161,051
Binder, temporary, H. A. Behn, Jr	15	161,198
Bird cage, L. P. Reichert	170	161,275
Bird cage hook, J. Comly	62	161,206
Bit brace, C. H. Stockbridge, (reissue)	29	6,350
Bit stock, H. C. Hart	29	161,031
Blind stop, L. Jermain	24	161,125
Boiler, agricultural, F. N. Mitchell	59	161,260
Boiler covering, E. W. Smith	149	161,168
Boiler, sectional steam, Sanborn and Shaw	148	161,161
Bolt for safe, vault, and other doors, J. Sargent	93	161,283
Bolt, king, L. Peutz	31	161,150
Book rest, R. S. Grunmon	146	161,026
Book support, R. T. Stoddard	146	161,293
Books, machine for rounding and backing, G. L. Bailey	15	161,089
Boots and shoes, machine for crimping leather for, C. B. Long	16	161,247
Bottle filler and corker, G. H. Ferry	1	161,107
Box scraper, A. W. Tuckerman	29	161,181
Bronze liquid, R. C. Oehmler	35	161,148
Burner, gas, C. E. Ball	64	161,091
Burner, gas, T. Haley	64	161,028
Butter worker, W. Johnson	45	161,043
Butter worker, A. H. Reid	45	161,276
Calendering printed sheets, machine for, Kivlan and Wood	109	161,242
Car axle box, J. N. Smith	122	161,070
Car axle lubricator, J. S. Eggleston	122	161,017
Car coupler, I. T. Sherrill	122	161,165
Car coupling, D. Bower	122	161,096
Car coupling, R. A. McKanna	122	161,255
Car coupling, Miller, Rogers, and Force	122	161,259
Car, sleeping, C. E. Lucas	121	161,249
Car spring, G. F. Godley	122	161,115
Car starter, D. D. Hardy	122	161,030
Car starter, G. A. Huse	122	161,042
Car wheel for tram roads, A. D. Griffin	122	161,223
Cars, &c., gong for street, B. F. Pinnell	24	161,109
Carding machine, J. Mason	28	161,252
Carriage bow rest, W. E. Yeager	31	161,189
Carriage, child's, C. H. Amidon	31	161,086
Carriage seat back, A. F. Hubbell	31	161,040
Casting chilled mold boards, &c., G. K. Smith	33	161,169
Chain, ornamental, C. Thiéry	86	161,297
Chair and lounge, convertible, H. Willgohs	62	161,081
Chair rounds, machine for making, J. W. Millet	174	161,144
Charcoal, retort for burning or revivifying, F. O. Matthiessen	61	161,253
Check rower, V. Horne	133	161,232
Cheese vats, heater for, L. A. Sunderland	45	161 176
Chinch bug destroyer, J. Cochran, Jr	63	161,099
Churn, G. P. Herndon	45	161,230
Churn, H. A. Simison	45	161,166
Cigar molds, machine for charging, N. Dubrul	160	161,015
Clock case, H. J. Davies	36	161,211
Clothes pin, W. H. Mayo	91	161,138
Clothes wringer, F. and M. Way	91	161,309
Coal hod, C. F. Barager	154	160,995
Coal, &c., hoisting and conveying, Stancliff and Green	79	161,175
Compound for scouring white goods, M. Mayer	11	161,139
Concrete, straw, F. B. Howard	153	161,038
Cooking vessel, steam, E. P. Bates	154	161,092
Copy slip for teaching penmanship, C. Allen	54	161,192
Corset, abdominal, H. G. Emery	156	161,018
Corsets, manufacturing, H. G. Emery	80	161 019
Cotton chopper and scraper, combined, R. McIlae	43	161,256
Cradle, folding, Reichard and Fisher	64	161,277
Croquet apparatus, P. West	143	161,080
Cultivator, L. C. Roberts	43	161,157
Cultivator, disk harrow, S. G. Randall	73	161,060
Cultivator, wheel, W. P. Dale	43	161 102
Curling iron, L. Wilkinson	161	161,313
Curtain fixture, A. H. Knapp	62	161,243
Cutlery, attaching hollow handles to, O. W. Taft	44	161,295
Cutter head, A. W. Slayton	173	161,287
Demijohn case, C. Newman	68	161,264
Dental plates, apparatus for forming, Hearson and Moseley	84	161,033
Digging stones, stumps, roots, &c., machine for, C. M. Lutkin	51	161,047
Draw bars, spring case for, J. Turner	122	161,301
Drier, J. E. Register	48	161,156
Drill bit, T. P. Farmer	100	161,106
Drills, coupling joint for oil well, C. B Wiser	51	161,092
Drilling machine, rock, J. A. Beamisdarfer	124	161,197
Electrotypes, seamless mold for, M. Joyce	164	161,238
Elevator, hay, E. V. R. Gardner	79	161,114
Elevator, water, W. Walter	118	161,079
Enameling moldings, A. C. White	54	161,187
Engine, hydraulic, W. L. Smith	118	161,068
Engine, road, G. T. Ellis	94	161,217
Engine, rotary, H. Cottrell	150	161,207
Engine, rotary, G. T. Ellis	150	161,218
Engines and calenders, trunnion for steam, T. Hill, (reissue)	150	6,344
Engines, valve for, G. M. Githens	152	161,025
Envelope machine, W. Liddell	109	161,133

	Class No.	No. of Patent.
Envelope opener, La Blanc and St. Pierre	146	161,188
Excavator, A. Goodyear	51	161,221
Excavator, M. Phillips	51	161,270
Fence, farm, A. N. Moore	52	161,261
Filter, C. Andersen	167	161,194
Finger nail trimmer, V. Fogerty	161	161,112
Fire arm, breech loading, W. F. Parker	18	161,267
Fire arm, breech loading, B. C. Watson	18	161,307
Fire arms, lock for, D. G. Hadley	55	161,117
Fire escape, T. P. Forsyth	30	161,113
Fire place, W. P. Abendroth	154	161,191
Fishing reel, Winans and Whistler	143	161,314
Fluid thief or pump, J. Hitchens	118	161,036
Food, preserving, D. Snedeker	58	161,072
Fruit jar, P. F. Darche	58	161,210
Furnace for gas retorts, D. Davison	66	161,212
Furnace, hot air, J. W. Crary	154	161,208
Furnace, hot air, J. H. Shoemaker	154	161,285
Furnace, puddling, E. Wood	85	161,317
Furnace, steam boiler, J. C. Hoadley	149	161,122
Furnaces, bottom for welding and heating, W. Small	60	161,167
Furnaces, chill for puddling, J. L. Pennock	85	161,268
Furnaces, water bridge bosbes for puddling, J. C. Longland	85	161,135
Gas, apparatus for charging a stream of water with carbonic acid, H. H. Dunham	1	161,216
Gas, process and apparatus for the manufacture of illuminating, W. H. St. John	66	161,073
Gas purifiers, tray or screen for coal, A. J. Tewksbury	66	161,296
Gas works, dip pipe of, A. Thomson	66	161,298
Gas wrench, S. B. H. Vance	64	161,182
Generator, steam, J. A. Miller	148	161,258
Gold, silver, &c., from their ores, collecting, M. Laffin	99	161,129
Governor, water wheel, A. Woodworth	168	161,084
Grain, machine for crushing, C. C. Washburn	59	161,185
Greenhouses, fumigator for, T. Shaw	63	161,163
Guns, barrel for shot, J. B. Tubbs	55	161,300
Guns, carriage for field, Franklin and Richards	105	161,219
Guns, reamer for shot, F. A. Deland	55	161,214
Harrow, revolving, J. Phillips	73	161,057
Harvester, C. W. Levalley	74	161,132
Harvester, corn, W. T. Orr	74	161,149
Harvester cutter, G. J. E. and M. Vanfossen	74	161,078
Harvester, potato, A. J. Davis	74	161 011
Harvester rake, M. F. Gibbs	74	161,220
Harvester rake, J. Ryncarson, (reissue)	74	6,349
Hat binding, paper, D L. Sheplic	76	161,067
Head lights, lens for, H. C. Felthousen, (reissue)	90	6,343
Hood, Brugger and Christophe	38	161,003
Horse stopping apparatus, Lanbeer and Woerle	72	161,131
Hose clamp or patch, G. S. Knapp	81	161,045
Hose, fire, J. V. D. Reed	81	161,272
Hose, fire, J. V. D. Reed	81	161,273
Ice machines, condenser for, A. Jas	83	161,237
Ice pick, W. C. Russell	58	161,282
Indicator, station, J. D. Smith	146	161,171
Ironing board, M. P. Moore	91	161,053
Key check, J. J. De Barry, (reissue)	93	6,342
Key ring, N. Stafford	23	161,174
Kiln, brick, D. P. Guise	20	161,027
Knitting machine, E. P. Curtiss	89	161,008
Knitting machine, circular, E. P. Curtiss	89	161,009
Knife, cork-screw, and shield, combined, J. S. Jennes	88	161,124
Ladder, extension, J. M. Davis	30	161,010
Ladder, step, W. L. Potter	30	161,059
Lamp collar, F. J. Seymour	90	161,065
Lamp stand, E. Bacon	90	161,088
Lamp wick, H. Halvorson	90	161,029
Lamp wick, H. Halvorson	90	161,118
Lampblack, apparatus for the manufacture of, J. Howarth	107	161,039
Lantern, signal, Foote and Gilman	90	161,021
Leather, compound for coating, J. Carmody	92	161,203
Leather dressing machinery, N. O. Lounsberry	92	161,046
Leather, machine for pebbling, graining, and embossing, A. W. Perrin	92	161,269
Lock for doors, &c., H. Winn	93	161,315
Lock, seal, Gale and David	93	161,023
Lock, time, D. Moore	93	161,052
Loom shuttle, Rollason and Brown	95	161,061
Marble and process of molding the same, artificial, W. Burnet	153	161,005
Match box, J. Knox	90	161,127
Metal, tool for turning, C. Cummings	160	161,007
Milk testing process, A. Middaugh	45	161,142
Millstone bush, S. Bernheisel	57	161,000
Millstone dress, Carvill and Caven	57	161,097
Miter box, H. Dittenhafer	29	161,014
Mowing machine, J. Garfield	74	161,024
Mowing machine, J. P., F. E., and O. E. Lord	74	161,136
Music box, C. Paillard	102	161,055
Musical instruments, string for, J. B. Hamilton	102	161,226
Nails, machine for forging, S. S. Putnam	103	161,154
Needles, machine for flattening the shanks of machine, S. C. Kingman	104	161,240
Nut lock, S. T. Hughes	14	161,235
Oat screen, J. N. Bell	159	160,999
Ordnance, breech loading, B. C. Watson	105	161,308

	Class No.	No. of Patent.
Ordnance, mounting and operating, B. B. Hotchkiss	105	161,037
Organ case, reed, J. Bates	106	160,997
Organ, reed, J. R. Lomas	106	161,134
Packing material, Halbert and King	151	161,294
Paint staff, miller's, W. Ransom	57	161,155
Paper bag, C. Amazeen	109	160,991
Paper barrel, J. L. Thomson	109	161,075
Paper pulp, machine for grinding wood for, B. F. Barker	108	160,996
Patterns, apparatus for stamping, I. Rosenthal	38	161,158
Pavement, A. B. Dean	110	161,013
Pavement, composition, D. G. Conger	110	161,100
Peat cutter, B. J. Denton	61	161,215
Pegging machines, nail blank or strip for, W. A. Rogers	16	161,260
Pen, fountain, G. Hauschild	146	161,228
Penmanship, copy slip for teaching, C. Allen	54	161,192
Pencil sharpener, W. H. Keyes	146	161,126
Photographic picture exhibiter, A. L. High	111	161,120
Piano forte action, A. K. Hebard	112	161,229
Piano forte agraffe, F. W. Niehaus	112	161,266
Picture mount, J. L. Van Dreizen	111	161,303
Pin separator, J. D. Shelton	104	161,164
Pipe, smoke stack heater, T. B. Field	154	161,108
Pipes, machine for making curved earthenware, H. B. Camp	20	161,202
Pipes, vacuum relief valve for water, P. Hinkle	167	161,121
Plane, bench, A. H. Dean	29	161,213
Planter, seed, U. T. Stewart	103	161,292
Plaster sower, F. C. Moder	133	161,145
Plow, W. Adams	114	160,969
Plow, gang, S. S. Scheumack	114	161,264
Plow standard, H. Borger	114	161,095
Plow wheel, D. Allen	114	161,193
Pocket book fastening, M. Rubens	146	161,159
Pocket book lock, B. M. J. Blank	146	161,094
Postage stamp holder, P. W. Hall	146	161,225
Pot, coffee, N. S. McFarland	136	161,254
Press, hay and cotton, H. K. Burnett	7	161,201
Printing presses, feed guide for, E. L. Megill	117	161 049
Propeller, chain, C. Smith	139	161,170
Pulley, band, J. Charlton	87	161,204
Pulley, friction clutch, D. Herrington	87	161 119
Purifier, middlings, C. T. Hanna	57	161,227
Radiator, steam, J. R. Worswick	147	161,085
Railway axle box, J. N. Smith	122	161,069
Railway rail support, Porter and Peck	120	161,153
Railway switch, street, R. Bevelander	120	161 001
Rake, horse hay, W. S. Archer	77	160,993
Ratoon cutting machine, J. Angers	73	160,992
Refrigerator, water evaporating, G. B. Satterlee	58	161,062
Rice cleaning machine, J. B. Rupert	57	161,281
Roll for forming the eyes of picks, &c., Wüstenhagen and Besler	49	161,188
Rolling tapered bars, machine for, Venners and Rowley	125	161,183
Rudders, hanging, R. B. McEntire	137	161,140
Sash fastener, E. G. Felthousen	24	161,020
Sash fastener, G. H. Metz	24	161,050
Saw, band, A. Newhall	130	161,263
Saw mill, gang, F. E. Town	130	161,299
Saw mill head block, A. Rodgers	130	161,279
Saw mill head block, N. Shaw	130	161,066
Saw mills, set work for, J. W. Stokoe	130	161,294
Saws, handle for cross cut, J. E. Emerson	29	161,105
Sawing machine, band, O. Bonney, (reissue)	130	6,340
Scales, coin, H. S. Cochran	132	161,098
Scales, postal weigh, T. Lanston	132	161,130
Scraper, road, W. Smith	51	161,288
Screw blank feeder, W. Aiken	171	160,990
Screw driver, W. F. Patterson	29	161,056
Screw heads, applying caps to, G. Hookham	171	161,231
Screw threading die, F. E. Wells	14	161,311
Separator, grain, M. O'Brien	159	161,147
Separator, grain, W. Toepfer	159	161,179
Sewer, L. A. Gouch	51	161,222
Sewing machine, Applegate and Webb	134	161 087
Sewing machine, H. B. Weiland	134	161,310
Sewing machine attachment J. J. Thompson	134	161,076
Sewing machine feed wheel, I. Manning	134	161,250
Sewing machine shuttle, J. G. Nichols	134	161,263
Sewing machine table tilting platform, M. Grebner	134	161,116
Shell fuse, R. L. Walker	165	161,184
Sheet metal, machine for corrugating, Piper and Nichols	136	161,152
Shirt, H. G. Fisk	38	161,110
Shirt bosom, R. Clnett	38	161,205
Shirt bosom, A. Sluzheimer	38	161,286
Shoe, G. L Davis	16	161,103
Shovel and ash pan lifter, combined, A. Johnson	154	161,044
Shuttle, weaver's, J. A. Crosby	95	161,101
Skirt protector, T. D. Day	38	161,012
Sod cutter, J. McArdle	72	161,048
Soldering machine, W. D. Brooks	136	161,200
Soldering machine, R. H. Smith	136	161,289
Sower, plaster, F. C. Moder	133	161,145
Spinning frame, ring, C. B. Morse, (reissue)	142	6,348
Stair pad, T. F. Walter	62	161,305
Standard and spring, combined, G. H. Spencer	31	161,173
Staves, machine for jointing, M. J. Seymour	40	161,162
Steam brake, J. T. Prendegast	122	161,271
Stereoscope, P. Murphy	157	161,054
Stereoscope, H. Rigby	157	161,278
Stool and seat, H. Beagle	62	161,196
Stool, &c., folding, U. H. W. Schenck	62	161,063
Stove and ranges, cooking, W. B. Treadwell	154	161,180
Stove pipe damper, Selden and Griswold	154	161,064
Stoves, floor shield for, J. A. Hunter	154	161,041
Suspender, belt, or garter fastening, A. C. Smith	38	161,071
Suspenders, cast off for, S. W. Fisk	38	161,111
Table, folding, J. W. and D. Howland	62	161,132
Table, folding, S. T. Waggoner	62	161,304
Telegraph lines, insulating block for, G. S. Pidgeon	50	161,058
Telegraph, printing, G. M. Phelps	50	161,151
Ticket case, L. J. Blades	146	161,093
Toy furniture, E. P. Woods	143	161,083
Toy, paper, W. H. Backus	143	160,994
Trap, air and water, N. Middleton	8	161,257
Trappe, machine for cutting out web gates of cast lead, J. A. Lowe	100	161,248
Truss, H. Howe	156	161,233
Valve, combined globe and check, I. W. Brown	152	161,002
Valve gear, F. H. Ball	152	161,195
Vehicle axle lubricator, J. S. Eggleston	31	161,016
Vehicle, wheel, L. P. Larson	31	161 245
Vehicle, traction, H. H. Chapin	94	161,006
Veneers, machine for cutting, J. C. Brown, (reissue)	176	6,341
Vise, C. L. Kingsley	100	161,241
Wagon, T. Y. Van Uleave	31	161,302
Wagon brake block, W. Hendrick	31	161,034
Wagon seat fastening, C. Dixon	31	161,104
Wagon, side bar, E. Soper	31	161,172
Wall protector and towel rack, combined, M. G. Bell	62	160,998
Washing machine, G. W. Mikesell	91	161,143
Washing machine, T. J. Webster	91	161,186
Watch key, A. and C. A. Wanner	36	161,306
Watch plate, F. A. Lange	36	161,244
Watch, stem setting, J. F. U. Jürgensen	36	161,239
Watch, stem winding, C. S. Moseley	36	161 262
Watches, mainspring for, G. Hunter	36	161,236
Water closet, H. P. Buchan	8	161,004
Water cock, self closing, J. B. Tougas	8	161,077
Water power, C. Monson	82	161,146
Water wheel and hydraulic governor, F. G. Hesse	168	161,035
Water wheel governor, A. Woodworth	168	161,084
Weighing apparatus, A. B. Davis, (reissue)	132	6,346
Weighing apparatus, A. B. Davis, (reissue)	132	6,347
Well reamer, W. Young	51	161,190
Windows, dust trap for bulk, S. A. Wright	166	161,312
Wire stand, J. H. Bigelow	88	161,199
Wood, embossing, W. Sochefsky	54	161,200
Wrench, G. W. Freeman	100	161,022

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED MARCH 23, 1875.

	Patent No.
Abendroth, W. P., Fire place	160,191
Adams, W., Plow	160,989
Aiken, W., Screw blank feeder	160,990
Allen, C., Copy slip for teaching penmanship	161,192
Allen, C. H., assignee	161,281
Allen, D., Plow wheel	161,193
Amazeen, C., Paper bag	160,991
American Cable Screw Wire Company, assignee	161,280
Amidon, C. H., Child's carriage	161,086
Anderson, C., Filter	161,194
Angers, J., Ratoon cutting machine	160,992
Applegate, J. H., and C. B. Webb, Sewing machine	161,087
Archer, W. S., Horse hay rake	160 993
Atkinson, W. D., Jr., assignee, (reissue)	6,345
Backus, W. H., Paper toy	160,994
Bacon, E., Lamp stand	161,088
Bailey, G. L., Machine for rounding and backing books	161,089
Bailey, H. J., Air compressing apparatus	161,090
Ball, C. E., Gas burner	161,091
Ball, F. H., Valve gear	161,195
Barager, C. F., Coal hod	160,995
Barker, B. F., Machine for grinding wood for paper pulp	160,996
Bates, E. P., Steam cooking vessel	161,092
Bates, J., Reed organ case	160 997
Beagle, H., Stool and seat	160,126
Beamiedarfer, J. A., Rock drilling machine	161,197
Behn, H. A., Jr., Temporary binder	161,198
Bell, J. N., Oat screen	160,999
Bell, M. G., Combined wall protector and towel rack	160,998
Bernheisel, S., Millstone bush	161,000
Besler and Wüstenhagen	161,188
Bevelander, B., Street railway switch	161,001
Bigelow, J. H., Wire stand	161 199
Blades, L. J., Ticket case	161,093
Blank, B. M. J., Pocket book lock	161,094
Bonney, O., Band sawing machine, (reissue)	6,340
Booth, C. L., assignee	161,030
Borger, H., Plow standard	161,095
Bower, D., Car coupling	161,096
Bradford, J. B., assignee	161,197
Brooks, W. D., Soldering machine	161,200
Brown, I. W., Combined globe and check valve	161,002
Brown, J. C., Machine for cutting veneers, (reissue)	6,341
Brown and Rollason	161,061
Brugger, J., and S. Christophe, Hood	161,003

	Patent No.
Buchan, H. P., Water closet	161,004
Bukey, T. B., assignee	161,036
Burnet, W., Artificial marble and process of molding the same	161,005
Burnett, H. K., Hay and cotton press	161,201
Camp, H. B., Machine for making curved earthenware pipes	161,202
Carmody, J., Compound for coating leather	161,203
Carson, J. W., assignee	161,001
Carvill, J., and J. Caven, Millstone dress	161,097
Castleberry, M. T., assignee	161,141
Caven and Carvill	161,097
Chapin, H. H., Traction vehicle	161,006
Charlton, J., Band pulley	161,204
Christophe and Brugger	161,003
Clark, W. H., assignee	161,170
Clegg, C. B., assignee	160,903
Cluett, R., Shirt bosom	161,205
Cochran, H. S., Coin scales	161,098
Cochran, J., Jr., Chinch bug destroyer	161,099
Colt's Patent Fire Arms Manufacturing Company, assignee	161,219
Comly, J., Bird cage hook	161,206
Conger, D. G., Composition pavement	161,100
Cottrell and Taylor, assignees	161,207
Cottrell, H., Rotary engine	161,207
Craig, S. H., assignee	161,071
Crary, J. W., Hot air furnace	161,208
Cresson, G. V., assignee	161,204
Crosby, J. A., Weaver's shuttle	161,101
Cummings, C., Tool for turning metal	161,007
Curtiss, E. P., Knitting machine	161 008
Curtiss, E. P., Circular knitting machine	161 009
Dale, W. P., Wheel cultivator	161,102
Dalton, J. and G., assignees	161,255
Danielson, J. A., Bag fastener	161,209
Darche, P. F., Fruit jar	161,210
David and Gale	161,023
Davies, H. J., Clock case	161,211
Davis, A. B., Weighing apparatus, (reissue)	6,346
Davis, A. B., Weighing apparatus, (reissue)	6,347
Davis, A. J., Potato harvester	161,011
Davis, F. N., assignee	161,075
Davis, G. L., Shoe	161,103
Davis, J. M., Extension ladder	161,010
Davison, D., Furnace for gas retorts	161,212
Day, T. D., Skirt protector	161,012
Dean, A. B., Pavement	161,013
Dean, A. H., Bench plane	161,213
De Barry, J. J., Key check, (reissue)	6,342
De Caindry, W. A., assignee	161,104
Deland, F. A., Reamer for shot guns	161,214
Denton, B. J., Peat cutter	161,215
Dittenhafer, H., Miter box	161,014
Dixon, C., Wagon seat fastening	161,104
Dover Fruit and Vegetable Preserving Company, assignee	161,156
Dubrul, N., Machine for charging cigar molds	161,015
Dunham, H. B., Apparatus for charging a stream of water with carbonic acid gas	161,216
Eggleston, J. S., Vehicle axle lubricator	161,016
Eggleston, J. S., Car axle lubricator	161,017
Ellis, G. T., Road engine	161,217
Ellis, G. T., Road engine	161,218
Elward, J. H., assignee, (reissue)	6,349
Emerson, J. E., Handle for cross-cut saws	161,105
Emery, H. G., Abdominal corset	161,018
Emery, H. G., Manufacturing corsets	161,019
Faltonte, J. D., assignee	161,247
Farmer, T. P., Drill pit	161,106
Feigl, Stubb & Co., assignees	161,206
Felthousen, E. G., Sash fastener	161,020
Felthousen, H. C., Lens for head lights, (reissue)	6,343
Ferguson, J. H.	161,269
Ferry, G. H., Bottle filler and corker	161,107
Field, T. B., Smoke stack heater pipe	161,108
Finnell, B. P., Gong for street cars, &c	161,109
Fisher and Reichard	161,277
Fisk, Clark, and Flagg, assignees	161,110, 161,111
Fisk, H. G., Shirt	161,110
Fisk, S. W., Cast-off for suspenders	161,111
Fogerty, V., Finger nail trimmer	161,112
Foote, E. H., and E. L. Gilman, Signal lantern	161,021
Foote, T. C., assignee	161,008, 161,009
Force, Miller, and Rogers	161,259
Forsyth, T. P., Fire escape	161,113
Franklin, W. B., and C. B. Richards, Carriage for field guns	161,219
Freeman, G. W., Wrench	161,022
Furniss, L., assignee	161,307, 161,308
Gale, C. C., and G. F. David, Seal lock	161,023
Gardner, E. V. R., Hay elevator	161,114
Garfield, J., Mowing machine	161,024
Gay, N. D., assignee	161,119
Gibbs, M. F., Harvester rake	161,220
Gilman and Foote	161,021
Githens, G. M., Valve for engines	161,025
Godley, G. F., Car spring	161,115
Goldmark, J., assignee	161,052
Goodyear, A., Excavator	161,221
Gouch, L. A., Sewer	161,222
Grebner, M., Sewing machine table tilting platform	161,116
Green and Stancliff	161,175
Griffin, A. D., Car wheel for tram roads	161,223
Griswold and Selden	161,064
Grummon, R. S., Book rest	161,026
Guise, D. P., Brick kiln	161,027
Hadley, D. G., Lock for fire arms	161,117
Hagelin, A., assignee	161,304
Halbert, H. J., and F. King, Packing material	161,224
Haley, T., Gas burner	161,028
Hall, P. W., Postage stamp holder	161,225
Halvorson, H., Lamp wick	161,029
Halvorson, H., Lamp wick	161,118
Hamilton, A. C., assignee	161,048
Hamilton, J. B., String for musical instruments	161,226
Hanna, C. T., Middlings purifier	161,227
Hardy, D. D., Car starter	161,030
Harrington, A. C., assignee	161,214
Harrington, D., Friction clutch pulley	161,119
Hart, H. C., Bit stock	161,031
Hauschild, G., Fountain pen	161,228
Hawkins, J. L., Bed bug trap	161,032
Hearson, F. L., and J. H. Moseley, Apparatus for forming dental plates	161,033
Heath, J. M., assignee	161,193
Hebard, A. K., Piano forte action	161,229
Hendrick, W., Wagon brake block	161,034
Herndon, G. P., Churn	161,230
Hesse, F. G., Water wheel and hydraulic governor	161,035
High, A. L., Photographic picture exhibitor	161,120
Hill, T., Trunnion for steam engines and calenders, (reissue)	6,344
Hinkle, P., Vacuum relief valve for water pipes	161,121
Hitchens, J., Fluid thief or pump	161,036
Hoadley, J. C., Steam boiler furnace	161,122
Hoadley Company, J. C., assignee	161,122
Hookham, G., Applying caps to screw heads	161,231
Horne, V., Check rower	161,232
Hotchkiss, B. B., Mounting and operating ordnance	161,037
Howard, F. B., Straw concrete	161,038
Howarth, J., Apparatus for the manufacture of lampblack	161,039
Howe, H., Truss	161,233
Howe, O., Cot bedstead	161,234
Howe Spring Bed Company, assignee	161,234
Howland, J. W. and D., Folding table	161,123
Hubbell, A. F., Carriage seat back	161,040
Hughes, S. T., Nut lock	161,235
Hunter, G., Mainspring for watches	161,236
Hunter, J. A., Floor shield for stoves	161,041
Huse, G. A., Car starter	161,042
Janes, C. P., Atomizer, (reissue)	6,345
Janin, A. C., assignee	161,237
Jas, A., Condenser for ice machines	161,237
Jenness, J. S., Combined knife, corkscrew, and shield	161,124
Jermain, L., Blind stop	161,125
Johnson, A., Combined shovel and ash pan lifter	161,044
Johnson, R. W., assignee	160,999
Johnson, W., Butter worker	161,043
Joyce, M., Seamless mold for electrotypes	161,238
Jürgensen, J. F. U., Stem setting watch	161,239
Keys, W. H., Pencil sharpener	161,126
King and Halbert	161,224
Kingman, S. C., Machine for flattening the shanks of machine needles	161,240
Kingsley, C. L., Vise	161,241
Kivlan, G. and W., and G. Wood, Machine for calendering printed sheets	161,242
Knapp, A. H., Curtain fixture	161,243
Knapp, G. S., Hose clamp or patch	161,045
Knox, J., Match box	161,127
Kohlmann, C., assignee	161,094
La Blanc, J., and X. St. Pierre, Envelope opener	161,128
Laflin, M., Collecting gold, silver, &c., from their ores	161,129
Lamb, S. T., assignee	161,039
Lange, F. A., Watch plate	161,244
Lankler, C., assignee	161,304
Lanston, T., Postal weigh scales	161,130
Larson, L. P., Wheel vehicle	161,245
Latham, C. H., assignee	161,083
Laubser, J., and W. Woerle, Horse stopping apparatus	161,131
Legge, J. H., assignee	161,317
Leiter, J., Galvanic battery	161 246
Levalley, C. W., Harvester	161,132
Liddell, W., Envelope machine	161,133
Lomas, J. R., Reed organ	161,134
Long, C. B., Machine for crimping leather for boots and shoes	161,247
Longland, J. C., Water bridge boshes for puddling furnaces	161,135
Lord, H., assignee	161,217, 161,218
Lord, J. P., F. E., and O. E., Mowing machine	161,136
Lounsberry, N. O., Leather dressing machinery	161,046
Lowe, J. A., Machine for cutting out web gates of cast lead traps	161,248
Lucas, C. E., Sleeping car	161,249
Ludlow, A., assignee	161,231
Lufkin, C. M., Machine for digging stones, stumps, roots, &c	161,047
Lynch, J., Jr., assignee	161,002
Lyte, F. M., Manufacturing ammonia	161,137
Madden, M., assignee	161,316
Manning, I., Sewing machine feed wheel	161,250
Martin, J., Machine for making barrels	161,251
Mason, J., Carding machine	161,252

	Patent No.
Matthiessen, F. O., Retort for burning or revivifying charcoal	161,253
Mayer, M., Compound for scouring white goods	161,139
Mayo, W. H., Clothes pin	161,138
McArdle, J., Sod cutter	161,048
McEntire, R. B., Means for hanging rudders	161,140
McFarland, N. S., Coffee pot	161,254
McKanna, R. A., Car coupling	161,255
McRae, R., Combined cotton chopper and scraper	161,256
Megill, E. L., Feed guide for printing presses	161,049
Merritt, W., Bedstead fastening	161,141
Metz, G. H., Sash fastener	161,050
Michel, J., Swinging berth	161,051
Middaugh, A., Milk testing process	161,142
Middleton, N., Air and water trap	161,257
Mikesell, G. W., Washing machine	161,143
Miller, H. H., J. F. Rogers, and C. Force, Car coupling	161,259
Miller, J. A., Steam generator	161,258
Miller's Falls Company, assignee, (reissue)	6,350
Millet, J. W., Machine for making chair rounds	161,144
Mitchell, F. N., Agricultural boiler	161,260
Moder, F. C., Plaster sower	161,145
Monson, C., Water power	161,146
Morgan, H. A., assignee	161,270
Morgan, W. G., assignee	161,313
Moore, A. N., Farm fence	161,261
Moore, D., Time lock	161,052
Moore, M. E., Ironing board	161,053
Morris, M., assignee	161,071
Morris, S., assignee	161,257
Morse, C. B., Ring spinning frame, (reissue)	6,348
Moseley, C. S., Stem winding watch	161,262
Moseley and Hearson	161,033
Mosher, G. A., assignee	161,125
Murphy, P., Stereoscope	161,054
National Manufacturing Company, assignee	161,199
National Watch Company, assignee	161,262
Newhall, A., Band saw	161,263
Newman, C., Demijohn case	161,264
Nichols, J. G., Sewing machine shuttle	161,265
Nichols and Piper	161,152
Niehaus, F. W., Piano forte agraffe	161,266
O'Brien, M., Grain separator	161,147
Oehmler, R. C., Bronze liquid	161,148
Orr, W. T., Corn harvester	161,149
Paillard, C., Music box	161,055
Parker, C., assignee	161,241
Parker, W. F., Breech loading fire arm	161,267
Patterson, W. F., Screw driver	161,056
Peck and Porter	161,153
Pennock, J. L., Chill for puddling furnaces	161,268
Pentz, L., King bolt	161,150
Periam, C. D., assignee	161,247
Perrin, A. W., Machine for pebbling, graining, and embossing leather	161,269
Pettyjohn, L. B., assignee	161,144
Phelps, G. M., Printing telegraph	161,151
Phillips, J., Revolving harrow	161,057
Phillips, M., Excavator	161,270
Pidgeon, G. S., Insulating block for telegraph lines	161,058
Piper, J. L., and J. A. Nichols, Machine for corrugating sheet metal	161,152
Porter, S. L., and D. Peck, Railway rail support	161,153
Potter, W. L., Step ladder	161,059
Prendegast, J. T., Steam brake	161,271
Putnam, S. L., assignee	161,001
Putnam, S. S., Machine for forging nails	161,154
Randall, S. G., Disk harrow cultivator	161,060
Ransom, W., Miller's paint staff	161,155
Redgrove, A. W., Window awning	161,274
Reed, J. V. D., Fire hose	161,272
Reed, J. V. D, Fire hose	161,273
Register, J. E., Drier	161,156
Reichard, E. D., and J. R. Fisher, Folding cradle	161,277
Reichert, L. P., Bird cage	161,275
Reid, A. H., Butter worker	161,276
Richards and Franklin	161,219
Richardson, A. P., assignee	161,077
Rigby, H., Stereoscope	161,278
Roberts, L. C., Cultivator	161,157
Rodgers, A., Saw mill head block	161,279
Rogers, Force, and Miller	161,259
Rogers, W. A., Nail blank or strip for pegging machines	161,280
Rollason, A., and J. Brown, Loom shuttle	161,061
Rosenthal, I., Apparatus for stamping patterns	161,158
Rowley and Venners	161,153
Rubens, M., Pocket book fastening	161,159
Rupert, J. B., Rice cleaning machine	161,281
Russell, W. C., Ice pick	161,282
Rutherford, J., Amalgamator	161,160
Rynearson, J., Harvester rake, (reissue)	6,349
Sanborn, C. L., and H. M. Shaw, Sectional steam boiler	161,161
Sargent, J., Bolt for safe, vault, and other doors	161,283
Satterlee, G. B., Water evaporating refrigerator	161,062
Schenck, U. H. W., Folding stool, &c	161,063
Scheumack, S. S., Gang plow	161,284
Schuyler, P. C., assignee	161,072
Selden, S., and M. Griswold, Jr., Stove pipe damper	161,064
Seymour, F. J., Lamp collar	161,065
Seymour, M. J., Machine for jointing staves	161,162
Shaw and Sanborn	161,161
Shaw, C. A., assignee	161,029, 161,118
Shaw, N., Saw mill head block	161,066
Shaw, T., Fumigator for greenhouses	161,163
Shelton J. D., Pin separator	161,164
Sheplie, D. L., Paper hat binding	161,067
Sherrill, I. T., Car coupler	161,165
Sherwood, D., assignee	161,083
Shoemaker, J. H., Hot air furnace	161,285
Shoninger, B., assignee	161,134
Simison, H. A., Churn	161,166
Sinsheimer, A., Shirt bosom	161,286
Slayton, A. W., Cutter head	161,287
Small, W., Bottom for welding and heating furnaces	161,167
Smith, A. C., Suspender, belt, or garter fastening	161,071
Smith, C., Chain propeller	161,170
Smith, E. W., Boiler covering	161,168
Smith, G. K., Casting chilled mold boards, &c	161,169
Smith, J. D., Station indicator	161,171
Smith, J. S., assignee	161,010
Smith, J. N., Railway axle box	161,069
Smith, J. N., Car axle box	161,070
Smith, R. H., Soldering machine	161,289
Smith, W., Road scraper	161,288
Smith, W. L., Hydraulic engine	161,068
Snedeker, D., Preserving food	161,072
Sochefsky, W., Embossing wood	161,290
Soper, E., Side bar wagon	161,172
Spencer, G. H., Combined standard and spring	161,173
Stafford, N., Key ring	161,174
Stancliff, G., and J. Green, Hoisting and conveying coal, &c	161,175
Stevenson, J., Setting basins	161,291
Stewart, U. T., Seed planter	161,292
St. John, W. H., Process and apparatus for the manufacture of illuminating gas	161,073
Stockbridge, C. H., Bit brace, (reissue)	6,350
Stoddard, R. T., Book support	161,293
Stokoe, J. W., Set work for saw mills	161,294
Stone, J. R., assignee	161,030
St. Pierre and La Blanc	161,128
Sunderland, L. A., Heater for cheese vats	161,176
Swick, G. W., assignee	161,247
Taft, O. W., Attaching hollow handles to cutlery	161,295
Taylor, M, assignee	161,074
Terrell, R., Bale tie	161,177
Terrell, R., Bale tie	161,178
Terrell, R., Bale tie	161,296
Tewksbury, A. J., Tray or screen for coal gas purifiers	161,297

TITLES, DRAWINGS, AND CLAIMS

OF

PATENTS GRANTED MARCH 23, 1875.

160,989. PLOWS. William Adams, Long Island, Kans. [Filed Feb. 1, 1875.]

Brief.—A horizontal knife extending at right angles from the plow-point, to cut under the furrow.

As a new article of manufacture, the plowshare A, with its attachment B, as described, and for the purpose specified

160,990. SCREW-BLANK FEEDERS. Walter Aiken, Franklin, N. H. [Filed Feb. 27, 1875.]

Brief.—Two levers, pivoted to a rectilinearly-moving bar, are formed with sockets at their forward ends for the reception of the screw-blank. Inclined shoulders on the levers strike against projections on the frame as the slide-bar moves back, and force, against the action of springs, the rear ends of the levers toward each other, thereby opening the jaws to receive a blank from the hopper.

1. In combination with the grooved bracket A, the projections *g g* and the inclined conductor D, arranged as described, the slide-bar B, and the two levers C C', provided with the sockets *d d*, inclined shoulders *f f*, and operative spring or springs *e e*, all being constructed and applied substantially in manner and to operate as and for the purpose specified.

2. The movable levers C C', provided with the blank-sockets *d d*, spring-recesses *b b*, inclined shoulders *f f*, and the side notches *c c*, all arranged substantially as specified.

160,991. PAPER BAGS. C. AMESBURY, Boston, Mass. [Filed July 31, 1874.]

Brief.—The sides of the sheet are folded inwardly, and to the laps are pasted a strip folded upon its longitudinal center. The bag-blank, folded upon its transverse center, and united with the side strip, forms a bellows-sided bag.

The improvement is making paper bags consisting in constructing a bag rectangular in cross-section when distended, with two longitudinal seams on each end, at or near the corners, from three pieces of paper, substantially as described.

160,992. RATTOON-CUTTING MACHINES. John Angers, Dallas, Tex. [Filed Dec. 15, 1874.]

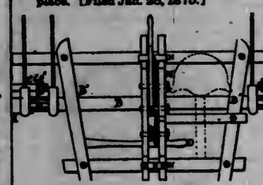
Brief.—A rectangular frame is provided with runners at the front end, and a series of bent wardly-curved cutters. Behind these is mounted a rotary cutter with radial blades. The curved cutters divide the roots in one direction, and the rotary cutter in the other, thus rendering the plowing of the sugar-cane stubble practicable.

160,992.

The herein-described machine for cutting ratteen roots, provided with vertical cutters *a*, and cutter-wheel A with cutters *b*, substantially as described.

160,994.

160,993. COAL-HODS. Chas. P. Barker, Waverlytown, N. Y. [Filed Oct. 24, 1874.]



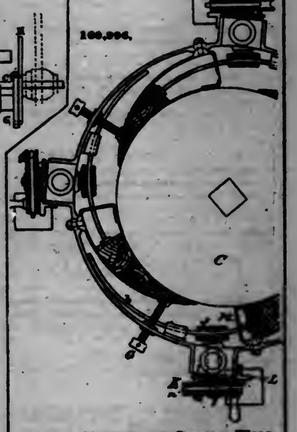
Brief.—The shovel covers the spout, but can be removed at pleasure for other uses.

160,995.

In combination with a pouring-spout of a coal-hod, a removable shovel or dust-pan, C, applied to said spout, substantially as described

160,996. HORSE HAY-RAKES. William S. Archer, Dayton, Ohio, assignor of three-fourths of his right to Charles R. Clegg, E. Morgan Wood, and Geo. A. Archer, same place. [Filed Jan. 26, 1875.]

1. In a horse hay-rake, a vertically-adjustable and swinging rake-head, hinged at its rear side to the shafts of the machine, it being arranged, with reference to the wheel-spindles, substantially as shown, whereby the position of the outer ends of the rake-teeth can be regulated with reference to the ground, and whereby the resistance offered by the material to be gathered is made to aid in swinging the head to a position below the spindles, for the purpose of facilitating the discharge of the load, substantially as set forth.



2. The slotted curved lever F, in combination with the connecting-links *j* and *j'* and rake-head E, substantially as and for the purpose described.

3. The slotted plate G and plate H, combined with the spindle C, slotted plate I, and rake-head E, substantially as and for the purpose described.

4. The combination of the slotted lever F, pins *b a*, link *j'*, chain 6', treadle D, and rake-head E, for the purpose described.

5. The guard-plate P, when constructed as shown, and combined with the teeth-holders L L', whereby it is made to act as a support for the rake-teeth against side pressure, as well as to prevent the clogging of the hay around the upper ends of the teeth.

160,996.

160,994. PAPER TOYS. WM. H. BOCKUS, Boston, Mass. [Filed Oct. 19, 1874.]

Brief.—The designs printed upon the sheets are such that the printed portion can be cut entirely away, and leave, when unfolded, an ornamental design.

As a new article of manufacture, a toy consisting essentially of a sheet of paper printed or stamped with a sectional or incomplete figure arranged to form, when folded radially and cut out, as described, a symmetrical design in a single piece, substantially as shown, for the purpose set forth.

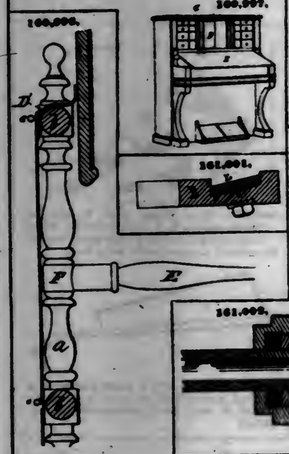
160,996. MACHINES FOR GRINDING WOOD FOR PAPER-PULP. Benjamin F. Barbour, Curtisville, Mass. [Filed Aug. 6, 1874.]

Brief.—The invention is in the peculiar mechanism for feeding the wood to the stone.

1. In combination with the stone C and eccentric casing H, the feeder M, curved rack *b*, pinion *l*, pulley K, and weighted cord *n*, operating together as herein specified.

2. In combination with the stone C, casing H, feeder M, connected pulley K, and pin *k*, the stop-pawl L serving to arrest the feeder at both ends of its motion, as herein specified.

160,997. REED-ORGAN CASES. J. Estes, Boston, Mass. [Filed Nov. 13, 1874.]



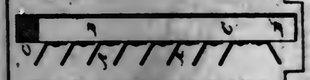
Brief.—Combined book-case, writing-desk, and organ-case.

1. The reed-organ case provided with the desk-chamber D and lid E, combined and arranged with the key-chamber A and its cover B, and the bellows and reed-chamber C, all substantially as specified.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON

2. The reed-organ case provided with the chamber F, cover G, the desk-chamber D and lid E, the key-chamber A and its cover B, and the bellows and reed-chamber C, all arranged as set forth.

160,996.

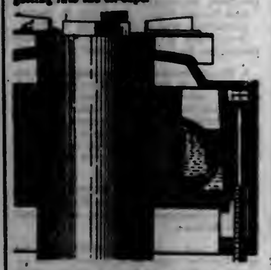


160,997.

161,001.

160,998. COMBINED WALL-PROTECTOR AND TOWEL-RACKER. M. G. Bell, Clarksville, N. J. [Filed Dec. 8, 1874.]

A combined wall-protector and towel-rack, consisting of the uprights a a, provided with clamping-springs D D, buttons c c, cross-bars b b, and towel-arms E E, pivoted to bars a a by the clasps F, substantially as and for the purpose set forth.



160,999. OATS-SCREENER. Jasper N. Bell, Fort Dodge, Iowa, assignor to J. N. Bell and R. W. Johnson, same place. [Filed Nov. 19, 1874.]

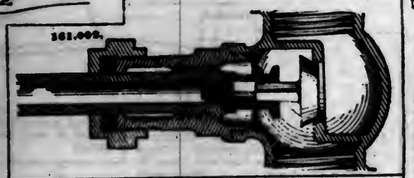
The inclined metal strip A, secured to frame C of sieve B at short distance above said sieve, to prevent oats from escaping through, as set forth.

161,000. MILLSTONE-DRESSER. Solomon Bernheisel, Green Park, Pa. [Filed Sept. 4, 1874.]

Brief.—Devices for distributing the grain between the stones, and sweeping the top of the bank, to prevent any dust or grain from getting into the oil-cups.

The distributer and sweeper G f f, in combination with the bank and spindle, substantially as specified.

161,001. STREET-RAILWAY SWITCHES. B. Bovelander, Boston, Mass., assignor to himself and S. L. Putnam, same place. [Filed Dec. 17, 1874.]



Brief.—A street railroad turn-out frog to which the inclined sliding surface most exposed to wear is formed of a hard piece of metal, capable of being detached and reversed when one face is worn.

The hard-metal plate E to the switch rail S, between the end f and the switch point g, and forward of the latter and between the side rails I, substantially as described.

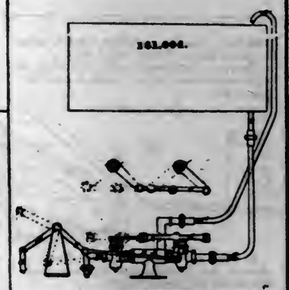
161,002. COMBINED GLOBE AND CHECK VALVES. I. W. Brown, Glenville, Md., assignor of one-half his right to J. Lynch, Jr., Portland, Me. [Filed July 31, 1874.]

The combination of the hollow square or fluted socket B on the stem C and corresponding square or fluted stem on valve D, for the purpose of a combined globe and check valve, and to permit the rotation of the valve on its seat for grinding or keeping tight while in use.

161,002.

161,003. HOODS. John Brugger and Sebastian Christophe, Manchester, N. H. [Filed Dec. 5, 1874.]

As a new and improved article of manufacture, a knit hood constructed of woolen yarn, worsted, &c., constructed with the sections B C, for protecting the face, horizontal eye-slit E, the edges of which are capable of being closed by means of a button connection when the cap is worn, and the elastic neck-piece D, for fitting the neck closely, substantially as described and specified.



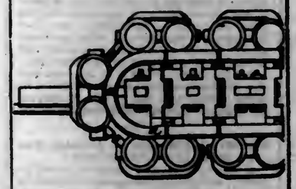
161,004. WATER-CLOSETS. H. P. Buchan, Southampton, England. [Filed June 3, 1874.]

Brief.—A cylinder, provided at each end with a tap, in connected by pipes with a reservoir for holding disinfecting fluid, and with the water-closet. When the handle or pull of the closet is raised, one tap is opened to allow the fluid to fill the cylinder, and the other tap is closed. When the handle is let down the reverse action takes place, and the fluid in the cylinder is discharged into the pan.

1. The combination, substantially as hereinbefore set forth, of a reservoir containing disinfecting fluid, a cylinder adapted to receive a charge of said fluid, taps at each end of said cylinder, a supply-pipe connecting the cylinder and water-closet, and lever-connections between the taps and pull-up handle of the water-closet, whereby the disinfecting fluid is shut off as the handle of the closet is raised to let on the water, and discharged when the water-supply is shut off.

2. The combination, substantially as hereinbefore set forth, of the reservoir, cylinder, the taps, their lever-connections, and the air pipe of the cylinder, whereby the capacity of the cylinder is increased, and the quick discharge of the fluid secured.

161,004.



161,005. ARTIFICIAL MARBLE, AND PROCESSES OF MOLDING THE SAME. William Burnet, Chicago, Ill. [Filed Mar. 3, 1875.]

1. The artificial or manufactured marble described, made from Keene's or other equivalent cement or plaster, composed in part or entirely of sulphate or carbonate of lime, or both, in combination with potash-alum, or with potash and alum, and either with or without lime-water.

2. The process of molding artificial marble in varnished, polished, or glazed molds, as described.

3. The process of molding artificial marble in wooden molds, or their equivalents, without the necessity of the interposition of oleaginous matter, as described.

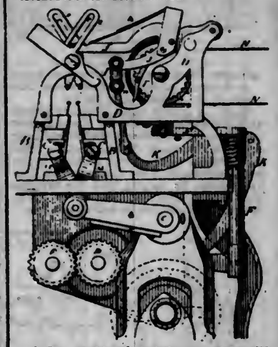
161,006. TRACTION-VEHICLES. Henry H. Chapin, Adrian, Mich. [Filed Jan. 23, 1875.]

1. An endless jointed track, a a a a, provided with a train of trucks flexibly connected together, and each truck carrying a shoe or section of track, all combined substantially as set forth.

2. The combination of two or more series of trains of trucks flexibly connected together, and to run independently upon endless jointed tracks, substantially as set forth.

3. The combination, with two or more endless jointed tracks, of sliding bars connecting the corresponding sections of the tracks, and levers for operating said sliding bars, substantially as and for the purpose set forth.

4. In an endless jointed track, the rails of the various sections, constructed to overlap each other at the ends, substantially as and for the purposes set forth.



161,007. TOOLS FOR TURNING METAL. C. Cummings, Virginia City, Nev. [Filed Jan. 23, 1875.]

The construction of the cutter with a conical base and thin shank with a countersunk hole, whereby, by means of the bolt and nut, the cutter is securely held from turning while at work, and a perfect degree of adjustment is permitted.

161,008. KNITTING-MACHINES. Edward P. Curtiss, Norwalk, assignor of one-half his right to Theodore C. Foote, Cleveland, Ohio. [Filed Feb. 13, 1875.]

Brief.—The two rows of needles rise and fall simultaneously in inclined ways, so as to bring their beards close together to surely catch the threads. There are two thread-guides to each needle, and each pair are crossed by a single spring-actuated lever, all of which are operated by a pattern-card, the holes in which are eyeleted to prevent wear. The tripping-lever is for raising all the thread-guide-actuating levers, and moving the thread-guides, so that they shall lay their threads into the needle-hooks.

1. In a machine for knitting a straight solid fabric, two sets of needles arranged in inclined ways, and all of the needles in each set operated simultaneously, so as to bring the heads of the pairs of needles together, substantially as and for the purpose described.

2. The combination of the thread-guides Z, spring-levers f, and jacquard N, constructed and operating substantially as described, for the purpose specified.

3. The combination of the tripping-lever I, jointed lever K, and cam L, with the levers f and jacquard cylinder M, substantially as and for the purpose described.

4. In a knitting machine, a jacquard, having the pattern formed therein with eyeleted holes, for operating the threads, substantially as specified.

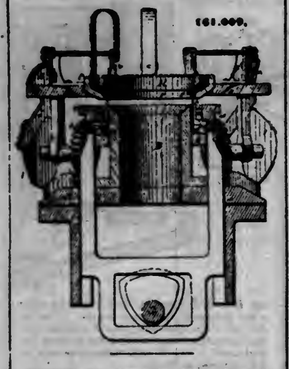
5. In a knitting machine, the cylindrical grooved jacquard carrier M, operating substantially in the manner and for the purpose described.

6. The sliding frame D, carrying the jacquard, thread guides, tripping-lever, and levers f, in combination with a cam, G, and rock-shaft F, substantially as and for the purpose set forth.

161,009. CIRCULAR-KNITTING MACHINES. Edward P. Curtiss, Norwalk, assignor of one-half his right to Theodore C. Foote, Cleveland, Ohio. [Filed Feb. 12, 1875.]

Brief.—All the needles reciprocate simultaneously in a vertical direction. A pair of rings, each provided with a yarn-guide for each needle, are reciprocated back and forth by the devices named in the fourth and fifth clauses of the claim, so as to cross the threads upon the needles and produce the fabric claimed.

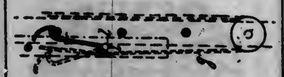
1. In a circular-knitting machine, annular yarn-carriers F H, set in a bed-plate, G, and reciprocated simultaneously in reverse or opposite directions, substantially as shown and described.



2. In combination with the grooved needle-carrier k, the independent sinkers n, having slot p, whereby the needles are held rigidly in place, and whereby any needle in said carrier may be removed and replaced at pleasure without disturbing the other needles or other parts of the machine, substantially as shown and described.

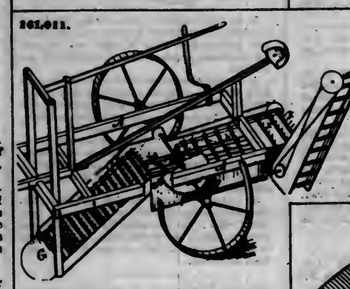
3. The within-described knit fabric formed of two threads crossed back and forth, as shown, so that such fabric may be cut length-wise at any point, and form or leave selvages on both sides, substantially as specified.

4. The combination, with the yarn-carriers, of the cams I, levers J and e, and connecting mechanism, whereby said carriers are reciprocated, substantially as and for the purpose described.



5. The toothed weft-carrier c, rotated by pinion h and meshing with pinions L, for the purpose of transmitting motion to the cams I, substantially as described.

161,009.



161,010. EXTENSION-LADDERS. James M. Davis, Bangor, Me., assignor to Joseph S. Smith, same place. [Filed July 22, 1874.]

Brief.—The sustaining-hooks are rigidly attached to a cross-bar pivoted loosely in the sides of the upper section. The elevating-chain is attached to said cross-bar, and is operated by a drum and crank. By turning the crank to extend the ladder, runner-shaped hooks pass over the rounds and drop into position, so as to hold the ladder extended. By turning the crank to contract the ladder the hooks are raised back, which frees them from contact with the rounds.

In an extension-ladder, the combination of two or more ladders with drums e, chain g, and lever l, substantially as and for the purposes set forth.

161,011.

161,011. POTATO-HARVESTERS. Albert J. Davis, Prairie City, Iowa. [Filed June 8, 1874.]

Brief.—In rear of an endless carrier, for conveying the potatoes from the ground, is a series of horizontal bars hung on a series of cranks on a transverse rod, for separating the potatoes from the earth. Above the sifter is an endless carrier for carrying the vines rearwardly.

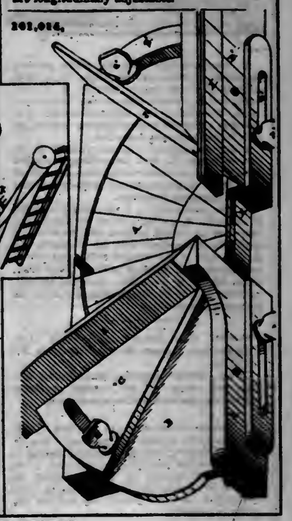
In a potato-harvester, the combination of the plow G, carrier 1 2 3, shaker 4 A, and vine-carrier 4 4, substantially as described, and for the purposes specified.

161,012. SKIRT-PROTECTORS. Theodore D. Day, Elizabeth, N. J., assignor to Sallie V. Day, same place. [Filed Feb. 4, 1875.]

A skirt-protector formed of a strip of india-rubber, having a thin portion or web, through which the rubber is stitched to a strip of muslin or similar material, and a rib that projects from the surface of the rubber sufficiently to protect the line of stitches from wear, substantially as specified.

161,013. PAVEMENTS. Andrew B. Dean, Louisville, Ky. [Filed Feb. 6, 1875.]

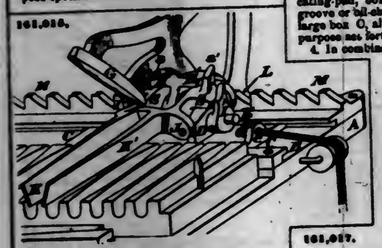
Brief.—A foundation of broken stone or coarse gravel, the interstices of which are filled with sand, leaving the surface irregular and rugged. Melted candle-gum is then applied in a thin coating to bind the base together. Asphaltum and candle-gum are then melted together and mixed with coarse gravel, broken stone, and sand. This compound is evenly spread over the foundation and firmly rolled. Over this layer is spread a surface coating of coarse sand and fine gravel, or finely-broken stone mixed with hot candle-gum and asphaltum, and treated in the same manner as the previous layer. The final layer should be rolled while hot, and the rollers should be kept moist while in use.



1. A paving compound consisting of candle-gum mixed with asphaltum, as described.

2. A pavement the binder of which is candle-gum and asphalt mixed together and incorporated with sand, gravel, broken stone, or other hard mineral substance, as set forth.

161,014. MITER-BOXES. H. Dittenhafer, Bloomville, Ohio. [Filed Sept. 19, 1874.]



Brief.—The side of the box against which the material to be cut rests is formed of two segments having slotted flanges upon their front edge. One of the flanges, having attached to it a pivoted saw-guide, the segments are longitudinally adjustable.

161,014.

The herein-described miter-box, consisting of the bed-piece A, segments B B', provided with flanges D D' having slots E E', the set-screws F F', saw-guide I, adjustably-slotted segments C C' provided with flanges J J', and set-screws G G', all constructed and operating substantially as shown, and for the purpose specified.

161,016.

161,016. MACHINES FOR CHARGING CIGAR-MOULDS. Napoleon Dubrul, Cincinnati, Ohio. (Filed Apr. 13, 1874.)

Brief.—The jaws are opened and closed by means of cams, which are operated by the lever that works the plunger. The heel of the lever works into an incline, to automatically adjust the jaws over the mold to be filled.

1. The lever F and plunger G, having cams H H', the pivot E, having cam I I', in combination with the upwardly-closing jaws K K', having cars S S', and lugs *e e'*, adapted to operate in the manner and for the purpose set forth.

2. The lever F, having heel L, for adjusting the filling mechanism by the upward stroke of said lever, in combination with a ratchet, M, and with jaws K K', plunger G, slide C, and a suitable mold, substantially as and for the purpose set forth.

161,017. CAR-AXLE LUBRICATORS. J. S. Eggleston, Auburn, N. Y. (Filed Jan. 20, 1875.)

Brief.—Draws expansible from axle-box and from each other. Oil fed through groove to lubricating-pad instead in wire-netting.

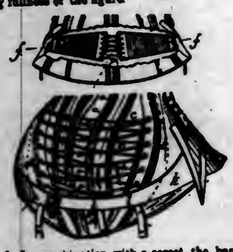
1. The combination of the axle-box B, sliding removable drawer C, removable box E, and a lubricating-pad, the drawer C having on its sides elastic retaining-strips *c*, and in its interior coil-springs D, which support the smaller removable box E, containing a lubricating-pad, all substantially as and for the purpose set forth.

161,016. VEHICLE-AXLE LUBRICATORS. J. S. Eggleston, Auburn, N. Y. (Filed Dec. 28, 1874.)

2. In an axle-lubricator, the fabric or wick D, combined with and enveloped in a close meshed or woven cage or netting, E, of hair, cloth, cotton, or such like pliable fibrous material, and having the enlarged central portion and arched or curved bottom portion, as and for the purposes described.

3. In combination with the wick D E, the slot or gutter C, with the enlarged central portion, and provided on each side of its edges with flat or slight depressed surfaces, as and for the purposes described.

4. The combination, in an axle-lubricator, of the axle A, having groove or slot C, enlarged at its central portion, and provided on each side of its edges with flat surfaces, box B, and wick D, surrounded with a fine woven or close-meshed cage or netting, E, of hair, cloth, cotton, or such like material, all constructed and adapted to operate as and for the purposes described.



2. The removable drawer C, provided on its sides and bottom with retaining rubber stripe *c*, in combination with coil-springs D, substantially as and for the purposes described.

3. In combination with the removable drawer C, having retaining elastic stripe *c*, coil-springs D, removable box E, and a lubricating-pad, box E being provided with the groove or oil-channel *e*, and fitted within the large box C, all substantially as and for the purpose set forth.

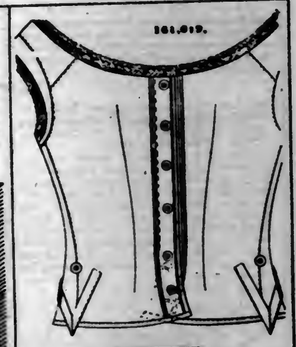
4. In combination with the removable sliding drawer C, provided with retaining-stripe *c* and springs D, and small drawer E, having channel *e*, the lubricating-pad F, consisting of fibrous material inclosed in a fine netting, and contained in box F, substantially as and for the purposes set forth.

161,018. ABDOMINAL CORSETS. H. G. Emery, Boston, Mass. (Filed Oct. 27, 1874.)

Brief.—The abdominal portions of *c* and *d d'* are disconnected, so as to conform to varying fullness of the figure.

1. In combination with a corset, the band or strap *h i*, connected directly with the back, and arranged to pass beneath and support the abdomen, substantially as shown and described.

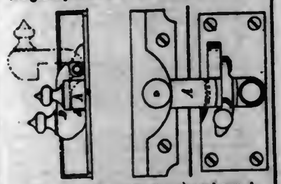
2. In combination with the extension parts *d d'*, the part *c* applied to and partly underlying the same, and admitting of expanding and holding the parts in the adjusted position, substantially as shown and described.



3. In combination with the extension parts *d d'*, constructed substantially as described, the lacing-straps *f* formed of closely-corded textile fabric, and stitched and made as described.

4. A corset formed with an open slit, 1 2, over the central line of the breast, and provided with a lapping-piece to lie under the opening, and a sustaining-strap, 5, arranged to operate substantially as and for the purpose described.

161,019. METHODS OF MANUFACTURING CORSETS. H. G. Emery, Boston, Mass. (Filed Oct. 27, 1874.)



In the manufacture of corsets, the method above described of cutting variable measurements for the shoulders relatively to a given measurement for the waist, by means of the described series of cutting-out patterns, having a given waist measurement and graduated or varying shoulder measurements, substantially as set forth.

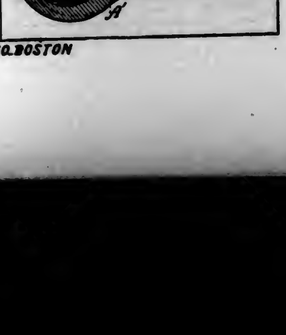
161,019.

161,020. FASTENERS FOR MEETING-RAILS OF SASHES. Edward O. Fathergeen, Buffalo, N. Y. (Filed Feb. 6, 1875.)

Brief.—A gravity locking-catch is pivoted to an upwardly-projecting lug in such manner as to drop down upon and hold the swinging arm firmly in place, the locking-catch being also provided with a suitable shoulder, to prevent the insertion of any thin instrument from the outside, for turning back the swinging arm, until released from the inside by lifting the gravity-catch from its locking position.

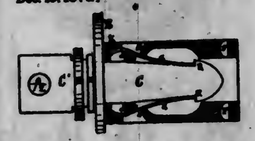
The combination, with the pivoted arm A, of the gravity locking-catch D, pivoted to lug *c*, and provided with a suitable shoulder, *d*, substantially as and for the purposes hereinbefore set forth.

161,021. SIGNAL-LANTERNS. Edward H. Foote and Edward L. Gilman, Somerville, Mass. (Filed Feb. 2, 1875.)



Brief.—A screen of thin colored fabric is arranged to surround the light, and is held extended by a coiled spring. The screen is drawn down by cords attached to its top, and passing through holes in the foot of the lamp, and operated by a lever beneath the lamp; said lever being held, when the screen is drawn down, by a spring-catch.

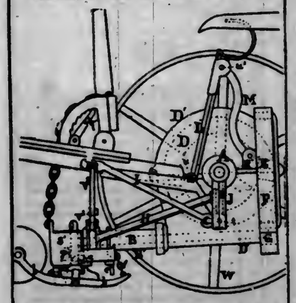
1. The lamp A, provided with the hoop B, standards *c*, ring D, spring *g*, and screen O, combined to operate substantially as and for the purpose specified.



2. The lever I, catch L, and cords *h h*, in combination with the screen O and spring *g*, substantially as and for the purpose specified.

161,022. WRENCHES. Geo. W. Freeman, Indianapolis, Ind. (Filed Sept. 29, 1874.)

A wrench, combining in its construction a handle, A, having an annular opening in its end, with a scroll-formed face, and a ratchet-socket-piece, B, fitting loosely therein, and arranged to operate substantially in the manner set forth.



161,023. SEAL-LOCKS. Chas. C. Gale and George F. David, Indianapolis, Ind. (Filed Dec. 19, 1874.)

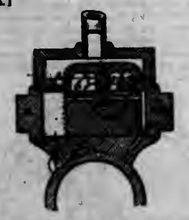
1. The case A, constructed and secured to the door as described, in combination with the key C, springs G G or pawls T T, and guard or cap D, substantially as specified.

2. The key C, constructed with barbs E E, flange E, breaking-groove V, projection C', and space X for the guard or cap D, substantially as specified.

161,024. MOWING-MACHINES. Joel Garfield, Ayer, Mass. (Filed Jan. 26, 1874.)

1. The finger-bar C, suspended from the main frame in front of the driving-wheel, in combination with the shoe *b* and pivot *c*, placed on the shoe, and on which it oscillates freely within limits defined by the set-screw *e* and chain *f*, on an axle parallel to the line of the finger-bar and head-piece *a*, by which the shoe is swung from the frame D at right angles to the line of the crank-shaft, around which it swings in the arc of a circle for the avoidance of obstructions, substantially as set forth.

2. In combination with the main frame, a portion, B', of which carries the finger-bar, the tongue F, pivoted at *i* to a projection on the main frame immediately under the axle, and projection J and brace I, applying the draft to the frame on one side of the crank-shaft, while the resistance of the finger-bar is on the other, and at the same time counterbalancing the weight of the latter by the force of the draft, substantially as set forth.



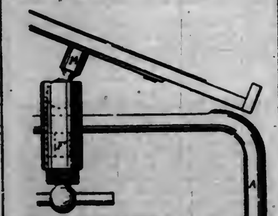
3. The guide *d*, pivoted to the shoe *b*, in combination with the spring *g*, pin *g*, and flange *h*, substantially as described, and for the purpose set forth.

4. The combination of the shoe *b*, lead-wheel W, pivot *c*, swinging head *a*, stop *e*, and chain *f*, substantially as described, and for the purpose set forth.

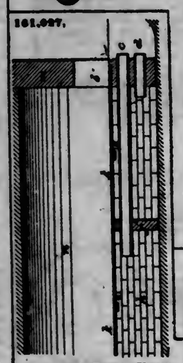
5. In combination with a finger-bar having transverse oscillation, a pitman and bell-formed crank-pin, and the boxes L and M, covering strap *k*, wedge-shaped head of the pitman *p*, slot *o*, and bolt *n*, so that the pitman may have free transverse oscillation, and the strain on the pitman in driving against the box made to tighten the fastening of the strap.

6. In combination with the main frame and finger-bar attached thereto and oscillating with it, the seat B, supported on arms L and M, the former of which rests on the pole P, which is attached to the main frame below the axle, and the latter to the frame in rear of the axle, substantially as described.

161,025. VALVES FOR ENGINES. George M. Githens, New York, N. Y. (Filed Aug. 29, 1874.)



1. The valve-moving piston and a stem passing through the exhaust-port, in combination with the steam-valve and the main cylinder, piston, and ports, the valve-moving piston being located between the steam-valve and the main cylinder, for the purposes and substantially as specified.

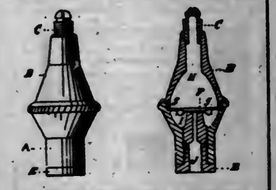


2. The valve-moving piston, having openings from each end to transverse groove receiving the valve-stem, in combination with the steam-valve, ports, main cylinder, and piston, substantially as specified, whereby the steam-spaces of the valve-moving piston are opened to the exhaust, as set forth.

161,026. BOOK-RESTS. Robt. S. Grummon, Newark, N. J. (Filed Dec. 19, 1874.)

In combination with the bent standard A, the sleeve B, having the ears D D and set-screws *a* and *b*, and the movable sleeve E, provided with the set-screw *d*, constructed and operating substantially as and for the purposes set forth.

161,027.



161,027. BRICK-KILNS. David P. Guise, Williamsport, Pa. (Filed Nov. 30, 1874.)

Brief.—A trench beneath the arch is divided into compartments by transverse partitions, and is covered by perforated pieces. Air for draft is supplied to any compartment by a separate or independent pipe leading thereto.

The combination and arrangement of the perforated pieces *h h h h*, sections *h h*, and tubes *c d*, as described and shown, for the uses and purposes set forth.

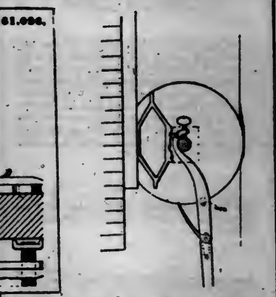
161,028. GAS-BURNERS. Thomas Haley, Cambridge, Mass. (Filed Feb. 13, 1875.)

Brief.—The flow of gas is regulated and the same entirely cut off by turning the burner in its seat.

The frustums A B, diaphragm F, ring E, and tip C, combined and arranged to operate substantially as and for the purpose specified.

161,029. LAMP-WICKS. Halvor Halverson, Cambridge, assignor to C. A. Shaw, Boston, Mass. (Filed Feb. 3, 1875.)

Brief.—The wick is subjected to the action of acid or gas, or oxidized by chemical action.



As a new article of manufacture, a fibrous lamp-wick, oxidized substantially as and for the purpose specified.

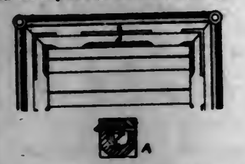
161,030. CAR-STARTERS. Dexter D. Hardy, Delavan, Ill., assignor, by mesne assignments, to himself, C. L. Booth, and J. R. Stone, same place. (Filed Oct. 12, 1874.)

Brief.—A lever with an adjustable fulcrum against the axle, and a lug and pawl against the periphery of the wheel.

161,030.

The combination of the lever A, having an adjustable fulcrum-bearing upon the axle of a car, the hook or lug *f*, and pawl *g*, substantially as described.

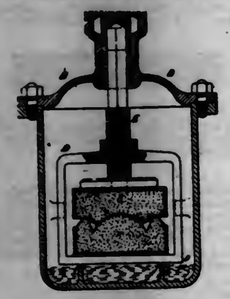
161,031.



161,031. BIT-STOCKS. H. C. Hart, Unionville, Conn. (Filed Dec. 26, 1874.)

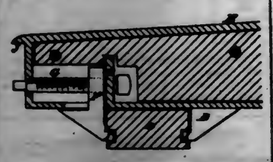
Brief.—The bit is secured to the stock by means of a screw-sleeve fitting over the head of the stock, and provided with a supplementary rotating cap, for holding the bit in the desired position.

The supplementary rotating cap C, in combination with the screw-head A and sleeve B, the cap and sleeve being provided with corresponding openings, all substantially as and for the purpose described.



161,029. BEDBUG-TRAPS. John L. Hawkins, San Quentin, Cal., assignor to Wm. W. Walker and John L. Hawkins. [Filed Nov. 5, 1874.]

Brief.—The traps are placed on the bedstead beneath the mattress, and the bugs enter the trap through the slits or openings.

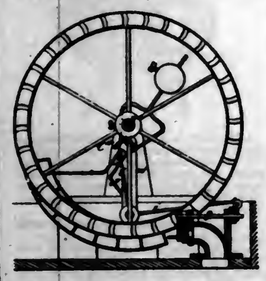


The trough A, consisting of the two parts, hinged together, and provided with the grooves F and slits or openings, substantially as and for the purpose set forth.

161,030. APPARATUS FOR FORMING DENTAL PLATES. F. L. Henrion and J. H. Moseley, Brooklyn, N. Y. [Filed Feb. 27, 1875.]

In a boiler for making dental plates, &c., the revolving hollow shaft c passing through the cover B, in combination with the cover B, from which it is detachable, and the mold-frame D, whereby pressure can be applied to the molds within the boiler, and the molds, frame, and cover can be withdrawn from the boiler and separated from the boiler-cover without reducing the pressure upon the molds, substantially as described.

161,031. WAGON-BRAKE BLOCKS. William Hendrick, Modesto, Cal. [Filed Mar. 1, 1875.]



1. The combination, with cap E, of fixed jaw B, secured to said cap inside of the line of the wheel, movable jaw C, and screw G, outside of the wheel, for the purpose of allowing the brake-block to be adjusted as the wheel becomes more dished, and to prevent weakening the bar A, all substantially as set forth.

2. The fixed jaw B, in combination with movable jaw C and the brake-block D, the said jaws being provided with projections I, substantially as and for the purpose set forth.

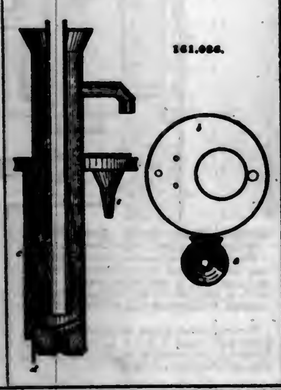
3. In combination with the brake-bar, the fixed jaw, movable jaw, and the operating-screw, the cap E, having the projecting flanges J J, substantially as and for the purposes set forth.

161,032. WATER-WHEELS AND HYDRAULIC GOVERNORS. Frederick G. Hesse, Oakland, Cal. [Filed Mar. 31, 1873.]

Brief.—Curved buckets extending through the wheel from face to face between inner and outer rims, in combination with the single water-pipe, which is arranged to discharge the stream of water tangentially upon the buckets as the buckets come in proper relation to the pipe.

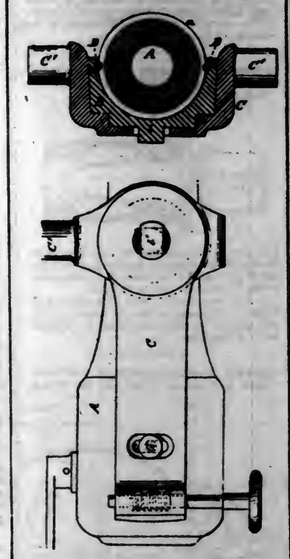
1. A water-wheel having curved buckets or water-passages extending through it from face to face between inner and outer rims, in combination with the single water-pipe, which is arranged to discharge the stream of water tangentially upon the buckets as the buckets come in proper relation to the pipe, substantially as and for the purpose herein described.

2. The buckets or passages through a wheel, curved and set as described, in combination with a single pipe, which is arranged to discharge the water tangentially upon the buckets, substantially as and for the purpose set forth.



3. The automatic hydraulic governing segment connected with a regulating mechanism, in combination with a water-wheel, substantially as and for the purpose described.

161,033. FLUID THRIVER OR PUMPS. Jos. Hitchens, Port Washington, Ohio, assignor of one-half his right to Thos. B. Bukey, same place. [Filed Feb. 23, 1875.]



Brief.—A pump for drawing fluids from barrels through the bung by means of a circular cup, which is perforated near its outer rim with an opening for the passage of the cylinder. The cup is also perforated with another and smaller hole, which is the opening of a duct which leads into the barrel, and catches the drippings from the measure or spout, and redeposits it in the barrel. A funnel is hinged to the cup.

In a fluid thief or pump, the arrangement and combination, with the main tube a, of the cup b, discharge-pipe c, and funnel d, as and for the purpose set forth.

161,034.

161,037. MEANS OF MOUNTING AND OPERATING ORDNANCE. Benjamin B. Hotchkiss, New York, N. Y. [Filed May 26, 1874.]

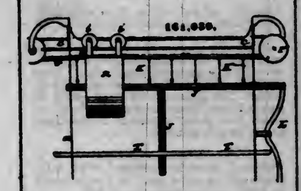
1. The saddle-piece B, formed with swelled sides, adapted to match in the inclosing-box C, in combination with the gun A, collar a, and convenient locking means D, as herein specified.

2. The combination of gun A a, saddle B, and trunnion-frame C C, the parts being secured together by the locking projection b by engaging in the opening c, as herein specified.

3. In combination with the gun A, trunnion-frame C C, and traverse means E, the pinching-screw G, having the loaded lever attached thereto for holding the trunnion-frame firmly to the gun, so as to relieve the traversing means from concussion, as herein specified.

161,038. STRAW CONCRETE. F. B. Howard, New York, N. Y. [Filed Feb. 11, 1875.]

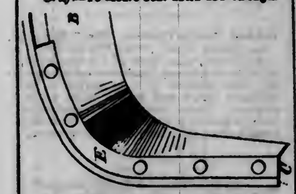
A compound composed of straw, silicate of soda, clay, sand, and coal-tar, substantially in the proportions and for the purposes set forth.



161,039. APPARATUS FOR THE MANUFACTURE OF LAMP-BLACK. John Howarth, New Cumberland, W. Va., assignor of one-half his right to Saml. T. Lamb, Cumbridge, Mass. [Filed Feb. 16 1875.]

Brief.—A horizontal gas-pipe, provided with burners branching alternately in opposite directions, extends the length of the apparatus below the soapstone slabs, and is movable longitudinally, to change the places of contact for flames and tiles, and so prevent overheating. A carriage, provided with scrapers to remove and boxes to receive the carbon, is suspended from and moves upon two longitudinal parallel rails.

1. In combination with the soap-stone tiles, the movable burners, substantially as and for the purpose described.



2. In combination with the soap-stone tiles, the movable carriage, with scrapers and collecting-boxes, substantially as and for the purpose specified.

3. In combination with the soap-stone tiles, the scrapers, connected with the carriage by roping and hinge, substantially as and for the purpose specified.

161,040. SEAT-BACKS FOR CARRIAGES. A. F. Hubbell, Sandusky, Ohio. [Filed Feb. 3, 1875.]

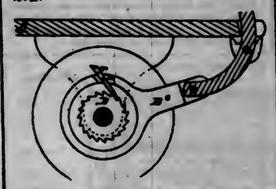
Brief.—To secure neat finish and strength

1. The combination, with the metallic seat-back B, of the wire D rolled in the edge thereof, said fillet E secured between the said wire and seat-back, as and for the purposes described.

2. The metallic seat-back, consisting of the back B, in the outer edge of which is rolled a wire, D, and a fillet, E, secured between the said wire and the seat-back, and made to extend only from the extremities of the sides back around the corners of the seat-back, the parts combined, as and for the purposes described.

161,041. FLOOR-SHIELDS FOR STOVES. J. A. Hunter, Peoria, Ill. [Filed Feb. 19, 1875.]

Brief.—A sheet-metal center grasping to rim of oil-cloth between flanges, or with the same riveted thereto.

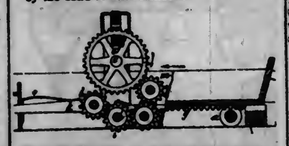


1. The combination, with a metal floor-shield for stoves, of an outer border or extension of oil-cloth, (as a carpet or floor protector,) united thereto by a double flange or rim, a b, which clamps the inner edge of the cloth, substantially as and for the purposes described.

2. The combination, with a metallic floor-shield for stoves, of a surrounding border or extension of oil-cloth or similar material, riveted thereto, or fastened together upon a wooden stiffener or platform, substantially as described.

3. The combination and arrangement of the shield A, flange b, and oil-cloth B, as described.

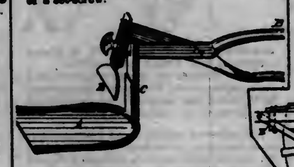
161,042. CAR-STARTERS. G. A. Hunt, Newburyport, Mass. [Filed Jan. 20, 1875.]



Brief.—Adds protecting-case to combination of pawl and ratchet actuated by bent lever.

The combination of ratchet D, pawl F, pawl-case E, and bent lever G, all substantially as and for the purpose set forth.

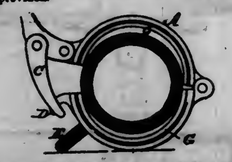
161,043. SUTTER-WORKERS. W. Johnson, Buffalo, N. Y. [Filed Sept. 15, 1874.]



Brief.—A fluted roller transverse to the trough; the trough moved to and fro endwise, propelled by a wheel and rack, the wheel moving continuously, operated alternately by a pinion on each side, thrown in and out of gear by the hand of the attendant.

The combination, with the ribbed working roller and the trough having a gear-rack, g, of the shaft h, pinion i', and reversible transmitting mechanism, whereby the continuous rotary motion of the roller produces a reciprocating motion of the trough, substantially as hereinbefore set forth.

161,044. COMBINED SHOVELS AND ASH-PAN LIFTERS. Andrew Johnson, Youngstown, Ohio. [Filed Jan. 20, 1875.]



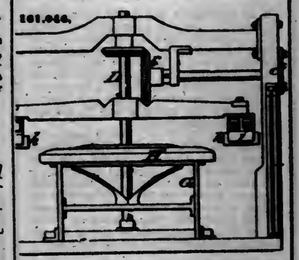
Brief.—The clamp slides between flanges upon the bent arm, and is adjusted by means of a set-screw.

The combination of a fire-shovel, A, with the adjustable clamp E and the tongs B D', substantially as and for the purpose specified.

161,045. HOSE CLAMPS OR FASTENERS. G. S. Knapp, Chicago, Ill. [Filed Feb. 13, 1875.]

Brief.—Concave halves hinged together, and provided with locking devices, by which they can be fastened around the hose. There may be any number of these locking devices, each consisting of a lever provided with a stirrup to engage with a lug or hook, the lug being formed on one of the halves, and the lever pivoted to the other. To prevent leakage when the clamp is in position around the broken portion of the hose, a rubber packing is provided.

1. The hose-clamp consisting of the two concaves A, hinged together, and provided with the lever B, link C, and hook D, as shown and described.

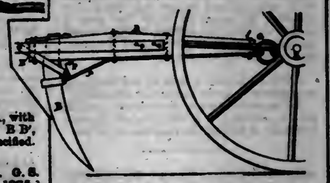


2. In combination with the hinged concaves A, provided with the lever B, link C, and hook D, as shown, the rigid handle E, serving as a means by which to hold the clamp when being locked and unlocked, and also as a means by which to carry the same when not in use.

3. In combination with the concaves A, hinged together, the packing G, arranged as shown, to form a joint around the hose, and also between the edges of the concaves, as set forth.

161,046. LEATHER-DRESSING MACHINERY. Norman O. Lounsberry, Wilmington, Del. [Filed Feb. 6, 1875.]

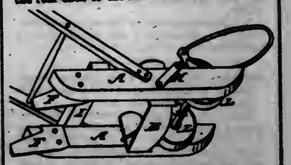
Brief.—The yielding table is supported upon slotted standards, and is provided with a raised bed or surface, which receives the stroke of the polishing-tool attached to arms which rotate in a horizontal plane.



161,046.

The table B, having the slotted uprights C and springs S, in combination with the rotary cross-head J, carrying glazing-pieces A, substantially as described.

161,047. MACHINES FOR DIGGING STUMPS, STUMPS, ROOTS, &c. Charles M. Leffkin, Langdon, N. H. [Filed Feb. 24, 1875.]



Brief.—The beam is constructed like an ordinary plow-beam, and is connected to the middle part of a cart axle-tree. The under side of the beam is strengthened by a rod of iron bolted to it, forming at the rear a supporting-brace for the colter-like standard, which is thrust beneath the stones, roots, and stumps, to loosen them from the ground. The machine is drawn by a team, and guided by handles extending rearwardly.

The combination of the hook or prong B, draw-iron D, swivel G, beam A, stay-iron I, handles O O, rod J, braces E E, and brace F, substantially as and for the purpose hereinbefore set forth.

161,048. SOD-CUTTERS. James McArdle, Winona, Minn., assignor of one-half his right to Alvin O. Hamilton, same place. [Filed June 18, 1874.]

Brief.—The perpendicular sides of the cutting-blade project in advance of the horizontal portion. Guide-plates are attached to the rear ends of the runners.

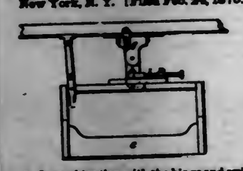
1. In a sod-cutter, the angular blade E, having perpendicular cutting portions, and a horizontal curved receding blade, substantially as shown and described.

2. The combination in a sod-cutter, of the angular blade E, guide-plates F F, friction-rollers L L, and runner-frame A, substantially as specified.

161,049. FEED-GUIDES FOR PRINTING-PRESSES. Edward L. Magill, Brooklyn, N. Y. [Filed Aug. 1, 1874.]

1. In a holder for feed guides, the hold-fast D, tapered in part of its length, having guards *c c* and fingers *b b* bent into angles *a a' a''*, by which it is retained upon the tympan-clamp, and thus secured to the platen of a printing-press, in combination with the counterpeak clamp E, provided with lugs *d d*, flanged set-screw *f* and dovetailed passage *e*, to receive and hold the feed-guides F and F', substantially as herein described.

2. In a feed-guide for printing-presses the beveled feed-guides F, having stop-curves *h* and mortise *i*, in combination with the adjustable elastic curved lip G, provided with lugs *g g* and hooks *c c c c*, arranged and constructed to project outward the distance allowed by the margin of the sheet of paper to be printed, and vibrate toward the tympan-sheet by the notice of the bed and platen in taking the impression, substantially as herein described.



161,650. SAND-PAPERING. Geo. H. Mott, Wyandotte, Kans. (Filed Feb. 17, 1875.)

Brief.—A serrated eccentric head, a projecting hook, and a lever or handle are cast in one piece, and fitted in a suitable case, with an operating-spring. There is also a locking-arm and key-shaft, the former held in place by a spring-disk, a flanged key being also provided, by means of which the arm is turned up from the outside, resting its end against a shoulder on the back of the hook, thus securely locking the device.

1. The eccentric E *a*, hook F, and handle G, constructed as herein shown and described.

2. The combination of the eccentric head E, hook F, locking-arm *J*, and key-shaft K, substantially as and for the purposes set forth.

161,651. SWINGING BEDPAN. Jacob Michel, New York, N. Y. (Filed Feb. 24, 1875.)

1. In combination with the hinge and swinging bed, the screw-rod *l*, substantially as shown.

2. The combination of the swinging bed *c*, hinge *g h*, screw-rod *l*, and holding-lever *e*, substantially as shown and described.

161,652. TIME-LOCKS. D. Moore, Brooklyn, N. Y., assignor to J. Goldmark, same place. (Filed Feb. 13, 1875.)

Brief.—A receptacle for mercury or other flowing material is attached to a bolt-actuating lever, and a reservoir is provided, from which such material is allowed to run in a regulated stream into the receptacle. An adjustable weight upon the lever serves to regulate the time that will be consumed, during which the mercury accumulates in the receptacle upon the lever sufficient to overbalance the weight and liberate the bolt automatically. In connection with this is an electric indicator to denote when the apparatus is properly in position and operative.

1. An adjustable weight, *n*, applied to and combined with the bolt-actuating lever *f*, the reservoir *m*, the receptacle, and the supply-regulator, substantially as set forth.

2. The reservoir supply-regulator receptacle and locking-lever, in combination with an electrical alarm and a circuit-closing lever, *n'*, actuated by the mercury or other material as it passes from the reservoir to the receptacle upon the lever, as set forth.

161,653. MUSIC-BOXES. Charles Paillard, St Croix, Switzerland. (Filed Nov 19, 1874.)

Brief.—Combines with a revolving pin cylinder two or more combs or sets of tongues in substantial unison with each other. These duplicate combs can be used singly or together. The advantage of small combs repeated is less interference of the vibrations, which, in larger instruments of but one comb, are too long in duration.

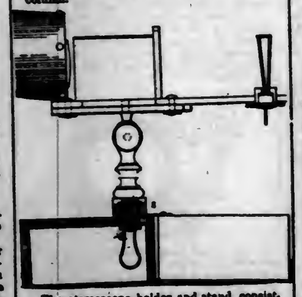
1. In a musical box, two or more combs of vibrators, the similar notes in all of which are of one and the same pitch, or nearly so, substantially as described and specified.

2. The combination, with the cylinder B, of the series of combs D, the similar notes in all of which are of one and the same pitch, constructed and arranged to operate substantially in the manner described and specified.

161,654. SCREW-DRIVERS. Wm. F. Patterson, Boston, Mass. (Filed Feb. 20, 1875.)

Brief.—The main blade of a screw-driver has a supplementary detachable and reversible blade attached to it by means of an elongated slot in each of said blades and a set-screw. The inner end of the supplementary blade is secured to the main blade by an adjustable clamp provided with a locking device.

The improved screw-driver described, the same consisting of the blade A, reversible blade L, screw D, and spring-clamp E, provided with the tapering flange K, all constructed and arranged to operate substantially as and for the purposes specified.

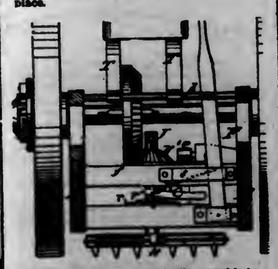


161,655. IRONING-BOARDS. M. E. Moore, Auburn, Me. (Filed Feb. 3, 1875.)

Brief.—At each end of the board is a sliding clamping-board, for holding the garment to be ironed, one being held by a spring-key, and the other by a roughened surface.

The improved ironing-board described, the same consisting of the body A, provided with the curved collar-slide B, spring-key C, and frictional stretcher D, constructed and arranged to operate substantially as and for the purpose specified.

161,656. STEREOSCOPES. Peter Murphy, Jersey City, N. J. (Filed Aug. 6, 1874.)



Brief.—A box (in which the stereoscope is folded) is made in two parts, hinged together, and provided with a hook at *d*, and a metallic nut, *e*, into which is screwed the base of the column.

The stereoscope holder and stand, consisting of a hinged two-part box opening to form the stand, and provided with the nut *e* for the screw-standard, and the link *i* secured by that standard and holding the box open, as set forth.

161,657. REVOLVING HARROWS. Jas. Phillips, Thorntown, Ind. (Filed Aug. 1, 1874.)

Brief.—A vertical shaft carries at its lower end a horizontal harrow. The upper end of the shaft has a cog-gear wheel, that receives motion from a driving-gear upon the axle-tree of the bearing-wheels. The harrow is elevated by means of a lever and clutch, and its gravity forces it into the ground. A friction-wheel rests upon the flange of the bevel-gear on the vertical shaft, to keep the wheel in place.

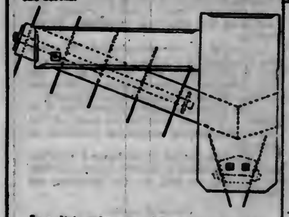
1. The wheel N' on vertically-movable harrow-shaft J, combined with flange *f* and holding-down wheel *c*, substantially as described.

2. The combination of the wheel N', provided with flange *f*, the wheel *c*, the grooved shaft J, provided with fixed collar *r'* and sliding collar *r*, the rod *a*, arm *c*, and lever K, operating substantially as described.

161,658. SCREW-ADJUSTING DEVICE. Wm. Wilson, Jr., Philadelphia, Pa. (Filed Feb. 20, 1875.)

Brief.—The screw-shaft is provided with a collar, and a sliding collar is fitted to the shaft, and provided with a pin, which enters a slot in the sliding-bar, and prevents the sliding collar from turning. The screw-shaft is turned by a key, and the sliding collar is moved by the screw-shaft, and carries the sliding-bar with it.

1. The sliding collar *d*, pin *e*, and sliding-bar B, in combination with the screw-shaft A, provided with the collar *c* and key-hole *f*, substantially as described.



2. The sliding collar *d*, pin *e*, and sliding-bar B, in combination with the screw-shaft A, provided with the collar *c* and key-hole *f*, and the sliding-bar C, substantially as described.

161,659. STEP-LADDERS. Wilson L. Potter, Hartford, Conn. (Filed Jan. 26, 1875.)

The combination of the ladder *a*, the hinged frame A, the centrally-set toggle-joint *c*, the hinged shelf *d*, and the toggle-joint *e*, all substantially as and for the purpose set forth.

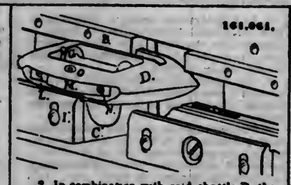
161,660. DISK HARROW-CULTIVATORS. S. G. Randall, Greene, N. Y. (Filed Feb. 20, 1875.)

Brief.—Two revolving shafts are secured to the under side of a frame, in a position oblique to the line of draft. Upon these shafts are secured a series of disks, with their faces looking inward and forward. A space is left between the inner disks of each series, and between and forward of these is placed a pair of disks, the faces of which look forward and outward. The soil is thrown outward by the two inner disks, and inward by the others of the series.

In a disk-cultivator, the combination, substantially as hereinbefore set forth, of a frame, two series of revolving disks arranged diagonally to the line of draft, with their axes inclined thereto, and leading disks interposed between the two series, and arranged to throw the earth in the opposite direction therefrom.

161,661. SHUTTLES FOR LOOMS. Alfred Rollason and James Brown, Lowell, Mass. (Filed Jan. 20, 1875.)

1. The combination, with the shuttle D, of a supplementary race-plank, as and for the purpose described.



161,662. INSULATING-BLOCKS FOR TELEGRAPH-LINES. Geo. S. Pidgeon, Pulaski County, Ill. (Filed Apr. 24, 1874.)

1. An insulating-block provided with two or more apertures, *b c d*, Fig. 1, to receive and retain wires to prevent crossing or contact.

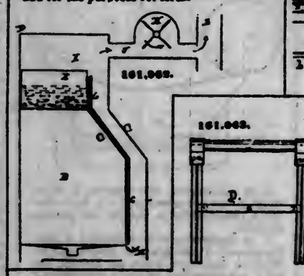
2. The combination of the angular openings *f* with the apertures *b c d* in an insulating-block having two or more apertures to receive and retain wires, all substantially as and for the purposes set forth.

161,663. SHUTTLES FOR LOOMS. Alfred Rollason and James Brown, Lowell, Mass. (Filed Jan. 20, 1875.)

2. In combination with said shuttle D, the supplementary race-plank H, adjustable vertically, as and for the purpose described.

3. In a shuttle for narrow-ware looms, the combination of the plate L, spring M, and projecting eyelet K, all arranged and operating together, as and for the purpose described.

4. In a shuttle for narrow-ware looms, the combination of the plate L, spring M, projecting eyelet K, and set-screw N, all arranged and operating together, as and for the purpose described.



5. In a shuttle for narrow-ware looms, the combination of the plate L, spring M, set-screw N, eyelet K, and supplementary eyelet O, as and for the purpose described.

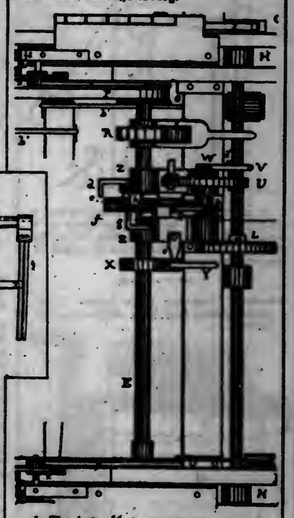
6. In a shuttle for narrow-ware looms, the tension device herein described, arranged in front of the delivery-eyelet K, as and for the purpose described.

161,664. WATER-EVAPORATING REFRIGERATORS. George D. Satterlee, New York, N. Y. (Filed July 21, 1874.)

Brief.—Usually needs no ice. Water drips down the fluted sides of the refrigerator, and is assisted in evaporation by a current of air induced by a fan, and conveyed into a chimney.

In combination with the water evaporating refrigerator hereinbefore described, the air-collecting chamber I under the dome D, eduction-pipe J, exhaust-blower K, and chimney flue or pipe L, substantially as described, and for the purposes set forth.

161,665. DAMPER-COLLARS. F. J. Seymour, Wolcottville, Conn. (Filed Oct. 20, 1874.)



Brief.—The perforated groove receives the drip. The metal of the screw-cylinder extends upward from the bottom of the annular groove, avoiding the sharp bend in the metal required when the cylinder is turned downward.

The lamp-collar made of one piece of sheet metal, with an annular groove and escape-hole, and with the cylinder *c*, extending upward at the inner portion of the annular groove, and having a screw-thread in the inner surface of the cylinder, as set forth.

161,666. HEAD-BLOCKS FOR SAW-MILLS. Noah Shaw, Eau Claire, Wis. (Filed June 27, 1874.)

Brief.—The setting-knees are drawn back by an arrangement of springs and levers after the last cut through the log.

1. The spring plate or tongue D, attached to the damper, in combination with the notched or recessed spindle B, substantially as and for the purpose set forth.

2. The combination, with the thimble E, of the sleeve F, arranged and operating relatively to the spindle-bearing in the pipe A, substantially as described.

3. The thimble or sleeve F and spring *g*, applied to the spindle B, and operating in combination with the damper C, to hold the pipe with a frictional grasp, substantially as and for the purpose set forth.

161,667. SHUTTLE-MOTION. Alfred Rollason and James Brown, Lowell, Mass. (Filed Jan. 20, 1875.)

1. The spring plate or tongue D, attached to the damper, in combination with the notched or recessed spindle B, substantially as and for the purpose set forth.

2. The combination, with the thimble E, of the sleeve F, arranged and operating relatively to the spindle-bearing in the pipe A, substantially as described.

3. The thimble or sleeve F and spring *g*, applied to the spindle B, and operating in combination with the damper C, to hold the pipe with a frictional grasp, substantially as and for the purpose set forth.

161,668. LAMP-COLLARS. F. J. Seymour, Wolcottville, Conn. (Filed Oct. 20, 1874.)

Brief.—The perforated groove receives the drip. The metal of the screw-cylinder extends upward from the bottom of the annular groove, avoiding the sharp bend in the metal required when the cylinder is turned downward.

The lamp-collar made of one piece of sheet metal, with an annular groove and escape-hole, and with the cylinder *c*, extending upward at the inner portion of the annular groove, and having a screw-thread in the inner surface of the cylinder, as set forth.

161,669. HEAD-BLOCKS FOR SAW-MILLS. Noah Shaw, Eau Claire, Wis. (Filed June 27, 1874.)

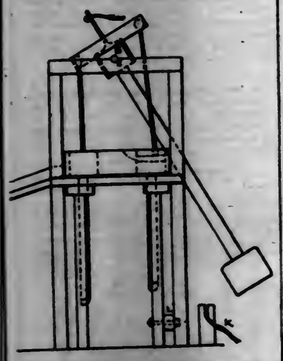
Brief.—The setting-knees are drawn back by an arrangement of springs and levers after the last cut through the log.

1. The lever M, in combination with the springs N, rods *b'*, cord *p*, and knee C, substantially as and for the purpose specified.

2. The pawls *e f*, arms *i s*, and shaft E, in combination with links *j* and *l*, rock-shaft W, with projections *m* and *n*, substantially as and for the purpose set forth.

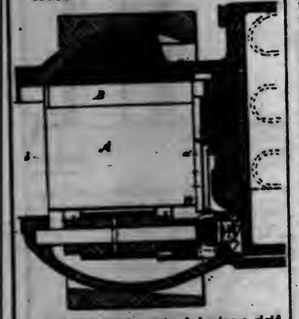
3. The lever S, pawl *o*, ratchet-wheel R, wheel X, and lever Y, in combination with knee C, blocks B, shaft E, pawls *f* and *o*, links *j l*, and rock-shaft W, substantially as and for the purpose herein specified.

161,067. PAPER HAT-BINDING. De Lane Shoplin, Boston, Mass. [Filed Feb. 4, 1875.]



Brief.—The binding is made preferably from manila paper, colored to the proper shade, gummed on one side, and wound on blocks like ribbon.

As a new article of manufacture, paper binding for hats and other articles of dress, consisting of a strip or web of paper of proper width, coated on one side with an adhesive composition, substantially as described.



161,068. HYDRAULIC REGULATOR. William L. Smith, San Francisco, Cal. [Filed Jan. 30, 1875.]

Brief.—The movement of the pendulum is arrested by a rope and a spring-bar arranged in the rear of the frame.

In combination with the frame-work of a hydraulic engine, operated by means of a weighted pendulum, as described, the spring cable or rope K, and spring-bar L, as and for the purposes specified.

161,069. RAILWAY AXLE-BOXES. J. N. Smith, Jersey City, N. J. [Filed Dec. 19, 1874.]

1. In a railroad-car truck, having a rigid frame, the ball-and-socket joint interposed between the bearings of the journal and the frame of the truck, in combination with the housing D, the bearings B, and axle A, substantially as and for the purposes set forth.

2. In combination with the box-frame D and journal A, having flanges a b, the lining B and cast C, as and for the purposes set forth.

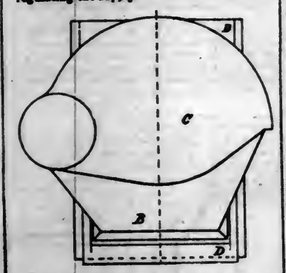
3. In a railroad-car truck, in combination with the journal A and housing D, which is connected to the truck by a ball-and-socket joint, the stopping-bar F, substantially as and for the purpose set forth.

4. The combination of the bolt H, roller K, tumbler I, web J, and oil-well o, for oiling the journal, substantially as and for the purpose set forth.

5. The combination, with the stopping-bar having a recess in its bearing-face extending beyond the center of the axle, of the web J, tumbler M, roller L, and bolt H, substantially as and for the purposes set forth.

6. In combination with the box-frame D, well o, bearings B and r, and oiling devices, the oil-tank E, substantially as and for the purposes set forth.

7. The combination, with the oil-tank E and box-frame D, of the valve h and spring i, substantially as set forth.



8. The combination, with the oil-tank E and box-frame D, of the packing k and hinge f, for excluding dust from the box-frame, substantially as set forth.

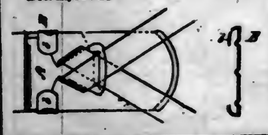
9. The combination of the stops t with the box-frame D and stopping-bar F, substantially as set forth.

10. In combination with the box-frame D, connected to the truck by the ball-and-socket joint, and axle A, the sliding cover O, for excluding dust, &c., substantially as set forth.

161,070. CAR-AXLE BOXES. J. N. Smith, Jersey City, N. J. [Filed Nov. 19, 1874.]

Brief.—Divided upper bearings, with wiper between them, for retaining surplus lubricant. Aperture in stopping-plate for observing wear of parts. Supplementary oil-chamber between well and journal-box, with openings for regulating the supply.

1. In combination with housing B, outer frame D, ball-and-socket joint a c, the projection b, substantially as and for the purpose set forth.



2. In combination with the journal A, bearing-pieces B B', cut apart, as shown, and lubricating apparatus below the journal, the roll f, and depending curtain g, substantially as and for the purpose set forth.

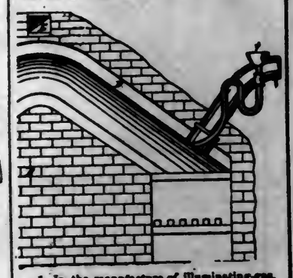
3. In combination with the journal A, and housing B, frame D, and ball-and-socket joint, the stopping-bar F G, made in two parts, connected by a hinge-joint, substantially as and for the purpose set forth.

4. The combination of journal A, bearings B B', and stopping-bar F G, provided with the notch or opening m, substantially as and for the purpose set forth.

5. In combination with the oil-tank C and housing B, the intermediate chamber e', connected with the interior of the oil-tank, and with the oil-well by the openings or holes e and d', respectively, substantially as and for the purpose set forth.

161,071. SUSPENDER, BELT, OR GARTER FASTENINGS. Albert C. Smith, Fort Madison, Iowa, assignor of two-thirds his right to Morris Morris and S. H. Craig. [Filed Dec. 31, 1874.]

The plate A, having the turned-down lip or flange a and slotted tongue C, of the form described, in combination with the locking-bevil B, provided with indentations c c and curved ends b b, as specified.



161,072. PROCESSES OF PRESERVING FOOD. David Sneddaker, Jersey City, N. J., assignor of one-third his right to F. C. Gebhauer, New York, N. Y. [Filed Feb. 23, 1875.]

Brief.—Treats the substance which has been impregnated with sulpherous acid with fumes of burning sugar.

The process herein described of deodorizing solid, liquid, or seriform substances from the fumes of sulphur by subjecting them to the action of the vapors generated from burning sugar or other saccharine matter subsequent to their impregnation with the sulpherous fumes, substantially as herein set forth.

161,073. PROCESSES AND APPARATUS FOR THE MANUFACTURE OF ILLUMINATING-GAS. Wm. H. St. John, New York, N. Y. [Filed Sept. 14, 1874.]

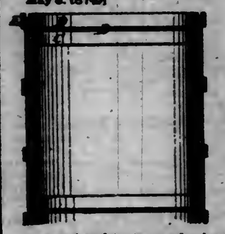
Brief.—The retort is U-shaped, placed horizontally, and so constructed that the first limb rises obliquely upward to its middle, and then extends obliquely downward, where it is bent to form the second limb, which rises and falls similar to the first limb. Each end of it rests over a separate furnace, from which flues extend, surrounding its entire length. The retort is very long, and constructed as described, for the purpose of completely fixing the gas before it passes from it.

1. In the manufacture of illuminating-gas, the process herein described for converting hydrocarbon into gas, consisting of the introduction of the hydrocarbon into a retort or a series of retorts, vaporizing it, and passing it through the retort or retorts, alternately ascending and descending, substantially as set forth.

2. The process herein described for producing an improved illuminating-gas, consisting in first producing oil-gas and coal-gas in separate retorts, then mixing them, and afterward passing them together through the scrubbing and purifying apparatus, as described.

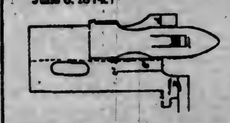
3. A retort for converting hydrocarbon into gas, composed of a portion ascending on one side of the furnace and descending on the other side, and a corresponding portion ascending and again descending, as set forth.

4. The friction-chambers b, provided with plates c, so as to give the gas a serpentine course, and take out any excess of carbon, as set forth.



5. The combination of the boxes b with the boxes d, connected by suitable pipes provided with valves, as and for the purposes set forth.

161,074. BALE-TIES. Richard Terrell, New Orleans, La. [Filed Jan. 13, 1875.]



A cotton-bale tie consisting of the base-plate A, having a bar, B, cast with or folded over the same, and the projecting section D of the plate A, having the relation to the plate B shown, whereby the lower section of the hook of which the plate B provides the bearing shall, when fastened, extend along said plate D, impinging against the same, as stated, and the shield C rounding the whole width of the base-plate A, and curved at its outer section, as shown, so as to provide a lateral opening for the insertion of the hook on the free end of the band, and a bearing-shoulder to retain the same in position when fastened, substantially as and for the purposes specified.

161,075. PAPER BARRELS. Judson L. Thomson, Beloit, Wis., assignor of one-half his right to F. N. Davis, same place. [Filed May 8, 1874.]

A paper barrel having wooden heads B B let into the barrel and resting on hoops C C, in combination with wooden hoops D E, both of which project beyond the chine, for the double purpose of protecting the latter from abrasion in handling, and to prevent injury from dampness, substantially as described.

161,076. SEWING-MACHINE ATTACHMENTS. John J. Thompson, Goshen N. Y. [Filed June 6, 1874.]

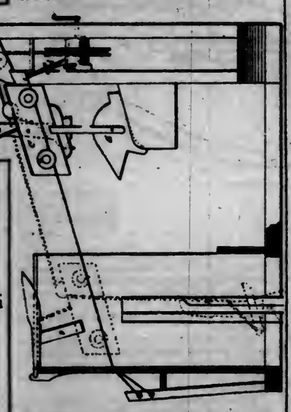
The sewing-machine attachment, comprising the fingers B' C', with the cord-tube r within their curves r', the elastic pressure-fender D, and the presser-plate B formed with the groove e in its under side, the whole being constructed and the several parts arranged, for co-operative action, substantially as and for the purpose set forth.

161,077. SELF-CLOSING WATER-COCKS. John B. Tongue, Worcester, Mass., assignor of one-half his right to A. P. Richardson, same place. [Filed Dec. 28, 1874.]

Brief.—Friction is diminished, and the escape of water around the spindle prevented by forming air-chambers in the upper part of the body of the valve, through which said spindle passes.

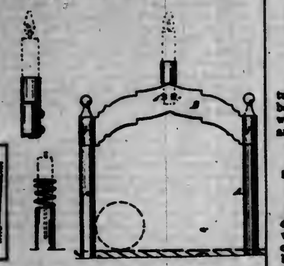
The cock or faucet herein described, consisting of the shell or body A A', with passages B C, valve-seat F, and the portions or projections K K K, the same forming air-chamber I, and the valve and spindle D E, as and for the purpose set forth.

161,078. HARVESTER-COUPLER. Geo. Vanfossen, J. H. VanFossen, and M. VanFossen, Bethesda, Ohio. [Filed Feb. 15, 1875.]



Brief.—Grooved shanks of the sickle-blades are confined in recesses between two grooved plates by means of a rod inserted in said grooves.

Sickle-blades A having grooved shanks a, in combination with the sickle-bar, formed of two grooved plates, B B', and with the rod C, substantially as described.

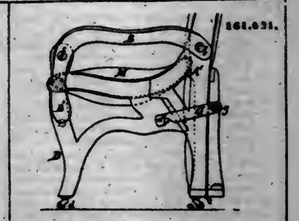


161,079. WATER-ELEVATORS. W. Walter, Derry Station, Pa. [Filed Feb. 1, 1875.]

Brief.—The bucket is secured to a frame attached to a shaft that passes through the carrier, and is held in place by a spring-catch. Upon the descent of the carrier a catch upon the frame over the well engages with a loop on the carrier, and at the same time a stop throws the spring-catch out, thus allowing the bucket to descend. Upon the ascent of the bucket the spring-catch locks the shaft to the carrier.

The combination of the carrier C, having the loop F attached thereto, shaft D, spring-catch G, catch E, stop t, and a hoisting apparatus, substantially as shown and described.

161,080. CROQUET APPARATUS. Prasbury West, Worcester, Mass., assignor to the West & Lee Game and Printing Company, same place. [Filed Jan. 5, 1875.]



1. In a croquet-wicket, the combination of the wood side columns A A and detachable arch-piece B, substantially as and for the purposes set forth.

2. The combination, with a croquet-wicket or croquet-stake, of a candle-socket or light-holder, for the purpose specified.

161,081. CONVERTIBLE CHAIRS AND LOUNGES. Henry Willgoke, New York, N. Y. [Filed May 20, 1874.]

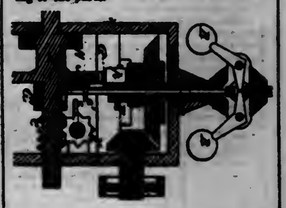
Brief.—The arm-pieces are constructed and arranged to connect the front and back portions of the chair, and also to serve as legs when the chair is converted into a lounge. The seat-piece is pivoted at the front, and its position can be adjusted as a seat, or to form the head portion of the lounge.

1. The piece M, turning on the pins m, in combination with the stops A' A', and adjustable to rest on either, as herein specified.

2. The L-shaped parts B B', in combination with the back A and front piece D, to both of which they are hinged, and adapted to serve the double purpose of arms for the chair and legs for the lounge, as specified.

161,082. COUPLING-JOINTS FOR OIL-WELL DRILLS. O. B. Wiser, Butler, Pa. [Filed Sept. 9, 1874.]

The pin A, the point of which is constructed of steel, and provided with a nut having a recess in its lower end for the reception of the elastic packing at the base of the pin, said pin, nut, and packing-ring combined with the screw-box of the auger-stem, constructed substantially as hereinbefore described, and for the purpose set forth.



161,083. TOY FURNITURE. B. P. Woods, Lowell, Mass., assignor to himself, Daniel Sherwood, and C. H. Latham, same place. [Filed Sept. 28, 1874.]

As a new article of manufacture, toy furniture consisting essentially of chairs, tables, bedsteads, and similar articles, when made of wire, substantially as described and shown, and for the purpose set forth.

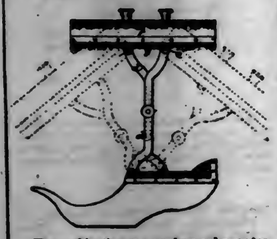
161,084. WATER-WHEEL GOVERNORS. A. Woodworth, Cambridge, N. Y. [Filed Sept. 12, 1874.]

Brief.—When the gate is open on account of low water or slow speed, the pin on the wheel will strike the collar on the rod, and cause the governor-balls to move both shields beneath their pawls, thus disengaging them, and preventing any disarrangement or breaking of the parts.

1. The worm-shaft F and wheel K, carrying the tappet *e*, in combination with the vertically-movable rod C, having the collar *e'*, substantially as and for the purpose described.

2. The combination of the reciprocating slide E, having gravitating-pawls *p*, actuated by an eccentric, *b*, on the governor-spindle A', with the ratchet-wheel J, the oscillating shield G, vertically-movable rod C attached thereto, and provided with collar *e'*, and wheel K, having tappet *e*, substantially as described.

3. The sectional clamp H, embracing the shaft F of the ratchet-wheel J, connected by means of the pin *p*, and adjusted to gripe with greater or less force the said shaft by means of a spring, *s'*, and a nut upon the end of the said pin, for the purpose of balancing the gate, so that it will be steadily moved by the governor, as specified.

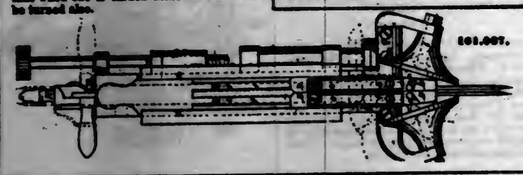


161,065.

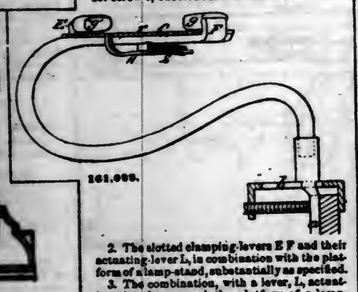
161,065. STEAM-RADIATORS. Jas. R. Worswick, Cleveland, Ohio. [Filed Jan. 11, 1875.]

Brief.—The projections cast with and depending from the top of the base are intended to insure a continuous circulation.

The projection F, in combination with the base A and the pipes, substantially as and for the purpose set forth.



161,066. CHILDREN'S CARRIAGES. Chas. H. Amidon, Miller's Falls, Mass. [Filed Nov. 10, 1874.]



The combination of a carriage or baggy top with the two standards d and a clamping or locking device, substantially as set forth.

161,067. SEWING-MACHINES. John H. Applegate and Chas. B. Webb, Philadelphia, Pa. [Filed June 9, 1874.]

Brief.—The bars which carry the pressers are geared together near their lower ends, so that when one is turned aside the other will be turned also.

161,067.

161,068.

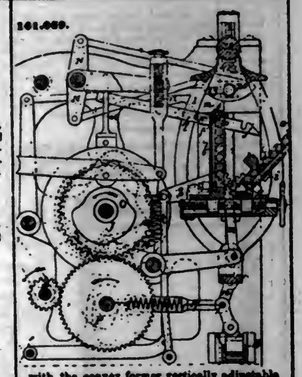
2. The slotted clamping-levers E F and their actuating-lever I, in combination with the platform of a lamp-stand, substantially as specified.

3. The combination, with a lever, I, actuating the clamps, and the platform of a lamp-stand, of the vibrating pawl H, substantially as specified.

4. The combination, with a pawl, H, adapted to engage with a rack, *r*, of a lamp-stand platform, of the spring *s*, for holding the same to an engagement therewith, substantially as specified.

5. The combination, with the simultaneously-actuated clamping-levers E F, of the shoes *f'*, of any flexible material, substantially as specified.

161,069. MACHINES FOR ROUNDING AND BACKING BOOKS. George L. Bailey, Portland, Me. [Filed Dec. 26, 1874.]



Brief.—The book is placed in the hinged holder, which closes and rises vertically, inserting the back of the book between jaws, which close upon it lightly. The roll then moves over and back, rounding the book, while the front edge of it rests on the convex former. The holder then rises a second time, together with the jaws, which latter now firmly gripe the book, when the roll moves back and forth again, performing the backing operation. The holder then descends and opens while the book is removed and another placed therein.

1. The book-holder provided with anti-friction devices for holding the book, whereby the outer leaves of said book are allowed free motion to accommodate themselves to the action of the roll during the process of rounding.

2. The book-holder, provided with anti-friction devices having an automatic adjustment by means of springs, whereby they adapt themselves to books varying slightly in thickness.

3. The hinged book-holder, in combination with the segmental gears *p*, *r* cam K, and connecting mechanism, whereby said holder is opened after the book is rounded and backed.

4. The book-holder, provided with anti-friction devices, as set forth, in combination

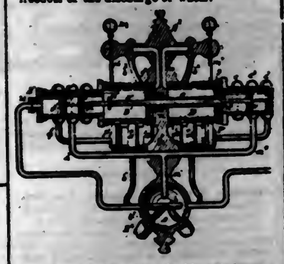
161,069.

with the convex former vertically adjustable therein.

5. The hinged book-holder, in combination with the adjustable latch *f*, catch *k*, and standard 49, operating to lock the holder when the same is raised.

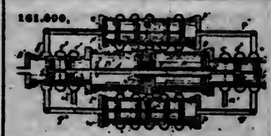
6. In a machine for rounding and backing books, a holder for said book, provided with operative mechanism whereby two distinct and successive upward motions are imparted thereto, one presenting the book to the roll for the operation of rounding, and the second and additional motion raising it still farther for the operation of backing, in combination with a swinging roll by which both these operations of rounding and backing are performed, substantially as herein described.

7. In combination with the vertically rising book-holder, the jaws 1 2, combined with operative mechanism, whereby, as the holder rises to present the book to the roll for the operation of rounding, said jaws close upon it lightly, and support it in an upright position during the operation.



8. In combination with a book-holder provided with anti-friction devices, as described, convex-former, and guiding-jaws 1 2, the swinging roll and its operative mechanism.

9. In a machine for rounding and backing books the vertically-rising holder, in combination with the vertically-rising and griping jaws and swinging roll, whereby the book is raised, griped, and backed, after being rounded, substantially as set forth.



10. The jaws 1 2, in combination with the toggle-joints and adjusting-wedges.

161,070. AIR-COMPRESSING APPARATUS. Harry J. Bailey, Pittsburg, Pa. [Filed Jan. 12, 1875.]

Brief.—The apparatus is so constructed that on the opening of the discharge-cock of a hydrant or water-faucet, the water flowing through the compressor from the source of supply, under pressure, will automatically operate the compressor, and compress and store air, without materially interfering with the freedom of the discharge of water.

1. In a double-acting double-cylinder air-compressor, an apparatus for automatically and simultaneously supplying water under pressure to, and taking the water-waste from, the outer ends of the pumping-cylinders, the construction being substantially as set forth.

161,070.

2. In a double-acting double-cylinder air-compressor, an apparatus, operating automatically by water-pressure, for automatically and simultaneously supplying air at atmospheric pressure to and conducting compressed air off from the inner and adjacent ends of the cylinders, such operations of air inflow and outflow being simultaneous in the two cylinders, but alternating on each, the construction being substantially as set forth.

3. Valve-chambers B B', arranged on the outer opposite ends of a double-acting double-cylinder air-compressor, such valve-chambers containing a system of valves, pistons, ports, and connections for supplying automatically and alternately water-pressure to and conducting it from the plungers, the construction being substantially as set forth.

4. In a double-cylinder air-compressor, a pumping-plunger in each cylinder, attached to a common stem, in combination with a valve-stem, having valves that govern the water-supply, arranged on the outer ends of the same, both stems moving in or near the axial line of the pumping-cylinder substantially as set forth.

5. In combination with a pair of pumping-cylinders, D D', a system of pipes, a^2 a^3 a^4 *e e'*, with suitable ports supplying water to and exhausting it from the pumping-plungers, and a valve-motion operated by water-pressure to change the direction of inflow and outflow, substantially as set forth.

6. In combination with a pair of pump-cylinders, D D', a system of pipes, b^1 b^2 b^3 b^4 b^5, with suitable ports for supplying and carrying off air to and from the pumping-cylinders, and a valve-motion operated by water-pressure to change the direction of ingress and egress, substantially as set forth.

7. As a means of effecting the movement of the valves by which water is supplied to the pumping-plungers, a system of pipes, c^1 c^2 c^3 *g g'*, in combination with valves c^4 c^5, valve-chamber F, and pistons *o o'*, and intermediate ports, substantially as described.

8. A system of pipes, c^1 c^2 c^3 *g g'*, in combination with valves c^4 c^5, valve-chamber F', and pistons *o o'*, and intermediate ports, substantially as and for the purposes described.

9. A valve-chamber, F, containing an arrangement of valves and ports for automatically regulating the water supply and escape to and from the pumping-cylinders, a piston or pistons for moving such valve or valves, and pipe-connections for the supply and escape of water in the automatic operation of such pistons, substantially as set forth.

10. A valve-chamber, F', containing an arrangement of valves and ports for automatically regulating the air supply and exhaust to and from the pumping-cylinders, a piston or pistons for moving such valve or valves, and pipe-connections for the supply and escape of water in automatic operation of such pistons, substantially as set forth.

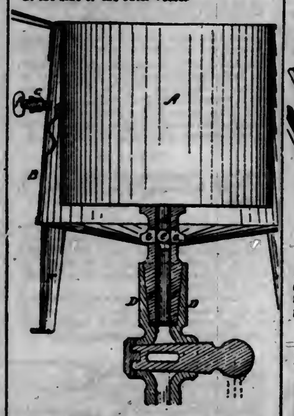
11. The combination of one or more air-compressing cylinders, the pistons of which are operated by water-pressure, a valve-motion for governing the water supply and escape, arranged in a separate chamber or cylinder, and automatically operated by water-pressure in the main cylinder, substantially as set forth.

12. The combination of one or more air-compressing cylinders, the pistons of which are operated by water-pressure, a valve-motion for governing the air inflow and outflow, arranged in a separate chamber or cylinder, and automatically operated by water-pressure acting independently of the water-pressure in the main cylinder, substantially as set forth.

13. Valves c^4 c^5, arranged one in each cylinder B B', with suitable ports and pipe-connections to and in combination with the water valve-chamber F and valves therein, for regulating the water supply and exhaust to and from the main pumping-cylinder, substantially as set forth.

14. Valves c^4 c^5, arranged one in each chamber B B', with suitable ports and pipe-connections to and in combination with the air valve-chamber F' and valves therein, for regulating the air ingress and egress to and from the main pumping-cylinder, substantially as set forth.

15. Piston-valves *s* c^1 c^2 c^3, arranged with communicating ports and pipes to and in combination with the water valve-chamber F, and valves and ports therein, substantially as set forth, whereby, at the completion of the stroke of the plungers *g g'*, the pistons in t^2 will be subject to a preponderance of water-pressure on one side, so as to give the valves a complete throw, and thus avoid danger of stoppage at a dead-point.



161,071. GAS-BURNERS. Charles B. Ball, Philadelphia, Pa., assignor to Jas. W. Carson, same place. [Filed Aug. 11, 1874.]

In an argand gas-burner, the ring A, constructed as described, to open on the outside, in combination with the tube B, having branches C, provided with shoulders C', expanded into the ring A, all substantially as and for the purpose herein set forth.

161,072. STEAM COOKING-VESSELS. E. P. Bates, Syracuse, assignor of one-half his right to W. H. Warner, Brooklyn, N. Y. [Filed Nov. 23, 1874.]

Brief.—Air may escape through the vent at the side of the outer vessel.

The combination, with the jacketed vessel A B, provided with legs F F, of the taper tube C, with perforations *e e*, and the socket D, forming a steam-tight connection with the steam-supply pipe, constructed and operating substantially in the manner described and specified.

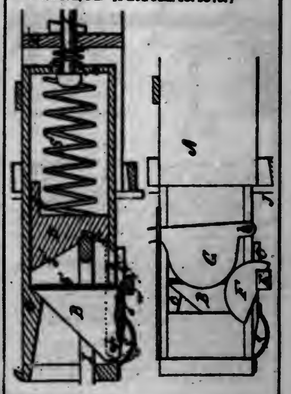
161,073. TICKET-CASES. Leonard J. Hodge, Boston, Mass. [Filed Feb. 8, 1875.]

Brief.—An inclined drawer, with sheet-metal partitions bent to form bottom and steps, has a ball-follower in each division.

1. The drawer A, composed of the series of united bent strips *a a'*, having lips *a' d*, substantially as described.

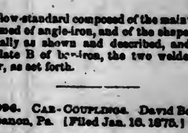
2. A drawer having the division-strips *a*, provided with lips *d a'*, bent in opposite directions, substantially at right angles to the strip *a*, as and for the purpose described.

3. The combination, with the ticket-holding drawer, of the globular circular or ball-like follower, adapted to roll down on the bottom of the drawer and support the tickets, substantially as described.



161,074. PLOW-STANDARDS. Henry Borger, Urbana, Ohio. [Filed Oct. 26, 1874.]

Brief.—Standard pressed to shape in dies; the top fitted in and welded.



A plow-standard composed of the main body A, formed of angle-iron, and of the shape substantially as shown and described, and the flat plate B of bar-iron, the two welded together, as set forth.

161,075. CAR-COUPLINGS. David Bower, Lebanon, Pa. [Filed Jan. 16, 1875.]

161,076. LOCKS FOR POCKET-BOOKS. Bart M. J. Blank, Jersey City Heights, N. J., assignor to Chas. Kohlmann, New York city. [Filed Feb. 13, 1875.]

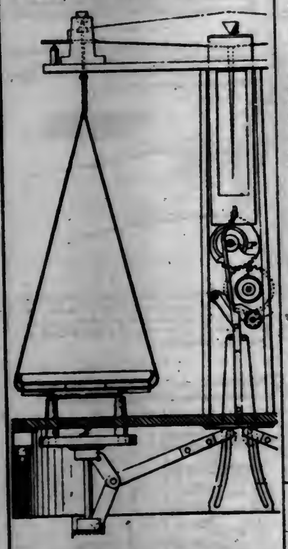
Brief.—The barb or pin *a* of the closing flap turns but a half-revolution, by reason of its leg *b* striking the inner edge of the binding-frame on the under side, thereby bringing the leg *b'* coincident with the slots *d* of the clasp-plate, attached to the body of the book.

The combination of lever-plate C, attached to binding-frame B, the pin *a*, having projecting legs *b b'*, with intermediate recess, and the clasp-plate D, having slots *d*, all constructed and arranged as and for the purpose specified.

1. The pivoted coupler B, provided with the transverse bar E and the spring S, in combination with cam lever G and cam F attached to the transverse bar E, substantially as described.

2. The combination, with a draw-bar, A, having slot *b* and shoulder *c*, of the vertically-vibrating coupler B, having projection C, substantially as specified.

161,097. MILLSTONE-DRESS. Jefferson Carvill and John Caven, Kingston, Minn. [Filed Jan. 18, 1875.]



Brief.—Adjustable portion can be lowered to recess as the stone wears away.

The combination of the adjustable portion A with a stone having a recess, C, substantially as specified.

161,098. COIN-SCALES. Henry S. Cochran, Philadelphia, Pa. [Filed Feb. 9, 1875.]

Brief.—For primary weighing, scale-pans rest on rollers supported by posts connected with lever or main weighing apparatus, friction on knife-edges thus reduced to minimum. For check or auxiliary weighing, a beam, N, supporting scale-pans, is thrown into operative position on knife-edges, through intervention of cam O and spur wheels S T.

1. The combination of the vertically-movable scale-pan frames, the toggle-levers, the lever-frames, the vertical arms, and the pointer or finger, substantially as herein described.

2. The combination, in a weighing apparatus, of two independent scales, A, and mechanism, substantially as described, for simultaneously throwing one scale into an operative position and the other out of action, substantially as described, for the object stated.

3. The combination of the scale-beam, its knife-edge, the vertically-movable plunger or post, and suitable lifting mechanism therefor, with the suspension-rods and scale-pans, substantially as herein set forth.

4. The combination of the lifting-cam, rack-arm, spur-wheel, and pinion with the movable plunger and the duplex scale mechanism, substantially as herein described.

161,099. CHINCH-BUG DESTROYER. John Cochran, Jr., Roscoe, Mo. [Filed Sept. 11, 1874.]

Brief.—A sheet metal furnace is mounted upon wheels. A fire is built upon a grate in the forward end. The bottom plate becomes heated, and as the machine is drawn over the ground the radiated heat and products of combustion are thrown upon the ground, and the insects thus destroyed.

The combination of the fire-box or furnace A, broad elongated flue C to extend toward the rear, with bottom-exit *b*, axle *d*, wheels E, and draft-bail G, all constructed substantially as and for the purposes herein set forth.

161,100. COMPOSITION PAVEMENTS. David G Conger, New York, N Y [Filed Jan. 14, 1875.]

Brief.—A paving-block composed of the following composition, viz: Two barrels paving-pitch, four quarts rosin, one part cement, four parts sand, one part plaster, and gravel equal in bulk to the aggregate of the cement, sand, and plaster. The pitch is first boiled to remove the volatile elements. The rosin, sand, cement, plaster, and gravel are then added. The composition is then pressed into blocks under a heavy rolling pressure, and allowed to remain in the molds until set.

As an article of manufacture, a paving-block formed and subjected to pressure while still hot, and allowed to set while under pressure, the said block composed of a compound of ingredients consisting of pitch or asphaltum, resin, cement, sand, field-plaster, or gypsum, and gravel, in the proportions and united and compounded substantially as described—that is, plastic while hot, but hardens when cool.

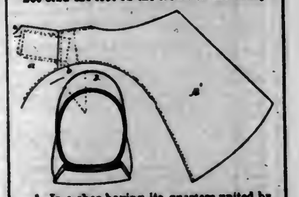
161,101. WEAVERS' SHUTTLES. John A. Crosby, Lawrence, Mass. [Filed Mar. 6, 1875.]

1. The combination of the part *a* of the spindle, arranged to be pivoted to the shuttle-body, with the part *f* pivoted to part *a*, and provided with a butt adapted to operate in connection with the spring *e* and shuttle body, substantially as described.

2. The combination of the shuttle body and its spring with the two-part spindle *a f*, curved or made bulbous, and pivoted together and adapted to operate substantially as described.

161,102. WHEEL-CULTIVATORS. William P. Dale, Pennsylvania State College, Pa. [Filed Aug. 20, 1874.]

Brief.—The plow-beams are connected to swinging rockists in front. Long staples connect the rear of the beams to vibrating inclined arms and also each beam independent for ward and back movement. The arms or lifting-levers are flexibly pivoted and connected, permitting the movement of the beams in all directions.



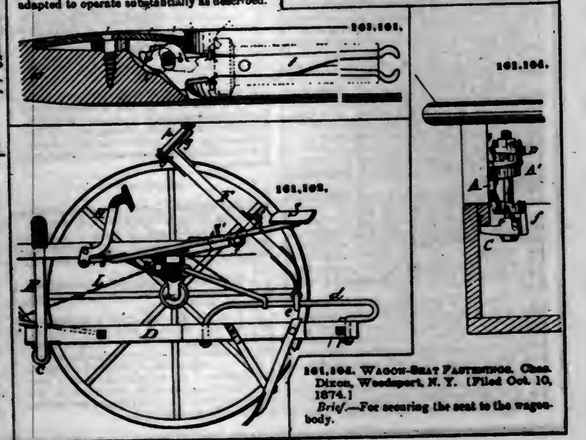
1. In combination with hinged or pivoted shovel-carrying beams D D, the vertically and laterally vibrating arms F F, connected together at their front ends by means of a hand bar, G, substantially as described.

2. Beams D D, connected by joints C C to longitudinally-vibrating arms E E, having independent bearings on the bounds O, substantially as described.

3. The supports S S, pivoted to the seat B, and having hooks *s* on their ends, in combination with plates *l l* and bounds C C, as described.

161,103. SHOES. Gustavus L. Davis, Haverhill, Mass. [Filed Feb. 5, 1875.]

Brief.—One of the quarters is made longer than the other, and stitched vertically, so as to form a pocket for an elastic strap, which is applied only at one side, and therefore cannot bind the foot on the crown of the instep.



1. In a shoe having its quarters united by an elastic gore, and having a vamp applied externally thereto, the quarters A A', having their lapels or front portions formed of unequal length, one of such lapels extending over and beyond the crown of the instep, while the lapel of its fellow quarter is of a correspondingly-decreased length, the same being as shown and described, and for the purpose set forth.

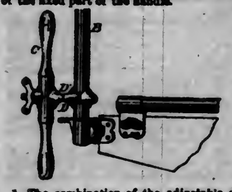
2. In a shoe having its quarters A A' united by elastic connection or gore, and having a vamp applied externally thereto, the part A formed with the extension *c*, as and for the purpose set forth.

3. In a shoe having its quarters united by an elastic connection or gore, the vamp B, having its body or toe and side portions formed whole or of a single piece of leather, and its instep part *d* curved and united thereto, as and for the purpose set forth.

161,104. WAGON-SEAT FASTENINGS. Chas. Dixon, Woodport, N. Y. [Filed Oct. 10, 1874.]

Brief.—For securing the seat to the wagon-body.

1. The wagon-seat fastening, composed of main plate, having socket legs A A', adjustable bolt B, with clamping-piece C and swinging locking-lever D, all combined to operate substantially as and for the purpose set forth.



2. The combination of upper leg A', having inclined surface and side shoulder *d*, with bolt B, and recessed cam-lever D, for producing rigid locking of parts, as described.

3. The clamping-piece C, having projecting shoulder *f*, in combination with recess *f'* of lower leg A', for defining extent of motion of clamp-piece, as specified.

4. The fastening cam-lever D, having side flanges *b* at upper side, for securing position of bolt-fastening nut, combined as set forth.

161,105. HANDLES FOR CROSSCUT-SAWS. Jos. E. Emerson, Beaver Falls, Pa. [Filed Jan. 20, 1875.]

Brief.—The handle is constructed in two parts, one of which is fixed, and the other adjustable and removable, secured together by means of two intermediate collars, provided with nearly half-circles on their opposite ends, and serrations at their meeting surfaces, for holding the adjustable and removable part at any desired angle with relation to the fixed part, or for placing the adjustable and removable part at any desired part of the length of the fixed part of the handle.

1. The combination of the adjustable and removable handle C and its intermediate devices with the fixed handle B of a saw, substantially as and for the purposes described.

2. The collars D and D', with their serrations or teeth *d*, in combination with the handles B and C, as and for the purposes described.

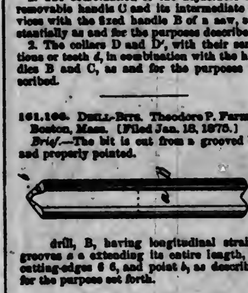
161,106. DRILL-BITS. Theodore P. Farmer, Boston, Mass. [Filed Jan. 18, 1875.]

Brief.—The bit is cut from a grooved bar and properly pointed.

drill, B, having longitudinal straight grooves *a* a extending its entire length, the cutting-edges *c c*, and point *b*, as described, for the purpose set forth.

161,107. BOTTLE FILLERS AND CORKERS. George H. Ferry, New York, N. Y., assignor to Jeremiah B. Bradford, Boston, Mass. [Filed Jan. 18, 1875.]

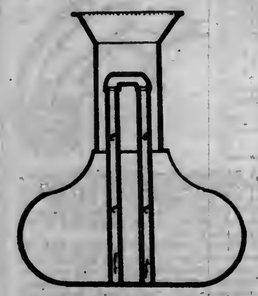
Brief.—A series of measuring-receptacles connected with the supply-reservoir, and provided with valves, which control their inlet and outlet passages,—each receptacle being provided with a central passage or tunnel extending vertically through it, and each receptacle being of the exact capacity of the bottle to be filled.



1. A series of measuring-receptacles, C C, of predetermined capacity, connected with the supply-tank, and provided with inlet and outlet passages *i d*, controlled by valves, in combination with plungers W W, substantially as and for the purpose described.

2. A series of plungers, W W, acting simultaneously in combination with a corresponding number of measuring-receptacles, C C, provided with central tunnel-shaped openings, or cork-conductors *a a*, substantially as described for the purpose set forth.

3. The bottle carrier Q, raised and lowered by suitable mechanism, in combination with a series of measuring-receptacles, C C, and cork-conductors *a a*, substantially as and for the purpose specified.

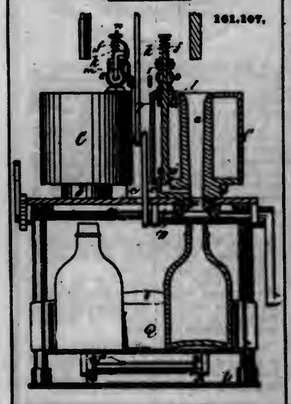


4. The platform I, and bottle-carrier Q, in combination with the measuring-receptacles C C, substantially as and for the purpose set forth.

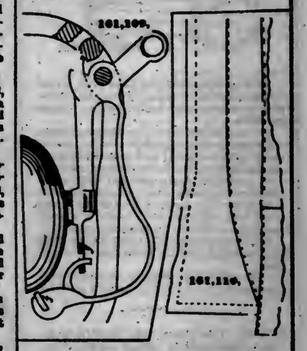
5. The spindles *f f*, with their springs *h h*, pad valves *i i*, operated by the levers *n n*, connected with the movable bars I I, as and for the purpose set forth.

161,108. SMOKE-STACK HEATER-PIPES. T. B. Field, Corning, N. Y. [Filed Nov. 7, 1874.]

Brief.—The circulation-pipes, which may contain either air or water, are placed vertically in the smoke-chamber at the front of the boiler.



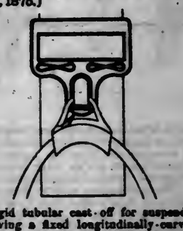
In a heater in which the waste heat of the smoke box and stack of a steam-boiler is utilized for heating air or water, the pipes C, combined therewith and arranged in pairs, as described, to enter and leave the smoke-box below the impinging currents of heat from the furnace, whereby the fluid to be heated is caused to pass twice through that portion of the smoke-box at which the heat enters from the furnace, and obtain thereby the full benefit of the heat upon said entering and exit pipes, as described.



161,109. GOODS FOR STREET-CARS, &c. E. P. Pinnell, New York, N. Y. [Filed Nov. 1, 1873.]

Brief.—The sudden checking of the motion of the parts, by the shoulder on the bell-carrying lever striking the stop on the bracket, causes the arm of the hammer to spring sufficiently to allow the bell to be struck by the hammer.

1. The elastic hammer-shaft, rigidly attached or formed in one with the lever carrying the bell, the lever and hammer-shaft being arranged and constructed to operate in relation with each other, so that the checking of the motion of the lever shall cause the hammer, by its own momentum, to strike the bell, substantially as set forth.



2. The lever B, constructed with the arm *d*, the spur *b*, and carrying the elastic shaft of the hammer, in combination with the hanger, or its equivalent, for suspending the said parts, substantially as and for the purpose specified.

161,110. SHIRTS. Henry Green Fisk, New York, N. Y., assignor to Fisk, Clark & Flagg, same place. [Filed Dec. 12, 1874.]

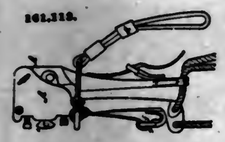
The combination of the shirt-collar, the bosom, and the pointed neck-band with its ends terminated inside of the ends of the collar, the ends of the said collar being in direct contact with the bosom, and the collar and bosom being separated elsewhere by the pointed band, substantially as described and shown.

161,111. CAST-OFFS FOR SUSPENDERS. S. W. Fisk, New York, N. Y., assignor to Fisk, Clark & Flagg, same place. [Filed Jan. 12, 1875.]

The rigid tubular cast-off for suspender ends, having a fixed longitudinally-curved tubular passage for the strap of the suspender ends to slide in, substantially as before set forth.

161,112. FISHING-MAIL TENSIONS. Valentine Fogarty, Boston, Mass. [Filed Feb. 24, 1875.]

Brief.—The annular frame carrying the cutter is rotated around the finger-receptacle.



The combination of a nail-cutter with the conserved finger-holding body *c*, adapted to operate with reference to each other substantially as described.

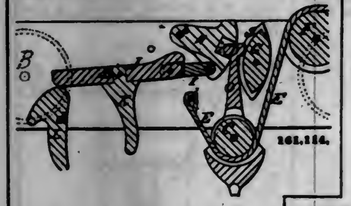
161,113. FISH-HOOKS. Thos. P. Forsyth, New Haven, Pa. [Filed Jan. 26, 1875.]

Brief.—The clamping-levers are provided with detachable and adjustable bits or clamping-pieces pivoted thereto, so as to adjust themselves to the rope. The clamping-levers are also provided with leather straps or loops for securing the hands, and the stirrups are furnished with slides for securing the feet of the operator.

161,112.

1. The pivoted clamping piece or bit, in combination with the clamping-lovers, and pivoted thereto, substantially as and for the purpose specified.

2. In combination with the clamping-levers, a detachable clamping piece or bit capable of being rigidly attached to the clamping-lever, substantially as and for the purpose specified.



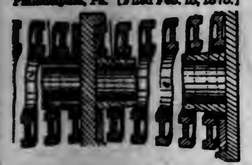
3. A clamping-lever, provided with a pivoted clamping piece or bit, in combination with a clamping-lever having a detachable bit capable of being rigidly secured to said lever, substantially as and for the purpose specified.

4. In combination with clamps A, the strap D, substantially as and for the purpose specified.

5. The stirrup E, provided with the slide f, substantially as and for the purpose specified.

161,114. HAY-ELEVATORS. E. V. R. Gardner, Johnstown, N. Y. (Filed Jan. 23, 1875.)

Brief.—Suspended from the carriage-frame, running on guiding-ways, is a carrier, which, on terminating its ascent, throws a knobbed extremity over its sheave, into a recess on the periphery of a pivoted segment, the movement of the latter being permitted by the hinged end of a lever, held in position by a hanging stop-piece, which, when struck, unlocks the devices.



161,114.

1. In a hay-elevator the combination, with the fixed segment G and the vertically-vibrating clamping-cam E, of the pulley-block C, having extension c, with right cylindrical or cylindroidal block D, substantially as specified.

2. The combination, with the fixed segment G and knob D of pulley-block C, of the vertically-vibrating cam E, link I, lever J, and gravitating stop L, substantially as specified.

161,115. CAR-SPRINGS. George F. Godley, Philadelphia, Pa. (Filed Feb. 15, 1875.)

1. A spiral solid plate-spring, having the upper and lower surfaces of the thickest part of the plate parallel when coiled, substantially as set forth.

2. A spiral solid plate-spring, having the opposite surfaces of the plate parallel when coiled, and the plate itself thinner at its central portion, substantially as set forth.

3. The combination, with the two cone-shaped coils, d d, of the plate f provided with axial projections, substantially as set forth.

161,116. TRIMMING PLATFORMS FOR SEWING-MACHINE TABLES. Maximillion Grobner, New Orleans, La. (Filed Jan. 16, 1875.)

The platform herein described, consisting of the base-plate A, tilting-frame F, and bracket-frame D, arranged to elevate the hind feet or legs of a sewing-machine, as described, and for the purpose specified.

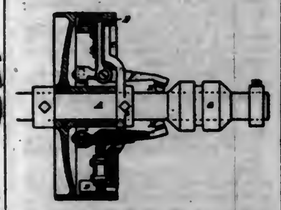
161,116.

161,117. LOCKS FOR FIRE-ARMS. Dana G. Hadley, Bethlehem, N. H. (Filed Feb. 17, 1875.)

1. The locking-lever provided with a square-shouldered hooked end, to operate in conjunction with a square-shouldered notch and undercut recess in the hub of the hammer or cock, substantially in the manner and for the purpose set forth.

2. The combination, in a fire-arm with the hammer cocking and releasing mechanism, of a hammer whose hub is formed with a square-shouldered notch, having an undercut recess, as described, and a locking-lever, formed with a square-shouldered hooked end, bearing against the periphery of said hub with a yielding pressure, and adapted to engage said notch and undercut recess at the times and in the manner set forth.

161,118. LAMP-WICKS. Haivor Halvorson, Cambridge, assignor to Chas. Albt. Shaw, Boston, Mass. (Filed Feb. 10, 1875.)

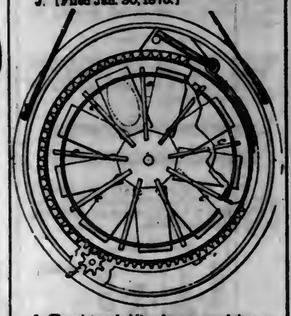


Brief.—To make the wick a better conductor and more easily trimmed.

As a new article of manufacture, a fibrous lamp-wick, oxidized by means of permanganate of potash, substantially as and for the purpose specified.

161,119. FRICTION-CLUTCH PULLEYS. D. Harrington, Worcester, Mass., assignor of one-half his right to N. D. Gay, same place. (Filed Feb. 12, 1875.)

Brief.—A shaft carrying a sleeve and a fixed cross-bar revolves in the hub of the pulley, a portion of which hub being oval for the purpose of a cam. A clutch-plate works in a slot near each end of the bar, and has pivoted on it a short lever parallel with the shaft. These, being forced apart at one end by a taper on the sleeve, become acted upon by the cam at their other end, and effect the clutching of the pulley by the full power of the machine.



1. The cam E, when employed in combination with the clutching or frictional surfaces and the movable sleeve or shipper in a friction-clutch wheel or pulley, for forcing into contact said frictional surfaces and locking the clutch, the parts being arranged for automatic action by force derived from the driving belt or power.

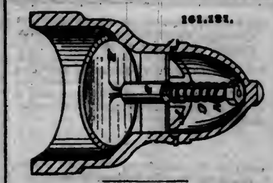
2. Substantially as described, in a friction-clutch pulley, the cam E, in combination with the pulley B, friction-pads D, and shipping-sleeve G, when used to automatically bring the friction-pads in contact with their bearing-surfaces on the pulley.

3. The combination, with the cam E, rotating with the pulley, the friction-pads D, connected with the shaft, and shipper-sleeve G, of the levers F and springs I, substantially as and for the purpose set forth.

4. The combination, with the cam E, pads D, shaft A, and shipper-sleeve G, of the levers F and springs I, as and for the purpose set forth.

161,120. PHOTOGRAPHIC-PICTURE REMINTERS. A. Loquince High, Mount Holly, N. J. (Filed Jan. 30, 1875.)

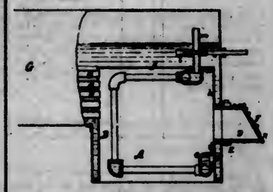
1. The picture-holding frames, revolving on a central pivot of the face-plate, in combination with intermediate connecting-legs, and a circumferential cog-wheel and pinion gearing therewith, substantially as described.



2. The revolving picture-holding frames, in combination with separate spring-brakes applied to their circumference, for preventing the turning of the frames until released by the direct action of the operating pinion on the frame gearing therewith, substantially as specified.

161,121. VACUUM RELIEF-VALVES FOR WATER-PIPES. Philip Hinkle, San Francisco, Cal. (Filed Jan. 30, 1875.)

Brief.—When the pressure of the spring and the water inside the pipe is removed by the vacuum caused by the flow of the water, the pressure of air outside of the valve will open it and allow air to enter.

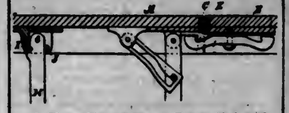


The air-chamber A, valve B, stem C, guide D, spring H, and screw-nut I, in combination with the water-pipe J and stand-pipe M, substantially as and for the purpose described.

161,121.

161,122. STEAM-BOILER FURNACES. John C. Hoadley, Lawrence, Mass., assignor to the J. C. Hoadley Company, same place. (Filed Dec. 10, 1874.)

Brief.—The straw or long fuel is fed through a "box," and prevented from passing through the boiler-tubes by means of a "grillage" of pipes, through which water is heated and fed to the boiler.



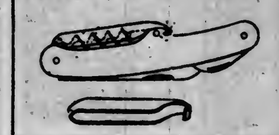
1. In combination with the fire-box B and the boiler G, provided with a series of flues leading out of the rear of the said fire-box and through the water-space of said boiler, the grillage A, constructed and arranged wholly in the said fire-box B, and with the said flue, substantially in manner and for the purpose as specified.

2. The combination of the educt l m, provided with a stop-cock, k, as described, with the grillage A, boiler G, and the fire-box B, arranged as set forth.

3. The feeding-box D, combined with, and to open through, the door E, and provided with a flap, H, and register F, all substantially as shown and described.

161,123. FOLDING TABLES. Jas. W. Howland and D. Howland, New Haven, Conn. (Filed July 25, 1874.)

Brief.—The sections of the table-top are provided with adjacent edge-sections at the joint, to receive and cover the hinges. The hinged legs are provided with socket-blocks and a holding-pin, so that the leg may be held by said pin in an extended or folded position.

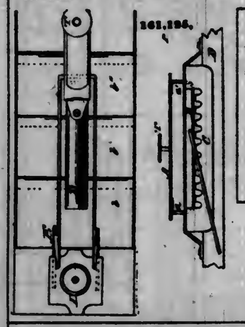


1. The table-sections A B, provided with adjacent edge-sections E E at the joint C, to receive and cover the hinges D, in the manner set forth.

2. The combination, with hinged legs H, of socket-blocks I and pin J, applied as and for the purpose specified.

161,124. CORDAGE KNIVES, CORKSCREWS, AND SHIELDS. John S. Jameson, Bangor, Me. (Filed July 3, 1874.)

Brief.—The shield is removable, and adapted to be fitted over the corkscrew, so that when the latter is closed against the handle of the knife the point of the screw is prevented from giving or receiving injury.



In combination with a knife having a corkscrew hinged thereto, the shield for said corkscrew, detachable therefrom when the same is in use, and retained in place by the corkscrew itself when said corkscrew is shut down, substantially in the manner herein set forth.

161,125. BLIND-STOPS. Louis Jermain, Green Island, assignor to Geo. A. Mosher, Troy, N. Y. (Filed Feb. 4, 1875.)

Brief.—The key attachment, with its facing-plate and handle, serving as a lifting device to raise the spring out of and above the notches, and thus to adjust and hold the blind-slats in desired position.

The key or plate B, having arms a a', facing-plate A, and handle T, in combination with the notched lock C, spring E, and rod D, all constructed, arranged, and operating substantially as described and shown, for the purposes set forth.

161,126.

161,126. PENCIL-SHARPENERS. Walter H. Keyes, Princeton, Mass., assignor of one-half his right to A. H. Keyes, same place. (Filed Feb. 12, 1875.)

As a new article of manufacture, a pencil-sharpener, E, having a divided surrounding casing, A B, constructed with the opening f, to insert the pencil, and the locking device H i, as set forth.

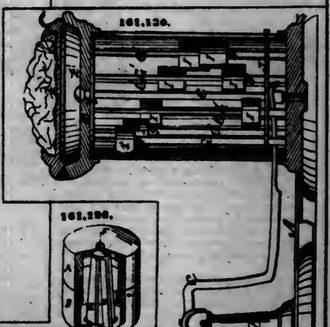
161,127. MATCH-BOXES. John Knox, Auburn, N. Y. (Filed Dec. 28, 1874.)

Brief.—The caps are removable for the purpose of filling the supply-cylinder and grooves. The grooved cylinder is revolved by means of the milled outer cap, for presenting the match to the slide.

The combination of slotted outer shell A, grooved cylinder C, head G, having notch g, head B, provided with friction-outlet I J, and sliding pusher F, all as specified.

161,127.

161,128.



161,128. BUTTERFLY-OVERSHOE. John La Blanc and Xavier St. Pierre, Ophir City, Utah. (Filed Sept. 12, 1874.)

As a new article of manufacture, the within-described envelope-opener, consisting of the tube A, open at the upper end, closed at the lower, having V-shaped guides C C, and provided with the median blade D, as shown and described.

161,129. COLLECTING GOLD, SILVER, &c., FROM THEIR ORES. Matthew Ladin, Chicago, Ill. (Filed Mar. 2, 1875.)

The process herein described for collecting gold, silver, and other metals from ores, grit, and the like, the same consisting in boiling the ore-pulp, mixed with pulverized charcoal, coke, and other carbon, in a pan or other vessel containing water and mercury, so as to collect the metal by amalgamation, substantially as specified.

161,130.

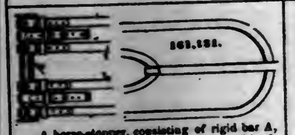
161,130.

161,130. POSTAL WEIGH-SCALES. Tolbert Lanston, Washington, D. C. (Filed Dec. 10, 1874.)

Brief.—The longer arm of lever moves a platform along vertical guide-rods. The guides pass through movable weights, whose play on rods is limited by stops. Greater the weight on scale-pan, greater the number of weights elevated by platform. A needle or indicator attached to platform passes through a slot in containing-case, the face of which is graduated to ounces and fractions of ounce.

1. In a weigh-scale, the combination of a platform, J, vertically movable upon guides in a horizontal plane, with the vertically-vibrating scale-beam C, substantially as specified.

2. The combination, with the platform J, vertically movable in a horizontal plane upon rods G G', of the weights I, vertically movable, and arranged upon the said rods, substantially as specified.

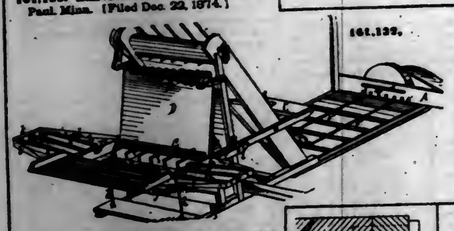


3. The combination, with the rods G', having shoulders g, of the vertically-movable weights I, substantially as specified.

4. The weights I, arranged one above the other, and guided to move vertically upon rods G', in combination with vertically-movable platform J and beam C, substantially as specified.

5. The combination, with the vertically-vibrating beam C and guide F, of the letter-platform E, pivoted to the said beam, and having shank e', substantially as specified.

6. The combination, with the vertically-vibrating scale-beam C, of the letter-trough E', having its lower side e larger than the other, substantially as and for the purpose specified.



161,131. HORSE-STOPPING APPARATUS. J. Lambert and William Woerle, Milwaukee, Wis.; said Woerle assignor to said Lambert. (Filed Dec. 2, 1874.)

161,121.

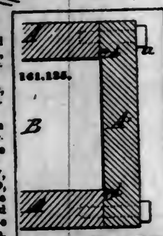
A horse-stopper, consisting of rigid bar A, and straps B B and C C, arranged, combined, and operating substantially as set forth.

161,122. HARVESTERS. C. W. Levalley, St. Paul, Minn. [Filed Dec. 22, 1874.]

161,122.

161,124.

1. The grain or divider board A, provided with the longitudinal slot a or its equivalent, in combination with the adjustable retarding-rod or cord a', substantially as described.



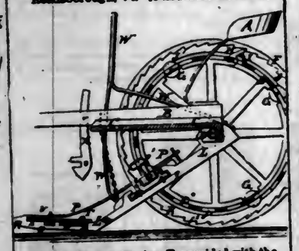
2. The scroll-bar B, made tapering in form, and operating in combination with the plat-form-apron, substantially as described.

3. The stripper-brush E, made tapering from front to rear, in combination with the elevator-apron, substantially as and for the purpose described.

4. The shattered-grain receptacle or box D', formed in part by the inclined chute-board D, and hinged thereto independently of the binders' stand, in combination with the hinged grain-receiving fingers g, arranged above the box D' and supported at their outer ends, when in working position, by said box, as described.

5. The slatted dumping-tray J and tables K, arranged in the described relation to each other and to the binders' stand and shattered-grain receptacle D', in combination with the apron L L', arranged to discharge the shattered grain gathered from the said tables to the receptacle, as described.

161,125.



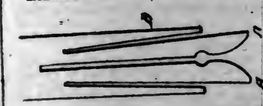
161,125.

161,126. WATER-RETAINER BOXES FOR PUDDLING-FURNACES. J. O. Longland, Rome, N. Y. [Filed Oct. 21, 1874.]

In a water-tank, the longitudinal pieces A A, provided with the tongues c c, in combination with the longitudinal pieces A' A', provided with grooves d d, tenoned end pieces B B, and packing b b, and water induction and eduction passages C C', substantially as and for the purpose set forth.

161,126. MOWING-MACHINES. Jason P. Lord, Francis E. Lord, and Orrin E. Lord, Readsborough, Vt. [Filed Dec. 12, 1874.]

1. The loose outer rims F, provided with the central rib f' and the ratchet-teeth f², the spring-pawls H I, and the grooved friction-wheels G, in combination with the rims of the wheels E, rigidly attached to the axle of the mower, substantially as herein shown and described.



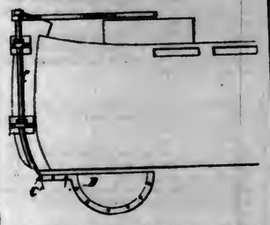
2. The combination of the hinged pawl O, the stationary pawl N, and the U-slide M with the notched edges of the rim of the wheel E, with the forked bar L, that carries the cutter-bar J, and with the connecting-rod P, that operates the sliding bar Q and vibrates the cutters, substantially as herein shown and described.

3. The three-armed lever W, in combination with the forked bar L, that carries the cutter-bar J, substantially as herein shown and described.

161,127. PROCESSES OF MANUFACTURING AMMONIA. Farnham Maxwell-Lyte, Paris, France. [Filed Mar. 10, 1875.]

The herein-described process of producing ammonia by the combination of nitrogen with nascent hydrogen liberated in the presence of a triad or pentad element, substantially as described.

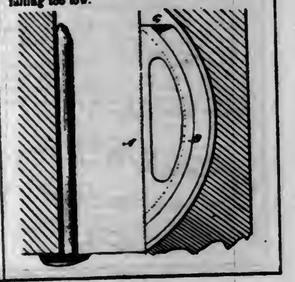
161,128. CLOTHES-PINS. William H. Mayo, Menasha, Wis. [Filed Jan. 18, 1875.]



As an improved article of manufacture, the pin herein described, formed of a single piece of wood with inner prongs A, wide at the bottom and narrow at the top, and the outer prongs B of reverse construction, to give strength and elasticity, all as and for the purpose specified.

161,129. COMPOUNDS FOR SCOURING WHITE GOODS. Moritz Mayer, New York, N. Y. [Filed Mar. 9, 1875.]

A compound for dressing and cleaning white fabrics, consisting of a mixture of French chalk, salts of sorrel, oxalic acid, and bicarbonate of soda in water, in the proportions and in the manner substantially as and for the purpose set forth.

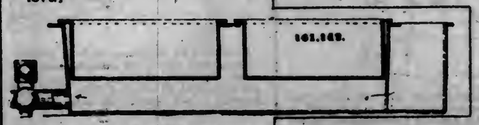


161,130. MEANS FOR HANGING BUDDIES. Richard B. McIlhtire, East Boston, M. Y. [Filed Oct. 22, 1874.]

The clasp-bearings B, operating shaft C and rudder-blade D, combined and arranged as and for the purpose set forth.

161,131. BEDSTEAD-FASTENINGS. Wyly Merritt, Atlanta, Ga., assignor to himself and M. T. Castleberry, same place. [Filed Dec. 5, 1874.]

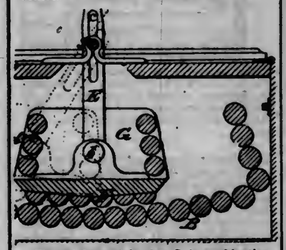
Brief.—The cylindrical enlargement holds the plate in the end of the rail, and the flange at the bottom of the plate prevents the rail from falling too low. The shoulders at the top of the curved head rest on the walls of the post-mortise, and prevent the plate from falling too low.



1. The combination of the curved T-headed plate A, having an enlarged portion, C, with the post having a curved anchorage mortise, D, and the rail having the slot E, with the enlargement F at the bottom, substantially as specified.

2. The improved fastening-plate A, having a curved T-head, H, with shoulders G and the flanged cylindrical enlargement C, substantially as specified.

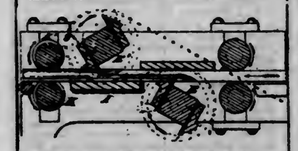
161,132. MILK-TESTING PROCESSES. Alvin Middaugh, Scio, N. Y. [Filed Dec. 12, 1874.]



161,132.

The process herein described of discovering impurities in milk, and the excess of water therein, by heating a given quantity of standard milk and a given quantity of each farmer's supply, to be tested, in separate vessels, to about 90° Fahrenheit, then coagulating the standard and samples, and finally compressing the undrained and unsalted curd, the specified heat thus developing the odors of the impurities, and the quantity of curd or whey indicating the water present, all substantially as herein before specified.

161,133. WASHING-MACHINES. Geo. W. Mikesell, Huntington, Ind. [Filed Oct. 31, 1874.]

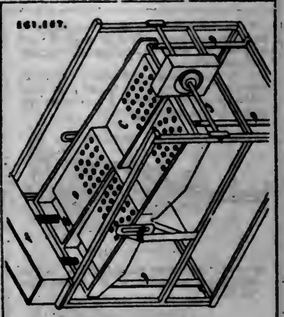


Brief.—The rubber is adapted to have a weight placed within. The handle is pivoted at the lower end to the rubber, and adjustable by a slot, and operates over a concave bed of rollers.

The weight-receiving box C, in combination with the pivoted adjustable handle E, provided with the slot e, fulcrum-pin g, and the concave bed B, substantially as and for the purpose set forth.

161,134. MACHINES FOR MAKING CHAIR-ROUNDS. John W. Millet, Johnstown, N. Y., assignor of one-half his right to Louisa Banks Pettyjohn, same place. [Filed Sept. 29, 1874.]

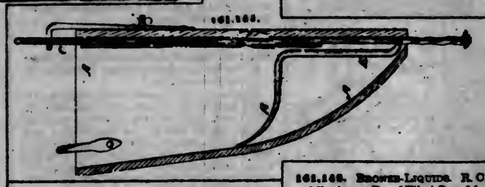
Brief.—The blanks for chair-rounds or similar articles are placed upon a fluted bed, and fed by suitable mechanism between two revolving heads provided with fluted knives, which plane both sides of the blank at the same time.



1. The combination, in a chair-round planer, of the fluted bed I, rollers K K', and roller L, as shown and described.

2. In combination with the cutters E E', the fluted bed I, roller L, rollers K K', and feed-rollers e e, as and for the purpose set forth.

161,135. PLASTER-SOWERS. F. C. Moder, Hortonville, Wis. [Filed Jan. 26, 1875.]



Brief.—Within the hopper, and upon the lower end of the plunger, are tines, the two inner ones of which are made spiral, while the outer ones are smooth, and to their lower ends is attached a beveled scattering board. Near the bottom of the hopper, and to the plunger, is attached the bent stirrer, for agitating the material to be sown.

161,135.

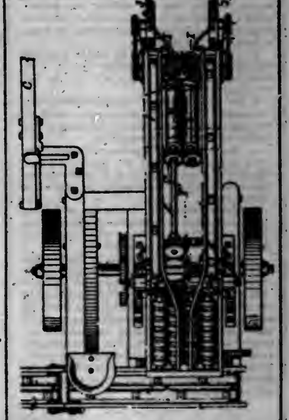
The combination, with box A, of the crooked stirrer E and reciprocating distributer C C C, all constructed and arranged substantially as and for the purpose specified.

161,136.

161,136.

161,137. WASHING-MACHINES. Geo. W. Mikesell, Huntington, Ind. [Filed Oct. 31, 1874.]

Brief.—Takes the water from a well or mining-shaft, where the water in the same is at a higher level than the surface of the ground, at a distance, in such a manner that a portion of the water may be withdrawn from the well and utilized for irrigating or other purposes, while the remainder of the water passes to a lower level than the bottom of the well or shaft, and operates as a power to raise the water in the well to the surface.



The combination of the reservoir C, provided with the pipe c, pipe D, wheel E, having the crank Y, connecting-rod H, and pump B, as and for the purposes set forth.

161,138. BROWER-LIQUIDS. R. C. Ockmler, Allegheny, Pa. [Filed Dec. 14, 1874.]

The compound of dragon's-blood, linseed-oil varnish, gum-copal, essential oil, spirits of turpentine, and gum-gamboge, consisting of its parts and proportions, as described, to be used for dissolving bronze-powder for the purpose of converting the same into a paint.

161,139. CORN-HARVESTERS. Wm. T. Orr, Kewanee, Ill. [Filed Jan. 2, 1875.]

The gathering-rollers J, provided with lifters, and arranged to operate with the feeding-rollers I and pulling-rollers F, substantially as described, and for the purpose specified.

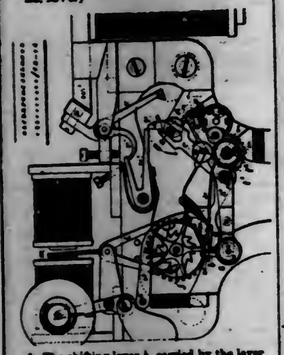
161,140. CHAIR-SEATS. M. O'Brien, San Francisco, Cal. [Filed Nov. 19, 1874.]

The hopper F, tubes I, chamber H, and screens E and C, in combination with the adjustable double eccentric K L and adjusting screws E, whereby I am enabled to adjust and control both the pitch and the throw of the screens, substantially as and for the purpose set forth.

161,141. KING-BOLTS. Levi Penta, Canton, Ohio, assignor to himself and H. W. Worts, same place. [Filed Jan. 20, 1875.]

Brief.—Prevents strain and wear on the king-bolt.

1. The combination of the king-bolt E I, made with the small lower part I, thimble-clip bar G g, and bridle L K, substantially as and for the purpose set forth.



2. The combination of the thimble-slip C D, axle A B, thimble-bar G g, bridle L K, and king-bolt E I, substantially as and for the purposes set forth.

3. The combination of the thimble-slip C D, thimble K with flanges h h, axle A B, thimble-bar G g, and king-bolt E I, substantially as and for the purpose set forth.

161,160.

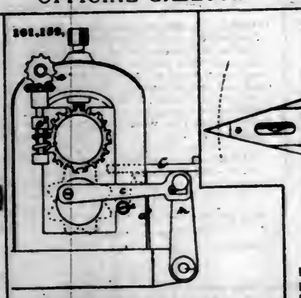
161,161. PRINTING-TELEGRAPH. George M. Phelps, Brooklyn, N. Y. [Filed Aug. 22, 1874.]

1. The shifting-lever A, carried by the lever e that is operated by the crank c and shaft d, in combination with the shifting impression-roller r and the independent frame r', carrying that roller and the cam 16 for moving the same, substantially as set forth.

2. The dedusting-plate 20 placed between the type-wheels, in combination with the movable impression roller or pad r, as and for the purposes set forth.

3. The spring-lever o', in combination with the magnet r, armature a, levers e e', and revolving arm s, for operating the printing mechanism, substantially as set forth.

4. The pause-wheel i gearing into the wheel f, in combination with the paper-feed, substantially as set forth, so as to allow the paper to remain stationary while the impression takes place.



5. The arrangement of two sets of figures, fractional signs, and letters on one type-wheel, combined with a second type-wheel containing letters, substantially as set forth.

6. In a printing-telegraph with two type-wheels and a mechanism for shifting the printing from one to the other, the combination of the arm a, the detents thereto controlled by an electro-magnet, the wrist-pin or a cam operating the roller-shifting mechanism and the cam operating the printing mechanism, arranged relatively to each other, substantially as shown, the shifting mechanism being thereby operated and then removed from the parts moving with the type-wheel before an impression is given, as set forth.

161,162. MACHINES FOR CORRUGATING SHEET METAL. J. L. Piper and J. A. Michels, Pittsburg, Pa. [Filed Nov. 2, 1874.]

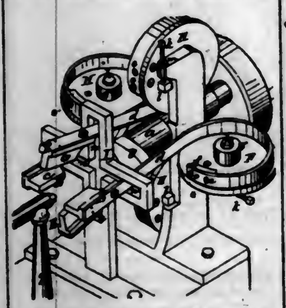
Brief.—The feed-table is carried on two pairs of pivoted supports, the outer pair fastened to a rock-shaft that receives its motion from a link attached to a crank-pin on the end of the lower roll. Said link works over a pin on the frame, and its outer end has an L-shaped slot to receive a pin on the rock-shaft lever. During a portion of the revolution of the rolls, the link is raised and rides freely on the pin, while at others the pin enters the vertical slot. When this causes the table to move forward and delivers a new sheet between the rolls.

161,163.

The combination of the rolls B B', feed-table C, pivoted supports c' c', rock-shaft n, slotted link o, and pin o, substantially as and for the purpose specified.

161,164. RAILWAY-RAIL SUPPORTS. Saml. E. Porter and Duane Peck, Rochelle, Ill. [Filed Feb. 8, 1875.]

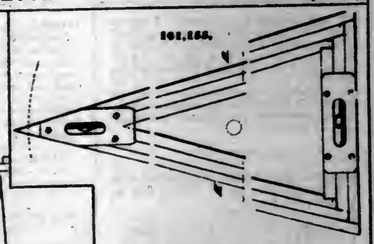
Brief.—A hollow metal rail-support, provided upon its upper side with lugs, between which and the rail are inserted securing-blocks, one of which is wedge-shaped, and when driven home is secured by a set-screw. The support is also provided with diagonal slots, the outer ends of which are enlarged to allow the insertion of the heads of the bolts which secure the rails.



1. The bed-plate A, having ledges or lugs C and D, block E, key H, and set-screw J, in combination with the rails B B, substantially as and for the purposes described.

2. The bed-plate provided with orifices N, having the square portion O and diagonal slot P, as and for the purpose specified.

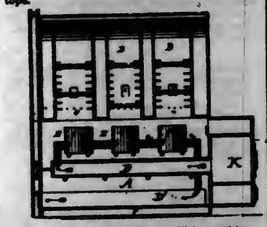
161,165. MACHINES FOR FORGING NAILS. Silas S. Putnam, Boston, Mass. [Filed May 26, 1874.]



Brief.—Two pairs of hammers—one horizontal and the other vertical—provided with spring-helves, the rear ends of which are attached to disks. By turning said disks (which is effected by adjusting-screws) the tensions of the spring helves are increased, and by loosening the adjusting-screws they are diminished.

The two pairs of hammers E E, in combination with the spring-helves d, disks H, screws h, and stops f, substantially as and for the purpose described.

161,166. MILLERS' PAINT-STAFFS. William Sansom, Noah, Ind. [Filed Sept. 21, 1874.]



161,155.

A rod-staff for milestones, made in triangular form, each side of the triangle being composed of a series of stripe, A, set on edge, and a flat strip, B, covering their edges, and the sides joined together, all as and for the purpose herein set forth.

161,156. DRYING. John B. Register, Dover, Del., assignor of one-half his right to the Dover Fruit and Vegetable Preserving Company. [Filed Feb. 22, 1875.]

Brief.—Vertical plates in the drums deflect the current of smoke upwardly against their tops.

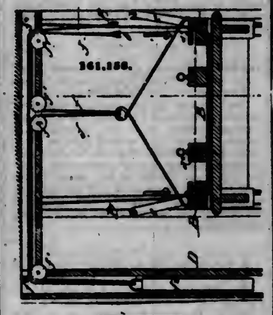
The chamber A and furnace K in combination with the flat flue D, drums E E, connecting-flues e e, sections B, and trays b b, all constructed and arranged to operate substantially as and for the purpose set forth.

161,157. CULTIVATORS. Leonard C. Robbins, Gorham, Me. [Filed Aug. 1, 1874.]

Brief.—The frame consists of three beams, pivoted together at the rear ends, and made laterally adjustable in front, the front end of each outside beam being provided with gage-wheels, independently adjustable. The cultivator-teeth are secured to the outer beams.

The outer beams, pivoted at the rear ends and made laterally adjustable in front, in combination with an adjustable gage-wheel on each, as shown and described.

161,158. APPARATUS FOR STAMPING PATTERNS. Isidore Rosenthal, New York, N. Y. [Filed Jan. 11, 1875.]



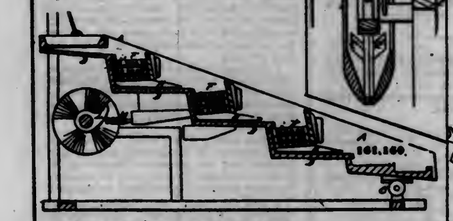
Brief.—A perforated pattern is stretched upon a frame, which is raised and lowered by means of the weighted cords working on pulleys.

1. The improved stamping apparatus, composed of a cloth-supporting table, with guide-pins, and a balanced suspended transfer-frame, having the perforated pattern-paper stretched thereon, and adapted to be raised and lowered by suitable mechanism, substantially in the manner and for the purpose set forth.

2. The balanced transfer-frame B, provided with central rail, and connected by cords and pulleys, with compensating-weights f', arranged to slide in guide-box D, in combination with additional weight-cord f'' and front cord f, substantially as shown and described.

3. The transfer frame, provided with adjustable intermediate pieces, and clamping top strips, for adjusting and stretching the transfer-paper to any width of pattern, as specified and shown.

161,159.



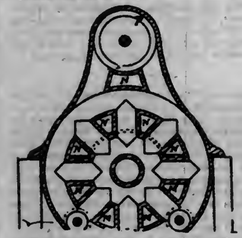
161,159. POCKET-BOOK FASTENINGS. M. Rubens, New York, N. Y. [Filed Jan. 26, 1875.]

The combination, with the hinged jaws B, of the spring-clasps C, made concave on the under side, and attached as shown and described, whereby they shut past each other, (without contact,) and each catches over the opposite jaw.

161,160. AMALGAMATORS. J. Rutherford, San Francisco, Cal. [Filed Feb. 4, 1874.]

Brief.—An inclined box, suspended at its upper end by rods, and at its lower resting on a roller, has its bottom formed of a series of steps, which support trays of amalgamated copper. These trays contain sieves, on which amalgamated copper balls are placed, and kept in motion by the jarring motion of the machine. Cams and a "crimped flange" give a compound lateral and longitudinal motion to the box, which is pulled back toward the cam-frame by its suspending-rods, and impinging against it is jarred. The pulp and water pass down through the sieves, copper balls, &c., to the bottom of the box, which retains the amalgam.

1. The inclined box A, suspended as shown, and provided with the steps D, for holding the screens and plates, substantially as herein described.



2. The trays or boxes F, provided with screens and placed in seats upon the steps, as herein described.

3. The amalgamated copper balls or rollers f, placed upon a surface and kept in constant agitation on the pulp or sand passes, substantially as and for the purpose described.

4. In combination with the boxes F, with their screens, as above, the balls or rollers f, substantially as and for the purpose herein described.

5. An amalgamator consisting of a series of offsets, each of which is provided with one or more boxes, F, with perforated bottoms, and provided with the balls or rollers f, together with the amalgamated plates H beneath, the whole being given a constant shaking motion, substantially as and for the purpose herein described.

161,161. SECTIONAL STEAM-BOILERS. C. L. Sanborn and H. M. Shaw, Boston, Mass. [Filed Jan. 12, 1875.]

A steam-generator composed of sections, made up of two or more annular hollow rings, connected with each other by radial tubes, the outer ring being connected, by tubes, with a steam-chamber, and having semicircular ribs, which, when the sections are placed in position, form the upper apertures into retorts, substantially as shown and described.

161,162. MACHINES FOR JOINTING STAVES. Marvin J. Seymour, Tarr Farm, Pa. [Filed Feb. 6, 1875.]

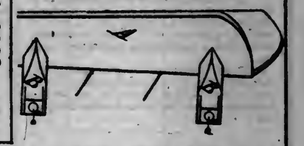
Brief.—Two concave disks are attached to each other at their outer edges, and have planing-bits inserted with their cutting-edges inward. The stave, being held between the revolving disks, is jointed upon both sides.

The beveled groove a in the wheel A, combined with cutters c and a stave-blank holder, substantially as described.

161,163.

161,164.

161,165.

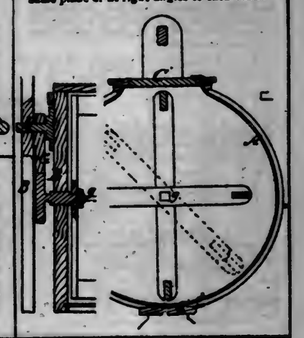


161,169.

161,168. FUMIGATORS FOR GREENHOUSES. Thomas Shaw, Danville, Pa. [Filed Nov. 7, 1874.]

Brief.—A conical or other shaped vessel is provided with grates to hold combustible material. The bottom connects by pipes with two fan-blowers, from which the conducting-pipes unite in one. The fumigating material is put into the vessel and ignited. Motion being now given to the blowers, a current of air is drawn into the mouth of the vessel, and the noxious gas discharged through the exit-pipe to any point desired.

161,166. PIN-SEPARATORS. J. D. Shelton, Huntington, Conn. [Filed Dec. 12, 1874.]



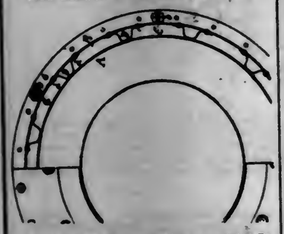
The separable bracket B B, made in two parts, with an orifice between them for the passage of the pins, and secured to the inclines A A, said brackets being also provided with recesses in their ends for the reception of adjusting-screws, as specified.

161,167. CAR-COUPLERS. Ira T. Sherrill, Paducah, Ky. [Filed Feb. 19, 1875.]

The combination, with a vertically-vibrating coupler, C, having a convex rear end, with notches a, of the end-wise movable rod B, and spring S, recessed into the draw-head, substantially as specified.

161,170. CHURNS. H. M. Simkins, Greenfield, Ohio. [Filed Feb. 23, 1874.]

Brief.—The dashers can either be set in the same plane or at right angles to each other.

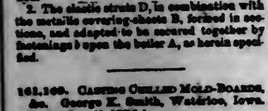


The dashers E E', made to fit one within the other, and provided with square apertures at one end, in combination with the flanged pin h, nut-screw c, and cone-shaft g, substantially as described, and for the purpose set forth.

161,167. BOTTOMS FOR WELDING AND HEATING FURNACES. William Small, McKeesport, Pa. [Filed Feb. 3, 1875.]

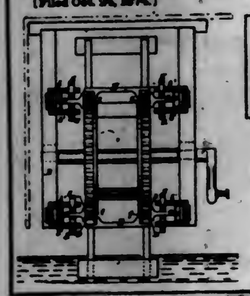
Brief.—Forms a loose or navitrified compound for furnace-bottoms, consisting essentially of an admixture of sand and salt, substantially as specified.

161,168. BOILER-COVERINGS. E. W. Smith, New York, N. Y. [Filed July 6, 1874.]



1. The flanged sections of sheet metal B B' and fastenings b, through said flanges, in combination with the soft packing C and strut D, for holding the sections B B' at a uniform distance from a boiler, A, as shown and specified.

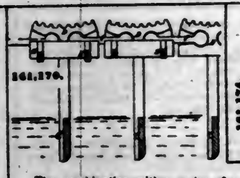
2. The elastic struts D, in combination with the metallic covering-sheets B, formed in sections, and adapted to be secured together by fastenings b upon the boiler A, as herein specified.



161,169. CASTING CHILLED MOLD-BOARDS, &c. George K. Smith, Waterloo, Iowa. [Filed Jan. 11, 1875.]

Brief.—To prevent chilled castings from warping or cracking in cooling.

A series of circular concave depressions in the plates, mold-boards, or other castings, evenly distributed over the entire side, opposite the face to be chilled, substantially as and for the purpose herein shown.



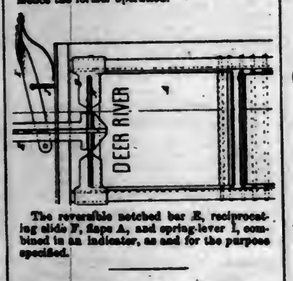
161,170. CHAIN-PROPELLERS. Clark Smith, Cornwall on the Hudson, N. Y., assignor to himself and Wm. H. Clark, same place. [Filed Oct. 24, 1874.]

1. The combination of the combined standard and spring, the rod G, and the lever and pawl, substantially as described.

2. The combination of the standard A, spring B, rod G, and lever and pawl, substantially as described.

3. The combination of the standard A, spring B, rod G, and lever and pawl, with the bolster, substantially as described.

161,170. [duplicate]



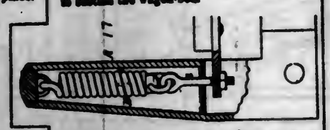
161,170½.

The combination with a series of paddle-blocks D, jointed together, and provided with side flanges G, of upper and lower ways provided with top, bottom, and side rows of friction-rolls, as and for the purpose specified.

161,171. STATION-INDICATORS. J. D. Smith, Gregg, N. Y. [Filed Apr. 1, 1874.]

Brief.—The flaps or boards indicating the stations are hinged to rods located in the center of a box, their free ends resting upon a support attached to the back of the box at the top and bottom thereof, and are temporarily held in place by the end of a notched bar attached to a reciprocating slide, which passes over the open face of the box. When the flaps have been released to fall to the bottom of the box, the slide is moved to that end also, and the box is then inverted to commence the former operation.

The reversible notched bar E, reciprocating slide F, flaps A, and spring-lever I, combined in an indicator, as and for the purpose specified.



161,172. SIDE-BAR WAGONS. E. Soper, New York, N. Y. [Filed Dec. 26, 1874.]

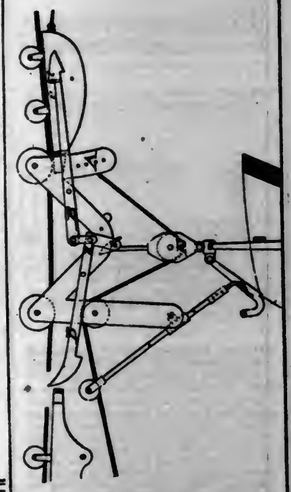
The side bars C C, C-springs K K, and truss B, combined with the rear axle of a wagon, as and for the purpose specified.

161,173. COMBINED STANDARDS AND SPRINGS. Geo. H. Spencer, Jersey City, N. J. [Filed Aug. 22, 1874.]

Brief.—Hollow standard containing springs to sustain the wagon-bed.

1. A hollow standard, A, provided with a spring, B, and rod G, connected at the lower end to the body of the vehicle, all combined as set forth.

2. The hollow standard A containing a spring, B, and having at the lower end a socket, c, for receiving the end of the bolster, all combined as set forth.



3. The combination, with the hollow standard and its spring B, of the rod G, guided as described, or so as to prevent contact of the spring with the standard.

161,174. KEY-RINGS. Nelson Stafford, Bayonne, N. J. [Filed Dec. 26, 1874.]

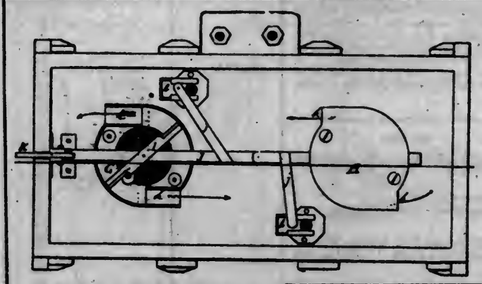
The key ring made with a rib or tongue at one end of the wire interlocking with a groove at the other end of the wire, and parallel, or nearly so, to a plane that runs through the center of the wire composing each ring, as set forth.

161,175. HOISTING AND CONVEYING COAL, &c. George Stancliff and Joseph Green, New York, N. Y. [Filed Mar. 1, 1875.]

Brief.—A carriage suspended on wheels on an inclined wire-rope has hooked up and automatically hooked to it the material in a bucket, balanced and held in position by a catch, the withdrawal of which is effected to trip the bucket by the tightening of the hauling-rope. At the top of the ascent of the hauling-chains an attached hook operates the engagement or otherwise of barbed latches on the carriage, for its attachment to the line at either end.

1. In hoisting and conveying apparatus, the combination of the bucket-suspending hook with the fulcrumed carriage-locking latch-levers, having lighter elbow-shaped front part with supporting cross-pins, for the purpose of attaching the bucket and releasing simultaneously the latch-levers for starting the carriage, substantially as and for the purpose set forth.

2. The combination of the bucket-suspending hook with the weighted and pivoted guard-plate and the cross-pin of the latch-levers, for producing the release of the hook and the lowering of the bucket, substantially as shown and specified.



3. The sliding and pivoted trip rod and hook, operated by the hoisting-rope, in combination with the pivoted latch-lever of the bucket-bail, for tilting the bucket on releasing the latch-lever by the trip-hook, as specified.

4. The fulcrumed latch-levers, provided with hooks at the upper side, being at greater distance from their outer end than the hooks at the lower side, in combination with the sliding and weighted upper legs or pins, and with the lower fixed pins of a stationary or movable end station, substantially as and for the purpose set forth.

161,176. HEATERS FOR CHEESE-VATS. L. A. Sunderland, Madison, Ohio. [Filed Aug. 13, 1874.]

Brief.—The tangential openings, discharging in opposite directions, serve to equalize the distribution of the heat beneath the vat.

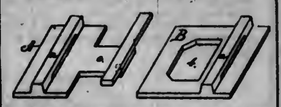
161,176.

1. The combination, with cape H, having openings h h of the valves i i, constructed and operating substantially as and for the purpose described.

2. The combination of the sliding bar J, and its operating mechanism, with the valve-arms I, carrying valves i i, and cape H, substantially as and for the purpose described.

3. The combination of the arms I, carrying valves i i, the sliding bar J, valves l l on the return pipes, arms j j, and lever K, substantially as and for the purpose described.

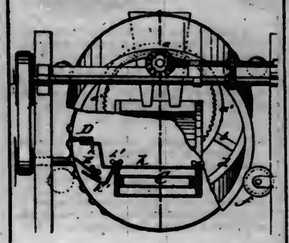
4. The tapering pipes or connections G G, combined with the heating apparatus of a cheese-vat, and constructed and arranged substantially as described.



5. In a heater for cheese-vats, the cape or chambers H, having tangent openings h h, in combination with the connections G G, as shown and described, for the purpose set forth.

161,177. BALE-TIES. Richard Terrell, New Orleans, La. [Filed Mar. 4, 1875.]

The bale-tie herein described, consisting of the plate A, provided with bars b b', sides a a', and cleats or hooks c c', as described, and for the purpose specified.

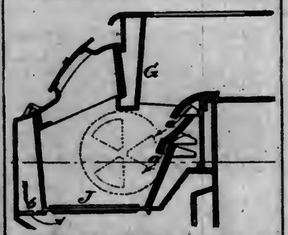


161,178. BALE-TIES. Richard Terrell, New Orleans, La. [Filed Mar. 4, 1875.]

A bale-tie consisting of two sections, A and B, the former provided with a raised bar, a, and tongue c, and the latter with raised bar a and slot b, as described, and for the purpose specified.

161,179. GRAIN-SEPARATORS. W. Toepfer, Milwaukee, Wis. [Filed Jan. 18, 1875.]

Brief.—Vibrating shoe within rotating cylinder carries with it an adjustable brush for cleaning the pockets of cylinder, and an adjustable blade for delivering into a trough attached at the side of shoe.



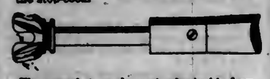
1. The combination of the brush D, its adjustable slotted supporting-arms A, the binding-screws b', and the sleeve-frame C, substantially as and for the purpose described.

2. The inclined adjustable blade E attached to and moving with trough E', substantially as and for the purpose described.

161,180. COOKING-STOVES AND RANGES. Wm. B. Treadwell, Albany, N. Y. [Filed Jan. 9, 1875.]

Brief.—The fire-chamber is surrounded on all sides by air-chambers.

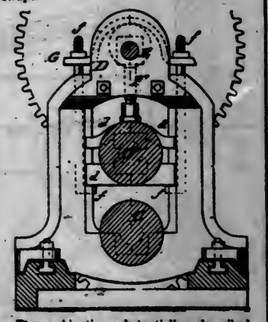
The air-chamber G above the fire-chamber, and communicating with the end air-chambers F F', provided with registers F, in combination with the front air-chamber E, having at its bottom perforations b, and back air-chamber E', provided with air-passages a a, substantially as described.



161,181. BOX-SCRAPERS. A. W. Tuckerman, Boston, Mass. [Filed Feb. 3, 1875.]

Brief.—Two quadrangular adjustable and detachable blades are arranged upon one head-stock, at an obtuse angle to each other, so that when one of the cutting-edges becomes dulled, another may be readily substituted.

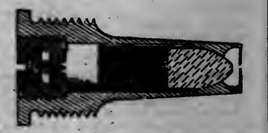
The box-scraper described, consisting of the shank B, provided with the head-stock C and cutting-blades d d, constructed and arranged to operate substantially as and for the purpose specified.



161,182. GAS-WRENCHES. S. B. H. Vance, New York, N. Y. [Filed Mar. 1, 1875.]

The wrench A, made semi-spherical in form, with cross-notches a' in its edge, and with ribs a' upon the inner or concave surfaces of its segments, substantially as herein shown and described.

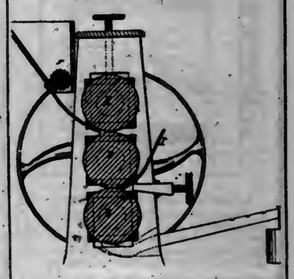
161,183. MACHINES FOR ROLLING TAPERED BARS. T. R. Veasey and Richd. Rowley, Cumberland, Md. [Filed Jan. 11, 1875.]



Brief.—The journals of the upper roll are arranged in sliding bearings, which are supported upon gibs attached to the eccentric straps. The eccentrics act upon steel pins arranged in the sliding bearings, to push the roll downward, said roll being elevated again when the eccentrics act upon the arched straps.

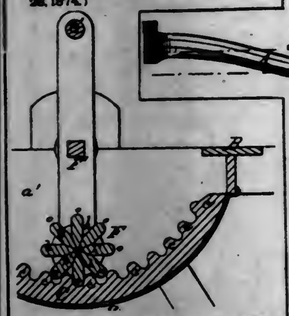
The combination, substantially as described, of the sliding journal-carriages d, that support upper roll, gibs f, pins F, and the eccentrics E', revolving in yokes or straps G, for the purpose set forth.

161,184. SHELL-FUSES. Rudolph L. Walter, Washington, D. C., assignor to Wm. A. De Caindry, same place. [Filed Dec. 10, 1873.]



Brief.—The firing-pin is adjustable, so as to be withdrawn into the cap, to insure safety in handling or transportation. In use it is screwed down and projects through said cap, to serve as a means for igniting the cartridge by concussion.

1. The combination of an ordinary center-primed metallic ball-cartridge, c, with a fuse-plug, A, arranged and operated in the manner substantially as and for the purposes described.



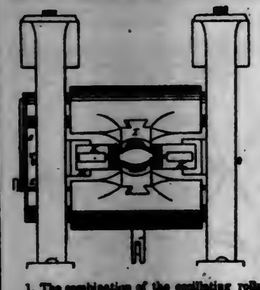
2. The firing-pin c, substantially as described, when used in combination with a fuse-plug and metallic cartridge.

161,185. MACHINES FOR CRUSHING GRAIN. Cadwallader C. Washburn, Madison, Wis. [Filed Mar. 13, 1875.]

The combination of the rollers B K L, arranged one above the other, feed-hopper P, and chute l, all constructed to operate substantially in the manner as and for the purpose specified.

161,186. WASHING-MACHINES. Thomas J. Webster, Humboldt, Kans. [Filed Nov. 28, 1874.]

The combination, with the hangers e of the rotating dasher and squeezer F, and with the vertical sides a' of soda-box A, of the grooved pulley-wheels C, upon the ends of the rock-shaft f', substantially as specified



161,187. METHODS OF ENAMELING MOLDINGS. Albert C. White, Brooklyn, N. Y. [Filed Mar. 1, 1875.]

The described method of enameling moldings, consisting, essentially, in tapering off the layer or covering of enamel toward the bottom of the recesses or grooves by means of suitably-constructed gages A', whereby a reduced thickness of enamel is presented to the action of the plane, and the splitting off of the edges prevented, substantially in the manner and for the purpose set forth.

161,188. ROLLS FOR FORMING THE EYES OF PICKS, &c. Wm. Westenhagen and John Bexler, Pittsburg, Pa. [Filed Jan. 12, 1875.]

Brief.—Pivoted between the journal-bearings of the two oscillating rolls are two segments, operated from a rock-shaft that receives its motion from a lever fixed to the lower roll. Suitable dies fitted in the upper and lower rolls, together with those on the pivoted segments, form the die-box in which the eye of the pick is drawn down and formed. A mandrel is inserted in the blank. This mandrel is provided with a loose collar that is struck to release the blank.

1. The combination of the oscillating rolls or die-carriers C C', geared by segments E, and driven by suitable power, and the lateral pivoted dies K K, the latter operated from the former by means of rock-shaft L and rods or arms h h, substantially as specified.

2. The combination of oscillating rolls or die-carriers C C' having dies I I, pivot-bearings H H, having dies K K, and suitable mechanism for operating the same, substantially as and for the purpose specified.

3. Mandrel N, provided with a sliding stripper, n', substantially as and for the purpose specified.

161,189.

161,189. CARRIAGE-BOW RESTS. Wm. H. Yeager, Lawrence, Kans. [Filed Jan. 30, 1875.]

The combination, with prop-bolt C and back-bow F, of the arm A and links G H, the said arm having a hub, B, with shoulders I J and stop K, as and for the purpose specified.

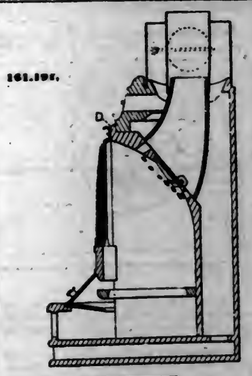
161,190. WELL-REAMERS. Wm. Young, Troy, Iowa. [Filed Nov. 6, 1874.]

Brief.—An outer revolving cylinder is provided with reamers to cut at different distances from the center, and is combined with an interior bucket, which receives the earth. The ball of the outer bucket is pivoted eccentrically at one side, the other being supported by a rod concentric with the pivot, the object being to rotate the ball out of the way of the inner bucket by reversing the motion when it is desired to raise said inner bucket.

1. A well-reamer consisting of the revolving cylinder A and cutters B B', substantially as described.

2. The cutters of a well-reamer, when constructed to cut at different distances from the center and in different planes, substantially as described.

3. The combination of the cylinder A, with a removable ball and the bucket C, substantially as described.



161,191. FIRE-PLACES. W. P. Abendroth, Port Chester, N. Y. [Filed Oct. 26, 1874.]

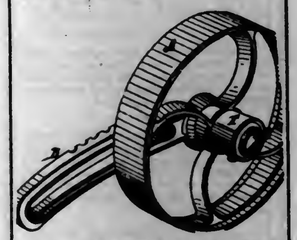
Brief.—When the damper is closed, the products of combustion are brought in contact with the wall of the conical flue. The flange prevents the escape of gas from the fire-place into the hot-air chamber.

1. The combination, with a fire-place, of the dome-shaped hood, provided with the rib or flange D, substantially as and for the purpose described.

2. The dome-shaped hood over the grate, provided with a rib or flange that surrounds the arch, to project over the face of the front plate, substantially as described, and for the purposes set forth.

161,192.

161,192. COPY-SLIPS FOR TEACHING PENMANSHIP. Campbell Allen, Albany, N. Y. [Filed Aug. 26, 1874.]

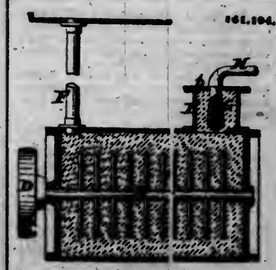


Brief.—The copy-slip being transparent enables the pupil, after copying it, to place the slip over the imitation to discover errors.

A transparent copy-slip, combined with a frame or border, substantially as herein described.

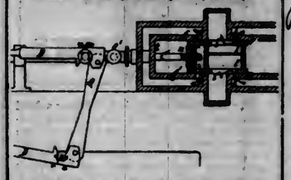
161,193. FLOW-WHEELS. David Allen, Allegan, Mich., assignor to Jno. M. Heath, same place. [Filed June 18, 1874.]

Brief.—The wheel-spindle is rigid with the standard, and has grooves on outer end, into which fits a spar of the sleeve, to prevent the latter from turning on the spindle. A flange covers the inner end of the hub, and a cap the outer end, leaving the wearing joints entirely protected.



In combination with the curved and slotted standard B, with flange C and recessed arm D rigidly attached thereto, the chill E, extending partially through the hub, and having spur d, wheel-hub F, and cap G, attached to, and revolving with, the hub, substantially as and for the purposes herein set forth.

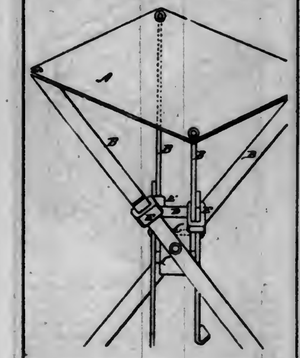
161,194. FILTERS. Christian Anderson, Brooklyn, N. Y. [Filed Sept. 21, 1874.]



Brief.—Has an agitator and a dome arrangement for receiving the strainer of the discharge-pipe, and thus preventing floating particles of the filtering material present in the liquid from flowing out of the vessel into and through the discharge-pipe.

161,184.

In combination with a filtering-vessel having an agitator, as described, a dome, E, rising from such vessel, for receiving the strainer G of the discharge-pipe, and for supplying the vessel with filtering material, substantially as described.

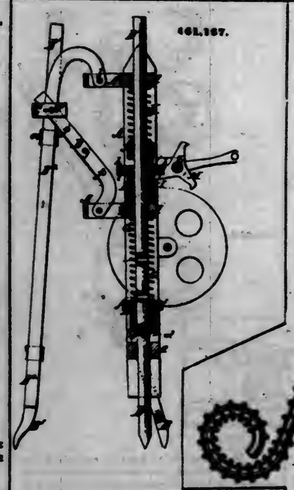


161,185. VALVE-GEARS. Frank H. Ball, Foxburg, Pa., assignor to Brainard T. Ball, Buffalo, N. Y. [Filed Apr. 24, 1874.]

1. The combination, with the recessed eccentric rods D D and studs e e', of the double-wedge-shaped bar Q, arranged between said studs and connecting the ends of the eccentric rods, substantially as and for the purpose hereinbefore set forth.

2. The combination, with the eccentric rods D D, provided with recesses p, of the bearing-pins r and set-screws s, substantially as and for the purpose hereinbefore set forth.

161,196. STOOLS AND SEATS. H. Beagle, Philadelphia, Pa. [Filed Dec. 10, 1874.]



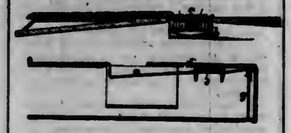
The combination of the seat A, jointed metallic legs B B, pivots C C, block D, and sliding collars E E, substantially as shown and described.

161,197. ROCK-DRILLING MACHINES. J. A. Beamisderfer, Campbelltown, Pa. [Filed Feb. 26, 1875.]

Brief.—The lifting and turning collar of the drill-rod is fastened and released through the intervention of the long wedge

161,197.

1. The combination, with the turning and lifting-collar H of rock-drills, of the wedge I for fastening and releasing said collar, substantially as herein described.



2. The combination of the revolving collar H, the revolving drill-rod D', the sliding wedge I, the spring-stop J, and the lifter M, substantially as and for the purpose described.

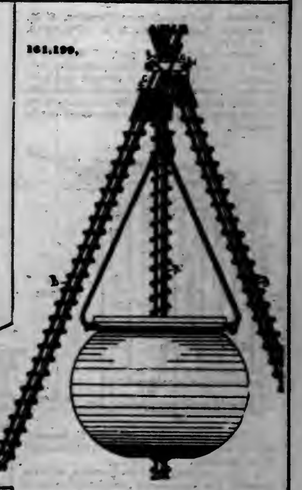
3. The combination of the revolving ratchet f, having a notched collar, E, the stop-bar F, revolving drill-rod D', having an adjustable pin, d, the springs G and K, the revolving, turning, and lifting collar H and wedge I, substantially as described.

4. The sectional extension-bar B' and B², hinged to the drill-frame, in combination with the bracing-support D, hinged to the machine, and the screw-clamp C and C', substantially as described.

161,198. TEMPORARY BINDERS. H. A. Bohn, Jr., Troy, N. Y. [Filed Sept. 12, 1874.]

Brief.—Binding-wires are separated by partitions, their inner ends bearing on the back, while their outer ends catch over the plate. By means of hinged cross-piece and slide, the wires are held in position. Covers are constructed wedge-shaped, thicker at their outer edge, so as to prevent them from warping out of shape.

1. The springs c, having their inner ends bent so as to press or hold the papers or music down upon the back b, and their outer ends to catch over the top of the plate g, substantially as set forth.

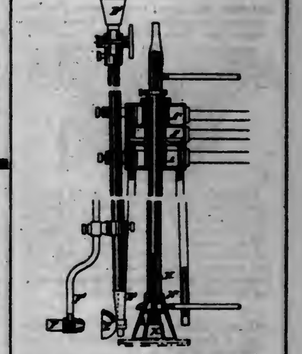


2. The springs c, bent as shown, in combination with the partitions c, substantially as shown.

3. The combination of the springs c, partitions c, cross-pieces 3, and plates b, substantially as described.

4. In a temporary binder, the covers c, having an increased thickness on their inner sides, which is greatest at or near their outer edges, substantially as shown and described, and for the purposes set forth.

161,199. WIRE STANDS. Josiah H. Bigelow, Worcester, Mass., assignor to the National Manufacturing Company, same place. [Filed Feb. 26, 1875.]



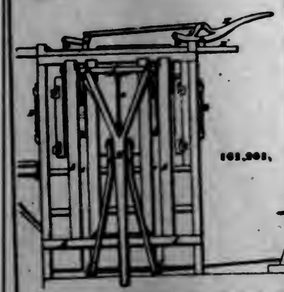
161,199.

1. A wire stand constructed of wire-covered wire, such as herein described, and having the shafts B formed with shouldered necks e, produced by divisions of the covering-wire, and connected by links g, encircling the necks between the shoulders f, substantially as described.

2. The link g, constructed as described, in combination with necks e, and the shoulders f of the shafts B, of said wire-covered wire, and connecting the shafts, substantially as described.

161,200. SOLDERING-MACHINES. Wm. D. Brooks, Baltimore, Md., assignor to Mary C. Brooks and Geo. D. Brooks, same place. [Filed Mar. 16, 1875.]

1. The elastic pipes B, and apertured sliding ring C c, combined as described, to allow of adjustment to different sizes of can.



2. The combination, with nozzle D², of the bowl E, and blow-pipe F F', arranged as described, to fuse the solder quickly, and cause it to flow through said nozzle upon the joint of can.

3. The air-injecting tube H, protector G, and water-chamber H', combined, to keep the cap from injury by the heat.

4. The hollow plug K, having side apertures k, combined with the air-injecting tube H, to force the air out upon the inner face of protector G, in the manner and for the purpose set forth.

161,901. HAY AND COTTON PRESSES. H. K. Burnett, Poughkeepsie, N. Y. [Filed Feb. 10, 1875.]

Brief.—The detached part of the side is held up by depressing a lever operating bell-cranks. When the bale is pressed the lever is raised, thereby allowing the detachable side to slide downward, whereby the bale is released from pressure, and room made for its removal.

161,901.

1. The combination of the lever E, braces I and G, rod b, and the follower F, substantially as described.

2. The construction of the frame A, with its movable side M, grooves g', and blocks o, doors B, and hinged platform or tables C, and top frames D, moving in the guides E', substantially as set forth.

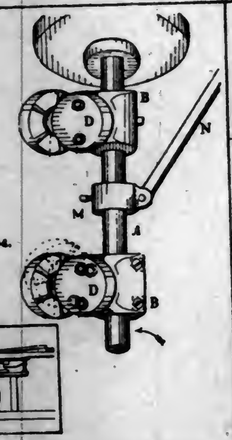
3. The bell-cranks S and connecting-rod f, in combination with the lever H, for the adjustment and support of the side M, substantially as specified.

4. The combination of the capstan L, ratchet f', slotted lever P, with the projections d' and g'', the lever E, and the rod b', substantially as shown.

5. The combination of the frame of a hay-press with a movable side or section, whereby the bale can be loosened, so as to be readily removable from the frame, substantially as described.

6. In combination with a capstan, L, a slotted lever, P, and a ratchet, f', substantially as set forth.

161,902. MACHINES FOR MAKING CURVED EARTHENWARE PIPES. H. B. Camp, Cuyahoga Falls, Ohio. [Filed Mar. 24, 1874.]



The combination, in a machine for making pipe of plastic material, by pressing it through an annular orifice between an outside hollow die, and a core of a plate having an orifice of a shape conforming to the size of the pipe to be made, said plate having a beveled edge, and surrounding the mandrel, and interposed between the head of the receiver and the hollow die, substantially as described.

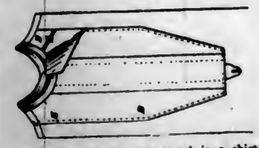
161,903. COMPOUNDS FOR COATING LEATHER. J. Carmody, New York, N. Y. [Filed Nov. 10, 1874.]

As a coating for leather, animal blood from which the clot has been removed, substantially as described, for the purpose specified.

161,904. SAND-PULLEYS. John Charlton, Philadelphia, Pa., assignor to Geo. V. Cresson, same place. [Filed July 31, 1874.]

Brief.—A sleeve, adjustable longitudinally and axially on a suspended rod, has on a vertical face a disk revolving by means of pins working in a circular groove. A projecting arm from the disk has a pulley revolving on it. A brace is pivoted to a similar sleeve, for adjustment.

161,904.



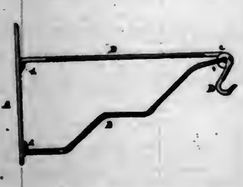
1. The guide-pulley head B, encircling the suspended rod A, and having universal lateral adjustment thereon, substantially as and for the purpose set forth.

2. The guide-pulley head B, fitted on the rod A, and sliding and rotating thereon for purposes of both universal vertical and rotary adjustments, substantially as described.

3. The guide-pulley head B, with cavity C, in combination with the disk D, with screws J, having their heads fitted in said cavity, and operating substantially as and for the purpose set forth.

4. The sleeve M, adjustable upon the pulley-hanger rod A, in combination with the rod N, jointed to said sleeve, substantially as and for the purpose set forth.

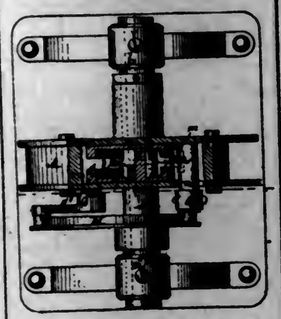
161,905. SHIRT BOSOMS. Robert Truett, Troy, N. Y. [Filed Apr. 8, 1873.]



1. The welts S S, interposed in a shirt-bosom between the shoulder-pieces and a line drawn across the bosom at the front of the neck-band, as shown and described.

2. A shirt-bosom composed of two or more plies or thicknesses of cloth in the main part, and of a less number in the upper portions of the extensions of the bosom, as shown and described.

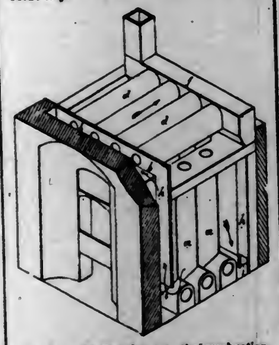
3. The stiffening-welts S S, and the shirt-bosom B, composed of varied thicknesses, in combination, and placed in the relation to each other shown and described.



161,906. BIRD-CAGE HOOKS. Jas. Comly, Philadelphia, Pa., assignor to Feigl, Stulb & Co., same place. [Filed Jan. 16, 1875.]

1. The plate A, with openings a and grooves c, in combination with the wires B, entering the openings and secured therein, and formed with heads d, entering the grooves c, substantially as and for the purpose set forth.

2. The combination, with one wire formed with the hook or eye c, of the other wire continued into an eye, C, and hook D, and operating as set forth.



161,907. ROTARY ENGINES. Herbert Cottrell, Newark, N. J., assignor to Cottrell & Taylor, same place. [Filed Aug. 11, 1874.]

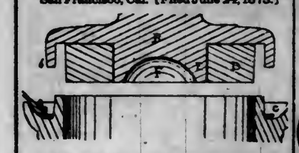
The stationary eccentric C, forming a fixed abutment within the cylinder A, and constructed with an induction and eduction compartment, and with an induction-port, m, narrower at the point where it first takes steam and broader where it ceases, to admit a greater volume of steam, as described, in combination with the rotating cylinder, swinging pistons, and hollow shaft having induction and eduction passages, substantially as set forth.

161,908. HOT-AIR FURNACES. J. W. Crary, Philadelphia, Pa. [Filed Dec. 14, 1874.]

Brief.—The air-heating pipes are of unburnt clay.

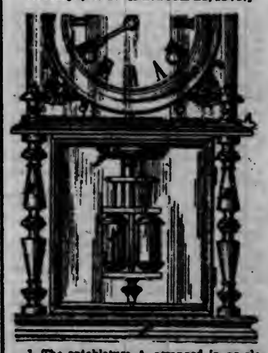
1. In a heating-furnace, the combustion-chamber B and air-heating pipes a of clay, arranged at the sides, back, and top of said combustion-chamber, and combined with the surrounding air-space x and hot-air chamber D, all substantially as and for the purpose set forth.

2. The combination, in a heating-furnace, of a combustion-chamber, B, flues or passages communicating with the chimney, and openings i, forming communications between said flues and the combustion-chamber near the lower corners of the latter, as and for the purpose set forth.



3. The combination of the passages b and f, the connecting-pipes d, vertical flues A, having openings i, and exit-flue j, communicating with said passage f, all as and for the purpose set forth.

161,909. BAG-FASTENERS. J. A. Danielson, Calumet, Mich. [Filed Feb. 12, 1875.]



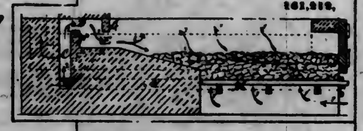
The combination of the shanks A A', pivoted together, and provided with the guide-segments B B', toothed jaws C C', collar D, and spring E, as and for the purpose set forth.

161,910. FRUIT-JARS. Pierre F. Darche, San Francisco, Cal. [Filed June 24, 1873.]

The fruit-jar A, provided with the groove C, and having its inner wall k extending above the outer wall i, in combination with the cork D and cover B, provided with the outer flange b and inwardly-projecting portion E, whereby is secured an inside and an outside sealed joint, substantially as and for the purpose set forth.

161,911. CLOCK-CASES. Henry J. Davies, Brooklyn, N. Y. [Filed Jan. 28, 1875.]

1. The entablature A, arranged in an elevated position, and constructed to receive and support the clock-work, and the glass shade, arranged over and inclosing the clock-movement, as and for the purpose described.



2. The elevated entablature, constructed to receive and support the clock-movement and the glass shade inclosing said movement, the pendulum of the clock passing downwardly through said entablature, and vibrating within a case below the entablature, as and for the purpose described.

161,912. FURNACES FOR GAS-RETORTS. D. Davison, New York, N. Y. [Filed Mar. 27, 1874.]

Brief.—The flue for introducing air above the fuel has a guarded opening, formed by an upward-extending bridge, a top plate, and a downward-extending bridge, which prevent the passage being choked by fuel.

The combination of the draft air flues A B C D in the brick work surrounding the furnace of the oven for heating retorts for the manufacture of illuminating-gas, combined with the bridge F, the bridge G, and the cap-tile H, forming opening E at the back of the furnace, the whole to be operated, in combination with the furnace, the oven, and the retorts contained therein, substantially as and for the purpose herein described.

161,912.

161,913. BENCH-PLANES. Asahel H. Dean, Philadelphia, Pa. [Filed Jan. 30, 1875.]

Brief.—The bit can be readily withdrawn, replaced, and adjusted by means of a lever-clamp, provided upon one side with a ring, fitting in a segmental recess in one of the cheeks of the body of the plane, and upon the other side with a segmental projection, adapted to a circular opening in the other cheek. To prevent the bit from slipping it is caused to bear directly upon a suitable projection upon the wooden handle.

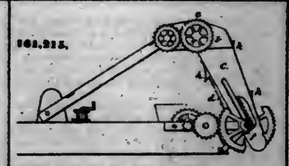
1. A plane in which the bit is confined to its bearings by a lever-clamp, H, constructed for connection to, and lateral withdrawal from, the frame or body of the plane, substantially in the manner described.

2. The clamp H, its set-screw d, projection e, and ring f, in combination with the cheek B, having an opening adapted to the said projection, and the cheek B', having a segmental recess adapted to the said ring, all substantially as set forth.

3. A plane having a metal body or frame, a wooden handle, and a retaining-screw, or its equivalent, between which and the handle the plane-bit is clamped, all substantially as described.

161,914. REAMERS FOR SHOT-GUNS. F. A. Deland, Memphis, assignor of one-half his right to A. C. Harrington, Lapeer, Mich. [Filed Dec. 30, 1874.]

Brief.—A conoidal reamer, the cutting-edges of which are disposed at various angles to its axis.

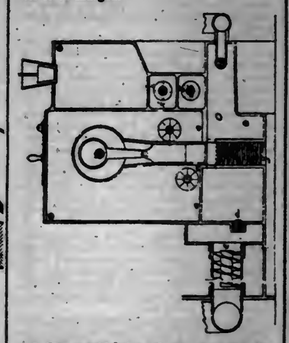


The truncated conical reamer A, having its flutes or cutters a disposed at various angles, substantially as and for the purpose set forth.

161,915. PEAT-CUTTERS. Benj. J. Denton, Oswego, N. Y. [Filed Jan. 21, 1875.]

Brief.—The elevating apparatus consists of a frame suspended by arms from the driving-shaft above, and can be raised and depressed together with the driving-gear and elevator-buckets. Adjustable cutters are attached to the elevator-belt and buckets, and are perforated to allow the water to drip off.

161,915.



1. The elevating apparatus, consisting of a frame, a, suspended to arms b centered at the driving-shaft c, together with the driving-gear for moving the elevator-buckets A while elevating or depressing the frame a, substantially as and for the purposes set forth.

2. The combination of the adjustable cutters a and scoring-cutters i with the elevator-buckets A for cutting peat, in the manner and for the purposes specified.

161,916. APPARATUS FOR CHARGING A STREAM OF WATER WITH CARBONIC-ACID GAS. Humphrey B. Dunham, Newark, N. J. [Filed Nov. 18, 1874.]

Brief.—A stream of water is charged with carbonic-acid gas while passing through the discharge-pipe or hose. The generating and charging mechanism is operated by the water to be charged.

1. The combination of an apparatus for charging water with carbonic-acid gas, and a pipe so arranged in connection with said apparatus that a stream of water flowing through said pipe may be mixed with water charged with carbonic-acid gas, and discharged on a fire, substantially in the manner and for the purposes set forth.

2. The combination of a water pipe or hose, provided with a water-wheel and gear, caused to revolve by the force of the water passing through a reservoir for marble-dust, or such like substance; and a reservoir for acid, provided with such mechanism, operated by said wheel, that charges of said marble-dust are mixed with sulphuric, or other suitable acid, and water, to charge the latter with carbonic-acid gas, and the mixture discharged into the said water pipe or hose, for the purposes set forth.

3. The combination of a water pipe or hose, through which water is forced by pressure, and an apparatus connected to it by a discharge-pipe, and an inlet-pipe for admitting water to said apparatus, all arranged in such manner that a stream of water may be charged with carbonic-acid gas and water by mechanism substantially as set forth.

161,917. ROAD-ENGINES. Geo. T. Ellis, Oswayo, Pa., assignor of one-half his right to H. Lord, same place. [Filed Jan. 23, 1875.]

Brief.—Boiler always self-adjusted horizontally. Power communicated by straight gearing to engine-shaft, which operates every wheel in the train. Wheels fixed or made to revolve freely on axle while running, at will of operator. Revolution of driving-shaft regulated without affecting that of engine-shaft. Steering-wheel axles pivoted, so that on striking obstacles no leverage is exerted against pilot. Subordinate improvements set forth in claims.

1. The combination of the pilot-wheels, the rigid part of the axle, and the movable parts of the axle, pivoted to such rigid part, and having the wheels attached to their outer ends, while to their inner ends power may be applied from the steering-wheel, substantially as set forth.

2. The combination of the pilot-wheel, the rigid part of the axle, and the movable part of the axle, pivoted to the rigid part in the line of draft of the wheel, substantially as and for the purposes set forth.

3. The combination of the movable parts of the pilot-wheel axles with the guide-plate K^2, bars K^1, and steering-wheel H, substantially as and for the purposes set forth.

4. The combination, in a locomotive carriage, of driving-wheels and axle with a longitudinal driving-shaft and a rotary engine, having its axis longitudinally of the carriage, so that the power can be applied to the driving-wheels directly from the engine-shaft, or from a shaft connected to the engine-shaft by straight gearing, substantially as set forth.

5. The combination of the engine-shaft with the parallel driving-shaft I I^2 and the friction-wheel gearing, for communicating motion from one shaft to the other, substantially as set forth.

6. The set of pulleys of different sizes on the engine-shaft, combined with the set of similar pulleys on the driving-shaft, and the set of adjustable intermediate friction-wheels, by which the power or speed of the driving-shaft can be varied at will without varying the power or speed of the engine-shaft, substantially as set forth.

7. The combination of driving-wheels and axle with a driving-shaft passing above or below the axle, and communicating power by means of a crown-wheel and beveled oblique-toothed gearing, for the purpose of driving the carriage, substantially as described.

8. The combination of the carriage-frame, the driving-wheels and axle, the longitudinal driving-shaft, operated directly from the steam-engine, and the crown-wheel and bevel-gear, to apply the power at the front edge of the crown-wheel, for the purpose of lifting the carriage-frame on its bearings on the axle while the carriage is running, and by the power applied to drive the same, substantially as set forth.

9. The combination of the driving-wheels and axle, the longitudinal driving-shaft, and the two bevel-gears, the driving-shaft being capable of sliding endwise, so as to apply the power to the front edge of the crown-wheel, whichever way the carriage may be moving, substantially as set forth.

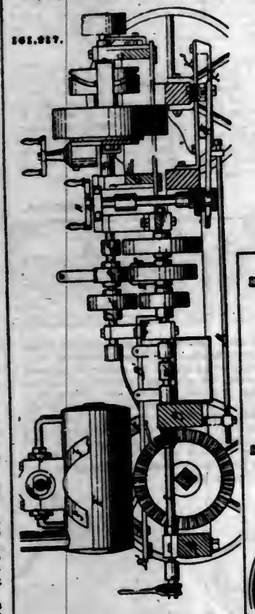
10. The combination of driving-wheels, driving-shaft, and sliding-clutch connection, by which the wheels can be made to run with the shaft backward or forward, or independently on it, substantially as set forth.

11. Driving-wheels combined with their axles, actuating mechanism, and attaching or detaching devices, constructed to permit the wheels to rotate with the axle, or to be liberated and rotate freely thereon while the vehicle is in motion, all substantially as set forth.

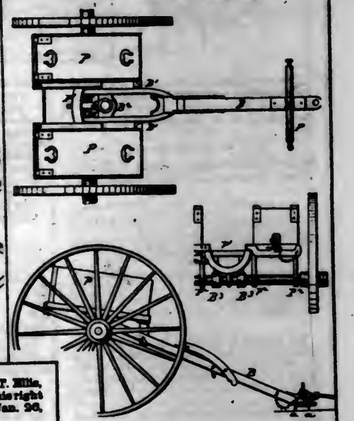
12. In a locomotive or other carriage having a driving-axle and driving-wheels connected by a sliding clutch, the rods M M, combined with the elbow-levers, substantially as and for the purposes set forth.

13. The combination of two or more carriages with the crossed rods M M, connected to the sliding clutches that lock the driving-wheels to their shaft, for the purpose of enabling the movement of the carriages themselves to unlock and liberate the wheel on the inner side of the curve, substantially as set forth.

14. The combination of the divided and pivoted pilot-wheel axle and the steering apparatus with the rods M M and the driving-wheels, axle, and clutches, by which the same movement of the steering-wheel that changes the course of the pilot-wheels also unlocks and liberates the driving-wheel on the inner side of the curve, substantially as set forth.



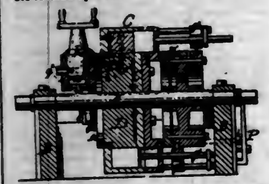
15. The combination of two or more carriages with a single longitudinal driving-shaft common to all the carriages, for the purpose of driving the same, substantially as described.



16. In a locomotive, a boiler and furnace combined with axle suspended by a gimbal or universal joint, so as to swing automatically to a horizontal position in any direction, substantially as set forth.

17. The oscillating cross-head $f f f f$, combined with the boiler and furnace, and with the feed-water and steam pipes, substantially as and for the purpose set forth.

18. The plug or block P, combined with the tube p, the oscillating cross-head, and the steam or water pipes, substantially as and for the purpose set forth.



161,917.

161,918. ROTARY ENGINE. Geo. T. Ellis, Oswayo, Pa., assignor of one-half his right to H. Lord, same place. [Filed Jan. 26, 1875.]

Brief.—The outer cylinder is cast in one piece, and revolves on a stationary center. One side of the cam-groove is made adjustable to take up wear.

1. A rotary engine having a revolving cylinder, C, constructed in one piece, combined with the fixed center D and independent abutment E, substantially as and for the purpose set forth.

2. In combination with the fixed center D and rotary cylinder C, the inner packing-ring n, working in a rabbet of the fixed center, and the outer ring M, held against the inner one by adjustable springs O, substantially as described.

3. The combination of the independent abutment E, with the center D, secured by means of the pin e in the elongated recess e', substantially as and for the purpose described.

4. The independent abutment E, combined with the sheet or plate metal packing s, applied around the rear wall and sides of the abutment in the cylinder C, substantially as described.

5. The independent abutment E, combined with the packing-strips $s s$, held in grooves or recesses in the proximate faces of the abutment and cylinder, substantially as described, to prevent steam from passing under the abutment.

6. The springs l^2, combined with the shaft A, the cylinder C, and the fixed center D, substantially as described, for the purpose specified.

7. The plug-valve R, having the cross-way r, the circumferential recess r^1, and vertical recess r^2, combined with the steam-pipe q^2, exhaust r^3, and ports or passages q q^1, substantially as and for the purposes set forth.

8. The combination of the fixed part H and the adjustable plate H^2, composing the cam, substantially as and for the purposes set forth.

161,919. CARRIAGES FOR FIELD-GUNS. W. B. Franklin and Chas. B. Richards, Hartford, Conn., assignors to Colt's Patent Fire-Arms Manufacturing Company, same place. [Filed Jan. 7, 1875.]

Brief.—Consists generally in details of construction whereby the carriage is composed principally of light wrought metal, and in an arrangement of caissons upon the same carriage with the gun, adapted to be tilted out of the way when the gun is to be fired.

1. The trail of a gun-carriage, constructed from I-shaped wrought metal, substantially as described, and combined with a tip and means for attachment to the axle of the carriage.

2. In combination with the trail and axle of a gun-carriage, the piece B, constructed to form the socket B^4 and ears B^3, substantially as and for the purpose described.

3. The tip for the trail, consisting of the transverse socket C, the shoe D, and the loop E, constructed substantially as described.

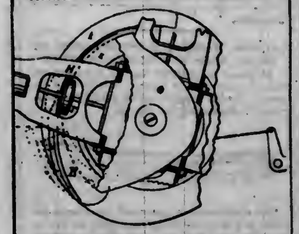
4. The hand-bar F, removably arranged in a recess beneath the trail, substantially as and for the purpose described.

5. A gun-carriage caisson-frame, constructed from angle or L-shaped metal, arranged in the manner described, to receive and secure the caisson, substantially as described.

6. The bar F^1, constructed with ears F^2 for attachment to the axle, combined with frames fixed thereon for the support of the caissons, substantially as described.

7. In a gun-carriage, the arrangement of the caisson-frame to be turned down forward of the pintle of the gun, substantially as described.

8. In a gun-carriage, the arrangement of the caisson-frame to be turned down forward of the pintle of the gun, combined with means, substantially as described, for holding said frame when so turned down forward, and to the trail when returned.



9. The combination of the frame for supporting the caisson F, and the hinged bar H^1 provided with stud or studs a, substantially as described.

10. A gun-carriage caisson, constructed with longitudinal pockets opening to the end of the caisson, substantially as described.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON

161,920. HARVESTER-RAKES. M. F. Gibbs, Livonia, N. Y. [Filed Oct. 20, 1874.]

Brief.—The reel and rake arms are provided with radially-adjustable rollers, which are directed to the upper or lower track by a movable switch, thus changing them to rakes or besters.

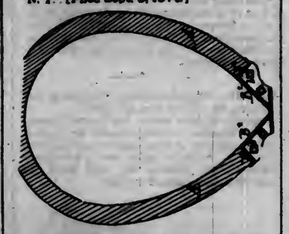
1. In combination with the roller r, having a lateral adjustment parallel to its axis, and tracks k and k', the hinged switch B forming a portion of the track over which the roller passes, all constructed and operating substantially as shown and described.

2. The reel-arms H, provided with the locking-pins j, and the radially-adjustable rollers r, in combination with the hinged switch B, for the purpose of locking said switch while the arm and roller is passing over it.

3. In combination with the arms H, and traverse-rollers r, the locking guard or disk G, for the purpose of holding the rake upon the platform while it is required to act as a rake, as set forth.

161,921. ELEVATORS. Andw. Goodyear, Albion, Mich. [Filed Oct. 14, 1874.]

1. The combination, in a self-loading manure-wagon, of an independently operative fork and scraper, for simultaneously taking up the long and short staff, substantially as set forth.



2. The independently operative fork or scraper, in combination with the lifting-chains H H^1, whereby the scraper or fork may be lowered and inclined to take on a load, and raised for carrying it away, substantially as set forth.

3. In combination with the fork or scraper and chains H H^1, the eye H^3 and hooked latch G and disengaging-arm L', substantially as set forth.

4. In combination with the fork or scraper and chains H H^1, respectively attached thereto in front and rear, the shaft I and sleeve I^1, for communicating a more rapid movement to the points in rising or falling, substantially as set forth.

5. In combination with the fork or scraper, the blocks K and guides K^1 and friction-wheel K^2, arranged in such relation to each other that when the former are taking on a load the latter shall be below and out of contact with the guides, substantially as set forth.

161,922. SEWERS. L. A. Cocoh, Yonkers, N. Y. [Filed Sept. 3, 1874.]

A sewer composed of an iron girder constructed with a base, B^1, inclined sides B^2, and flanged supporting-surfaces B^3, in combination with a superincumbent arch of masonry, substantially as herein described.

161,923.

161,924.

161,925. CAR-WHEELS FOR TRAM-ROADS. Archibald D. Griffin, Hopewell, Pa. [Filed Feb. 13, 1875.]

1. The combination of a soft-iron hub A, wrought-iron spokes B, and a rim or tread, C, cast of hard white iron without a chill, substantially as set forth.

2. The combination of the soft-iron hub A, spokes B, rim C, and ring c, whereby the spokes are secured in position without the use of bolts, substantially as set forth.

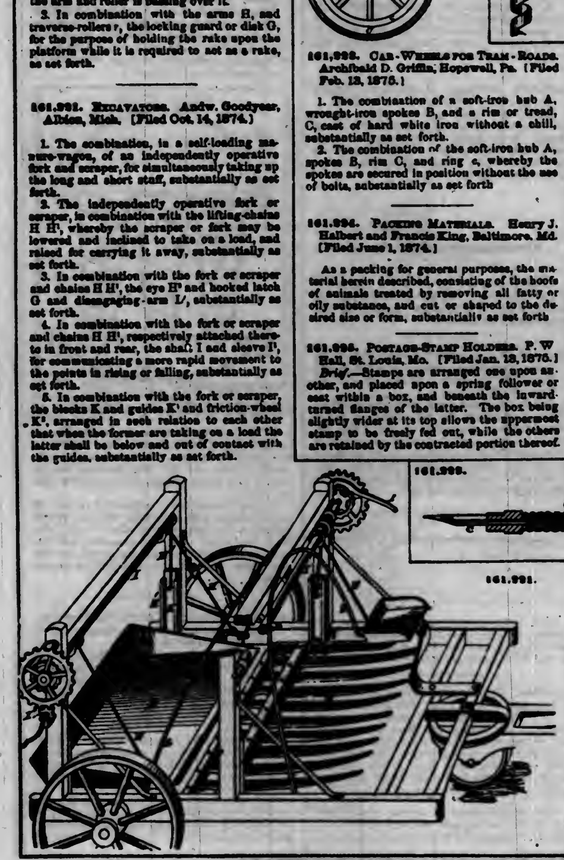
161,926. PACKING MATERIALS. Henry J. Halbert and Francis King, Baltimore, Md. [Filed June 1, 1874.]

As a packing for general purposes, the material herein described, consisting of the hoofs of animals treated by removing all fatty or oily substance, and cut or shaped to the desired size or form, substantially as set forth.

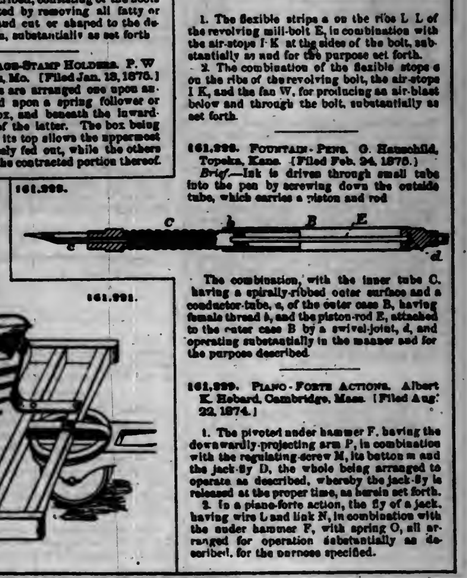
161,927. POSTAGE-STAMP HOLDERS. P. W. Hall, St. Louis, Mo. [Filed Jan. 13, 1875.]

Brief.—Stamps are arranged one upon another, and placed upon a spring follower or rest within a box, and beneath the inward-turned flanges of the latter. The box being slightly wider at its top allows the uppermost stamp to be freely fed out, while the others are retained by the contracted portion thereof.

161,928.



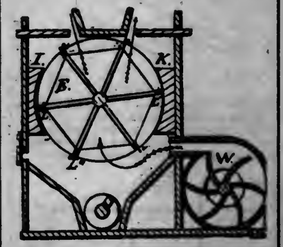
The within-described stamp-holder, consisting of the box A, provided with flanges a a, interior grooves b, and exterior ribs y, the apron C, one or more springs, D, slide B, and cover G, all constructed and arranged substantially as and for the purposes herein set forth.



161,929. STRINGS FOR MUSICAL INSTRUMENTS. James Baillie Hamilton, Oxford, England. [Filed Nov 13 1874.]

A string for musical instruments, composed of a coiled wire or metallic strip flattened in a direction parallel with the axis of the coil, in the manner and for the object specified.

161,930.



161,931.

161,932. MIDDLINGS-PURIFIERS. C. T. Hanna, Keokuk, Iowa. [Filed Nov. 1, 1872.]

Brief.—Devices for preventing the air passing between the sides of the bolt and the casing of the machine.

1. The flexible strips a on the ribs L L of the revolving mill-bolt E, in combination with the air-stops I K at the sides of the bolt, substantially as and for the purpose set forth.

2. The combination of the flexible strips a on the ribs of the revolving bolt, the air-stops I K, and the fan W, for producing an air-blast below and through the bolt, substantially as set forth.

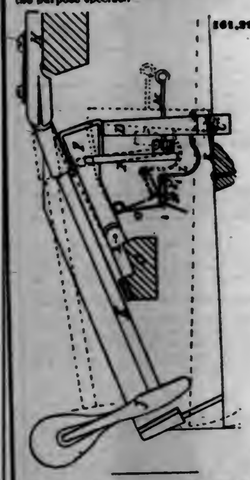
161,933. FOUNTAIN-PENS. C. Hauschild, Topeka, Kans. [Filed Feb. 24, 1875.]

Brief.—Ink is driven through small tube into the pen by screwing down the outside tube, which carries a piston and rod

The combination, with the inner tube C, having a spirally-ribbed outer surface and a conductor-tube, a, of the outer case B, having female thread b, and the piston-rod E, attached to the outer case B by a swivel-joint, d, and operating substantially in the manner and for the purpose described.

161,934. PIANO-FORTE ACTIONS. Albert K. Hobard, Cambridge, Mass. [Filed Aug. 22, 1874.]

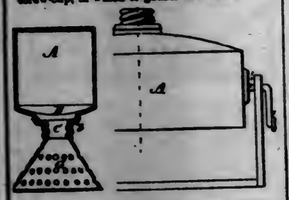
1. The pivoted under hammer F, having the downwardly-projecting arm P, in combination with the regulating-screw M, its bottom m and the jack-fly D, the whole being arranged to operate as described, whereby the jack-fly is released at the proper time, as herein set forth.



2. In a piano-forte action, the fly of a jack, having wire L and link N, in combination with the under hammer F, with spring O, all arranged for operation substantially as described, for the purpose specified.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON

3. The spring E, in combination with the pivot of the fly of a jack, substantially as described, for the purpose specified.



4. In combination with an under hammer, F, having the arm P and spring O, the fly of a jack, having wire L and link N, all arranged for operation substantially as described, for the purpose specified.

161,209.

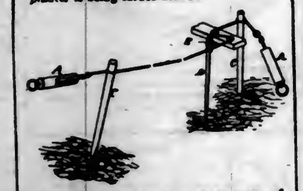
161,208. CHURNS. Geo. P. Herndon, Tupelo, Miss. (Filed Jan. 19, 1875.)

Brief.—Rotary churn formed of rectangular box, with a screw inlet-pipe and a conical screw-cap, in which to gather the butter.

The combination of the rectangular revolving box A, having screw inlet-pipe C, and the perforated conical screw-cap O, all constructed substantially as set forth.

161,209. METHODS OF APPLYING CAPS TO THE HEADS OF SCREWS. Geo. Hookham, Birmingham, England, assignor of one-half his right to Alfd. Ludlow, same place. (Filed Feb. 6, 1875.)

Brief.—The screw-head is reduced in size, and the neck enlarged. A metal cap struck up from a disk, and having a slight depression or nick formed therein, is placed on the head, and firmly attached thereto by means of dies, the edges of the cap being compressed against the under side of the head, and extending to the shank of the screw. The head is then finished by turning and remicking.



1. The method herein described of providing the heads of iron screws with a cover of brass or other ductile metal or alloy, the same consisting in applying to the screw-head, preliminarily prepared, as herein specified, a cap or covering of ductile metal or alloy, which is first compressed, fixed, and shaped on said head by pressure or stamping in a die, and subsequently finished and nicked, substantially in the manner herein set forth.

2. The series of tools or apparatus, herein-before described, and illustrated in Figs. 4, 5, 7, 8, and 9 of the accompanying drawings, to be used in fashioning the brass or other metallic cap, and for compressing, fixing, and shaping the brass or other cap or covering upon the head of the screw.

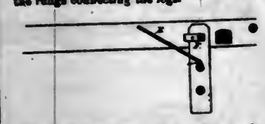
161,222. CHECK-ROWERS. V. Horne, Atlanta, Ill. (Filed Jan. 25, 1875.)

Brief.—To each end of the knotted check-rope is attached a spring-balance for regulating the amount of force applied in tightening the rope. A forked stake having a pulley is employed for holding the rope while the planter is being turned around.

1. The combination, in a check-rower, of the knotted rope B, or its equivalent, scales A A, and stakes C C, substantially as and for the purposes herein set forth.

2. The combination, in a check-rower, of the knotted rope B, or its equivalent, scales A A, stakes C C, and the forked iron stake D, with pulley E, substantially as and for the purposes herein set forth.

161,223. TRUSSES. Henry Howe, Council Bluffs, Iowa. (Filed Feb. 18, 1875.)

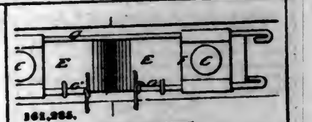


Brief.—The truss-pad rests in a socket, which is secured by a metal band to the waist-band. A coil-spring within the socket forces forward the pad proper. A pin on each side of the pad moves in side slots in the sockets, serving as a guide.

The combination of the waist-belt A, interior plate B, socket C, with band E, compress D, and a spring, G, substantially as and for the purposes herein set forth.

161,224. COT-BEDSTEADS. Otis Howe, Cambridgeport, Mass., assignor to the Howe Spring-Bed Company, same place. (Filed Nov. 11, 1874.)

Brief.—The bent arms prevent the braces from rising above the top of the bed-frame when the legs are folded up, and when the legs are turned down to support the frame the arms move with the legs, and draw the braces down into such a position that their bent ends can be readily inserted in the sockets in the rungs connecting the legs.



In a cot-bedstead, substantially as described, the bent arms F, in combination with the braces E, and the legs of the bedstead, as and for the purpose set forth.

161,225. NUT-LOCKS. Samuel T. Hughes, Irondale, Ohio. (Filed Oct. 10, 1874.)

Brief.—Upon the nut is placed a recessed locking-block. Upon the block an auxiliary nut of thin metal, one or more sides of which are rolled over to form loops. Through said loop, and a wire loop fixed in the locking-block, is passed a key, which again is held in place by a swivel-pin in the end of it.

The recessed blocks E, auxiliary nuts F, and keys G', in combination with the bolts C and nuts D, substantially as shown and described.

161,265.

161,226. MAINSPRINGS FOR WATCHES. G. Hunter, Elgin, Ill. (Filed Oct. 1, 1873.)

Brief.—A mainspring having a tongue cut near its outer end to engage in a suitable recess in the barrel, and act as a safety attachment of the spring and barrel.

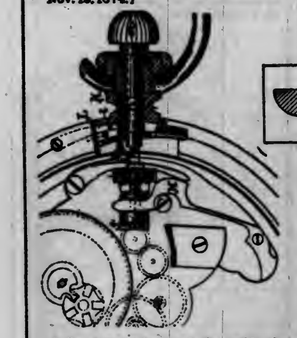
The mainspring A, provided at or near its outer end with the tongue a, which tongue is cut from the opening a', and extends forward and slightly outward, in combination with the winding-barrel B, provided within its inner side with the engaging notch b, substantially as and for the purpose specified.

161,227. CONDENSERS FOR ICE-MACHINES. Auguste Jas, New Orleans, La., assignor of one-half his right to A. C. Janin, same place. (Filed Mar. 13, 1875.)

Brief.—The fluid to be condensed enters the upper dome, and passes through diminishing chambers in a passage through a spiral flue formed by inserting a screw into the chamber. G is a tank or chamber, through which water flows freely or under pressure.

1. The combination, in the condenser or liquefactor, of the vapor-receiving chamber, the liquid-receptacle, the intermediate connecting-tubes, and the Archimedean screws within said tubes, substantially as shown and set forth.

2. The intermediate connecting-tubes, of conical form, provided with internal spiral passages, communicating at their larger ends with the vapor-receiving chamber, and at their smaller ends with the receptacle for the condensed vapor or gas, substantially as set forth.

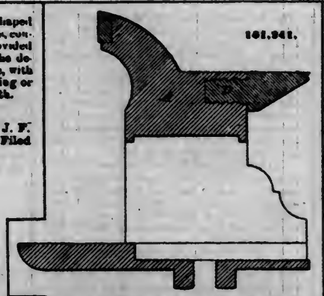


161,228. SEAMLESS MOLDS FOR ELECTROTYPES. Maurice Joyce, Washington, D.C. (Filed Mar. 8, 1875.)

Brief.—Mold is made preferably on paper or bristol-board, which is immersed in melted wax, then coated to the necessary thickness, and the design impressed or cut in. When bent to proper form the edges of the mold are soldered.

1. The process of preparing a seamless mold or matrix for producing seamless cylindrical or irregular-shaped electrotypes by putting a suitable coating upon a flexible base, and molding or cutting in the desired design while the mold is flat, then bending the mold to the desired shape, and uniting the edges by melting or soldering the coating together, substantially as described.

2. A seamless cylindrical or irregular shaped mold or matrix for producing electrotypes, consisting of a flexible base or support provided with a suitable coating, and having the desired design molded or cut into the same, with the edges of the mold united by soldering or melting the coating together, as set forth.

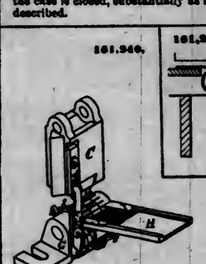


161,229. STEM-SETTING WATCHES. J. F. U. Jurgensen, Locle, Switzerland. (Filed Nov. 19, 1874.)

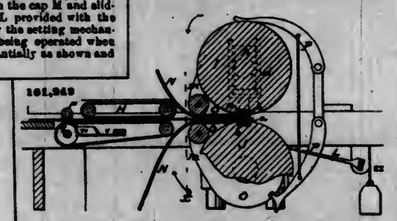
1. In a stem-setting watch, the combination of a sliding pin working in the stem and a ring surrounding said stem, substantially as herein described, whereby the setting mechanism is thrown into gear by pressure upon said ring transmitted through said sliding pin.

2. In combination with the cap M and sliding pin K, the spring L provided with the the projection i, whereby the setting mechanism is prevented from being operated when the case is closed, substantially as shown and described.

161,241.



A cast-metal vise-jaw, having the anvil B formed thereon in one and the same piece with the jaw, and the wrought-metal horn C when attached to the anvil in the process of casting the jaw, substantially as described.



161,242. MACHINES FOR CALENDERING PRINTED SHEETS. George Kivlan, Boston, Wm. Kivlan, Cambridge, and Geo. Wood, Boston, Mass. (Filed Feb. 5, 1875.)

Brief.—Two sheets of scabboard are attached to pressing-cylinders, so as to be free at one end, and to lift from the cylinders over a cam during a portion of the revolution. The printed sheets are fed between these scabboards as they pass over the cam, are pressed between them, and the offset taken up, when the sheets are delivered to a fly, and the scabboard, released, dries itself during the remainder of its revolution.

161,240.

161,243

1. The combination, with the revolving rolls I and J, of the flexible trails N, applied to the rolls, substantially as described, for the object specified.

2. The combination of the two rolls I J, each having a trail, N, with the disks O, having cams M, substantially as and for the purpose described.

3. The combination of the endless feed-apron H, delivery-fly L, and rolls I and J, having flexible trails N, all arranged together and operating substantially as described, for the purpose specified.

161,239. MACHINES FOR FLATTENING THE SHANKS OF MACHINE-NEEDLES. Saml. C. Kingman, Bridgeport, Conn. (Filed Feb. 19, 1875.)

Brief.—An intermittingly-revolving grooved (parallel to the axis) die-wheel receives the blanks from the hopper, and carries them successively under the stamp, by which the shanks are flattened.

1. In combination with the revolving pulley F, revolving eccentric shaft D, connecting-bar E, reciprocating slide C, and flattening-stamp b, the adjustable bar d, pawl-carrier e, pawl e, spring f, ratchet-wheel g, semicircular grooved die a, die-seat G, and spring-pawl h, all constructed arranged and operated for the purpose of automatically flattening the shanks of a series of needle-blanks, substantially as and in the manner and for the object set forth.

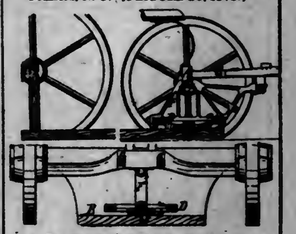
2. The combination of the frame A, pulley F, shaft D, connecting bar E, reciprocating slide C, gibe B B', adjustable bar d, pawl-carrier e, pawl e, spring f, die a, ratchet-wheel g, spring-pawl h, and die-seat G, with the inclined hopper H, all constructed, arranged and operated substantially as and in the manner and for the object set forth.

161,244.

161,245.

161,241. VISES. Chas. L. Kingsley, Meriden, Conn., assignor to Chas. Parker, same place. (Filed Sept. 24, 1873.)

161,244. WATCH-PLATES. F. A. Lange, Glashutte, Saxony. (Filed Feb. 9, 1875.)



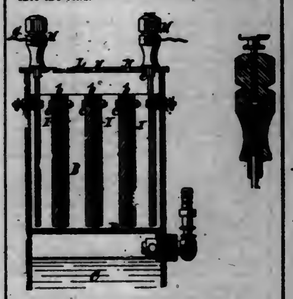
Brief.—A watch-plate provided with a slot, through which the barrel-arbor may pass, and the barrel thus be removed without raising the plate.

1. The top plate, having a slot or pathway for the removal of the barrel-arbor, extending from the outer edge of said plate to the opening through which said arbor passes vertically, substantially as set forth.

2. The spindle or arbor D, with its bearing d, combined with the top plate 2, having slot E, substantially in the manner and for the purposes set forth.

3. The combination of plate A, countersunk, as described, with spindle D, bush d, screws c, mainspring-barrel C, and back plate B, substantially as and for the purposes herein described.

161,245. WHEEL-VEHICLES. L. P. Larson, Yonkers, N. Y. (Filed Jan. 20, 1875.)



1. The combination of a frame, F, fastened to the fifth-wheel D, with the front axle connected to said frame by a hinge-joint, substantially as described.

2. The combination of the platform B with a fifth-wheel, D, resting on its upper surface, and provided with a raised frame, F, to which the front axle is connected by a hinge-joint, substantially as and for the purpose described.

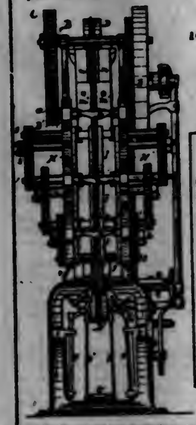
161,246. GALVANIC BATTERIES. J. Lotter, Vienna, Austria. (Filed Feb. 24, 1875.)

Brief.—Cup divided into two compartments by horizontal partition. Upper compartment divided into a number of cells, containing the plates, and each communicating, through a tube provided with a cock, operated from the top of the cup, with the lower compartment, which contains the battery solution, and which has no opening in its side, through which air-pressure is applied to force the solution up into the cells.

1. In a galvanic battery, the combination of the cup A, its horizontal partition D, one or more connecting-pipes, F, stopper G, and cock E, substantially as described.

2. In combination with the partition I of the compartment E, the tie-pieces b, supporting the elements of the battery, substantially as described.

3. The combination, with the cup A, of the lid L, having the holes N, and telescopic keys M, having springs f, substantially as described.



161,947. MACHINES FOR CRIMPING LEATHER FOR BOOTS AND SHOES. C. B. Long, Worcester, Mass., assignor of three-fourths his right to C. D. Parisen and J. D. Faitonte, Newark, N. J., and O. W Swick. [Filed Jan. 28, 1875.]

Brief.—The prepared stock is placed upon a form attached to an endless chain, and is passed between a series of vertical jaws, arranged one directly above the other, which are provided with right-and-left screws for positive lateral adjustment, and adapted to automatically increase or diminish their griping power by means of editable gearing actuated by weighted levers.

1. The pressure-plates I within the frames H H', provided with projections *f f'*, in combination with the right and left hand screws F', all substantially as and for the purpose set forth.

2. The presser-plates I within the frames H H', operated automatically by the right and left hand screws F', in combination with the gears 1, 2, and 3, and the weighted levers L, all arranged substantially as and for the purpose set forth.

161,947.

3. In a leather-crimping machine, a series of crimping-jaws, I, arranged one above the other, in combination with a series of levers adapted to vary the griping power of the jaws, and to act independently upon each pair of jaws, all substantially as and for the purpose described.

4. The jaws or plates I, provided with right and left threaded devices for their positive adjustment, in combination with the weighted levers L, substantially as described and shown.

5. The clamping-jaws R, provided with the stems *y y'* and levers 7 and 8, and adapted to be operated by rods *v v'*, all substantially as and for the purpose set forth.

6. In combination with the clamping-jaws R, provided with a suitable guide for direction, the cam-lever 7, connecting-rod *s*, and lever O', substantially as and for the purpose set forth.

7. The combination of the lug *e*, spring-catch *i*, lever Q, and upright shaft, provided with a forked device for operating the clutch for engaging or releasing the pulley C', all substantially as described, and for the purpose set forth.

8. The combination of hand-lever O and pivoted lever P, forked arm K' and weighted lever L, all arranged substantially as and for the purpose set forth.

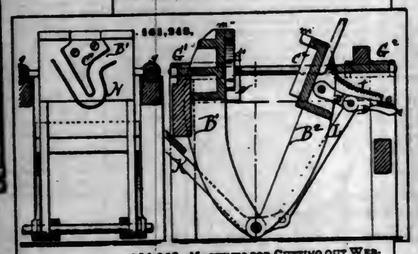
9. In a crimping machine, in combination, the endless chain *c'*, provided with projections *o* and the pivoted cranks *v*, all arranged substantially as and for the purpose set forth.

10. In a crimping-machine, the combination, with the presser-plates I, of the projections *f f'*, right and left hand screws F', gears 1, 2, and 3, levers L, and weights J, substantially as and for the purpose set forth.

11. In a crimping-machine, the combination of the plates I, projections *f f'*, right and left screws F', gears 1, 2, and 3, levers L, forked upright K', and pivoted levers P and M, substantially as herein set forth.

12. In combination with the plates I and their supporting projections *f f'*, right and left screws for operating said plates, and the forms F, substantially as and for the purpose set forth.

13. The combination of the forms F, of the plates I, right and left screws F', gears 1, 2, and 3, weighted levers L, pivoted cranks *v*, and endless chain *c'*, provided with projections for automatically operating or applying pressure to the material in its passage between the jaws, all substantially as set forth.



14. The combination, with the form or forms F, of the plates I, right and left screws F', gears 1, 2, and 3, weighted levers L, pivoted cranks *v*, projection 4, endless chain *c'*, provided with cam *s*, chain-wheel E, gear C, and driving-shaft B', substantially as and for the purpose set forth.

15. The combination, with the form F, of plates I, right and left screws F', gears 1, 2, and 3, levers L, pivoted cranks *v*, chain *c'*, provided with lugs or cam *s*, chain-wheel E, gear C, driving-shaft B', and clutch and lever S, substantially as and for the purpose set forth.

16. The combination of the presser-plates I, pressure-screws F', gears 1, 2, and 3, lever L, forked rod K, levers P and M, lever O', clutch-wheel C', gear C, chain-wheel E, chain *c'*, cam *s*, and pivoted cranks *v*, all arranged substantially as and for the purpose set forth.

17. The combination of clamping jaws R, pivoted ear or lever 7 8, rods Z Z', foot lever or treadle O', with projections 9, 10, for automatic disengagement of the material, substantially as set forth.

161,948.

161,948. MACHINES FOR CUTTING OUT WEB-GATES FOR CAST LEAD TRAPS. J. A. Lowe, New York, N. Y. [Filed Sept. 16, 1874.]

Brief.—A pair of cutters of a peculiar shape mounted on a fixed and movable frame, one of them provided with a support for the trap, and both arranged to abut instead of overlap the edges. The movable cutter is operated by treadle, rod, and toggles, one end of the toggle being attached to the movable frame, and the other being held by a spring against adjustable plate.

1. The combination of the cutters C' C', formed with square flat edges, arranged to come in contact without pressure or overlapping, substantially as and for the purpose shown and described.

2. The combination, with the cutters C' C', of the stationary plate or bar B', movable plate or bar D', and stops *n' n'*, substantially as and for the purpose shown and described.

3. The combination of the plates or bars B' B', cutters C' C', toggle-joint D' D', plate or bearing G', treadle or lever K, and connecting rods L, substantially as and for the purpose shown and described.

4. The rest or guide N, in combination with the cutter C', substantially as and for the purpose shown and described.

161,949. SLEEPING-CARS. Christian R. Lucas, Atlanta, Ga. [Filed Feb. 4, 1875.]

1. The upper berth C to take the place of the inner paneling of the upper part of the car, supported by its lower and inner ends upon the molding B, and hung to the wall of the car by the triangular pieces D D, which form divisions between the berths and allow the berth so much play that it can be readily lifted from the molding B for cleansing purposes, all combined as described.

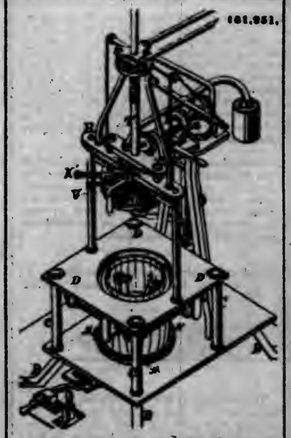
2. The sliding seat-frame I, attached to the inside of the ends of the bases K by means of the slotted arms L, all combined as and for the purpose stated.

161,949.

3. The combination, with the bases K K, of the long metallic connecting-box located beneath the floor of the car, and forming, with the bases K K, a receptacle, for the bedding, as set forth.

4. The window recess in the lower part of the car-body, and made open below, and provided with a water-table, all as and for the purpose described.

161,950. FEED-WHEELS FOR SEWING-MACHINES. Ira Manning, Philadelphia, Pa. [Filed Feb. 11, 1875.]



In combination with the feed wheel A, the reversible or interchangeable clamp B, having two bearing ends, *c c'*, two shoes, *f f'*, and two eyes, *g g'*, as and for the purpose described and represented.

161,951. MACHINES FOR MAKING BARRELS. Jacob Martin, Cairo, Ill. [Filed Jan. 26, 1875.]

Brief.—The staves are set up and forced into their proper positions by means of truss-hoops and revolving press-rollers. The cross is cut and staves chamfered before removing the barrel from the machine.

161,951.

1. As a means for compressing the upper portion of a barrel, the circular sectional head O, arranged to expand and contract radially, and operated by means of the connected shafts P' P', &c., eccentrics *p p*, and yokes *o o*, substantially as specified.

2. In combination with the studs M M, for supporting the lower truss-hoop N, and with suitable mechanism for forcing the barrel-staves downward, the disk K, for supporting the ends of the staves, arranged to move vertically, and sustained in position by the yielding pressure of a spring, I, substantially as and for the purpose shown.

3. In combination with the upper truss-hoop N, the vertically-moving head V and studs *v v*, substantially as and for the purpose set forth.

4. In combination with the truss-hoops N and N', which operate as guides for limiting the radial motion of the staves, the rollers *y y*, journaled upon and rotating in horizontal planes with the spring-bars Y Y, caused to travel over the inner faces of barrel-staves, and forced outward with a yielding pressure against the same, substantially as and for the purpose shown and described.

5. The means employed for cutting a croze and chamfer within each end of a barrel, consisting of the cutters *h h'*, fixed within and moving radially with the sliding heads H' and H'', and thrown outward by the wedge-bar K', recessed rods D' D', disk I', and inclined legs *i''* and *i'''*, said parts being combined to operate in the manner and for the purpose substantially as specified.

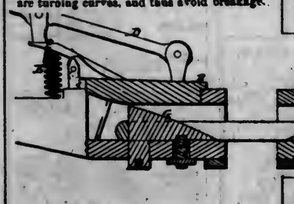
6. The metal head band M', made contractible, so as to be capable of closely embracing the ends of the staves, substantially as and for the purpose shown.

161,952. RETORTS FOR BURNING OR REVIVIFYING CHARCOAL. Franz O. Matthiessen, Jersey City, N. J. [Filed Feb. 12, 1875.]

Brief.—The retort is divided by one or more partitions, stationary or movable, which run longitudinally through the chamber. Object: to burn and discharge less than the whole retort's charge at a time, it being found in practice that one side is "done" before the other is ready to be discharged.

The combination, with the retort, of one or more upright or longitudinal partitions, arranged in transverse relation to the course of the flame or heated gases on the exterior of the retort, substantially as and for the purposes herein set forth.

161,954. COFFEE-POTS. N. S. McFarland, New York, N. Y. [Filed Feb. 16, 1875.]

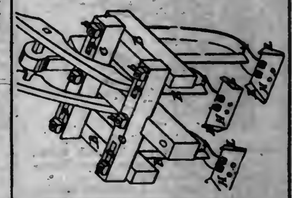


Brief.—A fixed upper strainer, a removable lower strainer, and circulating-orifices above the former.

The combination, with a coffee-pot, of the suspended coffee-receptacle G, provided with fixed upper strainer I and removable lower strainer and cap *i' i'*, and with circulation-orifices A above the upper strainer I, all substantially as herein described

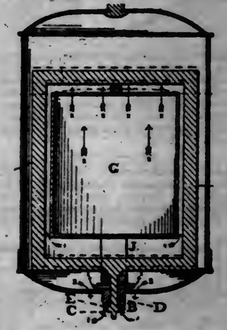
161,955. CAR-COUPLINGS. B. A. McKanna, Ellison, Ill., assignor of two-thirds his right to John Dalton and Geo. Dalton. [Filed Sept. 5, 1874.]

Brief.—The tongue is pivoted and held parallel with the sides of the draw head by springs, that it may "give" when the cars are turning curves, and thus avoid breakage.



1. The wedge-shaped tongue C, made movable, and combined with the draw-head, as and for the purpose set forth.

2. The door B, in combination with lever D, arm *a*, and spring E, as and for the purpose specified.



161,956. COMBINED COTTON CHOPPERS AND SCRAPERS. Roderick McRae, Fayetteville, N. C. [Filed Dec. 1, 1874.]

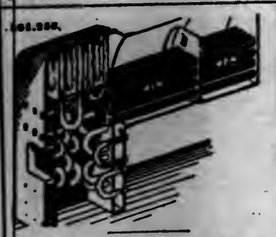
Brief.—A reversible blade with upturned ends, the wide edge designed for scraping, and the narrow for chopping, cotton.

The reversible double-edged scraping-share and chopping-blade H, having turned-up sides or vertical oblique flanges L, to adapt the same for use, in the manner and for the purpose herein set forth.

161,957. AIR AND WATER TRAPS. Nathan Middleton, Philadelphia, Pa., assignor of one-half his right to Stephen Morris, same place. [Filed Feb. 26, 1875.]

An air-chamber, automatically operating the valve of an air and steam trap or receiver, by the expansion and contraction of the air in said chamber, substantially in the manner and for the purpose set forth.

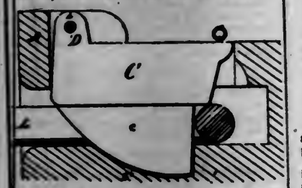
161,958. STEAM-GENERATORS. J. A. Miller, Providence, R. I. [Filed Mar. 26, 1874.]



Brief.—Return-water bends extend into the fire-box, and through the inner and outer walls, said box forming stays. The portion between the fire-box walls is perforated to allow circulation. A chamber is formed in the rear of the boiler by means of a tube-sheet partition, whereby the sediment is collected from the water before entering the main portion of the boiler.

1. The tubular stay, secured in the sheets of a fire-box, and provided with openings, and with plugs on its outer ends, the inner portion projecting into the furnace, to perform the duties of a stay and generating-tube, substantially as described.

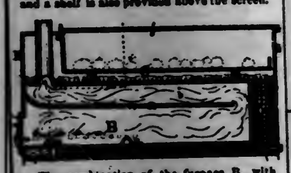
2. The tube-sheet B, in combination with the barrel of a locomotive-boiler, said sheet extending above the water-line of the boiler, substantially as and for the purpose specified.



161,958.

161,259.

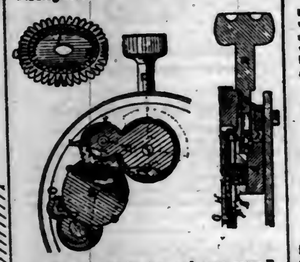
161,260. CAR-COUPLINGS. Hiram H. Miller, J. F. Rogers, and Christian Feree, Duncotown, Md. [Filed Aug. 1, 1874.]



Brief.—To couple in an automatic manner, and to hold the link horizontally when coupled.

The catch C, having the hollow cylindrical part *b*, curved lower portion *c*, and longitudinal shoulders *d d*, to rest on the link, and maintain it in position when coupled, in connection with the link L and draw-head, having the slot B and curved recess F, all constructed to operate in the manner and for the purposes set forth.

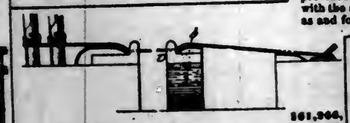
161,261. AGRICULTURAL BOILERS. F. N. Mitchell, El Paso, Ill. [Filed Feb. 13, 1875.]



Brief.—The furnace entirely within the boiler, save the door, is covered by a screen, and a shelf is also provided above the screen.

The combination of the furnace B, with usual horizontal return flue *i*, the boiler A, screen D, and shelf C, as described

161,262. STEM-WINDING WATCHES. C. S Moseley, Elgin, Ill., assignor of one-tenth his right to the National Watch Company, same place. [Filed Apr. 18, 1874.]



Brief.—Main spur-wheel is chambered out, the crown or miter wheel, gearing with the winding stem, being inserted in chamber. An intermediate gear-wheel, connecting the main spur wheel and the one on the winding-arbor, is carried on a plate pivoted on main spur wheel, and so kept normally out of gear with winding-arbor.

1. The combined miter and spur gears F and G, constructed in the manner and for the purpose substantially as specified.

2. The vibrating arm H, which carries the intermediate pinion K, pivoted to or upon the screw *f*, and having a friction connection with the gear G by means of the corrugated steel rings I and J, placed between their contiguous faces, said parts being constructed and combined in the manner and for the purpose substantially as shown.

3. The bridge for carrying the winding-train, consisting of the sections A and A', provided within their contiguous faces with the bearing *a* and recess *e'*, and combined with said winding-train and the plate of a watch, in the manner and for the purpose substantially as set forth.

161,264.

161,267.

4. The driving pinion C, provided interiorly, at opposite ends, with the square and round openings, and combined with the bridge A and A', push-pin or stem D, and bearing pin E, in the manner and for the purpose substantially as shown and described.

161,263. DEMIJOHN-CASES. C. Newman, San Francisco, Cal. [Filed Feb. 18, 1875.]

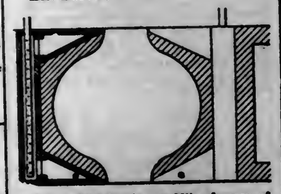
Brief.—An open top box of any size or shape to suit the body of the bottle or demijohn which is to be packed and cased. Two opposite sides of the box are made slightly higher than the body of the bottle, so that its neck will project above, while the other two sides are tapered upward from the sides in the form of a gable, so that they will be higher than the top of the bottle.

A bottle or demijohn box or case, A, having the truncated gable-ends *c c* in combination with the cover, consisting of the sloping sides *i i*, horizontal strip *j*, and brace K, the whole secured to the top of the box or case by means of screws *m m*, substantially as and for the purpose described.

161,265. SEWING-MACHINE SHUTTLES. J. G. Nichols, New Eureka, Kans. [Filed Oct. 3, 1874.]

The combination of the shuttle-body A, having a notch, H, and a slotted eye, K, in its opposite side walls, the fixed tension-disk or and plate F, provided with a notch, G, the spring-pressed tension-plate I, the pivoted latch or bobbin-retaining frame B, having a notch, D, and groove E, all constructed and relatively arranged as herein shown and described.

161,266. PIANO-FORTE AGRAFFES. F. W. Niehaus, St. Louis, Mo. [Filed Jan. 26, 1875.]



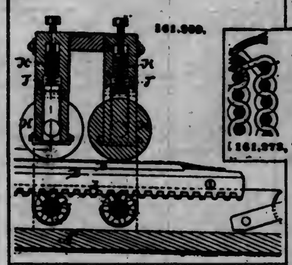
Brief.—The agraffe-pin is provided behind its bearing-point with a wood or other riser, held in place by the strings.

The agraffe D, constructed as described, with holes for the passage of the strings, and provided with the block *b*, in combination with the sounding-board bridge, substantially as and for the purpose herein set forth.

161,267. BREECH-LOADING FIRE-ARMS. W. F. Parker, Meriden, Conn. [Filed Feb. 6, 1875.]

The combination of the bolt E in the frame, notch *e* in the barrels, the bearing-surface of one or both inclined, and the vertical bar F, substantially as and for the purpose described.

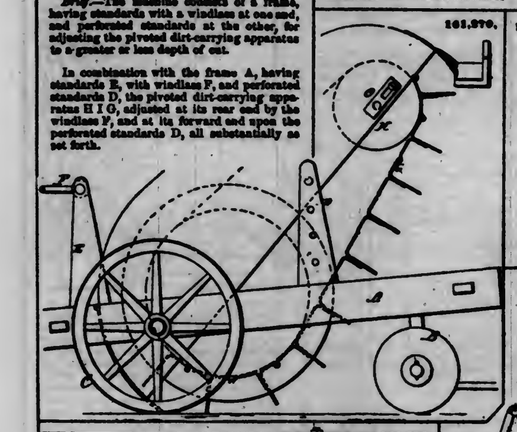
161,268. CHILLS FOR PUDDLING-FURNACES. Jos. L. Peacock, Coatesville, Pa. [Filed Mar. 4, 1875.]



The combination, in a puddling-furnace, of the within-described chills and cheeks with perforated steam-pipes, as set forth.

161,269. MACHINES FOR PEBBLING, GRAINING, AND EMBOSSING LEATHER. Adelbert W. Perrin, New York, assignor of one-half his right to James H. Ferguson, Brooklyn, N. Y. [Filed Feb. 18, 1875.]

1. In a machine for pebbling, graining, or embossing leather or other materials, two or more sets or series of pressure-rollers, journaled independently, arranged with the rollers of one set in rear of and opposite the spaces between those of the adjacent set, substantially as and for the purpose shown and described.

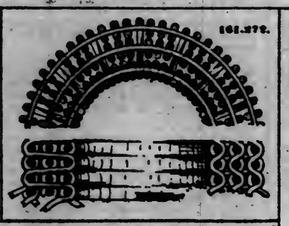


2. The combination of the yokes I, carrying the rollers H, the springs K, screws M, and vertically-adjustable frames J, substantially as shown and described.

161,270. REDUCATORS. Moreau Phillips, Springfield, Ill., assignor of one-half his right to H. A. Morgan, same place. [Filed Sept. 5, 1874.]

Brief.—The machine consists of a frame, having standards with a windlass at one end, and perforated standards at the other, for adjusting the pivoted dirt-carrying apparatus to a greater or less depth of cut.

In combination with the frame A, having standards E, with windlass F, and perforated standards D, the pivoted dirt-carrying apparatus H I G, adjusted at its rear end by the windlass F, and at its forward end upon the perforated standards D, all substantially as set forth.



161,271. STEAM-BRAKES. J. T. Prundergast, Huntington, W. Va. [Filed Mar. 6, 1875.]

The combination of the closed piston-cylinder B, the piston C, the guide-rod *a*, extending through the cylinder, the rack-bar D, drum G, suspended under the car-body, and having gear-wheel E, and the guide-roller *h* above, and bearing upon the rack-bar, all constructed and arranged to operate substantially as set forth.

161,272. FIRE-HOSE. J. Van Dusen Reed, New York, N. Y. [Filed Mar. 16, 1875.]

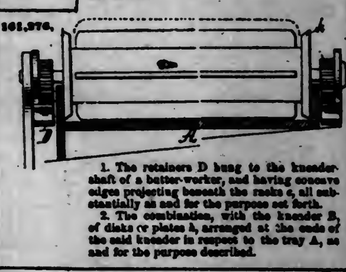
Fire-hose woven entire of an originally circular form, constituted of more than a single ply, and having the warp-threads uniformly spaced and the weft compactly packed up, substantially as described.

161,272.

161,272. FIRE-HOSE. J. Van Dusen Reed, New York, N. Y. [Filed Mar. 16, 1875.]

As a new manufacture, woven hose, suitable for fire-hose, in which the warp-threads around the entire tube are laid substantially uniformly contiguous to each other, and the weft-threads are packed up closely, the fabric being thus of substantially uniform compactness and strength throughout, and of uniform curvature of cross-sections, as described.

161,274. WINDOW-AWNINGS. Alphonso W. Redgrave, Chicago, Ill., assignor of one-half his right to F. B. Wilson, same place. [Filed Feb. 11, 1875.]



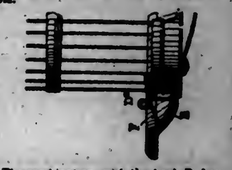
Brief.—The sliding rods have swiveled rings at the ends.

1. The casing A A' B, with downward-projecting part C, in combination with the hinged and sliding rods *d* and awning D, substantially as and for the purpose set forth.

161,274.

2. In an awning, the rods *d*, having a fork, *r*, and the rings *e*, in combination with the upright rods *b b'*, substantially as specified.

161,275.



1. The retainers D hung to the kneader-shaft of a batter-worker, and having concave edges projecting beneath the racks *c*, all substantially as and for the purpose set forth.

2. The combination, with the kneader B, of disks or plates A, arranged at the ends of the said kneader in respect to the tray A, as and for the purpose described.

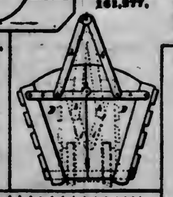
161,273. BIRD-CAGES. Louis P. Reichert, Buffalo, N. Y. [Filed Dec. 20, 1874.]

Brief.—The hinged hook is locked by a brace hinged at the opposite end of the hasp-plate, which attaches the hook to the cage-bottom.

1. The combination, with the hook D, having the projection D' and the eye D", of the double hinge-plate E and the lock F, when the said lock F acts as a stop or brace to the hook D, substantially as and for the use and purpose set forth and described.

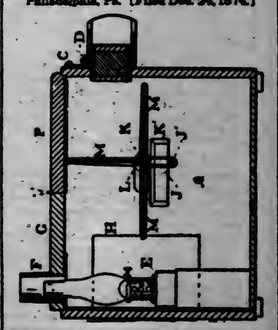
2. The combination, with the hook D, of the double hinge-plate E, lock F, base or bottom C, and lower horizontal head B, all when arranged to operate substantially as and for the use and purpose described.

161,276. BUTTER-WORKERS. A. H. Reid, Brandywine Manor, Pa. [Filed Nov. 24, 1874.]



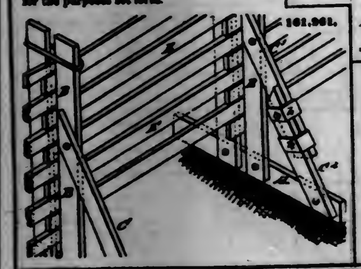
Brief.—The working-roll, passing lengthwise in the trough, carries a disk at each end to throw the butter to the center, and pendent retainers outside the trough are adapted to render fluffy the change of direction at each end thereof.

161,277. FOLDING CRADLES. H. D. Reichard and J. R. Fisher, Reading, Pa. [Filed Feb. 12, 1875.]

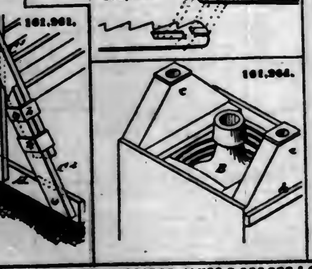


Brief.—The cradle is suspended from the standards by the jointed rods, and the folding ends, jointed rods, and hinged bottom are so arranged that the cradle can be compactly folded.

In a folding cradle, the combination of the folding ends D with the jointed rods *h i*, hinged bottoms *p*, and a suitable supporting-frame, substantially as shown and described.



161,277.



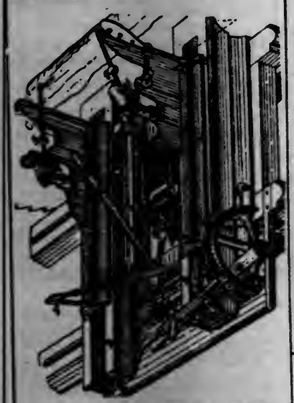
161,278. STEREOSCOPES. Henry Bight, Philadelphia, Pa. [Filed Dec. 24, 1874.]

161,279.

161,280.

161,281.

161,282.



1. The stereoscopic box A, in combination with the removable eyeglass or lens frame B and notch C D, substantially as and for the purpose set forth.

2. The stereoscopic box A, provided with stereoscopic lens and lens-frame in front, an illuminator at the rear, and a revolving view-holder arranged between the lens and illuminator, substantially as and for the purpose set forth.

3. The view-holder, constructed of the piece L, with horizontal notch e and vertical grooves b, in combination with the vertically-arranged rubber bands M, substantially as and for the purpose set forth.

161,879. HEAD-BLOCKS FOR SAW-MILLS. Alex. Rodgers, Muskegon, Mich. (Filed Dec. 31, 1874.)

Brief.—The setting-jacks are attached by a wire-rope passing over a series of sheaves to a hinged platform in the rear of the carriage, upon which stands the operator. His weight, added to that of the platform, retracts the setting-jacks, when they are released from the setting mechanism.

1. The supplementary rack D, in combination with the head-block B, as specified.

2. The stops E upon the rack D, in combination with the stop Q upon the head-block B, as set forth.

3. The disengaging-rack L, in combination with the setting-jack C and adjusting-lever F, as and for the purpose specified.

4. The reciprocating rack G, in combination with the setting-shaft O, provided with the teeth H, as and for the purpose set forth.

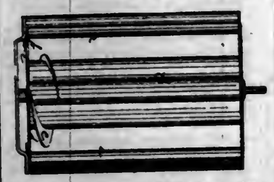
5. The cam I, operated by the hand-lever, as set forth, in combination with the toothed arc J and setting-rack G, as specified.

6. The platform S, in combination with the devices for retracting the setting-jacks, substantially as set forth.

7. The platform S, in combination with the carriage and head-blocks of a circular-saw mill, giving a suitable position for the operator of the head-blocks, as set forth.

8. The dogs provided with the rubber cushions g, in combination with the oscillating spring-posts V and setting-jacks, as specified.

9. The setting-shafts N and O, provided with the adjustable couplings, as herein described, for the purpose of regulating the relative positions of their pinions or other operating devices, substantially as set forth.

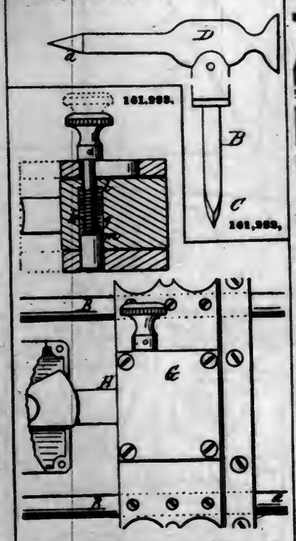


161,880. MAIL-BLANKS OR STRIPS FOR PRINTING-MACHINES. Willard A. Rogers, Boston, Mass., assignor to the American Cable-Screw-Wire Company, same place. (Filed Oct. 6, 1874.)

1. A metallic nail blank or strip provided with grooves or corrugations h, extending obliquely across one or both sides of the blank, from the base c of its thick edge to the ridge b of its thin edge, substantially as and to obtain the advantages stated.

2. As a new article of manufacture, a metallic nail blank or strip having oblique side grooves, tapering sides, and a beveled and serrated edge, from which to produce shoe-pegs embracing the characteristics herein stated.

161,881. RICE-CLEANING MACHINES. John B. Rupert, New Orleans, La., assignor of one-half his right to Columbus H. Allen. (Filed Jan. 20, 1875.)

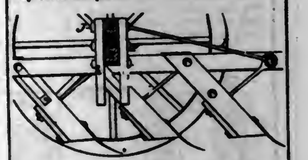


Brief.—The grain is deflected upwardly and against the interior corrugated sides of the cylinder by the beaters and spiral screw-plate, until its hulls are freed of all foreign matters.

The cylinder A, provided with corrugations c c, and head b, shaft c', beaters C, spiral screw-plate c, and brace B, all arranged as herein described, and for the purpose specified.

161,882. ICE-PICKS. Wm. C. Russell, Philadelphia, Pa. (Filed Sept. 9, 1874.)

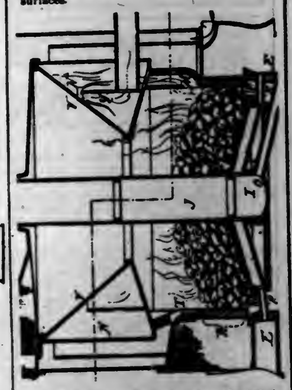
The herein-described implement for cutting and breaking ice, consisting of the flat blade C, provided with the stem B, and the tubular handle A, provided with the head D, having the face E and point c, all constructed substantially as set forth.



161,883. BOLTS FOR SAFE, VAULT, AND OTHER DOORS. James Sargent, Rochester, N. Y. (Filed Feb. 16, 1875.)

The combination, with the safe-bolts B B and lock D, of a socket or bearing, G, attached to the safe-bolts, a bolt or slide, H, connected with said socket or bearing, and a locking device for engaging said socket and bolt when the safe-bolts are thrown out.

161,884. GANG-PLOWS. S. S. Schenmack, Victoria, Tex. (Filed Dec. 12, 1874.)



Brief.—On the axle of a pair of wheels a cross-beam is placed, having two pairs of hangers projecting downward on either side of the axle. Another cross-beam bolted rigidly to the plow-frame slides in the hangers below the axle, and is vertically adjustable by bolts and pins.

The plow-frame A A' E, and saddle H, having adjusting hangers k k, and pivoted braces l l, combined with the axle K, as and for the purpose specified.

161,885. HOT-AIR FURNACES. James H. Shoemaker, Wilmington, Del. (Filed Jan. 20, 1875.)

Brief.—To provide extended air-heating surfaces.

1. The combination, in a heater, of a hot-air chamber I, central pipe J, communicating with said chamber, and a series of hollow radial arms, m, forming the grate and conducting air to the said central pipe, all as set forth.

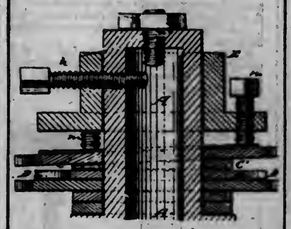
2. The hollow grate-supporter I, and its tubes K, in combination with the central pipe J.

3. The combination of the grate-supporting ring n, and its tubes p, attached to the casing E, with the grate and its hollow bars.

4. The fire-pot, having internal recesses, in combination with detachable plates q, arranged to cover said recesses and form flues M, all as set forth.

5. The combination, in a heating-stove, of the space N and its partition y, with the smoke-pipe s, connected to said partition y at one side of the same, all as and for the purpose set forth.

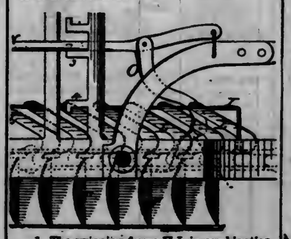
161,886. SHIRT-BOSOMS. Alex. Sinsheimer, Philadelphia, Pa. (Filed Oct. 10, 1874.)



Brief.—The side plaits are reversible, so that either side may be turned out, and thereby present a bosom of different faces from the same plaits

The shirt-bosom, having jaws-faced and reversible plaits B B, constructed and arranged substantially as described.

161,887. CUTTER-HEADS. A. W. Slayton, Tecumseh, Mich. (Filed Feb. 9, 1875.)

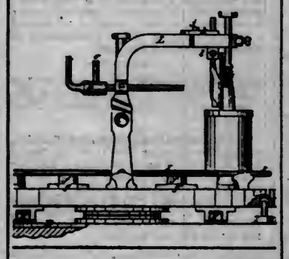


Brief.—One or more circular saws are attached to an adjustable flanged head, to prevent tearing out of cross-grained lumber when being tongued or grooved. The upper saw is secured in an inclined position by means of an inclined washer placed between the upper and lower saws, and held in place by set-screws passing through the lower end of a flanged sleeve.

The combination of the flanged adjustable head A, saws B B D, washers C C', flanged sleeve E, and set-screws k and m m, all constructed and arranged as and for the purposes herein set forth.

161,888. ROAD-SCRAPERS. W. Smith, Bernard Castle, England. (Filed Jan. 2, 1874.)

Brief.—The scrapers are hinged independently to a rod, and furnished with springs, so as to adapt themselves to the inequalities of the surface. The degree of pressure is regulated, through the swinging frame, by the lever N and rack R.



1. The swinging frame H I, in combination with the rod G and scrapers F, with spring-arms L, substantially as and for the purposes described.

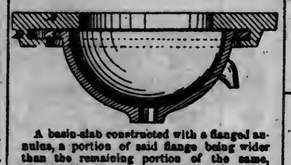
2. In combination with the swinging frame H I, the lever P, link Q, and lever N, with or without the rack or frame R, substantially as and for the purpose set forth.

3. The scrapers F, constructed, as shown, with spring-arms L and thimble-connections M, substantially as and for the purposes described.

161,889. SOLDERING-MACHINES. Richard Henry Smith, Baltimore, Md., assignor to Mrs. Sarah J. Smith, same place. (Filed Jan. 4, 1875.)

1. The soldering iron holder R, having a rear opening, m, and adjustable vertically and longitudinally by the slotted piece k and binding-screws j and l, in combination with the hinged frame L and compound blow-pipe S, substantially as and for the purpose described.

2. The independently rotating and detachable seats l, having the adjustable clamping devices J and the studs f, in combination with the sockets g, substantially as and for the purpose described.

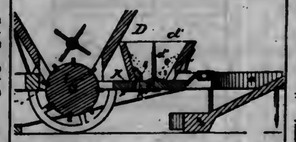


161,890. PROCESSES OF EMBOSSING WOOD. Wm. Sochofsky, New York, N. Y. (Filed Feb. 8, 1875.)

The described process of embossing wood with metallic leaf by treating the wood, or portions of the same, with glycerine, applying the leaf, and embossing with heated dies, substantially as and for the purpose described

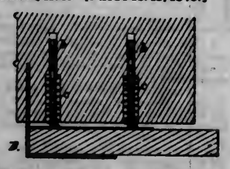
---

161,891. SETTING BASINS. John Stevenson, Brooklyn, N. Y. (Filed Oct. 20, 1874.)



Brief.—A flanged annulus, having a portion of the flange made to project, is secured to a slab or other fixture. The flange of the basin is inserted beneath the widest portion of the flange, when the entire flange of the basin will readily go within the annulus, and the basin being moved back from beneath the broader part, the flange of the basin will be supported by the entire flange of the annulus.

A basin-slab constructed with a flanged annulus, a portion of said flange being wider than the remaining portion of the same, whereby the basin is affixed to the slab, substantially in the manner described.



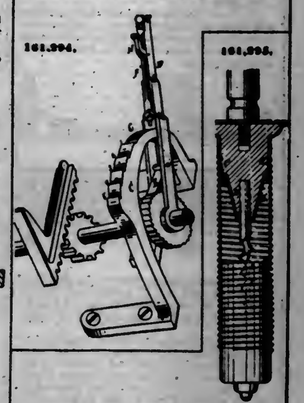
161,892. SEED-PLANTERS. U. T. Stewart, Rossville, Tenn. (Filed Feb. 4, 1875.)

Brief.—The seed-hopper is made in two parts, the front one of which is provided with the pivoted partition, to make a double hopper for sowing two kinds of seed, beneath which is reciprocated the seed-slide for dropping the seed.

In a seed planter, the double hopper D, consisting of rear chamber d and front chamber d', provided with pivoted partition d'', in combination with seed-delivering wheel I and dropping-slide K, having apertures k k', substantially as described.

161,893. BOOK-SUPPORTS. R. T. Stoddard, Boston, Mass. (Filed Feb. 19, 1875.)

The improved book-supporter, consisting of body A, the fixed plate H, and spring-plate C, constructed, combined, and arranged, substantially in manner as shown and described.



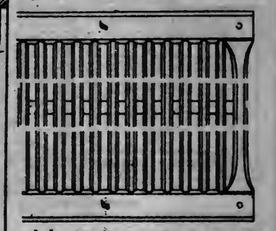
161,894. SET-WORKS FOR SAW-MILLS. J. W. Stokoe, Manistee, Mich. (Filed Feb. 12, 1875.)

Brief.—The quadrant is provided with a series of steps, with either of which the stop-pawl on the setting-lever engages, at the option of the operator.

1. The combination of the lever D, latch F, spring b, and bell-cranks G G' G' G', with the quadrant C, having a series of abutments in varying planes, substantially as and for the purpose set forth.

2. The combination of the latch F' and its bell-crank H with the lever D and latch F, substantially as and for the purpose set forth.

161,894. 161,895.



161,895. ATTACHING HOLLOW HANDLES TO CUTLERY. Owen W. Taft, New York, N. Y. (Filed Mar. 6, 1875.)

Brief.—A sheet-metal filled bolster has a fork, steel, or analogous article secured at one end, and a corkscrew at the other, and is removably secured in a hollow handle by a screw-thread or like device.

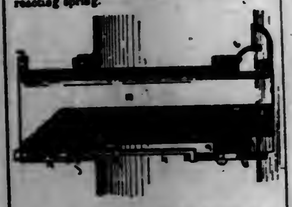
The combination, with a hollow handle, of a sheet-metal bolster or end piece, removably connected by screw-threads or equivalent device, and in which a fork, steel, corkscrew, or analogous article is secured by solder or analogous material, substantially as specified.

161,896. TRAYS OR SCREENS FOR COAL-GAS PURIFIERS. Andw. J. Tewksbury, Haverhill, Mass. (Filed Jan. 6, 1875.)

1. In a tray for gas-purifier, the bars B B, formed with dovetailed grooves b, the series of slats a, having their ends formed with corresponding dovetailed tenons c, and the spacing-blocks d, arranged and combined together in manner as shown and described.

2. In a tray for gas-purifying boxes, the bars C C, having their outer vertical faces formed concave, as and for the purpose set forth.

3. In a tray for gas-purifying boxes, substantially as described, the end bars B, formed with shoulders i i, in combination with the slats, formed with inclined shoulders l l, as and for the purpose set forth.

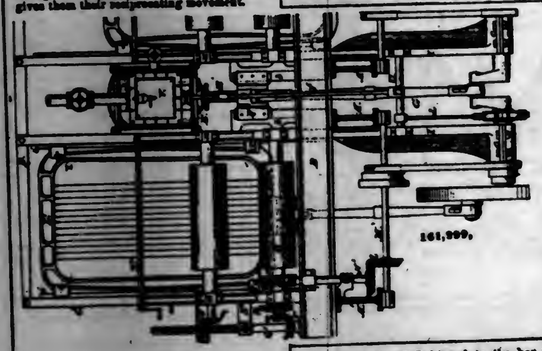


161,297. ORNAMENTAL CHAINS. C. Thiéry, Newark, N. J. (Filed Aug. 26, 1874.)

An ornamental chain composed of a series of separate rings or links, *a b*, united by secondary chains *c* passed through said main rings or links, substantially in the manner herein shown and described.

161,298. DIP-PIPES OF GAS-WORKS. Alex. Thomson, Worcester, Mass. (Filed Jan. 12, 1874.)

Brief.—A peculiar water-seal on the outside and at the foot of the dip-pipe; a sliding gate-valve working a part in the dip-pipe and within the main, and itself worked by a lever and a reacting spring.



1. The combination, with the dip-pipe B, of the water-seal cup C, constructed with an outer lip, *m*, inner lip *n*, and partition *o*, arranged for operation substantially as herein set forth.

2. The combination, with the dip-pipe B, of a sliding gate-valve, G, arranged upon the exterior of said dip-pipe, and within the hydraulic main, substantially as herein set forth.

3. The combination, with the dip-pipe B, of the water-seal cup C, gate G, gate-rod H having collars *f*, lever K, and spring I, all constructed and arranged for operation substantially as and for the purposes set forth.

161,299. GANG-SAW MILLS. F. R. Town, Boston, Mass. (Filed Mar. 1, 1875.)

Brief.—The pair of saw-frames are operated by a single engine placed between them, and acting directly upon the crank-shaft, which gives them their reciprocating movement.

1. A gang-saw mill having its various parts constructed, combined, and arranged substantially as herein shown and described.

2. The frame composed of beams A and A', the feeder-beams B B', vertical posts C C', provided with guides *i* and lugs, to which is bolted the steam-cylinder E and the connecting-cap D', the parts being united and arranged as and for the purpose set forth.

3. The mechanism herein described for feeding logs to the saw, consisting of a pair of cone-pulleys, or their equivalents, connecting shafting and gear, and rotating screw-gearing, with a worm-wheel upon the roll-shaft, as specified.

4. The feeding-rolls O O' and the worm-gear for driving the same, in combination with the sprocket-wheels E and pitch-chain *p*, substantially as and for the purpose specified.

5. The slide-blocks Y, constructed as shown and described, and provided with the adjusting-screw *g*, in combination with the recessed saw-frame *x x*, as set forth.

6. The suspending-brackets I, provided with the journal-boxes *c*, in combination with the beams A A' and crank-shaft H H', as and for the purpose set forth.

161,300. BARRELS FOR SHOT-GUNS. Joel B. Tubbs, Waterloo, N. Y. (Filed Feb. 23, 1875.)

A shot-gun provided at its muzzle end with a concentrating-ring, arranged within the bore, and secured against displacement, substantially as and for the purposes herein before set forth.

161,301. SPRING-CASES FOR DRAW-BARS. John Turner, Grosse Isle, Mich. (Filed Oct. 1, 1874.)

The combination, with the sills A A, draw-bar C, and volute spring D, of the cast-iron spring-case B B', having ribs *a a*, and secured to said sills by the transverse bolts *b*, as and for the purpose set forth.

161,302. WAGONS. T. Y. Van Cleave, Cornersville, Tenn. (Filed Nov. 21, 1874.)

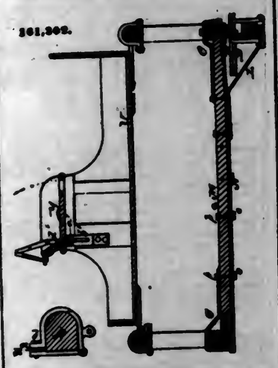
Brief.—A cuff for vehicles, hinged at one side, and fastened at the other.

1. The shaft-cuff B, hinged to the bar C, and fastened by means of the bent end *a*, bolt *b*, and rubber *d*, all combined as and for the purposes set forth.

2. A vehicle-cuff made in two pieces, and hinged together and fastened by a bolt passing through the bent end of the top part, and screwed into the end of the bottom part, all combined as set forth.

3. The lower part D of the fifth-wheel, provided with the bars G G', in combination with the hinged bar H and bolt *b'*, as and for the purposes set forth.

4. The combination of the coupling-cuff I, cil-cup *f*, parch-iron N, with nut *n*, and the fastening-bolt *m*, substantially as and for the purposes set forth.



5. The combination of the coupling-cuff I, hinged bars J J, cross-bar K, perch-brace L, pin *k*, and rubber *i*, substantially as and for the purposes set forth.

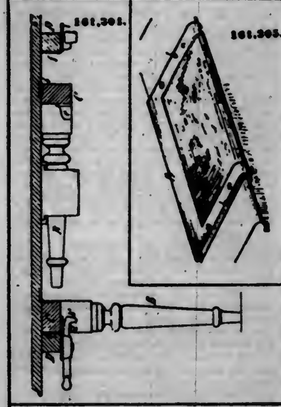
6. The perch-iron N, provided with hinged loops O O, in combination with the front and back springs, perch-pole M, bolts *p*, and nuts *o* made solid in the perch-iron, all as and for the purposes set forth.

7. The combination of the axle-stays P P, secured to the rear axle by the hinged cuffs R R, perch-pole M, bolts *s*, and nuts *r* made solid in one of the stays, as and for the purposes set forth.

8. The combination, with the bed U and spring-bar V, of the bed-irons T formed with loops *w*, the hinged bars *x*, and bolts *y z*, all substantially as and for the purposes set forth.

161,303.

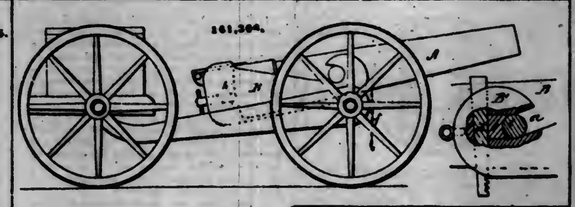
161,304. JEWELERS' MOUNTS. John A. Van Dreisen, Peoria, Ill. (Filed Feb. 18, 1875.)



In combination with a mat, C, having an opening through which the picture is seen, and its under surface covered with an adhesive substance, a backing, A, or mount composed of card or other suitable material, having a countersunk shallow recess, *a*, to receive a picture or similar object, substantially as and for the purposes described.

161,305. FOLDING TABLES. Emil T. Wagner, Buffalo, N. Y., assignor to A. Engelin and C. Lenkler, same place. (Filed Mar. 2, 1875.)

1. The combination, with the bed of a table, provided with cross-pieces D, of the hinged legs B, connected by cross-pieces C, and the fastening-device E *e*, substantially as and for the purpose herein before set forth.



2. In combination with the bed of the table, cross-pieces D C, and fastening-device E *e*, the interposed elastic strip *f*, substantially as and for the purpose set forth.

161,301.

161,305.

161,306.

161,305. STAIR-PADS. Thomas F. Walter, Philadelphia, Pa. (Filed Jan. 29, 1875.)

The combination of the frame A, with its curved edge, the carpet H, secured to the said frame, and the frame B, with its curved ends *c*, the whole being adapted to the tread of a stair, as set forth.

161,306. WATCH-KEYS. Albert Wanner and Charles A. Wanner, New York, N. Y. (Filed Nov. 17, 1874.)

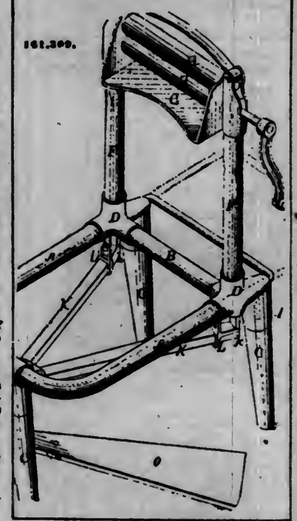
A watch-key consisting of the barrel A, composed of two sections, each section having one side of its interior of a width equal to the width of the arbor to be wound, and two sides at right angles thereto and parallel with each other, said sections being permanently connected together by a cylinder or collar, substantially as herein shown and described, whereby an imperceptible joint is formed, and the corners of the arbor to be wound are prevented from acting upon the meeting-points of the sections composing the barrel, as set forth.

161,307. BREECH-LOADING FIRE-ARMS. B. C. Watson, New York, N. Y., assignor of one-half his right to Leon Furniss, same place. (Filed Mar. 10, 1875.)

1. The combination, in a breech-loading fire-arm, of the barrel or barrels, having trunnions on a line with the center of the barrel or barrels, and a cable or frame, having adjustable bearings, substantially as and for the purposes herein set forth.

2. The extracting-plate G, rod *m n*, and elliptic spring *p*, arranged and combined for operation, substantially as and for the purposes herein set forth.

161,308. BREECH-LOADING ORDNANCE. B. C. Watson, New York, N. Y., assignor of one-half his right to Leon Furniss, same place. (Filed Feb 12, 1875.)



1. The cannon A, provided with trunnions *e e*, in combination with the case B, formed with the breech C, lips B', and grooves, as described, substantially as and for the purposes herein set forth.

2. The combination, with the cannon A and case B, constructed as described, of the bearing-blocks *b* and wedges *d*, as and for the purposes herein set forth.

161,309. CLOTHES-WRINGERS. F. Way and M. Way, Springfield, Ohio. (Filed Feb. 24, 1875.)

Brief.—The frame and standards are hollow. The lower roller is moved upward by rods within the standards by levers and a treadle. A drip-trough and the upper ends of the standards are cast in one pie

161,309.

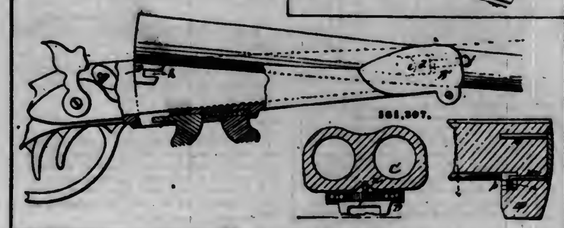
1. A clothes wringer in which the lower pressure-roller H is moved toward or against the upper roller H by means of rods I and I, that at their upper ends bear against the journals *b* and *b* of said lower roller, and are moved vertically and longitudinally by levers K and K, which bear against their lower ends, substantially as and for the purpose specified.

2. The pressure-rods I and I, contained within the hollow standards F and F, and the levers K and K, suspended from fixed fulcrums M and M, and at their forward ends bearing upon the lower ends of said levers, in combination with each other and with the frame of the machine, substantially as and for the purpose shown.

3. The drip-trough and roller-frame G, constructed of cast metal, in one piece, and provided with the threaded sockets *g* and *g*, in combination with the standards F and F, hav-threaded ends that fit into said sockets, substantially as and for the purpose set forth.

161,310. SEWING-MACHINES. Harry B. Weiland, Martinsburg, W. Va. (Filed Feb. 16, 1875.)

Brief.—On the extension of the main shaft is a sliding sleeve, locked thereon by a pin and groove. This sleeve also carries a sliding knob, locked in same manner, and which has two pins that engage the fly-wheel, and cause the main shaft to rotate. To wind the bobbin these pins are disengaged from the fly-wheel, which may then revolve without operating the machine.

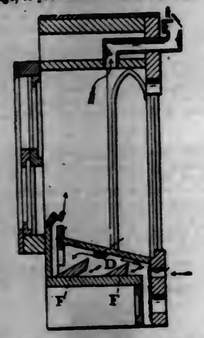


The combination of the extension *a*, pin *c*, the sleeve *f*, provided with the slot *d* and spring *h*, and pin *m*, the nut *p*, and the knob *i*, substantially as shown and described.

161,311. SCREW-THREADING DIES. F. R. Wells, Greenfield, Mass., assignor to the Wiley & Russell Manufacturing Company, same place. (Filed Dec. 11, 1874.)

Brief.—The screws interposed between the two sections of the die-plate are tapered, and the two sections are clamped against them by the screws H, without the employment of the annular die-holder commonly used

161,307.



161,311.

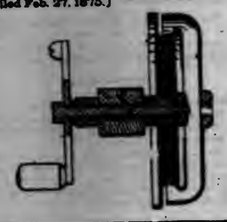
1. The improved die-plate, consisting of the sectional die-plate D D', the tap-screws c, and the binding-screws H, all constructed and combined substantially as described and shown.

2. The combination, with the improved die-plate consisting of the sectional die-plates D D', the tap-screws c, and the binding-screws H, of the holder A, substantially as described.

161,312. DUST-TRAPS FOR BULK-WINDOWS. Spencer A. Wight, Philadelphia, Pa. [Filed Jan. 23, 1875.]

Brief.—Traps are placed in the ventilating-passage, to prevent the entrance of dust.

The combination, with the ventilating-passage D of a bulk-window, of the dust-trap F, substantially as and for the purpose set forth.



161,313. CURLING-IRONS. Lewis Wilkinson, Brooklyn, N. Y., assignor to W. O. Morgan, same place. [Filed Jan. 18, 1875.]

Brief.—The handle clips over a gas-burner, the small openings admitting air to the flame which burns at the opening

As a new article of manufacture, a curling-iron, composed of the tapering spindle A, the hollow shank C attached to the base of the spindle A by the lips or flanges *b b*, and the handle B, having a tapering socket, all constructed, combined, and arranged to operate substantially as and for the purposes as herein shown and described.

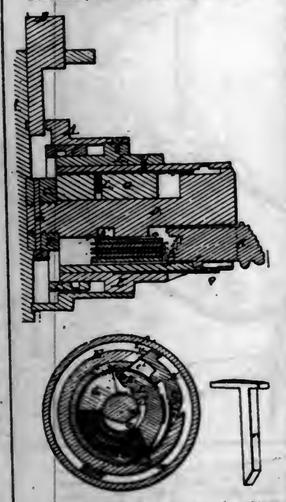
161,314. FENDER-RAILS. Thomas Winans and Thomas D. Whistler, Baltimore, Md. [Filed Feb. 27, 1875.]

1. The combination, with a rotary fishing-reel, of an eye or ring, independent of the reel proper, arranged by the side of and about on the prolongation of the axis of said reel, operating to lead the line over the side of the reel, and to deliver it freely without necessarily rotating the reel, substantially as and for the purposes set forth.

2. In a fishing-reel, a guide eye or ring, located at one side of, and about in line with, the axis of rotation of the reel proper, and provided with a lateral opening through which the line from the reel can enter and be withdrawn from said eye or ring, substantially as and for the purposes set forth.

3. The rotary reel, in combination with the said axially arranged guide eye or ring and cover in which said eye is contained, for joint operation, as set forth.

4. The combination, with the rotary reel proper, of the hinged cover, the central eye or ring contained by the same, and the line-passage extending from the circumference of the cover to the central eye or ring, substantially as set forth.



5. The cover, containing the eye or ring, and formed with a line opening or passage, as described, in combination with a slide or gate, movable to open and close the said passage, substantially as set forth.

6. The combination, with the hinged cover, central eye or ring, and sliding gate, closing the line-passage, as described, of the stationary inclined arm, encircled by a loop on the sliding gate, and operating to close or open the same, according as the cover is moved to or from the reel, substantially as set forth.

7. The line cover or case, in combination with the reel, formed with an outer disk of greater diameter than the case, whose periphery constitutes a braking-surface, substantially as shown and set forth.

8. The combination, with the butt of the pole, of the reel attached to the same, by a central spindle or shaft passing through and secured to the butt, substantially as shown and set forth.

161,315. LOCKS FOR DOORS, &c. H. Winn, Shelburne, Mass. [Filed July 30, 1874.]

1. The combination of the tumblers and key with a rotating shell and a non-rotating shell, when one of said shells contains the tumblers, and is carried backward and forward by the reaction of a pin or projection on one of said shells against two or more inclined surfaces on the other shell, carrying the tumblers toward and from the bits of a key, as described.

2. A shell containing tumblers, combined with a part having a key-hole, giving access to said tumblers, when said shell and tumblers partake of the rotation of the said part carrying the key-hole during the time while the tumblers are being set, but do not partake thereof at the time when the fence is projected against one or more of said tumblers, or into the notches thereof, to admit of the operation of the lock, for the purposes described.

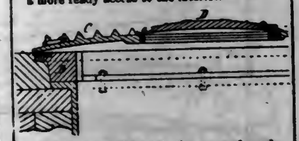
3. The arrangement of a shaft, having a key-hole and a depression to admit the fence, relatively to said key-hole, fence, and the end surface or surfaces of a shell or other part, and of a set of tumblers, which partake of the rotation of the key through a portion thereof, whereby said depression is not brought under said fence to admit the same, except at that point of the rotation of the shaft carrying the key-hole, when said key-hole is opposite the surface of the shell or other part, and not opposite the surface or surfaces of the tumblers.

4. One or more of the projections l' l' on a shaft, D, combined with one or more of the depressions m^1 n^1 in shell G, and m^2 n^2 in the tumblers, for the purposes described.

5. The spring Q, combined with the groove *q* and the inclined surfaces *t s*, arranged and operating as described.

6. A shell partaking of the rotation of the key through a part, but not through the whole, of the same, having the slots a^1 a^2 combined with the key or a projection thereon, for the rotation of said shell.

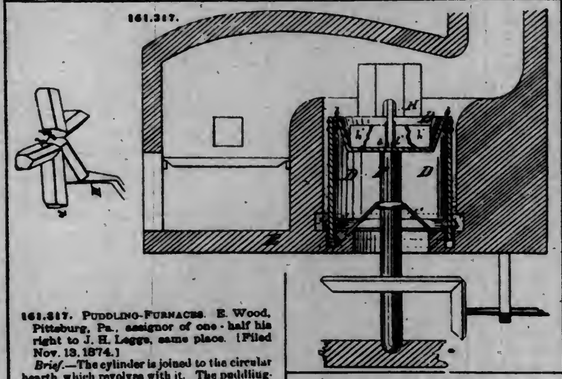
7. The hub V of the return-cap C, combined with the bolt, and a guide therefor, the projections e^1 e^2, the depressions p^1 p^2, the notch *w*, and tooth X', and one or more stops x^1 x^2, with the arrangement thereof, relatively to the position of the tooth X' in its rotation, as described, whereby the tooth X' strikes one of said stops when the key reaches its point of exit.



8. A fence and a key combined with a rotating shaft having a key-hole, which has one or more of its sides extended into the longitudinal portion of the lock, in which the ends of the tumblers take their setting from the key, and combined with a system of tumblers which have said ends located in said longitudinal portion, and in the same plane as the key-hole, at the time when they take their setting, but not at the time when the fence enters the tumbler-notches, or impinges on the sides of the tumblers to enter the same.

9. A fence and a system of tumblers having a motion substantially rectilineal with the axis of the key, a key of which the bitted portion rotates with the rotating shaft, combined with a rotating shaft having a key-hole, and with a cut-off located in position to intervene between the key-hole and the ends of the tumblers, which are set by the key at the time when the fence enters the notches of said tumblers, or impinges upon the sides of said tumblers, to enter said notches.

10. A system of tumblers and a fence, combined with a rotating shaft having a key-hole, and with a key of which the bitted portion rotates with said shaft, and with a cut-off which is stationary before the time when the fence enters the notches of the tumblers, or impinges on the sides of the tumblers, to enter said notches, whereby at said time the key-hole is rotated into such position relative to said cut-off that said cut-off intervenes between the key-hole and the ends of said tumblers, which take the setting thereof from the key.



161,316. ASH-CAN RECEPTACLES. Louis F. Winter, New York, N. Y., assignor of one-half his right to Michl. Madden, same place. [Filed Dec. 4, 1874.]

Brief.—A gasket of zinc is placed on the support of the main cover, for preventing the formation of ice. The main cover is provided with a small central-hinged cover, to admit of a more ready access to the interior.

1. In combination with the covers for ash-can receptacles, as described, a gasket of zinc or a zinc support for the purpose of preventing freezing, substantially as described.

2. In combination with the cover C, a central cover, D, as and for the purposes set forth.

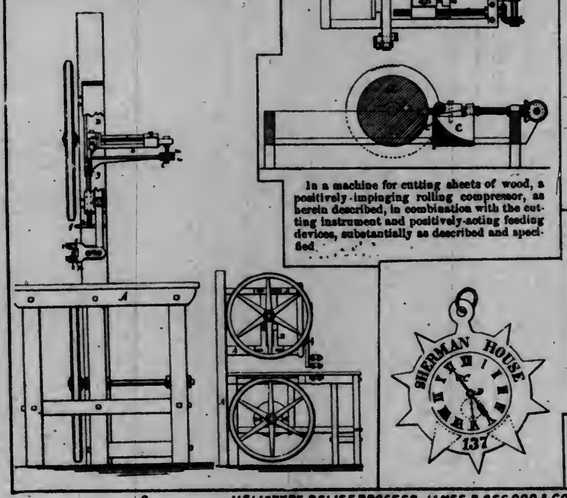
161,317. PUDDLING-FURNACES. E. Wood, Pittsburg, Pa., assignor of one-half his right to J. H. Legge, same place. [Filed Nov. 13, 1874.]

Brief.—The cylinder is joined to the circular hearth, which revolves with it. The puddling-tool is kept stationary in the revolving hearth. The cylinder forms a sand and water joint with the walls of the furnace.

1. The balling tool, consisting of the handle H, with the diverging wings *h'* pivoted or hinged thereon, substantially as described and shown.

2. The combination, with the cylinder D and the furnace-wall surrounding the same, of the intervening annular sand-joint, substantially as described.

3. The cylinder D, in combination with the rotary basin B and the water-trough e^1, said trough being formed in the base of the furnace, substantially as shown and described.



4. The guard-flanges *e e'*, in combination with the cylinder D and trough e^1, substantially as and for the purposes specified

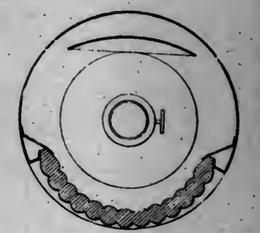
---

REISSUES.

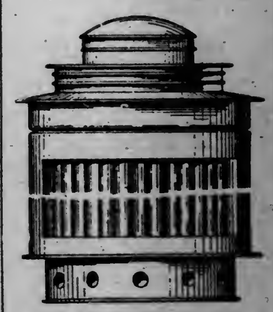
6,340. RAND-SAWING MACHINES. Olpha Bonney, San Francisco, Cal. Patent No. 126,121, dated Apr. 22, 1873. [Filed Feb. 19, 1875.]

Brief.—The bearings of the upper saw-pulley are vertically adjustable, the inner one resting upon an elastic support. The saw-guides are formed of movable steel plates, which may be adjusted to compensate for wear.

In a machine for cutting sheets of wood, a positively-impinging rolling compressor, as herein described, in combination with the cutting instrument and positively-acting feeding devices, substantially as described and specified.



6,341. MACHINES FOR CUTTING VENEERS. Julia A. Brown, Southfield, N. Y., assignee, by mesne assignments, of J. C. Brown, deceased. Patent No. 124,880, dated Mar. 26, 1872. [Filed Jan. 9, 1874.]

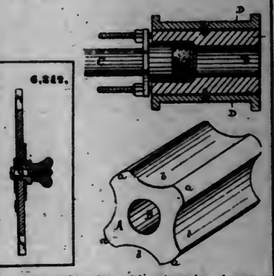


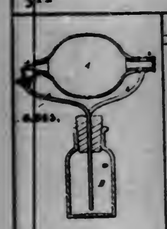
Brief.—The checking or splitting of veneers or sheets of wood in cutting them from round or flat logs is effectually prevented by means of a suitable cutting instrument, governed by positive feeding mechanism, in connection with a positively impinging rolling compressor.

1. The pulley-shaft G, supported at a point between its middle and the pulley C in a suspended box, in combination with the screw I and nuts n and n, substantially in the manner and for the purpose set forth.

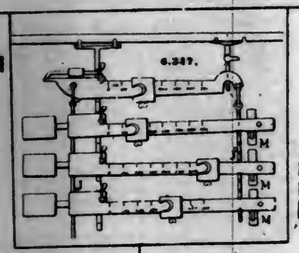
2. The block Q, with its gibs *s s*, and steel bearing-plates *t*, and screws *r*, in combination with the vertically-adjustable support and frame A, as and for the purpose set forth.

6,342. LENSES FOR HEAD-LIGHTS. Henry C. Felthousen, Buffalo, N. Y. Patent No. 110,449, dated Dec. 27, 1870. [Filed June 15, 1874.]

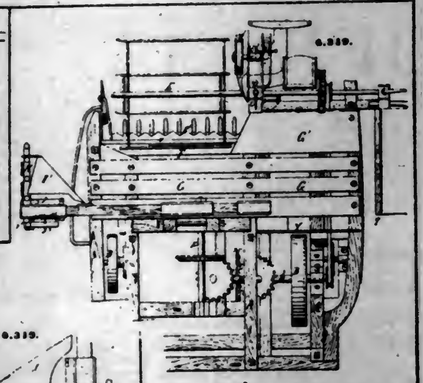




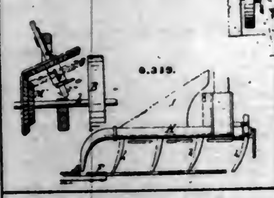
A front glass for head-lights, cast solid or in one piece, with convex ribs or collecting refracting-surfaces, substantially as and for the purposes herein shown and described.



6,343. TRUNNIONS FOR STEAM-ENGINES AND CALENDERS. Thomas Hill, Augusta, Ga. Patent No. 106,196, dated Oct. 11, 1870. [Filed Mar. 6, 1875.]

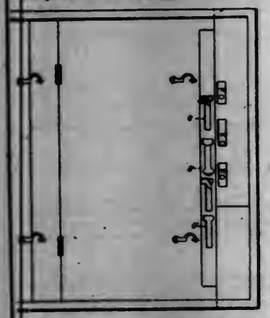


Brief.—A longitudinally-grooved stuffing-box is secured within the hollow trunnion, to allow of a free passage of air through the trunnion.



The combination, with a trunnion, A, provided with arms *a* and spaces *b*, of the sleeve D, substantially as and for the purpose specified.

6,245. ATOMIZERS. Chas. P. Jones, Boston, assignor, by mesne assignments, to Wm. D. Atkinson, Jr., Lynn, Mass. Patent No. 115,615, dated June 6, 1871. [Filed Feb. 3, 1875.]



Brief.—The liquid jet pipe has a branch, which is secured to the valve-case, so that the air-bulb is supported by one branch at either end. A drip-pipe carries back the waste into the bottle.

1. In the atomizer, the combination of the drip-cup *e* and its conduit *f* with the jet-tube *d* and the air-syringe nozzle, all being substantially as described.

2. The combination of the valve-case *b*, nozzle *a*, jet-pipe *d*, and branch *k*, all arranged and to run with the bulb A and vessel D, substantially as set forth.

6,246. WEIGHING APPARATUS. A. B. Davis, Philadelphia, Pa. Patent No. 37,569, dated Feb. 3, 1863. [Filed Nov. 11, 1874.]

Brief.—Scale-beams and weights inclosed in case, provided with doors that may be locked, and thus prevent access to apparatus, except to authorized persons.

1. The combination, with a many weight scale, consisting of a main weighing-beam and auxiliary weighing apparatus, of a box or casing furnished with doors, and having such openings that, while the attendant can observe the operation of the auxiliary apparatus from the outside of the casing, he cannot gain access to the apparatus itself, or gain a knowledge of the weight determined by said apparatus.

2. A box or casing containing a main weighing-beam and an auxiliary weighing apparatus, and provided with levers or equivalents, for the auxiliary weighing apparatus to be thrown in and out of connection with the main beam without allowing access to the apparatus itself, or imparting knowledge of the weight determined by said apparatus.

6,247. WEIGHING APPARATUS. A. B. Davis, Philadelphia, Pa. Patent No. 37,569, dated Feb. 3, 1863. [Filed Nov. 11, 1874.]

Brief.—Main weighing-beam has attached to it a stirrup supporting auxiliary scale-beams. Projecting levers regulate movement of auxiliary beams in stirrup, so that each beam may be used in succession, or all auxiliary beams may be thrown out of action, and only main beam used, as in ordinary platform-scale.

1. A many weight scale consisting of a main weighing beam and auxiliary weighing apparatus, in combination with a secret-box, wherein the auxiliary apparatus is so arranged that, by means of levers or equivalents, it can be thrown in and out of connection with the main weighing-beam, whereby the weigher may operate the auxiliary weighing apparatus to suit various commodities, without being able to determine what amount he is weighing, or in any manner tamper with the weights.

2. A weighing-beam connected to the platform of a scale, in combination with any desired number of weights of an auxiliary apparatus, any or all of said weights being adapted to be connected to or disconnected from the main weighing-beam, for the purpose specified.

3. The levers M, and stirrup J', operating in combination with the main weighing-beam E, and an auxiliary weighing apparatus, substantially in the manner and for the purpose set forth.

4. The stirrup suspended from the main beam, and having bearings for auxiliary weights, which may be communicated to the main beam, substantially as and for the purpose set forth.

6,248. RING SPINNING-FRAMES. C. B. Morse, Rhinebeck, N. Y. Patent No. 76,798, dated Apr. 14, 1868. [Filed Jan. 18, 1875.]

Brief.—The slots in the bolster and step rails allow the lifting-rod and ring-rail to be adjusted to centralize the spindles in the rings. The ring is secured in a holder which is located on top of the ring-rail over the holes, and provided on opposite sides with slotted ears, so as to be adjustable with respect to the spindles.

1. The combination of a continuous ring and lift rail, and a holder that holds the ring centered by two opposite slotted lugs or flanges and clamp-screws, as shown and described, for the purpose specified.

2. The tube E, in combination with the slotted rails A B and lifting-rod D, as and for the purpose specified.

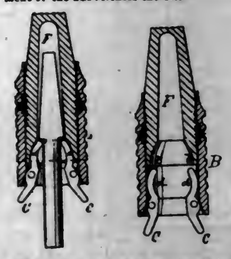
6,249. HARVESTER-RAKES. John Rynearson, Farmington, Ill., assignor to J. H. Elward, St. Paul, Minn. Patent No. 36,800, dated Oct. 28, 1862. [Filed Mar. 5, 1875.]

Brief.—Rake-arm is pivoted above the platform, and revolves in a vertical plane, delivering the grain from an elevated incline at the side of the machine.

1. An inclined elevating-surface at the inner end of the platform and cutting apparatus, extended in advance of the line of cut, in combination with an elevating mechanism, the forward part or tooth of which shall move up said incline in advance of the line of the bar to which the fingers are attached.

2. In the described combination with the vertically-curved platform G, the rake H, pivoted to and projecting horizontally forward from the rake-arm I, by which it is carried in a vertical orbit, all as herein shown and described.

3. The guide L and spring *h*, operating in the described combination with the pivoted rake-head H, to present it in the proper position to gather the grain and afterward retract it therefrom.



4. The fender Q, employed in combination with the pivoted rake H, in the manner and for the purpose specified.

5. The yielding hood *i*, operating in combination with the revolving rake H I, substantially as and for the purpose explained.

6. A platform constructed of vertically-curved slats, placed transversely of the machine at sufficient distance apart to admit the points of the rake-teeth between them, when used in combination with the rake H I, revolving in a vertical orbit, all as herein shown and described.

6,250. BIT-BRACES. Chas. H. Stockbridge, Whateley, Mass., assignor, by mesne assignments, to the Miller's Falls Company. Patent No. 62,232, dated Feb. 19, 1867. [Filed Mar. 5, 1875.]

Brief.—The bit is attached to the brace by means of an adjustable exterior nut, within and near the base of which are two pivoted dogs, in connection with a socket provided with two curved lower and inner edges, serving the purpose of cams. The bit is locked and fastened in place by moving the nut upward in the socket, thereby forcing the inner ends of the dogs against the body and under the shoulder of the bit. A reverse movement of the nut releases the bit.

The combination of the socket F, having cams *b b*, and a nut, B, provided with dogs C C, substantially as and for the purposes herein set forth.

OFFICIAL GAZETTE

OF THE

United States Patent Office.

VOL. 7.—NO. 13. TUESDAY, MARCH 30, 1875. PRICE { $6,00 per year—single. $5,00 per year in clubs.

The OFFICIAL GAZETTE is published on Tuesday of each week, from the United States Patent Office. The subscription price for 1875 is six dollars per year for single subscribers; five dollars per year to clubs of not less than five sent at one time, and which will be mailed free of postage to separate addresses if desired. Subscriptions will commence and terminate with the year. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

COMMISSIONER'S DECISIONS.

HARLOW *vs.* GUERNSEY.—*Interference.*

[*Appeal from the decision of the Examiner of Interferences in the matter of the interference between the applications of Charles F. Harlow and patent of James W. Guernsey, for* "IMPROVEMENT IN MACHINE FOR CLIPPING ANIMALS."—*Decided March* 22, 1875.]

A party to an interference, having conceded priority of invention to his opponent in general terms, and a patent having issued in accordance with his concession and request, is estopped from claiming a new interference with the same party on the subject-matter common to the same applications.

In an interference, judgment of priority is conclusive, not only on interfering matters which were claimed, but on all which might have been claimed.

SPEAR, *Acting Commissioner:*

This appeal is taken from the decision of the Principal Examiner refusing to dissolve the interference declared between the parties above named. It appears from the record that an interference was declared, in October of 1873, between the application of Harlow and that of Guernsey, on claims precisely the same and with subject-matter identical in both applications. On the 26th day of January, 1874, priority of invention was awarded to Guernsey, and letters patent were issued to him in accordance with the request of Harlow himself, and upon concession of priority made by Harlow over his own signature. Harlow now comes before the Office with an amended claim much broader in its scope than either of those allowed Guernsey, but including only elements which were also included in Guernsey's claims. Not only are the parties the same in this case, but the applications are the same.

It is not contended on the part of Harlow that he has any new evidence to bring forward, such as would ordinarily prevail in the Office for the granting of a new interference on the same subject-matter; but he appears to base his claims to this new interference, on the alleged ground that the subject-matter is not the same as that upon which he conceded priority of invention, or upon which the former judgment of the Office was based.

The concession which has been referred to is in the following terms:

I, Charles F. Harlow, above named, hereby concede priority of invention in the above-named interference to James W. Guernsey, above named, and ask that the above-named interference may be dissolved, and letters patent to be issued to said James W. Guernsey upon his above-named application.

It is to be observed that the terms of this are not limited to any special parts named or described by Guernsey, but refer generally to that application. Certainly there is nothing in the concession itself to intimate that he conceded to Guernsey the somewhat narrower claim for the combinations included in Guernsey's application, reserving to himself the right to the broad claim which would leave Guernsey's patent, when issued, comparatively worthless. The plain inference from the concession would be that he conceded all that Guernsey described in his application; and there is nothing in the specification of Harlow to weaken this inference, for his claims were no broader than Guernsey's. Harlow conceded at least all that he was then claiming. Further, as the two inventions are exactly the same in both applications, it is difficult to understand how that which Harlow now claims could be considered a completed invention at all, or be separated from the parts claimed by Guernsey. In any event, this concession is such that it has led Guernsey to take out a patent which the interpretation now put upon that concession would virtually render void, or, at best, of little value; for the interpretation now placed upon the concession is not that Guernsey was the prior inventor of what is shown in his patent, but only of a certain "pin, *a*," and "crank-pin *g*," and other subordinate and unimportant matters. But Guernsey's case does not rest solely upon the interpretation to be given to the concession made by Harlow. In the former interference between these two parties upon claims deliberately made in the same applications which are now brought forward, on due proceedings, Guernsey obtained from the Office judgment of priority over his competitor. The question now is whether that judgment included simply the combinations specifically claimed at that time and no more, or went to the ex-

tent of including anything which might properly have been claimed in those applications. A point precisely similar to this was before the Supreme Court in the case of *Beloit* vs. *Morgan*, (7 Wall., p. 619,) and was very clearly stated in the opinion of the court, and in cases cited in that decision. In *Henderson* vs. *Henderson*, quoted in that decision, the Vice-Chancellor said—

In trying this question I believe I state the rule of the court correctly, that where a given matter becomes the subject of litigation in, and of adjudication by, a court of competent jurisdiction, the court requires the parties to bring forward their whole case, and will not, except under special circumstances, permit the same parties to open the same subject of litigation in respect of a matter which might have been brought forward as a part of the subject in contest, but which was not brought forward, only because they have, from negligence, inadvertence, or even accident, omitted a part of their case. The plea of *res judicata* applies, except in special cases, not only to the points upon which the court was required by the parties to form an opinion and pronounce a judgment, but to every point which properly belonged to the subject of litigation, and which the parties, exercising reasonable diligence, might have brought forward at the time.

No reason appears why the rule here recognized should not be strictly applied to cases of interference in the Patent Office. Certainly, by reasonable diligence, applicants may ascertain at the outset the state of the art to which their inventions appertain, and the proper limitation which must be placed upon their claims.

In cases precisely like this, where the inventions shown by the two parties are the same, the enforcement of this rule can work no hardship; since, as before suggested, it seems hardly possible that any party should be entitled to claim, as sole inventor, whether broadly or narrowly, a machine, details of which essential to its completeness, he did not invent, and had expressly disclaimed. In no case will it occasion any hardship which may not be avoided by the exercise of ordinary prudence. On the other hand, to allow an applicant to split up his application and put his claims by piecemeal into successive interferences, would be to unnecessarily prolong litigation, and might work great hardship to an inventor manifestly entitled to priority.

It seems clear that Harlow, having gone into the interference with the narrow claims, equal in scope to those of Guernsey, and having accepted judgment upon them, is concluded as to the whole matter in the applications, and cannot have any new interference solely by reason of the presentation of claims not then made, in the applications when the first interference was determined.

The decision of the Examiner is accordingly reversed, and the interference will be dissolved.

DECISIONS OF THE COURTS.

U. S. CIRCUIT COURT, EASTERN DISTRICT OF MISSOURI.

ALFRED F. FOSTER vs. WILLIAM M. LINDSAY AND GERALD O. KALB.

[*In equity.—Before* TREAT, *J.: December*, 1874.]

Section 58 of the patent act of 1870 authorizes the court, in a suit thereunder, to review both patents on their merits, and to decree the cancellation of either or of both; and this on the ground of lack of novelty as to either or both, or any other ground that in an action for infringement would affect the validity of either. In a suit brought under section 58 of the act of 1870, to repeal an interfering patent, motion was made to strike out such part of defendants' answer as related to an alleged lack of novelty in the invention covered by complainant's patent, on the general ground that the object of the statute was merely to enable the complainant to determine the question of priority as between himself and his adversary prior to going before the public to test the validity of the patent on its merits: *Held*, that this allegation of the answer was admissible. The motion was overruled.

[*Hatch* and *Parkinson*, for complainant.
Kellogg and *Holmes*, for defendants.]

[This was a bill in equity, brought under sec. 58 of the patent act of 1870, for the repeal of certain letters patent granted to the defendants April 14, 1874, which were alleged to be for the same invention as was covered by a patent granted to complainant May 12, 1874, and, therefore, to constitute an interfering patent.

The defendants in their answer, besides denying that their patent was for the same invention as complainant's patent, and alleging that they were prior in date, asserted that complainant's patent was void for want of novelty, and set up alleged anticipations.

The case came up upon motion of complainant's counsel to strike out that part of the answer which alleged want of novelty and the anticipations, as irrelevant and immaterial.

In support of the motion, and in behalf of complainant, it was urged that the object of sec. 58 of the statute was to enable the patentee to remove the cloud cast over his *prima facie* right by the improper action of the Patent Office in granting two patents for the same invention, prior to going before the public to test the validity of his patent upon its merits, and to place himself in the same position—no better and no worse—than he would have occupied had the interference been declared and determined, as it should have been, in the Patent Office; that it was the design of the section to enable the patentees to determine between themselves which was prior in rights before either should be put to the expense of ascertaining whether his patent was valid as against the world; that, if the construction was otherwise, the patentee would derive no advantage whatever from this section, as he could without it, in an action for infringement, determine the validity of the respective patents, while, if he was obliged, in an action under the section in question, to establish the validity of his patent, he would be put to the same trouble and expense as in an action for infringement, while he must fail to obtain a decree for profits or damages; that the object of the statute was not to provide an additional mode of determining the validity of a patent, since, if it were, there was no reason why it should not apply to the repeal of other patents as well of interfering patents; that the court could, under the statute decree the cancellation of either patent only on the ground that it was in conflict with the other, since the statute makes no provision for cancellation on the ground of want of novelty, or upon any other ground than the existence of the other patent; that the statute provides in terms for the repeal of either of the interfering patents, but not of both; that the statute provides in terms for the defense of want of novelty in an action for infringement, and the fact that it makes no such provision in this case supports the presumption that it contemplated no such defense; and that the fact that an earlier patent was defective on grounds extraneous to the Patent Office record was no reason why a later patent, which was defective on the very ground and the only ground to which this statute referred, should not upon that ground be cancelled.

It was insisted, on behalf of the defendants, that the complainant's right of action being founded upon the existence of his patent, they were at liberty to attack its validity upon any ground that affected it.]

TREAT, *J.*:

The court delivered no written opinion; but, after stating the nature of the motion and the character of the suit in which it was made, referred to the 16th section of the statute of 1836 as analogous to the one it was called upon to construe. The case of *Mowry* vs. *Whitney*, (14 Wall., 434,) was referred to as indicating the construction put upon that statute by the Supreme Court. That was a suit in equity for the repeal of a patent on the ground of fraud in the extension of it, brought in the name of a party who had been sued for infringement. The Supreme Court held that "no one but the Goverment, either in its own name or the name of its appropriate officer, or by some form of proceeding which gives official assurance of the sanction of the proper authority, can institute judicial proceedings for the purpose of vacating or rescinding the patent which the Government has issued to an individual, except in the cases provided for in sec. 16 of the act of July 4, 1836;" that, under this 16th section, the court was only authorized to try the conflicts of claim arising from two interfering patents, and only to annul or set aside one patent so far as is necessary to protect the rights of the other party; that the decree in such a suit can have no validity except between the parties to the suit, and that the general public is left to the protection of the Government and its officers.

The court, after a review of this case of *Mowry* vs. *Whitney*, held the statute of 1870 to be broader in its application than that of 1836; that under it the court was authorized to review both patents on their merits, and to decree the cancellation, not only of either, but of both; and that it might do so on the ground of want of novelty in either or both, or any other ground that would in any action of infringement affect the validity of either.

The motion was accordingly overruled.

EXTENSIONS GRANTED.

31,443.—Improved Felly-Machine.—Granted to CHARLES H. DENISON, February 19, 1861.

Claim.—1. The adjustable plates *n p*, provided with the pins *o q*, when used in connection with the plate G and cutter-head F, as and for the purpose set forth.

2. The combination of the adjustable semicircular bed or bearing piece I and yielding bar J with the cutter-head F, plate G, and bars *n p*, provided with the pins *o q*, all being arranged for joint operation as and for the purpose herein set forth.

31,525.—Improvement in the Manufacture of Hoe-Blanks.—Granted to NATHAN BRAND, February 26, 1861; reissue No. 1,481, dated May 26, 1863.

Claim.—I claim the vibrating reciprocating roller-dies E E', constructed and operated as described, for the purpose set forth.

And in combination with the dies E E', having a longitudinal score, I claim a pair of vibrating reciprocating dies or rollers, provided with a lateral or circumferential score for the shank of the hoe-blank, so as to roll the hoe-blank and elongate it parallel with the shank.

31,525.—Improvement in the Manufacture of Hoe-Blanks.—Granted to NATHAN BRAND, February 26, 1861; reissue No. 1,482, dated May 26, 1863.

Claim.—In the production or manufacture of hoe-blanks with shanks made of the same piece of metal with the plate, and extending onto the plate as a rib, and strengthened around and at the point of the rib by making the metal thicker than in the more extended portions of the hoe-blank, I claim forming said hoe-blanks by rolling them in different directions at a right angle to each other, as set forth.

31,533.—Improvement in Weighing Apparatus.—Granted to AUGUSTUS B. DAVIS, February 26, 1861.

Claim.—A series of weighing-frames, each having the levers I and K and bell-crank lever M, connected together and operating as set forth, when the said frames are so arranged along the opposite side walls of a lock that the said levers I shall be at right angles to and partly overhang the said walls, as and for the purpose herein described.

31,534.—Improvement in Scale-Beams.—Granted to AUGUSTUS B. DAVIS, February 26, 1861.

Claim.—A weighing apparatus composed of an upper and lower graduated beam, when the lower beam is suspended, at or near both its ends, to the upper beam, and when it is entirely dependent upon the said upper beam for its support, and for the proper performance of its functions, as and for the purpose herein set forth.

31,546.—Improvement in Polishing Iron Bars and Rods.—Granted to B. LAUTH, February 26, 1861.

Claim.—The production of polished bars, rods, plates, or sheets of iron or steel by passing them cold through between rolls, after they have been subjected to the acid bath, to remove the scale, substantially as herein described.

31,566.—Improvement in Drying Fruits, Vegetables, &c.—Granted to MARSHALL P. SMITH, executor of FRANCIS H. SMITH, deceased.—Patented February 26, 1861; reissue No. 3,017, dated June 30, 1868; reissue No. 4,468, dated July 11, 1871; reissue No. 4,834, dated March 26, 1872.

Claim.—1. A chamber through which a current of air is passed, and in which the articles to be dried are subjected to a progressive temperature and dryness, substantially as described.

2. I claim the process of drying fruits and vegetables by subjecting them to a current of air artificially warmed, in combination with a gradually-increasing temperature and increasing dryness, substantially as described.

3. I claim a drying-chamber in which the operation is continuous, in combination with increasing temperature and dryness, as above set forth.

4. I claim a drying-chamber in which the drying air is admitted at one end and escapes at the other, when such air passes through and around the articles to be dried, so as gradually to reduce its temperature and dryness, as described.

31,578.—Improvement in Paper-Folding Machines.—Granted to WILLIAM H. MILLIKEN and JOHN MILLIKEN, February 26, 1861; reissue No. 3,785, dated January 4, 1870.

Claim.—1. The combination, with the horizontal rolls E, of the inclined rolls I and inclined table H, so arranged that the sheet of paper, after receiving its first fold, shall slide down the inclined table to gages, which determine its position for the second fold without loss of register, and without the use of tapes or belts, substantially as described and specified.

2. The combination and arrangement of the inclined table H, inclined roll I, gages K, and knife L, for making the second fold in the sheet, substantially as described and specified.

3. The combination of the inclined trough M with its fingers a^3 b^3 d^3, so arranged that the sheet shall be guided into the trough after passing the rolls I, and slide to the position for its third fold, substantially as described.

4. The inclined rolls P and Q, at right angles to each other, in combination with the knife U, substantially as described and specified.

5. The guide-plate *q*, employed for deflecting the sheet in one direction or the other, for giving it three or four folds, without the necessity of unshipping or stopping the operation of the machine, substantially as described and specified.

6. The combination, with the folding-knives, of a pair of rollers, one of which is kept in contact with the other by a spring-pressure, so as to readily yield to the edge of the folding-knife, the passage of double sheets, or any inequalities in the paper folded, substantially as described and specified.

Disclaimer filed February 19, 1875.

Disclaims fifth clause of claim, as above set forth.

31,578.—Improvement in Combined Paper-Folding Machines with Printing-Presses.—Granted to WILLIAM H. MILLIKEN and JOHN MILLIKEN, February 26, 1861; reissue No. 3,786, dated January 4, 1870.

Claim.—The combination, with the rolls E E of a folding-machine, of a knife, or the equivalent therefor, upon the fly of a printing-press, which shall enter the sheets to the rolls, whereby the two machines become co-operative, and the folding of the printed sheets is completed direct from the press, substantially as described.

31,579.—Improvement in Corn-Planter.—Granted to FRANCIS B. PRESTON, February 26, 1861.

Claim.—The combination of the three handles *d h i* with the slide D, tube A, and hopper B, one of the handles, h, being attached to the slide, and the other two being attached to plate *c*, as and for the purpose set forth.

DISCLAIMERS FILED.

31,578.—Improvement in Paper-Folding Machines.—WILLIAM H. MILLIKEN and JOHN MILLIKEN, Manchester, N. H.—Patented February 26, 1861; reissue No. 3,785, dated January 4, 1870. Disclaimer filed February 19, 1875. Disclaims: "The sixth clause of the claim in the following words, to wit: "'6. The combination, with the folding-knives, of a pair of rollers, one of which is kept in contact with the other by a spring-pressure, so as to readily yield to the edge of the folding-knife, the passage of double sheets, or any inequalities in the paper folded, substantially as described and specified.'"

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date March 30, 1875.]

8,229 and 8,230.—Monument.—ANTON LINGEMANN, Port Huron, Mich.—Cases A and B. Applications filed March 6, 1875. Term of patents 7 years.

8,231.—Pedestal for Stools.—ASAPH MERRIAM and CHARLES L. LITTLE, West Meriden, Conn. Application filed February 9, 1875. Term of patent 7 years.

8,232.—Pitchers.—THOMAS B. ATTERBURY, Pittsburg, Pa., assignor of one-half his right to JAMES S. ATTERBURY, same place. Application filed January 12, 1875. Term of patent 7 years.

8,233 to 8,236, inclusive.—Carpets.—ROBERT R. CAMPBELL, Lowell, Mass., assignor to LOWELL MANUFACTURING COMPANY, same place. Applications filed March 22, 1875. Term of patents 3½ years.

8,237 to 8,239, inclusive.—Carpets.—ETIÉNNE GUIRAUD, New York, N. Y., assignor to LOWELL MANUFACTURING COMPANY, Lowell, Mass. Applications filed March 22, 1875. Term of patents 3½ years.

8,240 to 8,244, inclusive.—Font of Printing-Types.—CARL E. HEYER, Boston, Mass. Applications filed February 18 and March 22, 1875. Term of patents 3½ years.

8,245.—Font of Printing-Types.—PETER A. JORDAN, Philadelphia, Pa., assignor to MACKELLAR, SMITHS & JORDAN, same place. Application filed March 10, 1875. Term of patent 7 years.

8,246 and 8,247.—Oil-Cloths.—HENRY KAGY, Philadelphia, Pa., assignor to THOMAS POTTER, SONS & CO., same place.—Cases A and B. Applications filed March 16, 1875. Term of patents 3½ years.

8,248.—Carpets.—CHARLES S. LILLEY, Lowell, Mass., assignor to LOWELL MANUFACTURING COMPANY, same place. Application filed March 22, 1875. Term of patent 3½ years.

8,249 and 8,250.—Carpets.—DAVID MCNAIR, Lowell, Mass., assignor to LOWELL MANUFACTURING COMPANY, same place. Applications filed March 22, 1875. Term of patents 3½ years.

8,251.—Tea-Caddies.—WILLIAM T. SHERER, Chicago, Ill. Application filed February 6, 1875. Term of patent 7 years.

8,252.—Carpets.—CHARLES W. SWAFF, Lowell, Mass., assignor to LOWELL MANUFACTURING COMPANY, same place. Application filed March 22, 1875. Term of patent 3½ years.

8,253.—Carpets.—THOMAS J. STEARNS, Boston, Mass., assignor to THE ROXBURY CARPET COMPANY, same place. Application filed March 22, 1875. Term of patent 3½ years.

8,254.—Towel-Racks.—CORNELIUS TEN EYCK, White House Station, N. J. Application filed March 12, 1875. Term of patent 14 years.

8,255 and 8,256. Ornamentation of Rubber Boots and Shoes.—ANDREW R. TROTTER, Providence, R. I.—Cases A and B. Applications filed March 13, 1875. Term of patents 14 years.

TRADE-MARKS REGISTERED DURING THE WEEK.

2,319.—Washing-Powder.—OTIS CORBETT, Chicago, Ill. Application filed March 11, 1875.

"words 'Corbett's California Concentrated Erasive Soap Plant,' arranged as the sides of a parallelogram, and inclosing a representation of the plant *Phalangium pomaridianum*."

2,320.—Loom-Temples.—DUTCHER TEMPLE COMPANY, Hopedale, Mass. Application filed August 2, 1871.

"letter 'D' and a lozenge."

2,321.—Fine-Cut Chewing-Tobacco.—ARTHUR GILLENDER & CO., New York, N. Y. Application filed February 19, 1872.

"word 'Solace.'"

2,322.—Cigars.—S. JACOBY & CO., New York, N. Y. Application filed December 9, 1872.

"word 'Moldado.'"

2,323.—Heaters, Ranges, and Grate-Work.—DANIEL MERSHON'S SONS, Philadelphia, Pa. Application filed February 6, 1875.

"words 'THE RUSSIAN.'"

2,324.—Preparation to be used on Sheep.—REDINGTON, HOSTETTER & CO., San Francisco, Cal. Application filed March 20, 1875.

"device, design, cut, or print of a sheep, and the words or name 'Saponaceous Carbolic Sheep Dip,' combined and arranged as shown."

2,325.—Flour.—AUGUSTUS A. TAYLER, Londonville, Ohio. Application filed March 18, 1875.

"words 'World's Favorite.'"

2,326.—Bitters.—PETER D. VAN INGEN, Brooklyn, N. Y. Application filed March 19, 1875.

"word 'Centennial.'"

2,327.—Hose for Pumps, Engines, &c.—WANNALANSET MANUFACTURING COMPANY, Boston, Mass. Application filed February 8, 1875.

"one or more red yarns or threads woven into the fabric of which the hose is composed or made, and running lengthwise, parallel with the axis of the cylindrical hose, as shown in the photographic fac-similes accompanying this amendment, and also of the words 'RED LINE HOSE.'"

2,328.—Medicine.—J. C. AYER & CO., Lowell, Mass. Application filed August 24, 1874.

"words 'Ayer's Cherry Pectoral.'"

2,329.—Silk Fabrics.—P. A. DAILY & CO., New York, N. Y. Application filed March 25, 1875.

"word 'ENTERPRISE.'"

2,330.—Coffees, Spices, Mustard, &c.—JAMES M. EARLE, New York, N. Y. Application filed March 16, 1875.

"representation of a head of an American Indian."

2,331.—Boots and Shoes.—GRAFF, WATKIN & CO., Philadelphia, Pa. Application filed March 24, 1875.

"word 'KEYSTONE.'"

2,332.—Cotton Prints.—HAMILTON WOOLEN COMPANY, Southbridge, Mass. Application filed March 22, 1875.

"words 'Knickerbocker Prints.'"

2,333.—Cough-Sirup.—LES SŒURS DE L'ASILE DE LA PROVIDENCE DE MONTREAL, Montreal, Canada. Application filed March 24, 1875.

"seal of corporation, around which are printed the words 'Sirop de Gomme d'Epinette Composé,' and 'Compound Syrup of Spruce Gum,' which have been generally arranged as shown in the accompanying drawing. Such seal is composed of the figure of a virgin, sitting on a throne, at the foot of which are two figures of saints; around these figures are the words 'Charitas Christi Urget Nos,' and under the throne the letters A. P. M., the whole being surrounded by a wreath of lilies."

2,334.—Petroleum and its Products and Other Oils.—POWER BROTHERS & CO., London, England, and WILLIAM H. POWER & CO., New York, N. Y. Application filed March 25, 1875.

"word 'INTERNATIONAL.'"

2,335.—Floor-Cloths and Similar Fabrics.—FREDERICK WALTON, Staines, England. Application filed March 22, 1875.

"letters 'LINOLEUM.'"

2,336.—Cider-Mills.—WHITMAN AGRICULTURAL WORKS, St. Louis, Mo. Application filed March 22, 1875.

"words 'Whitman's Americus.'"

2,337.—Atomizers.—YOUNG, LADD & COFFIN, New York, N. Y. Application filed March 13, 1875.

"words 'Centennial Perfumer and Atomizer.'"

APPLICATION FOR EXTENSION.

UNITED STATES PATENT OFFICE,
Washington, D. C., March 22, 1875.

On the petition of JOHN HASELTINE, of Boston, Mass., authorized by act of Congress approved February 18, 1875, praying for the extension of a patent granted to him on the 25th day of March, 1856, for an Improvement in Water-Wheels,

It is ordered that the testimony in the case be closed on the 11th day of May next; that the time for filing arguments and the Examiner's report be limited to the 21st day of May next; and that said petition be heard on the 26th day of May next.

Any person may oppose this extension.

J. M. THACHER, *Commissioner.*

BOUND VOLUMES OF PATENTS.

The bound volumes of patents, containing the specifications and drawings of patents in full from May 30, 1871, to within a few months of date, may be consulted at the following places:

Astor Library, New York city.
American Society Civil Engineers, New York city.
Bronson Library, Waterbury, Ct.
Court of Appeals, Syracuse, N. Y.
Cooper Union Library, New York city.

Y. M. C. A. Library, Scranton, Pa.
Y. M. M. L. A., Cincinnati, Ohio.

COPIES OF SPECIFICATIONS AND DRAWINGS.

Persons desiring copies of all specifications and drawings of any particular class of patents can purchase them at the rate of ten cents each, and have them mailed, free, to their address, as soon as possible after the patents are issued, by leaving a deposit of not less than three dollars with the Commissioner of Patents. The index of classes for subscribers, date of September, 1871, is furnished gratis to any applicant.

In ordering copies of any drawing or specification, the name of the inventor and patentee, the title of the invention, and the date of the patent must be given; and for any search required in consequence of the omission of any of these data a charge of one dollar may be made. So in ordering a copy of an assignment, the liber and page of the record, as well as the name of the inventor, must be given; otherwise an extra charge will be made for the time consumed in making any search that may become necessary.

Copies of the specifications and drawings of design patents will be furnished by the Patent Office at the cost of making them. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

REMITTANCES.

All money sent by mail, either to or from the Patent Office, will be at the risk of the owner. In no case should money be sent inclosed with models. All payments to or by the Office must be paid in specie, Treasury notes, national bank-notes, certificates of deposit, or post-office money-orders.

INDEX OF INVENTIONS PATENTED MARCH 30, 1875.

	Class No.	No. of Patent
Air cooling apparatus, F. A. Hyatt	58	161,515
Alarm register, fire, Phelps and Edmonds	50	161,544
Auger, earth, D. J. Arnold	51	161,374
Awl for shoemakers, S. A. Smith	16	161,502
Bag holder, D. and C. Garver	57	161,501
Bag holder, M. Olson	57	161,435
Bale tie, J. H. Hardman	7	161,409
Bale tie, H. B. Jones	7	161,416
Bath tub, A. C. Brownell	8	161,324
Bed bottom, O. F. A. Faulkner	62	161,333
Bed lounge, C. Astalfy	62	161,319
Bed rails to their posts, device for fastening, L. Guienot	62	161,507
Bed, ventilating, E. L. Roberts	62	161,551
Bee hive, G. H. Mobley	9	161,428
Beer, manufacture of medicated, R. W. Tavener	98	161,574
Bell pulls, &c., fastening for, J. Schade	34	161,355
Belt coupling, J. Hare	81	161,509
Bill file, T. Hutchinson	146	161,415
Blastings, &c., priming for electric, G. M. Mowbray	50	161,432
Blower, rotary, J. McCloskey	12	161,349
Boiler for water heaters, J. R. Lamb	154	161,522
Boiler, sectional steam, H. Whittingham	148	161,582
Boiler tube cleaner, C. Schmandt	148	161,558
Bonds, &c., machine for numbering, embossing, and inking, Bodel, Masse, and Webster	117	161,473
Boot and glove buttoner, combined, G. Stackpole	23	161,548
Boot and shoe heels, machine for constructing, E. N. Higley	16	161,511
Boots and shoes, cording material for, A. P. Nash	16	161,434
Boots and shoes, machine for inserting fibrous screw fastenings in, G. V. Sheffield	16	161,449
Bottle, mustard, A. A. Plastridge	88	161,351
Breeching attachment, T. S. Hanchett	72	161,408
Brick machine, W. S. Wallace	20	161,580
Burner attachment, lamp and gas, T. V. Keam	90	161,517
Burner, gas, J. W. Lyon	64	161,531
Burner, gas generating, R. F. Clayton	64	161,327
Burner, vapor, S. S. Gray	90	161,336
Butter print, R. S. Williams	45	161,464
Candle holder, H. Smith	90	161,360
Cane juice, apparatus for bleaching, J. M. Lescale	155	161,527
Car body, street, J. Stephenson	121	161,570
Car brake, H. F., J. M., and W. B. Rice	122	161,549
Car brake, E. Stewart	122	161,571
Car coupling, C. C. Garrett	122	161,405
Car door, freight, McCarty and Glenn	121	161,345
Car platform, street, J. Stephenson	121	161,569
Car spring, B. A. Clooney	122	161,386
Car, street, J. Stephenson	121	161,565
Car, street, J. Stephenson	121	161,566
Car, street, J. Stephenson	121	161,567
Cars, signaling device for street, J. Stephenson	121	161,568
Carriage, hose, T. McCabe	31	161,425
Carriages, fifth wheel for, R. W. McClelland	31	161,348
Carriages, prop nut and rivet for, G. A. Keene	14	161,518
Cartridge shell, N. C. Hunting	32	161,514
Cartridge shells, machine for feeding, A. C. Carey	32	161,382
Carts, trough for coal, W. P. Patton	31	161,543
Churn, P. La Tourrette	45	161,525
Cistern supply regulator, automatic, T. Van Kannel	126	161,457
Clothes drier, M. C. Griffeth	91	161,406
Clothes frame, C. T. Rowe	91	161,554
Coal hod, J. H. Murphy	154	161,433
Coal hod, C. F. Thomas	154	161,577
Cock, self-closing, W. Knaust	152	161,341
Coke and illuminating gas, apparatus for the manufacture of, J. T. B. Bennett	66	161,377
Concentrator, J. Vincent, Sr.	3	161,460
Corn dropper, I. G. Vail	133	161,363
Cradle, automatic, W. Kindermann	62	161,417
Cultivator, F. W. Tolley	43	161,455
Cup, seasoning, J. Coulthard	88	161,484
Cupboard and sink, combined, H. Cull	88	161,389
Curtain fixture, Buckley and Sawyer	62	161,477
Curtain fixture, O. Ellsworth	62	161,496
Curtain fixture, H. L. Hall	62	161,407
Cutter head, F. Schwamb	173	161,447
Dental plugger, R. B. Donaldson	46	161,393
Digger, potato, H. W. King	114	161,520
Door check, D. Gundelfinger	24	161,505
Draw head, J. H. Garteide	122	161,335
Drier, lumber, J. J. Curran	48	161,490
Drilling rails, device for, J. H. Lakey	100	161,418
Elevators, coal and other, Winslow and Goldsmith	79	161,584
Engine, air and gas, J. Taggart	2	161,454

	Class No.	No. of Patent.
Engine, direct-acting reciprocating, R. Creuzbaur	150	161,486
Engine, hydraulic, F. Rochow	118	161,441
Engines, cut off for steam, D. H. Smith	152	161,451
Engines, pumps, &c., piston for steam, Felbinger and Koch	151	161,400
Envelope, shirt, J. Gilbert	109	161,503
Equalizer, draft, W. H. Brown	31	161,476
Evaporating apparatus, F. Randon	155	161,353
Excavator, M. E. Lasher	51	161,524
Faucet, beer, Miller and Powell	167	161,427
Feed cutter, J. A. Schwerdt	50	161,448
Fenders, &c., feet for, F. S. Bissell	154	161,470
Fifth wheel for carriages, R. W. McClelland	31	161,348
File wrapper, Grinsted and Darling	146	161,506
Finger ring boxes, machine for making cushions for, B. L. Dennison	86	161,493
Fire arm, breech loading, W. M. Scott	18	161,559
Fire arm, magazine, R. S. Chaffee	18	161,480
Fire arms, lock for, J. H. Lester	55	161,343
Fire box door ring, G. F. Chalender	118	161,481
Fire extinguisher, chemical, A. Gray	35	161,504
Fire extinguishing apparatus, J. H. Connelly	118	161,388
Floor and ceiling, fire-proof, L. T. Scofield	4	161,356
Floor and ceiling, fire-proof, L. T. Scofield	4	161,357
Flowers, artificial, S. Orth	54	161,350
Forge blower, L. H. Watson	12	161,581
Fork, horse hay, E. V. R. Gardner	77	161,404
Fracture splint, Brown and Davis	156	161,323
Fruit gatherer, N. Lash	63	161,523
Fulling mill, R. Eickemeyer, (reissue)	76	6,358
Furnace for steam generators, H. M. Smith	149	161,361
Furnace, hot air, W. McFarland	154	161,535
Furnace of bakers' ovens, Crumbie and Donald	6	161,489
Furnace, pipe welding, J. Fieldhouse	60	161,401
Fuses, priming for electric, G. M. Mowbray	50	161,430
Fuses, &c., priming for electric, G. M. Mowbray	50	161,431
Gas retort, W. Harkness	66	161,410
Gas retort, W. F. Weible	66	161,369
Gate, farm, S. R. Holt	52	161,337
Generator, steam, S. R. Mathewson	148	161,423
Generators, fusible plug for steam, J. F. Mahoney	148	161,422
Glove, Clute and Derfee, (reissue)	38	6,352
Grain drier, R. S. Reynolds, (reissue)	48	6,361
Grain drill teeth, I. B. Sandusky	133	161,445
Grain, machine for hulling and cleaning, Wallace and Hyde	57	161,367
Grain scourer, T. Wallace	57	161,368
Grate bar, A. W. Cram	149	161,485
Grate bar, R. C. Graves, (reissue)	72	161,338
Harness snap, L. Humbert	74	6,359
Harvester, J. H. Elward, (reissue)	74	161,395
Harvester, J. H. Elward	74	161,396
Harvester, J. H. Elward	74	6,351
Harvester, Buxton and Howe, (reissue)	74	161,530
Harvester, S. S. Loudenslager	74	161,540
Harvester rake, J. P. Monnett	72	161,446
Horse collar and hame, Schneider and Meek	72	161,461
Horses, apparatus for breaking, J. Z. Walling	60	161,427
Horseshoe fastening, McVeen and Price	60	161,379
Horseshoe nails, machine for making, A. D. Bingham	81	161,383
Hose, device for drying and stretching, A. C. Carey	81	161,492
Hose joint, E. Dayton	81	161,463
Hose, machine for manufacturing hydraulic, J. A. Wiley	58	161,474
Ice machine, W. H. B. Bowers	85	161,320
Iron, manufacture of, J. F. Bennett	31	161,387
Jack, thill coupling, J. H. Combs	61	161,466
Kiln, peat, W. E. Wright	90	6,355
Lamp, B. B. Schneider, (reissue)	90	161,339
Lamp chimney attachment, H. Johnson	172	161,384
Lathes, centering device for wood turning, H. B. Carpenter	24	161,411
Letter box alarm, J. Harrison	74	161,483
Lever attachment for mowing machines, A. B. Conde	163	161,541
Lightning rods, machine for making, W. B. Mann	93	161,375
Lock, combination, W. Baldwin	93	161,371
Lock for doors, &c., H. Winn	95	161,437
Loom for weaving hair cloth, J. Paradis	95	161,443
Loom let-off mechanism, Rose, Cartwright, and Rose	95	161,545
Loom shuttle, R. W. Porter	87	161,468
Lubricating compound, I. G. Betts	87	161,469
Lubricating compound, I. G. Betts	87	161,521
Lubricating compound, J. J. Koch	174	161,532
Matches, machine for boxing, F. Mansfield	25	161,510
Meat cutter, J. P. Harris	153	161,414
Millstones, making emery rubbers for burr, E. C. Illingsy	124	161,325
Mining powder, R. Cahoe	74	161,322
Mowing machine, W. W. Briglin	74	161,533
Mowing machine, H. C. and D. C. Markham	74	161,483
Mowing machines, lever attachment for, A. B. Conde	38	161,378
Neck tie fastening, E. Berliner	14	161,462
Nut lock, O. T. Welch	156	191,362
Obstetrical supporter, W. E. Steinbeck	105	161,579
Ordnance, projectile for rifled, W. H. Van Gieson	3	161,456
Ore crusher, D. Trumbull, Jr.	85	161,380
Oven for annealing building blocks of furnace slag, R. Beyer		

	Class No.	No. of Patent.
Painting and banner, G. Frohe	54	161,499
Pantaloons shaper, R. M. Eastman	38	161,495
Paper boson, E. P. Furlong	109	161,403
Pavements, composition for, J. P. Richardson	110	161,550
Pen handle and lead pencil combined, H. C. Benson	146	161,467
Piano stool, Düring and Leck	62	161,394
Pile driver, explosive, J. M. Allen	62	161,373
Pin and clamp, combined shawl, G. and F. Hartje	86	161,413
Pipe fittings, machine for tapping, J. Kacerovsky	64	161,340
Pitcher, glass sirup, L. Wagner	68	161,364
Plane, bench, W. Johnstone	29	161,516
Planing machine, wood, J. Ross	173	161,444
Planter, seed, Post and Colbert	133	161,438
Plow, ditching, A. L. Harned	114	161,509
Plow, sulky, E. Robertson	114	161,440
Press, cider, D. F. Emry	19	161,397
Press, screw, W. H. H. Minge	7	161,539
Priming for electric blastings, &c., G. M. Mowbray	50	161,432
Priming for electric fuses, G. M. Mowbray	50	161,431
Priming for electric fuses, G. M. Mowbray	50	161,430
Priming for electric fuses, G. M. Mowbray	117	161,370
Printing press, plate, J. Wilson	150	161,376
Propellers, speed regulator for, E. E. Bean	97	161,392
Protractor, A. H. Dodd, (reissue)	63	161,381
Pruning implement, C. B. Cannon	116	6,357
Pump, Curtis and Russell, (reissue)	118	161,563
Pump box, W. A. Spooner	68	6,360
Putty, manufacture of, G. W. Hatfield, (reissue)	101	161,330
Pyrometer, B. Crawford	134	161,458
Quilter and corder, gage, G. Vincent	190	161,439
Railroad pinch bar, C. Ragan	120	161,547
Railroad rail chair, J. Raddin	120	161,519
Railroad signal, R. L. Kilpatrick	50	161,561
Railroad signaling apparatus, electrical, Siemens and Frischen	77	161,358
Rake, horse hay, D. P. Sharp	154	161,365
Range, portable, G. W. Walker	154	161,442
Register, adjustable ventilating, G. W. Rogers	57	161,553
Regulator, feed, J. M. Ross	143	161,537
Rocker, child's, B. E. Merembeck	73	161,512
Roller, field, A. Hilts	126	161,420
Roof, metallic, T. M. Loeie	126	161,538
Roofing tile, S. Mills	35	161,412
Salt brine, purifying and concentrating, W. Harrison	24	161,564
Sash weight, E. J. Sprague	131	161,557
Saw gummer, D. Sattler	131	161,583
Saw, jig, G. S. Williams	130	161,352
Saw mill, D. C. Prescott	130	161,585
Sawing machine, scroll, G. S. Young	132	161,575
Scale beam, T. Tebow	132	161,576
Scale beam, T. Tebow	171	161,390
Screw, wood, A. Cummings	171	161,528
Screw, wood, Litchfield and Boeklen	171	161,529
Screws of rolls, mechanism for operating the adjusting, J. S. Worth	125	161,465
Seal, metallic, E. J. Brooks	93	161,475
Sewing machine, H. A. Blanchard	134	161,471
Sewing machine, H. A. Blanchard	134	161,472
Sewing machine, J. H. Barr	134	161,478
Sewing machine, L. Chevallier	134	161,492
Sewing machine, O. Farrar	134	161,399
Sewing machine attachment, D. M. Mellon	134	161,536
Sewing machine for stitching button holes, &c., J. McCloskey	134	161,534
Sewing machine presser feet, guide attachment for, G. Vincent	134	161,459
Sheet metal, die for raising articles of, N. C. Stiles	136	161,572
Shoe, C. Perley, (reissue)	16	6,354
Shoe soles, apparatus for drying, A. F. Smith, (reissue)	16	6,362
Shoes, device for exhibiting, R. T. Leaverton	16	161,526
Shoemakers, awl for, S. A. Smith	16	161,562
Shovel, T. J. Blake	141	161,321
Shutter and blind fastening, C. H. Craig	24	161,329
Shutter fastener, C. Russell	24	161,556
Shuttle box mechanism, G. Crompton	95	161,487
Shuttle mechanism, G. Crompton	95	161,488
Slicer and corer, apple, Siler and Brooks	88	161,359
Spinning ring blanks, die for forging, Forehand and Wadsworth	142	161,334
Stamp, hand, J. Sigwalt, Jr.	146	161,450
Steel, manufacture of, J. Eyquem	85	161,398
Stereotype blocks, registering device for, A. J. O'Shea	164	161,542
Stove, E. Smith, (reissue)	154	6,363
Stove, magazine, E. Bussey	154	161,479
Stump extractor, W. H. Fulton	79	161,500
Sugar, manufacturing hard, F. O. Mathiessen	155	161,494
Table, convertible, F. A. Gilbert	62	161,502
Table, folding extension, A. W. Fay	62	161,497
Table implement, O. W. Taft	44	161,573
Thill coupling, A. W. Forwood	31	161,402
Thill coupling, J. Walker	31	161,366
Thread, twine, &c., twister for making, Sutherland and Groves	142	161,453
Tile molding machine, C. Diebold	39	161,391
Tippet and muff, combined, J. Engel	39	161,393
Tobacco machine, lump, D. W. De Forest	160	161,331
Towel rack, folding, J. T. Sherwin	62	161,560
Toy block, C. M. Crandall, (reissue)	143	6,356
Toy pistol, T. Case	143	161,396

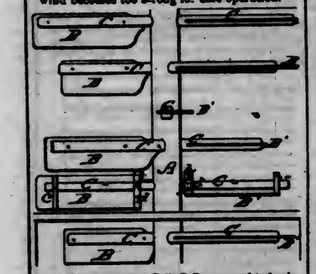
	Class No.	No. of Patent.
Trap, fly, H. B. Earing	143	161,494
Trap, fly, D. E. Roe	143	161,354
Trimming, J. T. Ross	38	161,552
Truck, hand, H. Parker	31	161,436
Truss, J. L. Rowe	156	161,555
Valve, rotary reversing and cut-off, J. C. H. Stut	152	161,452
Valve, slide, V. Forquenot	152	161,496
Vehicle bolster plate, W. J. Lewis	31	161,344
Vessels, construction of spindle-shaped, W. L. and T. Winans	137	161,373
Wagon, R. W. McClelland	31	161,346
Wagon standard, R. W. McClelland	31	161,347
Washing and wringing machine, combined, J. H. Cook	91	161,398
Watch, J. R. Hopkins	36	161,513
Watch closing and indicating apparatus, D. Moore	36	161,429
Watch key, H. Lohmeyer	36	161,491
Well, filter, W. P. Powers	51	161,546
Well points, drive, D. A. Danforth	167	161,491
Wheel molds, forming gear, J. Clayton	31	161,385
Whip socket, J. M. Underwood	31	161,578
Windmill, J. M. Armour	118	161,316
Window sash, W. Kreitzer	30	161,342
Window screen, L. D. Lockwood	30	161,419

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED MARCH 30, 1875.

	Patent No.
Alexander, C. M., assignee	161,340
Allen, J. M., Explosive pile driver	161,373
Armour, J. M., Windmill	161,318
Arnold, D. J., Earth auger	161,374
Astalfy, C., Bed lounge	161,319
Baldwin, W., Combination lock	161,375
Bean, E. E., Speed regulator for propellers	161,376
Beardsley, G. F., assignee	161,524
Benedict, W. R., assignee	161,497
Bennett, J. F., Manufacture of iron	161,320
Bennett, J. T. B., Apparatus for the manufacture of coke and illuminating gas	161,377
Benson, H. C., Combined pen handle and lead pencil	161,467
Berliner, E., Neck tie fastening	161,378
Betts, I. G., Lubricating compound	161,468
Betts, I. G., Lubricating compound	161,469
Bingham, A. D. Machine for making horseshoe nails	161,379
Bissell, F. S., Feet for fenders, &c	161,470
Blake, T. J., Shovel	161,321
Blanchard, H. A., Sewing machine	161,471
Blanchard, H. A., Sewing machine	161,472
Bodell, L. G., J. Masse, and W. Webster, Machine for numbering, embossing, and inking bonds, &c	161,473
Boeklen and Litchfield	161,528, 161,529
Bowers, W. H. B., Ice machine	161,474
Beyer, R., Oven for annealing building blocks of furnace slag	161,380
Briglin, W. W., Mowing machine	161,322
Brooks, E. J., Metallic seal	161,475
Brooks and Siler	161,359
Brown, G. H., and R. C. Davis, Fracture splint	161,323
Brown, W. H., Draft equalizer	161,476
Brownell, A. C., Bath tub	161,324
Buckley, C., and L. L. Sawyer, Curtain fixture	161,477
Burr, J. H., Sewing machine	161,478
Bussey, E., Magazine stove	161,479
Buxton, J. E., and T. J. Howe, Harvester, (reissue)	6,351
Byers, E., & Sons, assignees	161,543
Cahoe, R., Mining powder	161,325
Cannon, C. B., Pruning implement	161,381
Carey, A. C., Machine for feeding cartridge shells	161,382
Carey, A. C., Device for drying and stretching hose	161,383
Carpenter, W. B., Centering device for wood turning lathes	161,384
Cartwright and Rose	161,443
Case, T., Toy pistol	161,396
Chaffee, R. S., Magazine fire arm	161,480
Chalender, G. F., Fire box door ring	161,481
Chamberlain, A. N., assignee	161,491
Chevallier, L., Sewing machine	161,482
Clayton, J., Forming gear wheel molds	161,385
Clayton, R. F., Gas generating burner	161,327
Clooney, B. A., Car spring	161,386
Chute, S. J., and D. M. Durfee, Glove, (reissue)	6,352
Colbert and Post	161,438
Collard, G. D., assignee	161,548
Colton, F. B., assignee	161,373
Combs, J. H., Thill coupling jack	161,387
Conde, A. B., Lever attachment for mowing machines	161,483
Connelly, J. H., Apparatus for extinguishing fires	161,388
Cook, J. H., Combined washing and wringing machine	161,398
Costello, J., assignee	161,327
Coulthard, J., Seasoning cup	161,484
Craig, C. H., Shutter and blind fastening	161,329
Cram, A. W., Grate bar	161,485
Crandall, C. M., Toy block, (reissue)	6,356
Crandall, C. M., & Co., assignees, (reissue)	6,356
Crawford, B., Pyrometer	161,330
Creusbaur, R., Direct-acting reciprocating engine	161,486

	Patent No.
Crompton, G., Shuttle box mechanism	161,487
Crompton, G., Shuttle mechanism	161,488
Crumbie, A., and D. Donald, Furnace of bakers' ovens	161,489
Cull, H., Combined cupboard and sink	161,389
Culter, R. A., assignee	161,494
Cummings, A., Wood screw	161,390
Curran, J. J., Lumber drier	161,490
Curtis, F., and E. P. Russell, Pump, (reissue)	6,357
Danforth, D. A., Drive well point	161,491
Darling and Grinsted	161,506
Davis and Brown	161,323
Dayton, E., Hose joint	161,492
De Forest, D. W., Lump tobacco machine	161,331
Dennison, B. L., Machine for making cushions for finger ring boxes	161,493
Diebold, C., Tile molding machine	161,391
Dodd, A. H., Protractor	161,392
Donald and Crumbie	161,489
Donaldson, R. B., Dental plugger	161,393
Drake, H. L., assignee, (reissue)	6,362
Durfee and Clute, (reissue)	6,352
During, C. A. A., and J. Leck, Piano stool	161,394
Dutcher, G. N., assignee	161,401
Earing, H. B., Fly trap	161,494
Eastman, R. M., Pantaloons shaper	161,495
Edmonds and Phelps	161,544
Eickemeyer Felting Company, assignee, (reissue)	6,358
Eickemeyer, R., Fulling mill, (reissue)	6,358
Ellsworth, O., Curtain fixture	161,496
Elward, J. H., Harvester, (reissue)	6,359
Elward, J. H., Harvester	161,395
Elward, J. H., Harvester	161,396
Elward, J. H., Harvester	161,397
Emry, D. F., Cider press	161,332
Engel, J., Combined tippet and muff	161,398
Eyquem, J., Manufacture of steel	161,359
Farrar, O., Sewing machine	161,437
Faulkner, E. H., assignee	161,333
Faulkner, O. F. A., Bed bottom	161,400
Faulkner, W. H., assignee	161,497
Fay, A. W., Folding extension table	161,400
Felbinger, F., and J. G. Koch, Piston for steam engines, pumps, &c	161,401
Fieldhouse, J., Pipe welding furnace	161,534
Folk, D. C., assignee	161,499
Forehand, S., and H. C. Wadsworth, Die for forging spinning ring blanks	161,334
Forquenot, V., Slide valve	161,498
Forwood, A. W., Thill coupling	161,402
Frary, J. D., assignee	161,326
French, A. D., assignee	161,493
Friechen and Siemens	161,561
Frohe, G., Painting and banner	161,499
Fulton, W. H., Stump extractor	161,500
Furlong, E. P., Paper bosom	161,403
Gardner, E. V. R., Horse hay fork	161,404
Garrett, C. C., Car coupling	161,405
Gartside, J. H., Draw head	161,335
Garver, D. and C., Bag holder	161,501
Geyser, J. B., assignee	161,335
Gilbert, F. A., Convertible table	161,502
Gilbert, J., Shirt envelope	161,503
Glenn and McCarty	161,345
Goldmark, J., assignee	161,429
Goldsmith and Winslow	161,584
Goodhue, W. S., assignee, (reissue)	6,359
Graves, R. C., Grate bar, (reissue)	6,353
Gray, A., Chemical fire extinguisher	161,504
Gray, S. S., Vapor burner	161,336
Green, W. D., assignee	161,580
Griffeth, M. C., Clothes drier	161,406
Grinsted, W., and J. A. Darling, File wrapper	161,506
Groves, T., administrator	161,453
Guienot, L., Device for fastening bed nails to their posts	161,507
Gundelfinger, D., Door check	161,505
Hall, H. L., Curtain fixture	161,407
Hanchett, T. S., Breeching attachment	161,408
Hardman, J. H., Bale tie	161,409
Hare, J., Belt coupling	161,508
Harkness, W., Gas retort	161,410
Harned, A. L., Ditching plow	161,509
Harris, J. P., Meat cutter	161,510
Harrison, J., Letter box alarm	161,411
Harrison, W., Purifying and concentrating salt brine	161,412
Hartje, G. and F., Combined shawl pin and clamp	161,413
Hatfield, G. W., Manufacture of putty, (reissue)	6,360
Herr, A. H., assignee, (reissue)	6,361
Hersome, C., assignee, (reissue)	6,354
Higley, E. N., Machine for constructing boot and shoe heels	161,511
Hilts, A., Field roller	161,512
Himzey, E. C., Making emery rubbers for burr millstones	161,414
Hobbs, J. H., Brockunier & Co., assignees	161,364
Hobbs, W. H., assignee, (reissue)	6,353
Holt, S. R., Farm gate	161,337
Hopkins, J. R., Watch	161,513
Howe and Buxton, (reissue)	6,351
Humbert, L., Harness snap	161,338
Hunting, N. C., Cartridge shell	161,514
Hutchison, T., Bill file	161,415
Hyatt, F. A., Air cooling apparatus	161,515
Hyde and Wallace	161,367
Jacobson, J., assignee	161,436
Jeerns, H., assignee	161,577

	Patent No.
Johnson, H., Lamp chimney attachment	161,339
Johnston, J., assignee	161,409
Johnstone, W., Bench plane	161,516
Jones, H. B., Bale tie	161,416
Kacerovsky, J., Machine for tapping pipe fittings	161,340
Keam, T. V., Lamp and gas burner attachment	161,517
Keene, G. A., Prop nut and rivet for carriages	161,518
Kilpatrick, R. L., Railroad signal	161,519
Kindermann, W., Automatic cradle	161,417
King, H. W., Potato digger	161,520
Knaust, W., Self-closing cock	161,341
Koch, J. J., Lubricating compound	161,521
Koch and Felbinger	161,400
Kreitzer, W., Window sash	161,342
Lakey, J. H., Device for drilling rails	161,418
Lane Manufacturing Company, assignee	161,384
Lamb, J. H., Boiler for water heaters	161,522
Lash, N., Fruit gatherer	161,523
Lasher, M. E., Excavator	161,524
La Tourrette, P., Churn	161,525
Leaverton, R. T., Device for exhibiting shoes	161,526
Leck and Düring	161,394
Leesale, J. M., Apparatus for bleaching cane juice	161,527
Lester, J. H., Lock for fire arms	161,343
Lester, M. W. and F., assignees	161,361
Lewis, W. J., Bolster plate for vehicles	161,344
Litchfield, C. T., and R. Boeklen, Wood screw	161,528
Litchfield, C. T., and R. Boeklen, Wood screw	161,529
Lockwood, L. D., Window screen	161,419
Lohmeyer, H., Watch key	161,421
Loste, T. M., Metallic roof	161,420
Loudenslager, S. S., Harvester	161,530
Lyon, H. A., assignee	161,338
Lyon, J. W., Gas burner	161,531
Mahoney, J. F., Fusible plug for steam generators	161,422
Maloney, J. A., assignee, (reissue)	6,361
Mansfield, F., Machine for boxing matches	161,532
Markham, H. C. and D. C., Mowing machine	161,533
Marriott, A., assignee	161,522
Mason, J. M., assignee	161,340
Masse, Webster, and Bodel	161,473
Mathewson, S. R., Steam generator	161,423
Matthiessen, F. O., Manufacturing hard sugar	161,424
May, L. A., assignee, (reissue)	6,362
McCabe, T., Hose carriage	161,425
McCarty, H. C., and E. Glenn, Freight car door	161,345
McClelland, R. W., Wagon	161,346
McClelland, R. W., Wagon standard	161,347
McClelland, R. W., Fifth wheel for carriages	161,348
McCloskey, J., Sewing machine for stitching button holes, &c.	161,534
McCloskey, J., Rotary blower	161,349
McFarland, W., Hot air furnace	161,535
McLeod, C. A., assignee	161,479
McVeen, S., and B. K. Price, Horseshoe fastening	161,426
Meek and Schneider	161,446
Mellon, D. M., Sewing machine attachment	161,536
Meremboek, B. E., Child's rocker	161,537
Miller, J. T., assignee	161,575
Miller, W. B., and W. Powell, Beer faucet	161,427
Mills, S., Roofing tile	161,538
Minge, W. H. H., Screw press	161,539
Mobley, G. H., Bee hive	161,428
Monnett, J. P., Harvester rake	161,540
Moore, D., Watch closing and indicating apparatus	161,429
Morgan, E. F., assignee	161,343
Moury, J. B., assignee	161,328
Mowbray, G. M., Priming for electric fuses	161,430
Mowbray, G. M., Priming for electric fuses, &c	161,431
Mowbray, G. M., Priming for electric blastings, &c	161,432
Munn, W. B., Machine for making lightning rods	161,541
Murphy, J. H., Coal hod	161,433
Nash, A. P., Cording material for boots and shoes	161,434
New York Car-Spring Company, assignee	161,386
Olson, M., Bag holder	161,435
Openheimer, L. M., assignee	161,405
Orth, S., Artificial flowers	161,350
O'Shea, A. J., Registering device for stereotype blocks	161,542
Palmer, G. L., assignee	161,393
Paradis, J., Loom for weaving hair cloth	161,437
Parker, H., Hand truck	161,436
Patton, W. P., Trough for coal carts	161,543
Perley, C., Shoe, (reissue)	6,354
Peters, G. B., assignee	161,468, 161,469
Phelps, D. T., and C. W. Edmonds, Fire alarm register	161,544
Pinstridge, A. A., Bottle for mustard	161,351
Porter, R. W., Loom shuttle	161,545
Post, W., and M. Colbert, Seed planter	161,438
Powell and Miller	161,427
Powers, W. P., Filter well	161,546
Prescott, D. C., Saw mill	161,352
Price and McVeen	161,426
Raddin, J., Railway rail chair	161,547
Ragan, C., Railroad pinch bar	161,439
Randon, F., Evaporating apparatus	161,353
Ransom, S. H., assignee, (reissue)	6,363
Reckendorfer, J., assignee	161,467
Reynolds, R. S., Grain drier, (reissue)	6,361
Rice, H. F., J. M., and W. B., Car brake	161,549
Richardson, J. P., Composition for pavements	161,550
Roberts, E. L., Ventilating bed	161,551
Robertson, E., Sulky plow	161,440
Robertson, W. W., assignee	161,516
Rochow, F., Hydraulic engine	161,441
Roe, D. E., Fly trap	161,354
Rogers, G. W., Adjustable ventilating register	161,442
Rose, G. P., A. Cartwright, and B. S. Rose, Let-off mechanism for looms	161,443
Ross, J., Wood planing machine	161,444
Ross, J. M., Feed regulator	161,553
Ross, J. T., Trimming	161,552
Rowe, C. T., Clothes frame	161,554
Rowe, J. L., Truss	161,555
Russell, C., Shutter fastener	161,556
Russell and Curtis, (reissue)	6,357
Sandusky, I. B., Grain drill teeth	161,445
Sattler, D., Saw gummer	161,557
Sawyer and Buckley	161,477
Schade, J., Fastening for bell pulls, &c	161,355
Schmandt, C., Boiler tube cleaner	161,558
Schneider, B. B., Lamp, (reissue)	6,355
Schneider, J. J., and A. S. Meek, Horse collar and hame	161,446
Schofield, E., assignee	161,556
Schwamb, F., Cutter head	161,447
Schwerdt, J. A., Feed cutter	161,448
Scofield, L. T., Fire-proof floor and ceiling	161,356
Scofield, L. T., Fire-proof floor and ceiling	161,357
Scott, W. M., Breech loading fire arm	161,559
Sharp, D. P., Horse hay rake	161,358
Sheffield, G. V., Machine for inserting fibrous screw fastenings in boots and shoes	161,449
Sherwin, J. T., Folding rack for towels	161,560
Siemens, E. W., and C. L. Frischen, Electrical railway signaling apparatus	161,561
Sigwalt, J., Jr., Hand stamp	161,450
Siler, H. H., and T. A. Brooks, Apple slicer and corer	161,359
Smith, A. F., Apparatus for drying shoe soles, (reissue)	6,362
Smith, D. H., Cut off for steam engines	161,451
Smith, E., Stove, (reissue)	6,363
Smith, H., Candle holder	161,360
Smith, H. M., Furnace for steam generators	161,361
Smith, S. A., Awl for shoemakers	161,562
Smith, W. T., assignee	161,530
Sparrow, E. S., assignee	161,329
Spooner, W. A., Pump box	161,563
Sprague, E. J., Sash weight	161,564
Stackpole, G., Combined boot and glove buttoner	161,548
Stainback, W. E., Obstetrical supporter	161,362
Stephenson, J., Street car	161,565
Stephenson, J., Street car	161,566
Stephenson, J., Street car	161,567
Stephenson, J., Signaling device for street cars	161,568
Stephenson, J., Street car platform	161,569
Stephenson, J., Street car body	161,570
Stewart, E., Car brake	161,571
Stiles, N. C., Die for raising articles of sheet metal	161,572
Stut, J. C. H., Rotary reversing and cut-off valve	161,452
Stuart, B., assignee	161,460
Sutherland, J., Twister for making thread, twine, &c	161,453
Taft, O. W., Table implement	161,573
Taggart, J., Air and gas engine	161,454
Tavener, R. W., Manufacture of medicated beer	161,574
Tebow, T., Scale beam	161,575
Tebow, T., Scale beam	161,576
Thomas, C. F., Coal hod	161,577
Tolley, F. W., Cultivator	161,455
Trumbull, D., Jr., Ore crusher	161,456
Tyson, W. W., assignee	161,409
Underwood, J. M., Whip socket	161,578
Vail, L. G., Corn dropper	161,363
Van Gieson, W. H., Projectile for rifled ordnance	161,579
Van Kannel, T., Automatic cistern supply regulator	161,457
Vincent, G., Gage quilter and corder	161,458
Vincent, G., Guide attachment for sewing machine presser feet	161,459
Vincent, J., Sr., Concentrator	161,460
Wadeworth and Forehand	161,334
Wagner, L., Glass syrup pitcher	161,364
Walker, G. W., Portable range	161,365
Walker, J., Thill coupling	161,366
Wallace, T., Grain scourer	161,368
Wallace, T., and G. Hyde, Machine for hulling and cleaning grain	161,367
Wallace, W. S., Brick machine	161,580
Walling, J. Z., Apparatus for breaking horses	161,461
Watson, L. H., Forge blower	161,581
Webster, Bodel, and Masse	161,473
Weible, W. F., Gas retort	161,369
Welch, J. S., E. P., J. H., R. W., and H. P., assignees, (reissue)	6,361
Welch, O. T., Nut lock	161,462
White, G., assignee	161,478
Whittingham, H., Sectional steam boiler	161,582
Wiley, J. A., Machine for manufacturing hydraulic hose	161,463
Williams, G. S., Jig saw	161,583
Williams, R. S., Butter print	161,464
Wilson, J., Plate printing press	161,370
Winans, W. L. and T., Construction of spindle-shaped vessels	161,372
Winn, H., Lock for doors, &c	161,371
Winslow, S., and T. Goldsmith Coal and other elevators	161,584
Withey, A. E., assignee, (reissue)	6,362
Worth, J. S., Mechanism for operating the adjusting screws of rolls	161,465
Wright, W. E., Peat kiln	161,466
Young, G. S., Scroll sawing machine	161,585



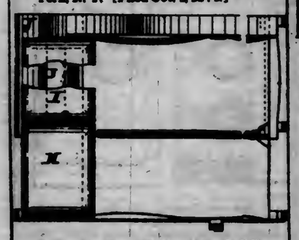
TITLES, DRAWINGS, AND CLAIMS

OF

PATENTS GRANTED MARCH 30, 1875

161,316. WINDMILLS. John M. Armour, Northwood, Ohio. [Filed Oct. 26, 1874.]

Brief.—The features of this invention are the self balancing and regulating arrangement, by allowing the opposite vanes to swing beyond the horizontal and vertical points till they are balanced, and the yielding and turning of the vanes on their shafts when the wind becomes too strong for safe operation.



1. Counter-vanes B B' B B', secured to horizontal rocking shafts C C, arranged in bearings of a vertical driving-shaft, A, the said vanes being arranged to have a free self-limiting movement beyond the horizontal and vertical lines, respectively, and constructed to turn automatically upon their shafts when a certain predetermined pressure of wind thereon shall have been reached, substantially as herein specified.

2. Regulating-brake D D, in combination with the vane-shafts C C, substantially as and for the purpose herein specified.

3. Safety latches or pins *f f*, in combination with the vanes B B' and shaft C, substantially as and for the purpose herein specified.

161,319. BED-LOUNGES. C. Antaly, New York, N. Y. [Filed Oct. 1, 1874.]

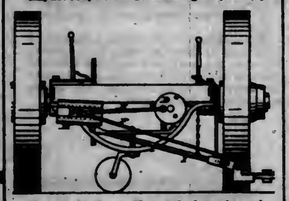
The combination, with the seat and sliding extension-frame of a sofa-bed, of the head-board H, connected to the upwardly-curved portion of the front rail of the sliding frame, and the supplemental head-board I, connected to the head-board H, substantially as and for the purpose described.

161,320. MANUFACTURE OF IRON. J. F. Bennett, Pittsburg, Pa. [Filed Jan. 2, 1875.]

Brief.—Makes silicon pig, rich in silicon, in the blast-furnace, and subjects it in a reverberating-furnace to the neutral flame for a definite time, whereby the silicon is replaced by the carbon of the carbonic-acid gas in a certain ratio.

1. The process herein described, for manufacturing iron, consisting in first reducing the ore in a blast or similar furnace with the minimum amount of flux, so as to obtain a silicon iron, and then subjecting the impure pig metal to a neutral flame of carbonic-acid gas for the removal of the silicon.

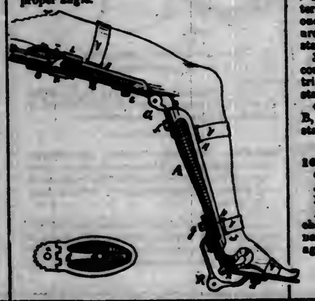
2. The process herein described for obtaining a pig metal containing a high percentage of carbon, consisting in first adding silica, such as quartz or jasper, to the iron ores, and reducing the admixture, so as to obtain an impure pig containing the desired amount of silicon, and then subjecting the impure pig metal to a neutral flame of carbonic-acid gas, so as to eliminate silicon and deposit carbon



161,321. SHOVELS. Thos. J. Blake, Pittsburg, Pa. [Filed June 1, 1874.]

Brief.—A shovel in which the blade is of steel, and the straps of iron, the two being united without welding or riveting.

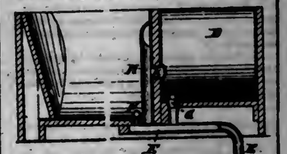
As a new article of manufacture, a shovel consisting of a blade and shank, with socket and straps for attachment to handle, the whole complete in a single piece of metal, composed of steel differing in temper, or composed in part of steel, and in part of iron, as above described, the said components existing in union independent of pressure-welding, rivets, or other separate fastening, substantially as specified.



161,322. MOWING-MACHINES. W. W. Briglin, Avoca, N. Y. [Filed Aug. 28, 1874.]

The inclined way H, attached to the main frame, and sliding pin G, in combination with the connecting-rods E and F and crank-wheel D, all constructed and arranged to operate the cutter-bar in the manner substantially as described.

161,323. FRACTURE-SPLINTS. George H. Brown and Robert C. Davis, Indianapolis, Ind. [Filed July 23, 1874.]



Brief.—In a jointed splint the section which carries the foot is so hinged as to permit lateral as well as vertical motion, and has a set-screw for one movement, and rack and pawl for the other, to confine the foot section at its proper angle.

The adjustable hinge-joint *s*, in combination with the section C and A of the splints, pivot-bolt *e*, ratchet *y*, and pin *p*, substantially as described.

161,324. BATH-TUBS. Asa C. Brownell, Brooklyn, N. Y. [Filed Sept. 4, 1874.]

Brief.—A bath-tub having a partition which forms on one side a plunge-bath, and on the other a sits or foot bath. A single overflow and discharge pipe serves for both baths.

The sits or foot bath D, having its sides cut down, as described, in combination with the overflow-pipe H and discharge-pipe E of the plunge-bath C, all constructed and arranged substantially as shown and described.

161,325. MINING-POWDERS. S. Cahuc, Toulouse, France. [Filed Aug. 21, 1874.]

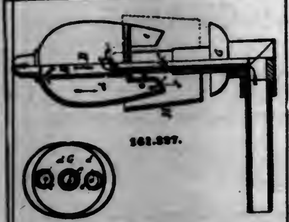
Brief.—Adds sulphate of iron to prevent combustion, except at very high temperatures.

A mining-powder composed of nitrate of potash, sulphur, tanner's bark, lamp-black, water, and sulphate of iron, substantially as described.

161,326. TOY PISTOLS. Truman Case, New Haven, assignor to James D. Frary, New Britain, Conn. [Filed Mar. 26, 1874.]

1. The method herein described of discharging suitably-prepared match-splints or arrows from toy pistols or guns by exploding the detonating material, substantially as described, within a barrel adapted to hold the splint until the explosion, and to substantially guide it thereafter.

2. A toy pistol for exploding detonating material, provided with a hammer and trigger in one piece, and operated by a simple lever-pressure to crush said detonating material, substantially as specified.



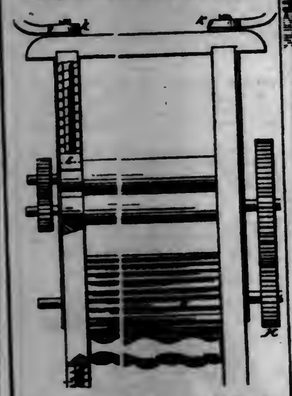
3. The combination of the barrel and stock, constructed in one piece, with a hammer and trigger, also constructed in one piece, substantially as described.

4. In combination with the stock A, barrel B, trigger C, and hammer D, the cap E, substantially as and for the purpose specified.

161,327. GAS-GENERATING BURNERS. E. F. Clayton, Melrose, assignor to himself and John Costello, Boston, Mass. [Filed Feb. 17, 1875.]

Brief.—The dome consists of a longitudinal chamber with lateral passages, which terminate in hollow legs, perforated to cast a jet against the generating-pipe.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON

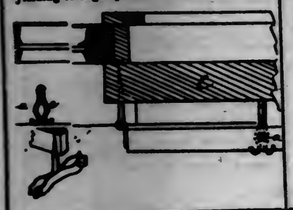


161,827.

1. The dome-shaped case D, composed of the mixing-chamber B, lateral passages *d*, hollow legs *e*, substantially as and for purposes stated.

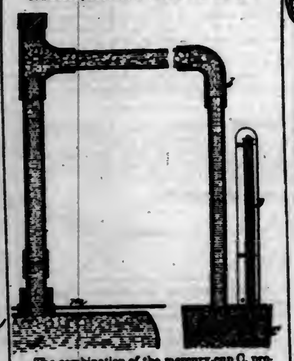
2. The dome D, consisting of chamber E, lateral passages *d*, and hollow legs *e*, in combination with the generating-pipe C, as shown and set forth.

3. The combination of the dome D, consisting of chamber E, lateral passages *d'*, and hollow legs *e*, with generating-pipe C, and shield H, as shown and set forth.



161,828. COMBINED WASHING AND WRINGING MACHINES. Joseph H. Cook, Mercer, Pa., assignor of one-half his right to J. B. Moury, same place. [Filed Apr. 10, 1874.]

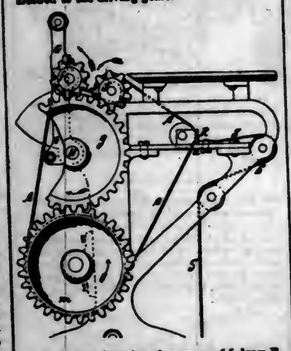
The combination of the cog-wheel H on the end of the washing-roller D, the cog-wheel J on the end of the wringer-roller G, the spring *i* under said roller, the screw-rods *f*, and the adjusting-nuts *h*, all as and for the purposes set forth.



161,829. SHUTTER AND BLIND FASTENINGS. Chas. H. Craig, Quincy, Mass., assignor to Edmund S. Sparrow, same place. [Filed Jan. 6, 1875.]

Brief.—A clutch or spring-fastening, made of thin strips of metal, with drive-spike attachment, is secured to the blind, and engages with a vertical pin or projection, like-wise secured to the window-sill or side of the building; the construction automatically fastening the blind or shutter closed or open, but yielding to slight pressure for release.

An improved blind fastening, consisting of the clutch or spring fastening *c* and the pin or projection *a*, secured, one to the blind and the other to the window-sill or side of the building, all constructed, arranged, and operating substantially as described and shown, for the purpose set forth.

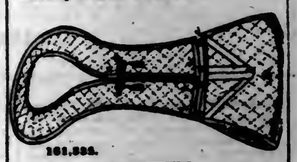


161,830. PYROMETERS. Mary Crawford, Pittsburg, Pa., administratrix of Benjamin Crawford, deceased. [Filed Oct. 31, 1874.]

The combination of the mercury-cup C, provided with a suitable indicating device, and the receiving-vessel A, filled with oil, tin, or a suitable metallic alloy, connected by a tube filled with oil, substantially as and for the purpose set forth.

161,831. LUMP TOBACCO-MACHINES. David W. De Forest, Brooklyn, N. Y. [Filed Oct. 2, 1874.]

Brief.—The size of the pocket is determined by a band-tightener operated by a treadle. The rolls that carry the band or apron have gears situated at one side, that give positive movement to them, and they are always meshed to the driving-gears.

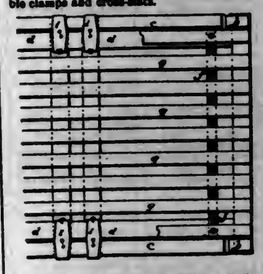


1. The combination of gears *g m f f*, drum E, rolls B U, belt A, and pivoted frame U, as described.

2. The combination of gears *g m f f*, drum E, rolls B C, frame G, and the sliding roll D, band S, and treadle T, as described.

161,832. COMBINED TIPPETS AND MUFFS. Jos. Engel, Frankfort-on-the-Main, Germany, assignor of one-half his right to G. L. Palmer, Wilkesbarre, Pa. [Filed Aug. 17, 1874.]

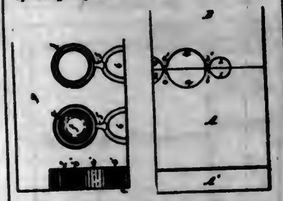
1. A combined tippet and muff, finished and provided with fastenings upon both sides, to adapt it to be reversible, so as to be worn either side out, substantially as described and shown.



2. A combined tippet and muff, detachably connected, and made to be reversible, substantially as described and shown.

161,833.

161,834. BED-BOTTOMS. Oscar F. A. Faulkner, Mount Pleasant, Iowa. [Filed Dec. 24, 1874.]

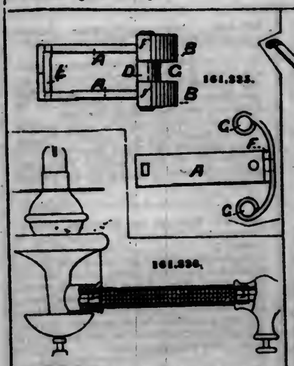


Brief.—The slat-frame rests on the side spring-bars, which are supported by the hooks at the corners of the bedstead. The rigidity of the spring-bars is regulated by the adjustable clamps and cross-slats.

The combination of the hooks *b*, spring-bars *c d*, clamps *l e*, cross-slats *c*, cross-bars *f*, and slats *g*, substantially as described.

161,834. DIES FOR FORGING SPINNING-RING BLANKS. Sullivan Forehand and Henry O. Wadsworth, Worcester, Mass. [Filed Feb. 20, 1875.]

Brief.—The invention comprehends several dies, forming a series, by means of which the end of a rectangular bar is swaged into a spinning-ring blank.



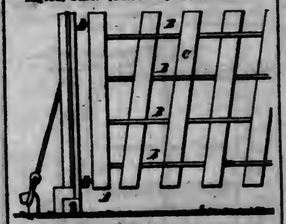
1. The combination, with the part A, provided with the openings or recessed parts *a*, 1, and 3, and projections *b* and *c*, recess 6, concavity *h*, rounded projection *f*, and circular groove *g* of the part B, provided with openings or recessed parts *a'*, 2, and 4, projections *b' c'*, recess 6, concavity *h*, rounded projection *f*, and circular groove *g*, substantially as and for the purposes set forth.

2. The combination, with the peculiarly-constructed part D, of the part D', substantially as and for the purposes set forth.

3. The combination, with the part G H, of the central trimming-plunger I, substantially as and for the purposes set forth.

161,835. DRAW-HEADS. Jos. H. Gartside, Port Perry, assignor to John B. Geyser, Pittsburg, Pa. [Filed Aug. 4, 1874.]

A draw-head formed by uniting the separate pieces A A, B B, C C, D D, E, and F F, having the tenons, mortises, and openings shown, substantially as and for the purposes set forth.



161,835.

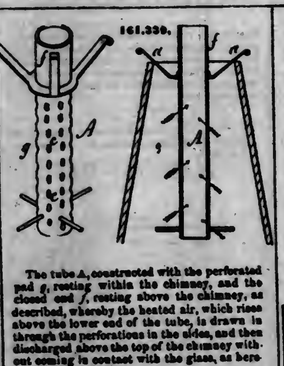
161,836. VAPOR-BURNERS. Solomon S. Gray, Boston, Mass., assignor to himself and Allen F. Gray, same place. [Filed Oct. 20, 1874.]

Brief.—Shot in the feed-tube for communicating heat from the burner and regulating the flow.

The combination, in a vapor-burner having a feed-tube, a burner-tube, and a series of jet openings arranged below the burner-tip, of a packing of shot within the feed-tube, heated by the said flame from the said jet openings for vaporizing the liquid naphtha, and regulating the flow of the liquid, as and for the purpose specified.

161,837. FARM-GATES. S. R. Holt, Worthington, Ohio. [Filed July 22, 1874.]

The gate herein described, composed of the end vertical posts A, horizontal stringers B, and pickets C, said pickets provided on alternate faces with slots *c*, and placed or woven in an inclined or slanting position on the horizontal stringers B, substantially as and for the purposes described.

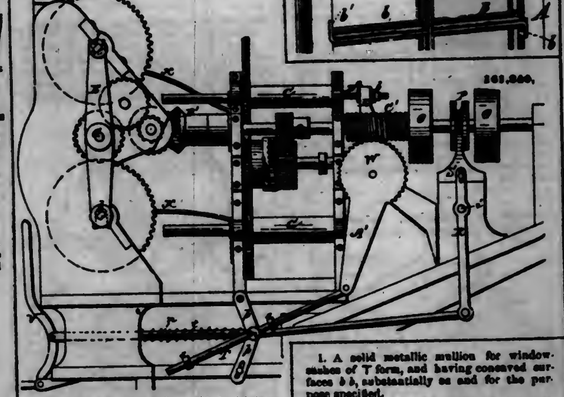


161,838. HARNESS-SNAPS. Leroy Humbert, Sioux City, Iowa, assignor of one-half his right to H. A. Lyon, same place. [Filed Feb. 26, 1875.]

A harness-snap having loop A, beveled and curved side bars B B, oblate space C, and a hook, D, ending in a tongue which passes between, and is prolonged in the plane of, said side bars, substantially as specified.

161,839. LAMP-CURRENT ATTACHMENTS. Henry Johnson, Rochester, N. Y., assignor, by mesne assignments, to Margaret Johnson, same place. [Filed Feb. 20, 1875.]

Brief.—Intended to assist in producing draft through the chimney, and to obviate breakage.



161,839.

The tube A, constructed with the perforated pad *g*, resting within the chimney, and the closed end *f*, resting above the chimney, as described, whereby the heated air, which rises above the lower end of the tube, is drawn in through the perforations in the sides, and then discharged above the top of the chimney without coming in contact with the glass, as herein before described.

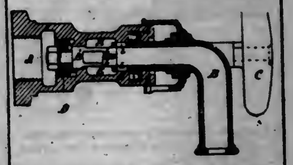
161,840. MACHINES FOR TAPPING PIPE-FITTINGS. J. Kacerovsky, Bridgeport, Conn., assignor to C. M. Alexander and J. M. Mason, Washington, D. C. [Filed Aug. 28, 1874.]

Brief.—The parts are duplicated. The chucks are disposed radially in a carrier revolved by the operator, to bring the fittings into position. One jaw of each chuck is pivoted, and is closed by a lever pivoted so that one end bears against the jaw, and the other against a curved bar on the frame. The side taps are in the same plane and operate together, while the third tap is situated below, and operates after the others have finished. The motion of the taps is reversed by clutch mechanism operated to automatically run back the taps after they have completed the thread, and stop the machine. A sleeve, fastened to each of the three shafts that communicate motion to the spindles, carries a pin that bears against a stud on the first gear-wheel, and permits a certain amount of lost motion when the clutch is shifted.

161,840.

1. The plate or clutch J, provided with jaws *f* and levers *h*, in combination with the adjustable bar K on the main frame, for holding the fittings to be tapped, and releasing the same automatically, substantially as herein set forth.

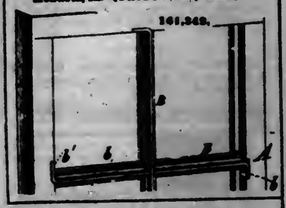
2. The combination of the adjustable frame I, set-screw *d*, clutches J, lever L, and gearing M, all constructed substantially as and for the purposes herein set forth.



3. The combination of the adjustable worm C', segment W, with arm A', pivoted rod T, passing through the swivel-pin *m*, the adjustable collars *r r* on the rod T, the toggle-links *p p*, rods *b a*, spring I, lever E, and shipper S, all constructed substantially as and for the purposes herein set forth.

4. The combination of the movable clutch P, lever R, rod *k*, swivel-pin *m*, toggle-joint *p p*, rod *a*, spring *t*, and lever V, all constructed substantially as and for the purposes herein set forth.

5. The combination of the mandrels B B, formed with screws D D, the sleeves C C, yoke E, barrel-nuts *a a*, jam-nuts *b b*, adjusting-screw G, and gearing H, all constructed substantially as and for the purposes herein set forth.



161,841. SELF-CLOSING COCKS. William Knaust, Vienna, Austria. [Filed Mar. 1, 1875.]

Brief.—When the knob is depressed the bent pipe is pressed inward, the valve removed from its seat, and the piston above said valve out of its recess, allowing water to flow into the recess, from whence it enters through openings into the bent pipe, and is discharged.

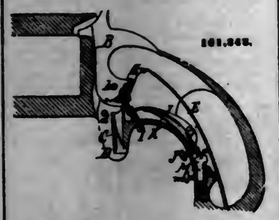
A cylinder, A, with recess E, in combination with a bent pipe, B, sliding in said chamber, valve-disk D, openings L L, and knob C, the whole being arranged in the manner and for the purpose substantially as described.

161,842. WINDOW-SASHES. W. Kreisner, Mendota, Ill. [Filed Feb. 20, 1875.]

161,842.

1. A solid metallic mullion for window-sashes of T form, and having concaved surfaces *b b*, substantially as and for the purpose specified.

2. The solid metallic mullion B *b b*, constructed with ears *b'* at the ends, substantially as specified.



161,843. LOCKS FOR FIRE-ARMS. John H. Lester, Winsted, assignor to himself and H. P. Morgans, New London, Conn. [Filed Feb. 20, 1875.]

1. A fire-arm having the pin or locking means I, in combination with the hammer H, having two or more recesses, 1 2 3, and adapted to serve therewith in locking the hammer in several different positions as and for the purpose herein specified.

2 In combinance with the trigger D *d* and the usual provision for cocking, retaining, and liberating the hammer by the trigger, the employment of one or more separate recesses, 1 2 3, in the hammer, in combination with a locking piece, l, and spring K, acting through suitable connections to constantly throw the locking-piece into engagement with the recesses, as and for the purposes specified.

3. The safety-catch M *m*, serving in combination with the hammer B, locking-piece l, and with suitable connecting and operating means to further insure against accident, as herein specified.

161,842.

161,844. BOLSTER-PLATES FOR VEHICLES. William J. Lewis, Pittsburg, Pa. (Filed Feb. 20, 1875.)

As a new article of manufacture, a bolster-plate having a raised ring on one face, and a corresponding depression on the opposite face, so that each plate shall serve either as an upper or lower bolster-plate, when used with a second plate of the same form, substantially as described.

161,845. FIREBOX-CAR DOORS. Harry C. McCarty and Edward Glenn, Renovo, Pa. (Filed Feb. 11, 1875.)

The combination of door C, pivoted at one of its lower corners to the door-frame, and having sliding gate G, with the car A, provided with keepers D and E, substantially as set forth.

161,846. WAGON-BODIES. Robert W. McClelland, Cerro Gordo, Ill. (Filed Apr 30, 1874.)

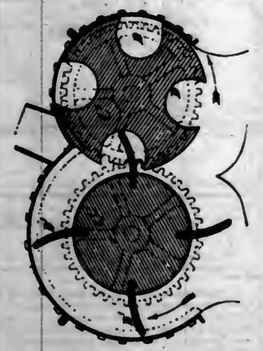
1. The side-beams provided with dovetailed grooves on their outer faces, in combination with the standards C C, severally attached to the sills B B, and provided with dovetailed tenons on their inner faces, by means of which the side-boards may readily be removed, and at the same time the employment of belts and nuts dispensed with, substantially as described.

2. In a wagon-body, the combination of the hinged foot-board F, having lugs G and supporting-chains H, with the removable dash-board I, the latter being adapted to hold the foot-board in a vertical position by resting on the lugs G, substantially as and for the purposes set forth.

161,847. WAGON-STANDARDS. Robert W McClelland, Cerro Gordo, Ill. (Filed Oct. 30, 1874.)

The brace A, consisting of the base a, having a suitable bolt-hole, adapting it to be attached to the wagon-body, and having the vertical standards a' adapted to receive the side boards B, all substantially as described.

161,848. FIFTH-WHEELS FOR CARRIAGES. Robert W. McClelland, Cerro Gordo, Ill. (Filed Oct. 30, 1874.)



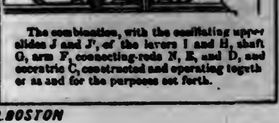
1. In a fifth-wheel the small upper plate B, fitting into the large recessed lower plate B', and carrying the reach-rod F, all combined substantially as and for the purpose specified.

2. The combination, in a fifth-wheel, of the lower plate B, having the rim B', the upper plate B', having the recessed bench G, and the clip king-bolt D' having the boss D, all to operate substantially as described.

161,849. ROTARY BLOWERS. J. McCloskey, Connersville, Ind. (Filed Feb. 20, 1875.)

Brief.—The solid part of one cylinder revolves in near proximity to the surface of the other. The form of the recesses is such that, receiving the blades, the latter may traverse the groove without touching the solid surface.

The combination of the double-lobed casing and cylinders C and C', having the segmental recesses D and blades D', respectively, constructed and arranged to operate so that the approximate contact between the circular parts of the cylinders shall be continued till the blades have entered the recesses a little way, and be resumed as the other side a little before they pass out of the recesses, substantially as set forth

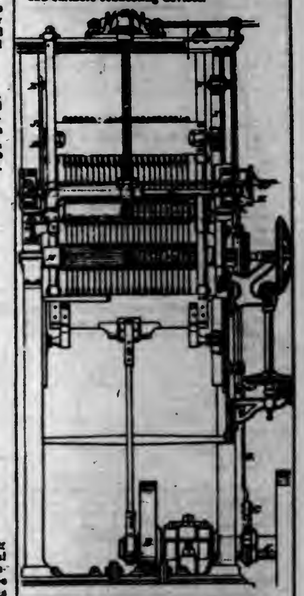


161,850. ARTIFICIAL FLOWERS. Susette Orth, Pittsburg, Pa. (Filed Feb. 6, 1875.)

1 As a new article of manufacture, artificial flowers made of tissue-paper or other suitable material, and coated with a compound of india-rubber and wax, substantially as described, and for the purpose specified.

2 Sheets of tissue-paper or other suitable material, coated with a compound of india-rubber and wax, and tinted in various colors previous to the application of such compound, substantially as and for the purpose set forth.

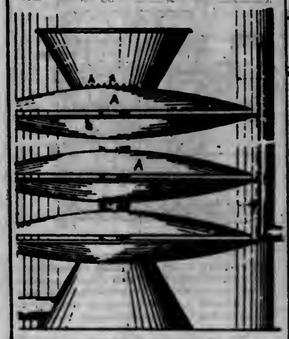
161,851. BOTTLES FOR MUSTARD. Asa A. Plastridge, Chicago, Ill. (Filed Aug. 3, 1874.)



Brief.—The neck of the bottle and the cylindrical stopper are provided with corresponding vertical slots, so that the width of the opening can be varied to suit the consistency of the contents, and by turning the stopper one side the bottle is made air-tight; the vertical slot also provided for the handle of a spoon, when mustard is used.

The improved mustard-bottle herein described, consisting of the body A, having the cylindrical neck B, provided with the vertical slot b, and the cylindrical stopper C, having the vertical slot a, substantially as and for the purpose shown and described.

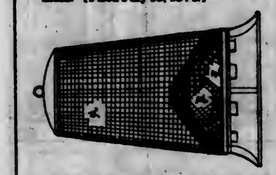
161,852. SAW-MILLS. D. Clint Prescott, Marinette, Wis. (Filed July 2, 1873.)



Brief.—The upper slides are pivoted, and a vibrating movement given to their lower ends by means of an eccentric on the crank-shaft and suitable connecting devices.

The combination, with the oscillating upper slides J and J', of the levers I and H, shaft G, arm F, connecting-rods N, E, and D, and eccentric C, constructed and operating together as and for the purposes set forth.

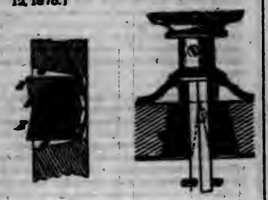
161,853. EVAPORATING APPARATUS. F. Bandon, New Orleans, La. (Filed Mar. 16, 1875.)



Brief.—The juice, conveyed into a hopper, passes out through small perforations in a fine stratum upon the deflector, which is the convex top of a steam-heated chamber. The juice rising from the deflector into the tray below, which conveys it back to the center, where it repeats the process. The series of deflectors is heated by steam or hot air. Pipes remove the water of condensation. A pipe is also provided, by which hot or cold air is injected across the surface of the deflectors. The treated product is conveyed away at the bottom.

1. The plane-convex deflecting-chambers A A, trays E E, and central steam or hot air tube C, the whole being combined as described, whereby the liquid to be evaporated, as it runs off the deflecting-surfaces, is caught in the tray below and reconveyed to the center of the apparatus and discharged on the deflecting-surface below through an opening around the heated surface of the tube C, as and for the purpose specified.

2. The deflecting-chambers A A, trays E E, pipe G, having openings *g g* for discharging a blast of either hot or cold air between each of the series of deflectors, as and for the purpose specified.

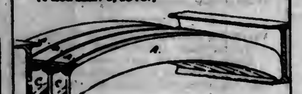


161,854. FLY-TRAPS. David B. Roe, Ayer, Mass. (Filed July 16, 1874.)

1. In combination with a trap for flies, the mat E, having a radially-extending edge, upon which part of the bait is placed as a decoy.

2. The base D, cone B, with receiver A opening therefrom, and the mat E, having a projecting edge, in combination, as and for the purposes above set forth.

161,855. FASTENINGS FOR BELL-PULLS, &c. John Schade, Stamford, Conn. (Filed Jan. 12, 1875.)



161,856. HORSE HAY-RAKES. D. P. Sharp, Ithaca, N. Y. (Filed Feb. 11, 1875.)

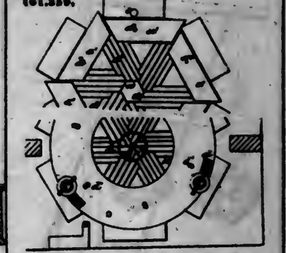
Brief.—Rake-teeth are raised to dump the load by turning the friction-pad attached to the axle up against the inner periphery of a circular rim on one of the transporting-wheels.

The combination, with the axle A and wheel B, of a rim, *a*, formed on the wheel, and the friction-pad *b* on the axle, resting therein, the connection being made by turning the pad against the inner periphery of the rim, as specified.

161,856. FIRE-PROOF FLOORS AND CEILINGS. Levi T. Scofield, Cleveland, Ohio. (Filed Mar. 6, 1875.)

A ceiling or floor tile, A, constructed to extend in a single length from beam to beam, and formed with lateral projecting portions *a*, whereby channels C are left, which said channels extend from beam to beam, substantially as and for the purpose described.

161,857. FIRE-PROOF FLOORS AND CEILINGS. Levi T. Scofield, Cleveland, Ohio. (Filed Dec. 12, 1874.)



1. A tile of terra-cotta, burnt clay, or any other suitable material, constructed to span, in a single piece or length, the space between two beams, and provided with the hollow spaces C, extending from beam to beam, as substantially as and for the purpose described.

2. A tile designed to span, in a single length, the space between two beams or supports, the said tile provided with orifices extending from beam to beam, and with intermediate unbroken webs *f*, substantially as and for the purpose described.

161,858. APPLE SLICERS AND CORERS. H. H. Siler and T. A. Brooks, St. Lawrence, assignors to themselves and T. A. Brooks, Raleigh, N. C. (Filed Aug. 21, 1874.)

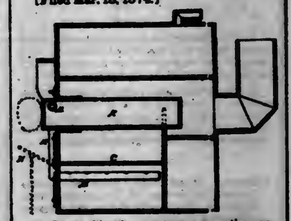
Brief.—The cutters or knives are grouped and secured together in a series of triangular sections, each having one blade extending beyond the apex, forming together a core-cutter, which may be adjusted to and from the center, varying with the size of core to be cutted; or all the blades may be brought together when there is no core to be removed. These triangular cutting-sections slide upon each other, and upon base-blocks, by means of a slotted ring-plate provided with perforations to receive pins on each cutting-section, so that the action of all the sections is simultaneous.

161,859.

1. The series of cutters *c'*, arranged as shown on knives *c*, as and for the purpose specified.

2. The combination, with base blocks C, of cutter-bed sections *c*, arranged to slide on each other and on the base-blocks, as and for the purpose described.

3. The combination, with ring-plate D, having slots *d* and perforations *d'* arranged in a circle, of the cutter-bed sections *c*, provided with pins *c'*, to enable the core-cutters to be moved by the plate to or from the center.

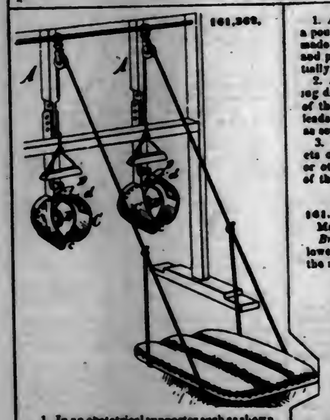


161,860. CANDLE-HOLDERS. Henry Smith, Westminster, England. (Filed Jan. 28, 1875.)

Brief.—By raising the encircling ring the spring-spars are forced through the slots in the holder into the candle.

The holder A, provided with the openings *a* and *a'*, and having attached to its outer side the spring-clutches B and B, provided with the spars *b b*, &c., in combination with an encircling ring, which, when moved upward over said springs, causes them to close inward, substantially as and for the purpose specified.

161,861. FURNACES FOR STEAM-GENERATORS. Horatio M. Smith, Chicago, Ill., assignor of two-thirds his right to Moses W. Lester and Franklin Lester, same place. (Filed Mar. 18, 1874.)



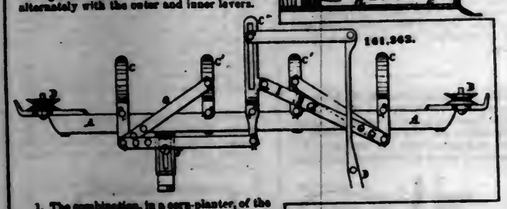
1. In combination, a steam-generating apparatus, a closed retort, having an outer door, and arranged within the influence of the fire employed to generate the steam, and the pipe M, for conducting to or impinging upon the said fire the gas generated within the retort, substantially as and for the purpose specified.

2. The combination, in a steam-generating apparatus, of the retort K, the pipe M, and the horizontally-hinged door H, all arranged substantially as described, and for the purposes specified.

161,862. OBSTETRICAL SUPPORTERS. Wm. E. Steinbeck, Somerville, Tenn. (Filed Feb. 8, 1875.)

Brief.—The pendent knee-supports are made adjustable in length, and the knee cushions or parts are surrounded by a leather rim of a shape to readily confine the knee when inserted.

161,862.



1. In an obstetrical supporter such as shown, the suspension-bars A, adjustable in length, substantially as and for the purpose specified.

2. The knee-supports B, in combination with the shields C c, provided with strap D and buckle d, substantially as and for the purpose specified.

161,863. CORN-DROPPERS. Isaac G. Vail, Logan County, Ill. [Filed Jan. 12, 1875.]

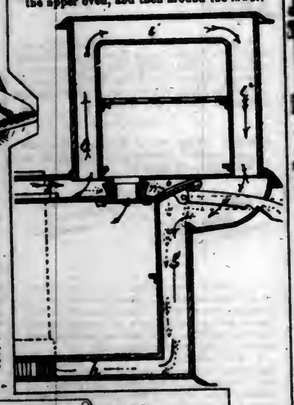
Brief.—To the planter-frame, by adjusting-pieces, is attached a beam, to which are pivoted the forked vibrating bars, connected together and to the main spring-bar by connecting-rods. The knotted check-row cord imparts motion to the seed-slide by passing through the forked levers, the knots engaging alternately with the outer and inner levers.

1. The combination, in a corn-planter, of the spring-bar D with the forked levers C C' and lever C' and supporting-bar A, substantially in the manner and for the purpose set forth.

2. The combination, with the planter-frame and the supporting-bar A, of the adjusting-piece E and F, for adjusting the height of the check-row attachment, substantially in the manner and for the purpose described.

161,864. GLASS SYRUP-PITCHERS. Louis Wagner, Wheeling, W. Va., assignor to J. H. Hobbs, Brockunier & Co., same place. [Filed Feb. 1, 1875.]

Brief.—The syrup-pitcher is made wholly of glass, with the exception of the lid and one-half of the hinge.

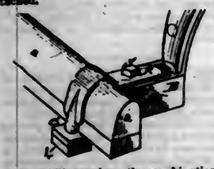


1. A glass syrup-pitcher, having a body, B, a pouring-spout, a, and flaring drip-cup b, all made at the same operation and in one piece, and provided with a drip-opening, c, substantially as set forth.

2. A glass pouring spout or lip, a, and flaring drip-cup b, made in one piece, the juncture of the two forming a sloping bottom, which leads back to a drip-opening, c, substantially as set forth.

3. As a means of attaching a lid, the sockets or recesses e in the sides of the handle, or other projection from the cylindrical part of the pitcher, substantially as set forth.

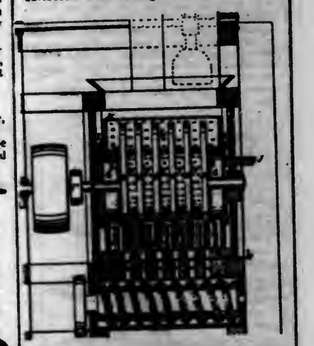
161,865. PORTABLE RANGES. O. W. Walker, Malden, Mass. [Filed Feb. 6, 1875.]



Brief.—The draft may pass around the lower oven only, or it may pass first around the upper oven, and then around the lower.

The combination, with the range-body, its oven, and the damper or plate o, closing the end of the flue-space f between the two ovens, of the flues f^1 f^2 g h, to convey the products of combustion from the fire-chamber, over the lower oven, about the elevated oven, and then about the lower oven, substantially as described.

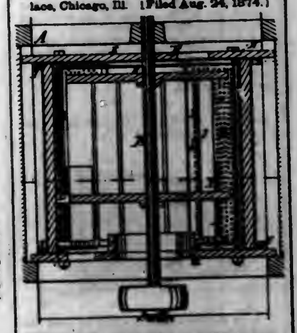
161,866. THILL-COUPLINGS. Jas. Walker, Cincinnati, Ohio. [Filed Jan. 19, 1875.]



Brief.—Lubricator protected, but easily detached.

In a thill coupling the combination of recessed bearing-iron C, rubber P, R, bolt S, lips E, and bearing-rod K, substantially as set forth.

161,867. MACHINES FOR HULLING AND CLEANING GRAIN. Thomas Wallace, Chicago, and Geo. W. Hyde, Joliet, Ill. [Filed Feb. 10, 1873.]

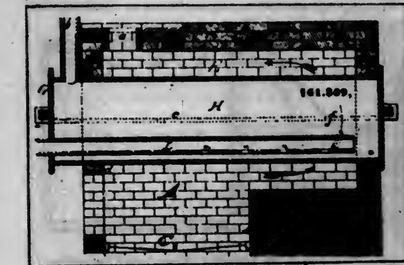


Brief.—Grain fed along entire length of cylinder, so that the sides and periphery of the stones are immersed in the grain. The rods projecting from the bottom and sides of the outer cylinder in between the disks cause the grain to change position, and present new surfaces to the scouring-faces of the disks.

1. The vertical revolving annular disks D, spaced along a horizontal shaft, in combination with the cylinder H, into which the grain is fed along the entire length at the top, and from whence it is drawn along the entire length at the bottom, substantially as specified.

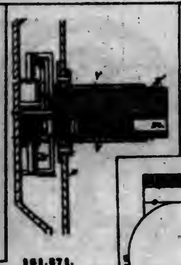
2. The combination of the vertical revolving disks D, cylinder H, and stationary rods M, projecting from said cylinder in between the disks at the sides and bottom, a the manner specified.

161,868. GRAIN-SCOURERS. Thomas Wallace, Chicago, Ill. [Filed Aug. 24, 1874.]



The combination of the cases M, air-openings N, perforated metal sections D, frames E, and scouring-stones C, substantially as and for the purpose specified.

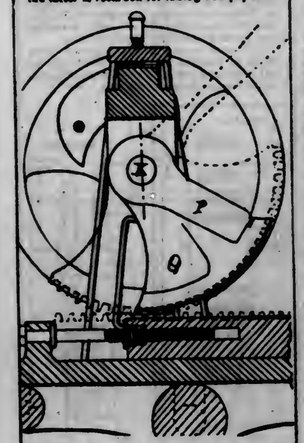
161,869. GAS-RETORTS. Wm. F. Welble, Tidioute, Pa. [Filed Oct. 24, 1874.]



Brief.—Horizontal flanges extend longitudinally along the outsides of the retort, and rest in ledges in the walls of the furnace, thus dividing it into upper and lower flues. The flanges have openings at the back end for the passage of flame and smoke, and at the front end they extend and are turned up to hold the retort-hands.

1. The portable retort, consisting of the cylinder H, its horizontal side flanges e, extended at their ends, the gas-pipes, the cylinder-heads O, their bearing-lugs k, and the perforated distributing-pipe L, substantially as specified.

2. The combination, with the retort-cylinder H and its side flanges e, notched at f, of the furnace, having the ledge-bearings s in its side walls, to receive the side flanges e of the retort, as specified.

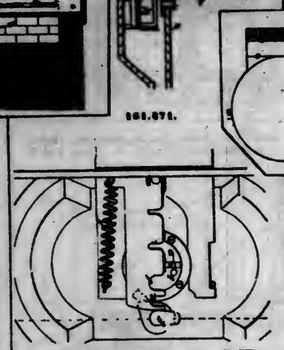


161,869.

161,870. PLATE-PRINTING PRESSES. James Wilson, Boston, Mass. [Filed Dec. 26, 1874.]

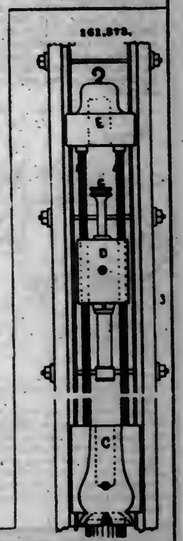
Brief.—The impression-segment, balanced by a counter-weighted wheel, is fixed on a rock-shaft independent from the rock-shaft which carries the operating-lever, and a segment-rack geared with the reciprocating bed, and has a lug adjustably engaging with a clutch-lever extending from the latter shaft. The depression of a treadle connected by a cord to the counter-weight wheel brings the lug on the segment into contact with the clutch lever, and the operating-lever being depressed, the bed and impression-segment are moved forward simultaneously for the impression, whereupon the weight retains the segment out of contact with the bed, while the latter is returned for inking and paper

1. The combination, in a plate-printing press, of the impression-segment Q, counterpoise-weight S', and pulley S', all mounted upon the shaft R, with the weight and segment upon opposite sides thereof, and connected, by the cord or chain s, to the treadle T, and arranged to operate substantially as described, for the purpose specified.



2. In a plate-printing press, the impression-segment Q, mounted upon the shaft R, in combination with the dog or clutch P, mounted upon the shaft K, and arranged to engage with said segment when moving in one direction, and to move independently thereof when moving in the opposite direction, substantially as described.

3. In combination with the impression-segment Q and dog P, mounted upon separate and independent shafts, an adjustable point of contact, f, whether attached to the segment or dog, substantially as described.



4. In combination with the segment Q and dog P, mounted upon separate shafts, and arranged to engage with each other, as set forth, the toothed rack l, secured to the carriage or table H, and the toothed segment J, arranged to engage therewith, and mounted upon the same shaft with the dog P, substantially as described

---

161,871.

161,872.

161,872.

161,871. LOCKS FOR DOORS, &c. H. Winn, Shelburne, Mass. [Filed Aug. 5, 1874.]

1. A fence, a rotating shell having a key-hole, a key composed of a bitted portion to act the tumblers, and a shank working in said key-hole to rotate said shell, of which key the bitted portion and the shank rotate in common, a system of tumblers, and a cut-off located in position to intervene between the key-hole and the tumblers when the fence enters their notches or impinges on their sides to enter the same, all combined together, when the tumblers partake of the rotation of the rotating shell at the time when the cut-off intervenes, as aforesaid.

2. The operative parts of the two ends of the fence arranged in different vertical planes, for the purposes described.

3. The enlargement from d' to d^2 of the slot V in shell M, for the purposes described.

4. The tumblers and a box containing them, moved back and forward for the purposes described, combined with a restorer, when said restorer is located in position to stop the backward movement of the tumblers at the time they are required to be restored, while the backward movement of the box continues pressing the tumblers therein against said restorer until said tumblers are in a restored position in said box.

5. A rotating shell having a key-hole and a system of tumblers, between which and said key-hole a stationary cut-off is made to intervene by the rotation of said shell and tumblers, which tumblers, if retired (without other motion) from their position while being set, would collide with said cut-off, combined with said cut-off, a box containing the tumblers, a bearing for it and a stationary shell, when of said box and stationary shell the one has a pin or projection acting against one or more inclined surfaces of the other, said pin or projection and surfaces being arranged, relatively to each other and to the cut-off, to project said box and the tumblers therein, before they reach the cut-off in their rotation, into position to avoid the collision of the tumblers and cut-off, when said tumblers are further rotated to cause said cut-off to intervene as described.

6. The supplementary pick d^3 in the tumbler r, for the purpose described.

7. A box containing tumblers and having a bearing, as described, combined with an outer shell, when the one rotates in common with the key throughout its rotation, while the other does not, and when the one has a pin or projection acting against four or more inclined surfaces of the other, whereby said box is projected forward and back, carrying the tumblers toward and from the bits of the key, all combined with said tumblers and key, and operating as described.

8. The fence I and slot V, with its enlargement in the stationary shell, combined with a rotating shell and a system of tumblers, partaking of the rotation of said rotating shell.

161,873. CONSTRUCTION OF SPINDLE-SHAPED VESSELS. William Louis Winans and Thomas Winans, London, England [Filed Mar 9, 1875.]

The combination, substantially as described, of a dock or docks, cabin or cabins, with the hull of spindle-shaped vessels, such as are herein described and referred to, as aforesaid

---

161,874. EXPLOSIVE PILE-DRIVERS. James M. Allen, Baltimore, Md., assignor to F. B. Colton, Philadelphia, Pa. [Filed Mar. 10, 1875.]

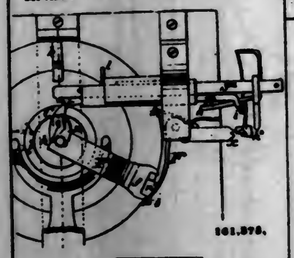
Brief.—An explosive pile-driver is provided with guide-rods extending from the head-block to the gun below, which also serve as brace-rods.

Guide-rods F F and a head-block, E, combined with the ram D and gun C of a powder pile-driver, substantially in the manner and for the purpose herein set forth.

161,874. EARTH-AUGERS. Don Juan Arnold, Brownsville, Nebr. [Filed Aug. 28, 1874.]

Brief.—An earth-auger provided with a screw-shaped flange having a series of V-shaped cutters arranged on an inclination outward, to cut the earth successively from circumference to center.

The spiral flange C, provided with a series of V-shaped cutters, arranged on an inclination outward toward the circumferential edge of auger, as shown and described.

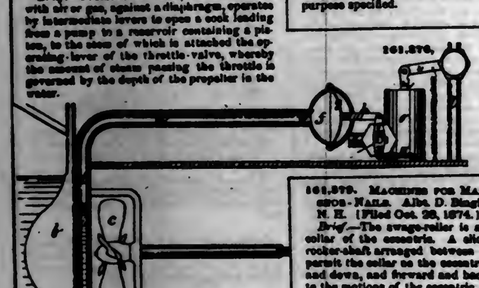


161,875. COMBINATION-LOCKS. Wm. Baldwin, Tioga, Pa. [Filed Aug. 18, 1875.]

1. The fork-arm F', carried by the spindle within the lock, in combination with a fence-lever, F, having an arm or projection, b, to engage therewith, substantially as herein described

2. The fence-lever F, provided with a notched or corrugated plate, *b*, to cluster with a point or points in letting down the fence, substantially as herein specified.

3. The combination of the yielding cam C on the spindle, the sliding rod E, carrying projections *e f*, the detent *g*, having a beveled head, *h'*, and the fence-lever F, having a notched and beveled head, *n*, arranged and operating substantially as described, to periodically drop and to re-elevate and support the fence in the manner set forth.

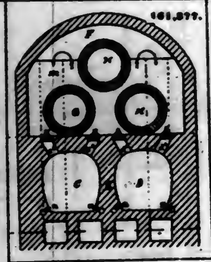


I a and detent *g*, in combination with the fence-lever F, having an arm, *m*, and notched head *n*, and the projection *h* on one of the tumblers for successively disengaging the fence and disarranging the tumbler-notches during the retraction of the bolt or bolts, as herein set forth.

161,876.

161,876. SPEED-REGULATORS FOR PROPELLERS. Edwin B. Bean, Boston, Mass. (Filed Mar. 15, 1875.)

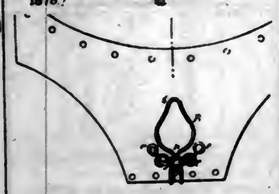
Brief.—Pressure of water, in a tube filled with air or gas, against a diaphragm, operates by intermediate levers to open a cock leading from a pump to a reservoir containing a piston, to the stem of which is attached the operating-lever of the throttle-valve, whereby the amount of steam passing the throttle is governed by the depth of the propeller in the water.



The combination, with the pipe *d*, receptacle *f*, flexible diaphragm *g*, of the cock *i*, cylinder *o*, piston *s*, connection *w*, lever *t*, and rod *h*, as and for the purpose herein shown and described.

161,877. APPARATUS FOR THE MANUFACTURE OF COKE AND ILLUMINATING-GAS. John T. B. Bennett, Birmingham, England. (Filed Sept. 10, 1874.)

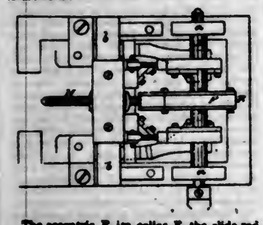
Brief.—The gas-retorts are placed in an inclosed chamber directly over the coke-ovens. Dampered passages connect the ovens with the retort-chamber. Waste heat and products of combustion from the former pass into the latter for heating the retorts.



1. An apparatus consisting of ovens C D and chamber F, connected by dampered passages *c' d'*, and having the retorts G H I, as and for the purpose specified.

2. Sliding dampers K, recessed slab K', and covering-tile K², combined as and for the purpose set forth.

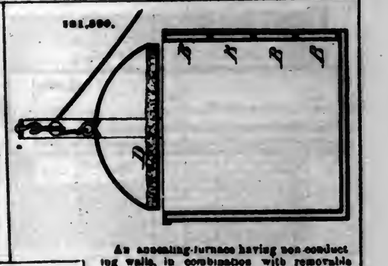
161,877.



161,878. NECK-TIE FASTENINGS. Emile Berliner, New York, N. Y. (Filed Feb. 6, 1875.)

A neck-tie shield provided with the loop B, having U-shaped portions *f f*, with eyes *e e*, and attaching-cord C, constructed and arranged to operate substantially as and for the purpose specified.

161,879. MACHINES FOR MAKING HORSE-SHOE-NAILS. Alba D. Bingham, Nashua, N. H. (Filed Oct. 20, 1874.)



Brief.—The swage-roller is applied to the collar of the eccentric. A slide-rod and a rocker-shaft arranged between the standards permit the collar on the eccentric to move up and down, and forward and back, or conform to the motions of the eccentric, and they also maintain the swage-roller in its due relation to the anvil.

The eccentric E, its collar F, the slide-rod or arm H, and the rock-shaft I, arranged and applied together and to the driving-shaft D, swage-roller G, and the hook-standards *b b*, all essentially as and to operate as specified.

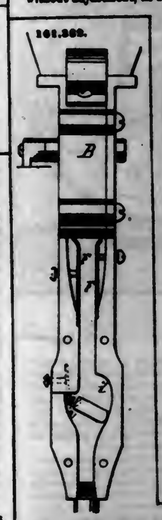
161,880. OVENS FOR ANNEALING BUILDING-BLOCKS OF FOUNDAGE-SLAG. Beanlee Boyer, Lebanon, Pa. (Filed Feb. 27, 1875.)

Brief.—After heating the oven to the required temperature, the slabs are removed, and the blocks to be annealed are introduced layer after layer. With the layers the slabs are reapplied, and the cover is raised as required.

161,880.

An annealing-furnace having non-conducting walls, in combination with removable pieces B and a vertically-movable cover, D, substantially as and for the purposes described.

161,881. PRUNING IMPLEMENTS. Charles B. Cannon, Keokuk, Iowa. (Filed July 13, 1874.)



Brief.—Consists in combining within a double-grooved and slotted handle two operating-shafts—one carrying a saw and the other the cutting parts—and in the use of two or more sleeve-rings fixed at intervals on the handle, for convenience of operating the tool at different distances without adjustment.

1. The combination, in an improved pruning-tool, of the double grooved and slotted handle A, the saw and cutting operating shafts H K, and the sleeve-rings K, all made, arranged, and operating substantially as set forth.

2. The pruning-tool, with a number of sleeve-rings, K, fixed at intervals on the handle for use in operating the tool at different distances without adjustment, as set forth.

161,882. MACHINES FOR FEEDING CARTRIDGE-SHELLS. Augustus C. Carey, Boston, Mass. (Filed Feb. 6, 1875.)

Brief.—A peripherally grooved and corrugated feed-wheel provided with pockets receives the blanks from the hopper, and carries them around to the mouth of an ejection-tube, through which they fall by gravity. The blank, if started with its closed end downward, engages with a hook arranged in a recess in the tube, and is turned by said hook to its proper position. An agitator in the hopper is constantly actuated by the corrugations in the wheel. Fingers fixed to the frame prevent the blanks from clogging.

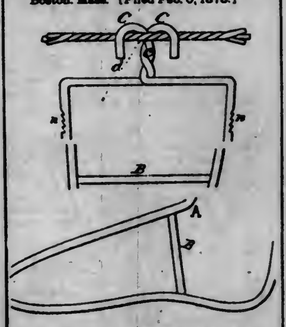
161,882.

161,883.

1. In a machine-feeder for cartridge-shells, &c., the combination of the hook *f*, arranged in a recess, *i*, of the ejection-tube D, with wheel C and hopper A, substantially as specified.

2. The ejection-tube D, having recesses *i'* and hook *f*, adapted for use substantially as specified.

3. The adjustable thrust-springs F, in combination with a feed-wheel, C, and hopper B, substantially as specified.



4. The finger H, in combination with a peripherally grooved feed-wheel, C, substantially as specified.

5. The fingers *k*, in combination with a peripherally-grooved feed-wheel, having pockets *b*, substantially as specified.

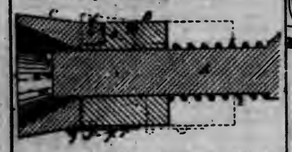
6. The feed-wheel C, having corrugations *c*, peripheral groove *c'*, and cups *b*, substantially as specified.

7. The agitator-spring G, in combination with a transversely-corrugated feed-wheel, C, and a hopper, A, substantially as specified.

161,883. DEVICES FOR DRYING AND STRETCHING HOSE. Augustus C. Carey, Boston, Mass. (Filed Feb. 6, 1875.)

1. A device for drying and stretching hose, consisting of the foot and leg shaped wire frame A, substantially as specified.

2. In combination with a device for drying and stretching hose, the hooks C, having a shank, *c*, forming a bight or bend, *d*, substantially as the manner and for the purpose specified.



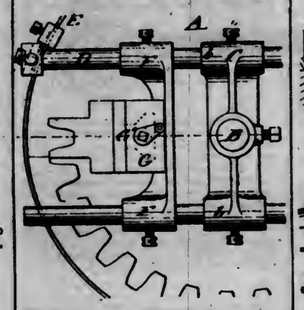
3. The wire frame A, for drying and stretching hose, having notches *n*, for holding the hose against longitudinal shrinkage, substantially as specified.

4. In combination with the wire frame A, the transverse braces B, substantially as specified.

5. The frame A, having braces B, notches *n*, and hooks C C, substantially as specified.

161,884. CENTERING DEVICES FOR WOOD-TURNING LATHES. Ward B. Carpenter, Topsham, Vt. (Filed Feb. 1, 1875.)

Brief.—The funnel-shaped portion of the chuck is hinged to the sliding cylindrical part, so that it may be turned to one side.



1. A centering device for a lathe, composed of the sliding sleeve B, hinged or pivoted at one side to the funnel-shaped centering-cup C, as and for the purpose described.

2. The combination of the funnel-shaped cup C, sleeve B, hinged together as described, with the locking-strap F, constructed substantially as and for the purpose described.

3. The funnel-shaped centering-cup C, hinged or pivoted to and adjusted with relation to the sliding sleeve B by the strap F, in combination with springs *e*, as and for the purpose described.

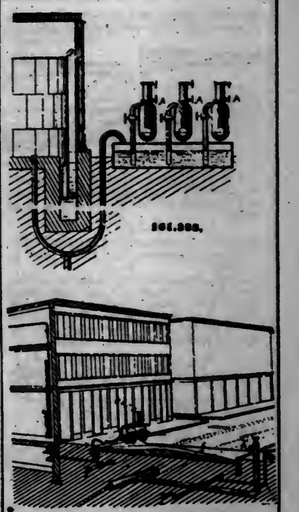
161,885. MACHINE FOR FORMING GEAR-WHEEL MOLDS. James Clayton, Portsmouth, Ohio. (Filed June 13, 1874.)

Brief.—The position of the arm of the revolving pattern-support is defined by the adjustable marker clamped to the bed flange. A screw-clamp secures the arm to the flange.

The combination, in a gear-wheel-molding machine with a vertical circular bed-flange, A, of the stop-piece D', on guide-arm and the marker E, both adjustable on same flange, as and for the purpose set forth.

161,886. CAR-SPRINGS. Benj. A. Clooney, New York, N. Y., assignor to New York Car-Spring Company. (Filed Dec. 4, 1874.)

A spring composed of a hollow cylinder of rubber placed between two spiral springs of half-round and half-flat coils, with the round faces next to the rubber, all combined substantially as and for the purposes set forth.

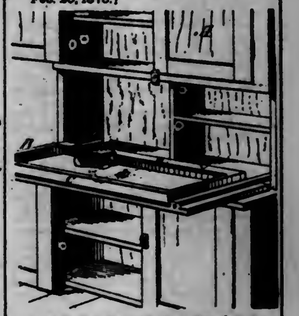


161,887. TELL-COUPLING JACES. John H. Combs, Seamford, Conn. (Filed Sept. 9, 1874.)

A shackle-jack consisting of the hooked jaw A and the removable sliding jaw H, to be operated by a rack and pinion, substantially as and for the purpose set forth.

161,888. APPARATUS FOR EXTINGUISHING FIRES. Jos. H. Connelly, New Brighton, Pa. (Filed Jan. 25, 1875.)

Brief.—A system of carbonic-acid-gas generators, with gas-holder and distributing mains and pipes extending into houses and rooms, is employed for extinguishing fires. Jet-nozzles introduced into the water-mains, or other pipes from the gas-mains, or into the gas-pipes from a steam-boiler, impregnate either the water with the gas or the gas with steam.



1. In combination with the system of gas-mains, distributing-pipes, holder, valves, and independent connections to the several rooms or compartments to be protected, one or more fixed or permanent carbonic-acid-gas generators, A A, connected therewith, with intermediate purifiers, substantially as set forth.

2. In combination with the main, service, and distributing pipes of a carbonic-acid-gas apparatus for extinguishing fires, an ejector-nozzle arranged therein for supplying a jet of steam thereto, substantially as set forth.

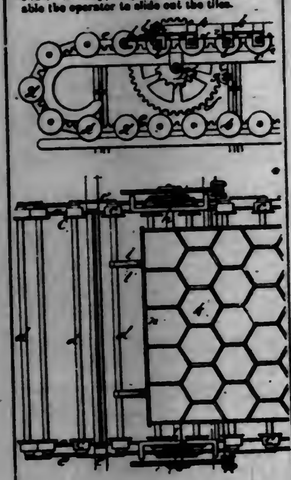
3. An ejector, *f'*, arranged in the line of hose from the service-pipe, with a steam-pipe connection thereto from the steam-generator, substantially as described.

4. The combination of a carbonic-acid-gas service-pipe and a fire-plug, arranged relatively to each other substantially as set forth, with reference to Fig. 6.

161,889. COMBINED CUPBOARDS AND SINKS. Henry Coil, Marshalltown, Iowa. (Filed Feb. 20, 1875.)

1. In combination with the cupboard A, the hinged or pivoted lid B, provided upon its inner surface with a raised edge, C, forming a sink when the lid is in a horizontal position, substantially as shown and described.

2. The combination of the sink, having inclined bottom, raised edge-strip at rear side, and exit-pipe, with a receptacle of sufficient size to admit the swinging of the exit-pipe therein, and a waste-pipe for the purpose of draining off the water in the open or closed position of the sink, substantially in the manner and for the purpose set forth.

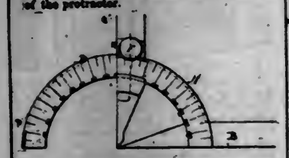


161,390. WOOD-SCREWS. A. Cummings, New York, N. Y. [Filed Feb. 15, 1875.]

A screw the head of which is provided at its center with an angular cavity, as shown and described, and with the usual slot, as set forth.

161,391. TILE-MOLDING MACHINES. Chas. Diebold, Lebanon, Pa. [Filed Mar 6, 1875.]

Brief.—An endless way is partly or fully covered on its length by a tray consisting of lateral rows hinged together of hexagonal molds. As each row, on reaching the curved end of the way, drops, their opened ends enable the operator to slide out the tiles.



1. In a tile-molding machine, the endless revolving carriage, the molds *b* connected therein, and the upper and lower disconnected rails *a b*, combined in the manner described.

2. Mold-boxes *b*, arranged in transverse rows, hinged to the axles *d*, substantially as described.

3. The hooks or clasps *l*, hooked to plates *m*, and constructed with braces *F*, substantially as described.

161,392. PROTRACTORS. Alvin E. Dodd, New York, N. Y. [Filed Jan. 18, 1875.]

Brief.—The bars are so arranged that one side of each bar must radiate from the center of the protractor.

The protractor A, having bar B rigidly attached at one end and extending to the center thereof, in combination with the bar C, adjustably attached to said protractor by clamp E and screw F, as shown and described.

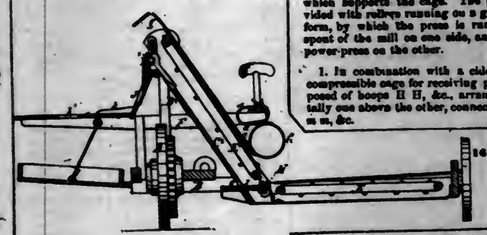
161,393. DENTAL PLUGGERS. Robt. B. Donaldson, Washington, D. C. [Filed Mar. 9, 1875.]

Brief.—The tubes through which the plugger moves are secured to a circular box, in which a hammer forced out by a spring operates against the end of the plugging-tool. Tool is to be used with a rotating engine.

1. The combination of the rotating disk C, provided with the spring-hammer H, the tubes G I, tool-stock K, and spring S, in the manner and for the purpose described.

2. The combination of the disk C, hammer H, spring F, and tool-holder K, together with mechanism for driving the disk, as and for the purpose specified.

3. The combination of the tubes G I, connected together and with the case A, in the manner and at the angle described, the spring S, and tool-stock K, with mechanism for driving the tool-stock, as set forth.

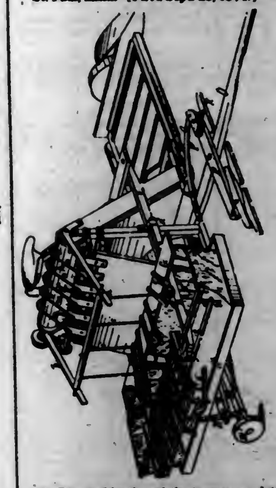


161,394. PIANO-STOOLS. C. A. A. During and John Lack, New York, N. Y. [Filed Oct. 31, 1874.]

The screw D', cross-piece C', and rods C C, combined in the manner described with stool A and bank B, for the purposes specified.

161,395. HARVESTERS. John H. Elward, St. Paul, Minn. [Filed June 27, 1874.]

Brief.—The cut grain falls upon the platform-apron, and is carried from it by the elevator-apron to the binders' table.



1. The cylindrical shield G, suspended from the seat-plank, as described, and forming the support for the retaining-rods *g*, connected to its lower inner face, and leaving an unobstructed convex surface upon its outer or platform side, as and for the purpose set forth.

2. The tootbed cams or rods I and crank or eccentric shaft H, in combination with the platform apron and elevator, substantially as and for the purpose set forth.

3. The crank or cam shaft H' and its stripper-rods I', arranged at the delivery end of the elevator-apron for removing the grain therefrom, as set forth.

4. The combination, with the cam or crank shafts H, of the stripping rods I and the intermediate bent straps or wires *r*, arranged and operating as and for the purpose set forth

161,396. HARVESTERS. John H. Elward, St. Paul, Minn. [Filed Sept. 20, 1874.]

1. The combination of the transverse plate or cleats with the inner face of the endless apron, with the teeth protruding on its working face, whereby said apron is made to present an unobstructed continuous surface to the action of the stripping device, as explained.

2. The dumping-tray J, in combination with the toggle-link or jointed locking brace or lever and link K L, arranged and operating, substantially as described.

3. The hinged axle-bar M, wheel M', hinged adjustable bar N, and standard N', arranged and operating in the described relation to the binders' platform, substantially as and for the purpose set forth.

161,397. CIDER-PRESSES. David F. Henry, Canton, Ill. [Filed Feb. 12, 1875.]

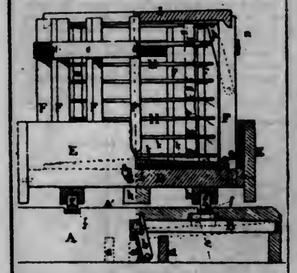
Brief.—The whole of the exhausted pomace is removed at one operation by means of hooks and ropes attached to rings on fixer-arm piece which supports the cage. The press is provided with rollers running on a grooved platform, by which the press is run under the spout of the mill on one side, and under the power-press on the other.

1. In combination with a cider-press, the compressible cage for receiving pomace, composed of hoops H H, &c., arranged horizontally one above the other, connected by bands *n n*, &c.

161,398.

2. In combination with the circle of uprights F, the pivoted supports *p p*, notched to support the cage H H, substantially as described.

3. The cider-press base, when constructed with bottom D, sides or hoop E, joists *h h h*, and rollers *g g*, &c., and circle of uprights F F, substantially as described.



4. In combination with the press E d A, and rollers *g g*, &c., the grooved platform A A', provided with the traps or drops *c c*, bars B *b b'*, lever C, and catch *b*, or its mechanical equivalent, substantially as described.

5. In combination with the circle of uprights F F, the disk or follower I, when constructed with slots *q q* on the edge to receive the respective uprights F, and a hanging lip, *n*, between each slot, to inclose the margin of the cage H, as described.

6. The pomace lifter or cross G, provided with the radiating grooves *s* and perforations *t t*, and the rings *v* at the end of each arm, by which to raise said cross and cage, with the pomace, from out of the press at one operation, substantially as described.

7. The arrangement and construction of cross G, with rings *v*, cage H, supports *p*, uprights F, and follower I, with slots *q*, and rim *n*, as described.

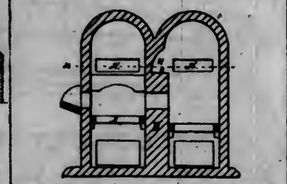
8. The construction and arrangement of the grooved platform A A, roller traps *c c*, bars B *b b'*, lever C, and catch *b*, as described.

161,399. MANUFACTURE OF STEEL. Jean Erquem, Paris, France. [Filed Feb. 20, 1875.]

Brief.—Heats iron with a mixture of peat with an ammoniacal salt, preferably sal-ammoniac.

The process, herein described, of converting iron into steel by placing the iron, together with pulverized peat and with an ammoniacal salt, preferably hydrochlorate, into a furnace, and heating, so that the gases given off by the decomposing peat and hydrochlorate will affect the iron, substantially as set forth.

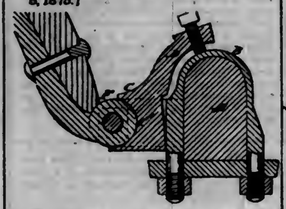
161,400. PISTONS FOR STEAM-ENGINES, PUMPS, &c. Franz Feldinger and Johann G. Koch, Vienna, Austria. [Filed Sept. 21, 1874.]



1. A piston having a series of radial cavities, with openings at different points, communicating with its opposite sides or faces, a series of small pistons having stems, and a circumferential packing-ring, said parts being combined as shown and described.

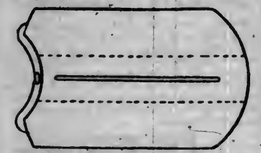
2. The combination of a small piston, F, having a projection or stem, I, with a piston having a radial cavity for reception thereof, and a passage leading out from said cavity to the sides of the piston, substantially as shown and described, whereby steam is admitted around the stem and in rear of such small piston.

3. The combination, with the piston A, having arms D, as described, of the cylinders G, for reception of the small pistons F, as specified.



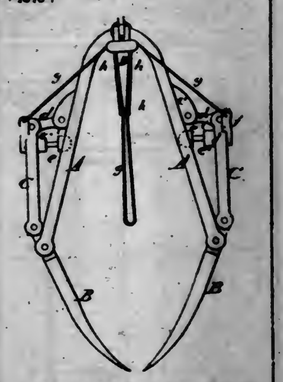
161,401. PIPE-WELDING FURNACES. Jos. Fieldhouse, Chicago, Ill., assignor of one-half his right to George N. Dutcher, same place. [Filed Jan. 23, 1875.]

Brief.—Improvement on Patent No. 86,918, granted to same party August 7, 1868; and consists in the addition of means for supporting the blanks in the welding-chamber after they have been heated in the first oven, and preparatory to giving them the final or welding heat.



In the pipe-welding furnace herein described, the recess H, arranged to form the shelf *s* for supporting the pipe-blanks, in combination with opening L, arranged to admit of the insertion and removal of the pipe-blanks, as specified.

161,402. BELL-COUPLINGS. Alfred W. Forwood, Georgetown, Ky. [Filed Feb. 5, 1875.]



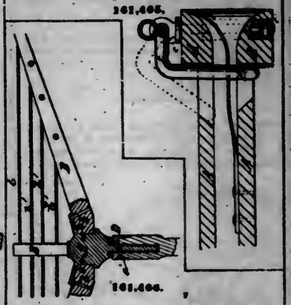
The box C C', having a lever-arm, D, adjustable by a set-screw in relation to the clip B, for regulating the approach of the box to journal F, substantially as set forth.

161,403. PAPER BOXES. E. P. Furlong, Biddeford, Me. [Filed Apr. 20, 1872.]

An imitation shirt-bosom having the slit or slits made therein, and having the plait a secured either to the front or back side thereof, substantially as described.

161,404. HORSE HAY-FORKS. Emmet V. R. Gardner, Johnson, N. Y. [Filed Mar. 6, 1875.]

1. In combination, with the forks B B, pivoted to the slotted arms A A, the links *d*, arrow-head catches *e*, arms *f*, and ropes *g*, substantially as described.



2. The handle D, pivoted to the arm A, and having the pulleys *h h*, and staple *k*, for the tripping-ropes *g g*, substantially as described.

161,405. CAR-COUPLINGS. Charles C. Garrett, Calvert, Tex., assignor to himself and Louis M. Oppenheimer, same place. [Filed Jan. 4, 1875.]

1. The sliding rods C C, in combination with draw-head A and angle-pin E, on shaft D, to avoid the coupling of two cars that may accidentally come in contact, as set forth.

2. The cross-bar rods C C, having nuts *a a'*, combined with tapering holes of draw-head, as shown and described.

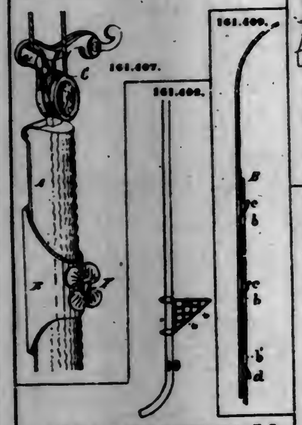
161,406.

161,406. CLOTHES-DRIERS. M. C. Griffeth, Canadaga, N. Y. [Filed Aug. 20, 1874.]

In a horizontal rotating clothes-drier, the arms B, connected by ropes *b'*, in combination with the hub A, having sockets *a*, spindle *a'*, and annular recess *c*, and the socket ferrels D, having the annular projection *d*, substantially as and for the purpose set forth.

161,407. CURTAIN-FIXTURES. H. L. Hall, Chicago, Ill. [Filed Feb. 23, 1875.]

Brief.—The case, containing the pulley-bearing shank and coiled spring, is held in position by a set-screw passing through the outer case, and engaging in notches on the exterior of the inner case. The outer or clamp case is secured to the window-casing. Above the pulley, on an arm of the shank, is arranged a dog with a serrated edge, that bears against the curtain-cord, and holds it securely against a projecting stud.



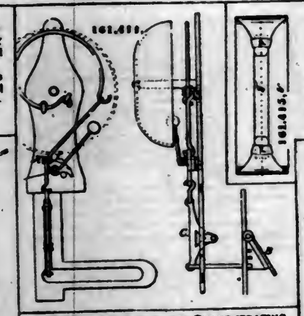
1. The combination of the case A and heat tachments B C, or its equivalent, and spring D, with the clamp case E and screw F, as and for the purpose specified.

2. The combination of the pulley C, or its equivalent, with head of stem H, and *e*, and the dog B, substantially as and for the purpose set forth.

161,407.

161,408.

161,409.

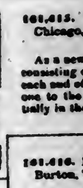


161,409. BRIDGING ATTACHMENTS. T. S. Hanchett, Wolcottville, Conn. [Filed Sept. 17, 1874.]

The multiple-staple for the holdback-strap, made of the sheet vertical bars 2 between the horizontal bars in the frames attached to the shafts, for the purposes and as set forth.

161,410. BALE-TIES. John H. Hardman, Allegheny, Pa., assignor of three-fourths his right to Wm. W. Tyson, W. H. Faulkner, and J. Johnston, same place. [Filed Feb. 28, 1875.]

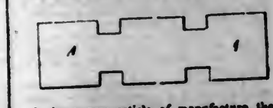
The tongues *c c* and reverse tongue *d* on end C, in combination with slots *b b b'* in end B, substantially as and for the purpose described.



161,411.

161,412.

161,413.



161,414.

161,415. BELL-FILES. Thos. Hutchinson, Chicago, Ill. [Filed Jan. 23, 1875.]

As a new article of manufacture, a bell-file consisting of the tablet A and elastic cord B, each end of the cord and tablet being united one to the other by the clasps *d d*, substantially in the manner specified.

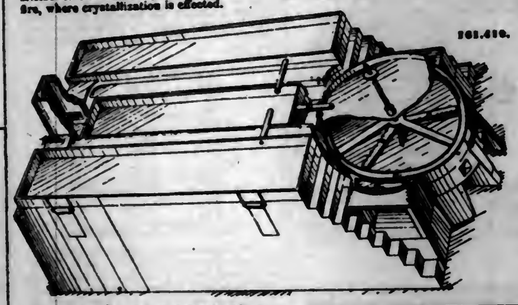
161,416. BALE-TIES. Henry Bradley Jones, Burton, Tex. [Filed Jan. 30, 1875.]

1. As a new article of manufacture, the buckle herein described, consisting of the base or bar B and the two projecting horns C C', curving toward each other from said base, substantially as and for the purpose specified.

2. The combination of the buckle herein described with a band or hoop, A, notched in the manner shown, as and for the purposes specified.

161,417. AUTOMATIC CRADLES. Wm. Kindermans, Troutville, Pa. [Filed Oct. 17, 1874.]

Brief.—When the base-frame is placed upon an inclined floor, the horizontal movement of the cradle is preserved by the lateral adjustment of the guide-bar.



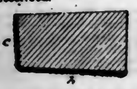
The combination, with cradle A, turning on pivots *a a*, of the clock mechanism O, rod F, wire D, and guide-bar E, as and for the purpose specified.

161,418. PURIFYING AND CONCENTRATING SALT-BRINE. Wm. Harrison, Liverpool, England. [Filed Dec. 22, 1874.]

Brief.—The brine is detained in the shallow pans over the flues of the furnace until impurities have been deposited and saturation has been attained. Then the brine is admitted to the shallow pan directly over the fire, where crystallization is effected.

161,419.

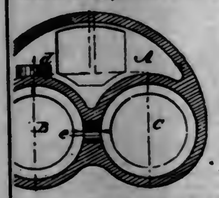
The herein-before-described process of manufacturing chloride of sodium or common salt from saline waters which hold in solution foreign matters, the same consisting in the use of broad and shallow pans placed over the flues as well as over the fire-place of the furnace, and exposed to the direct contact of the products of combustion, the brine being detained in the primary pan or pans over the flues until brought to the point of saturation, and made to discharge the foreign matters, and then being carried forward to the remaining pan or pans, in which it is subjected to the more intense heat of the fire-place, until the crystallization of the salt takes place and the evaporation is complete.



161,420. COMBINED SHAWL-PINS AND CLASPS. Geo. Hartje, Newark, N. J., and Frederick Hartje, New York, N. Y. [Filed Feb. 17, 1875.]

In combination with a shawl-pin, constructed as described and shown, the arm *b* and ring *c*, arranged to operate substantially as and for the purpose set forth.

161,421. MODES OF MAKING EMERY-RUBBERS FOR BURR MILLSTONES. E. C. Hinsey, Iowa City, Iowa. [Filed Aug. 10, 1874.]



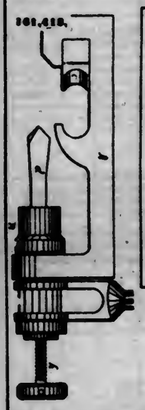
The improved process of preparing emery, to be used as a furrow and face rubber for millstones, by boiling a mixture of glue and shellac in milk or water, after which the emery is mixed with the boiled glue and shellac, and then pressing such compound into sheets of proper dimensions, which sheets are thereafter treated to a solution of alum, substantially as described.

161,414.

161,422. PUMPING-ENGINES. Wm. Markness, Providence, R. I. [Filed Jan. 6, 1875.]

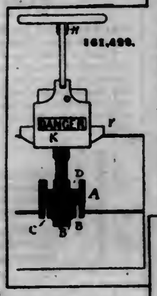
Brief.—The different chambers have extended mouth-pieces and lids at each end.

A gas-retort composed of the two circular chambers B C, arranged side by side, and the semicircular chamber A above the two former, with internal connecting-passages *e d*, the whole being cast in a single piece, substantially as described.



161,423. LETTER-BOX ALARMS. Jos. Harrison, Reading, Pa. [Filed Jan. 18, 1875.]

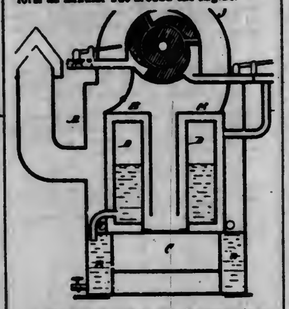
1. The combination of the letter-port A, the cover B, and the projecting flange *d*, substantially as described.



2. The combination of the cover B, having the regulator-pins *h*, with the plate A, and a bell mechanism, constructed substantially as shown and described.

The combination, as described and shown, of the frame A, key *c*, drill-stock B, and actuating lever or handle C with the sliding drill *d* and screw *k* acting directly against the head of the drill, substantially as specified.

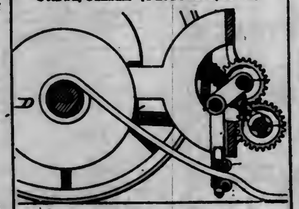
161,424.



161,425.

161,426. STEAM-GENERATORS. Sebra B. Mathewson, Gilroy, Cal. [Filed Dec. 10, 1874.]

Brief.—A rotary engine is combined with an upright boiler, the latter constructed to form an annular flue around the engine.



1. The shell A, with its annular water chamber B, fire-place C, and annular boiler D, having the shell E arranged to form a flue surrounding the boiler, substantially as and for the purpose described.

2. The combination of the annular flue J with the engine-cylinder, the flue forming a jacket around the engine, substantially as and for the purpose set forth.

161,427. PROCESSES OF MANUFACTURING HARD SUGAR. Frans O. Matthiessen, Jersey City, N. J. [Filed Feb. 4, 1875.]

As an improvement in manufacturing hard sugar, the process herein described, which consists in cutting the mass of sugar, while soft, into pieces of the required size, and then subjecting such pieces to the drying operation, as and for the purposes specified.

161,428. HOSE-CARRIAGES. Thos. McCabe, Ottawa, Canada. [Filed Feb. 9, 1875.]

1. A hose-carriage having its reel or drum D operated from one of the traction-wheels through the medium of a friction-wheel, E, and a friction-pulley, G, the latter bearing on the face of wheel E to move to and from the center of the same, in order to vary the speed of the reel, all combined substantially as shown and described.

161,419. WINDOW-SCREENS. Lorenzo D. Lockwood, Charlestown, N. H. [Filed Feb. 13, 1875.]

1. The strip *f*, having the groove *f'*, for the reception of the net D, in combination with the bar A, having the recess *f*, as described.

2. The bar A, having the recesses *e f*, the strip *f*, provided with the groove *f'*, and the bar B, having the groove *l*, in combination with the tension-rod C, substantially as described.

161,420. METALLIC ROOFS. Thos. M. Louis, Elmira, N. Y. [Filed Feb. 20, 1875.]

In a metallic roof consisting of sectional plates, the wick or packing J, in combination with the capping C and trough *e*, formed substantially as specified.

161,429.

161,421.

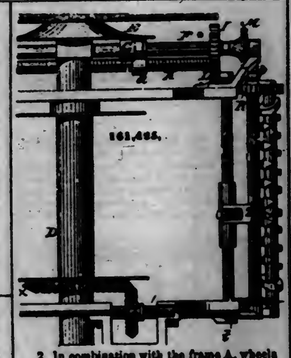
161,421. WATCH-KEYS. Henry Lohmeyer, Shreveport, La. [Filed June 4, 1874.]

Brief.—The watch-key screws into or upon a hollow push-rod attached to a stud rising from the catch-spring.

In combination with the pendant D of the watch and short watch-key A, the hollow push-rod C *c*, placed within the pendant, and acting directly on the case-spring, closed at its lower end by the stud *d* on the case-spring, and receiving and holding within its top end the milled-head watch-key A B, substantially as and for the purposes described.

161,422. FUSIBLE PLUGS FOR STEAM-GENERATORS. James F. Mahoney, Erie, Pa. [Filed Mar. 19, 1875.]

Brief.—A ring provided with a valve-seat and a plug containing fusible metal are inserted in the crown-sheet. When the fusible metal melts, the valve can be forced down upon its seat to close the aperture in the plug. To the saddle on top of the boiler is attached a plate containing the words "Safe," "Danger," over which slides a slotted plate, which is attached to the valve-stem.



1. In combination with a valve seat or ring containing a fusible plug for use in steam generators, an adjustable valve, which may be forced down upon its seat or raised therefrom from the outside of the generator, substantially as and for the purpose set forth.

2. In combination with a valve for closing the aperture in a fusible plug for use in steam-generators, caused by the melting out of the fusible portion of the metal, a slide made to move with said valve, and a stationary seat, the parts being arranged substantially as and for the purpose set forth.

3. The combination of the recessed valve seat or ring A and the plug B B', a portion of which is made of fusible metal, substantially as and for the purpose set forth.

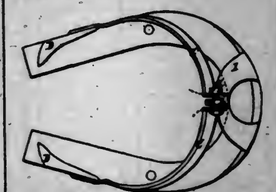
4. The combination of the recessed valve seat or ring A, the valve D, rod E, clamp H, connecting-rod I, sliding plate K, and the stationary plate upon which it moves, substantially as and for the purpose set forth.

161,423.

2. In combination with the frame A, wheels C, and drum or reel D, having the wheel X, the friction-wheel G, and the shafts F, O, and V, provided with pinions, whereby motion is communicated from the traction-wheel to the reel, as set forth.

3. In combination with the shaft F and the drum or reel D, connected therewith by suitable gearing, the friction-wheel E, sliding pulley O, and screw-shaft K, to move the pulley, as described.

4. In combination with the frame A and the drum or reel D, the sliding guide-frame or carrier Z, with the double-threaded screw P and fork *m*, for moving it to and fro, as described.



5. The guide-frame or carrier Z, provided with the rollers *p*, and having one side hinged to swing outward, all combined as shown and described.

6. In combination with the wheel E, the shaft F, provided with one or more friction-pulleys, and having one end mounted eccentrically in the block *d*, having the hand-lever *e*, as set forth.

7. In combination with the wheel E and the shaft F, provided with the sliding pulleys O and H, the screw-shaft K, provided with the detachable nuts *s* engaging with the pulleys, as shown and described.

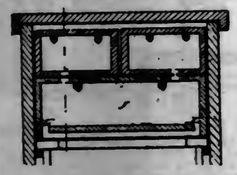
161,424. HORSESHOE-FASTENINGS. Saml. McVean and Benjamin E. Price, Cleveland, Ohio. [Filed Dec. 5, 1874.]

Brief.—Improvement on patent of Stickney & Taylor, October 18, 1864, No. 44,754. The toe-piece is provided with a perforated lug, through which the bolt that secures the side straps passes.

The bands O O', pivoted to the heel of the shoe, as described, bolt G, toe-piece I, having a perforated lug, H, in combination with the shoe B, substantially as described and for the purpose set forth.

161,425. BEER-FAUCETS. William B. Miller and Wm. Powell, Cleveland, Ohio. [Filed Oct. 21, 1874.]

Brief.—Air is drawn into the pump-chamber through the orifice in the lower part of the spigot, and forced into the barrel through the upper orifice, both of which are controlled by valves.

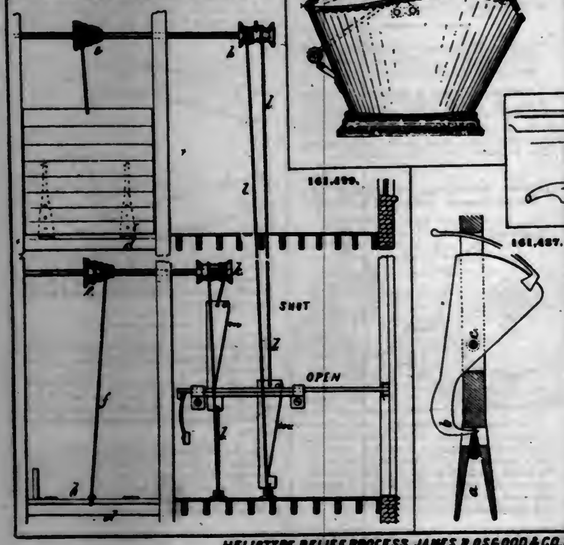


The herein-described faucet, consisting of the body A, cylinder A', piston D, key C, having therein hole *d*, and valve *e*, port *b*, port *a*, and valve *c*, outlet G, and chamber E, constructed and arranged to operate substantially as described, and for the purpose set forth.

161,427.

161,428. BEE-HIVES. George H. Mobley, Nevada, Mo. [Filed Mar. 18, 1875.]

Brief.—The honey-box, of equal length and width with the brood-chamber beneath, has a space beneath its bottom, which bottom does not touch its sides. A passage-way for the bees and for the escape of air is thus provided.



The honey-box J, having bottom K raised and narrower than the box to allow the bees to pass therein and up through the spaces I, as set forth.

161,429. HATCH CLOSING AND INDICATING APPARATUS. Daniel Moore, Brooklyn, N. Y., assignor to Jos. Goldmark, same place. [Filed Feb. 13, 1875.]

Brief.—The several hatches are connected by ropes to conical grooved pulleys attached to horizontal shafts. Wedge-shaped counter-balance-weights are attached by ropes to drums on the horizontal shafts. These weights from each shaft descend to the room on the first floor; and when any one of the hatch-doors is open, its corresponding balance-weight enters a slot in a bolt-bar, which is projected into the outside door-jamb, thus preventing the door from being locked until all the hatches are closed.

1. The conical grooved pulley *c*, connected by a rope or chain to the hatch, in combination with the counterbalance-weight *m*, suspended by a rope or chain, *t*, to the cylindrical drum *h*, for the purposes and as set forth.

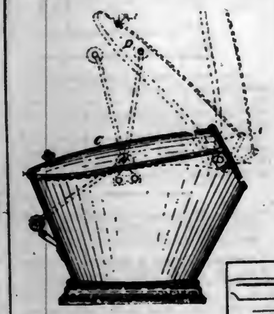
2. The counterbalance-weights *m*, connected to the respective hatches by ropes or chains and intermediate pulleys or drums, and located side by side in a convenient position to form indicators, by which the condition of the various hatches in the building can be ascertained by inspection of such weights, substantially as set forth.

3. The safety bar or bolt *n*, combined with and actuated by the hatch opening and closing mechanism, whereby the bolt is interposed to prevent the door-lock being operated when either hatch is raised, substantially as set forth.

161,430. PRIMINGS FOR ELECTRIC FUSES. George M. Mowbray, North Adams, Mass. [Filed Mar 13, 1873.]

A composition of metallic antimony and fulminate of mercury, as a priming for electric fuses, substantially as described.

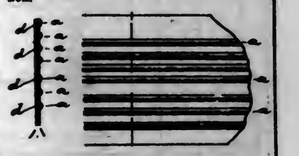
161,431. PRIMINGS FOR ELECTRIC FUSES, &c. George M. Mowbray, North Adams, Mass. [Filed Mar. 19, 1873.]



The above-described composition of bismuth and fulminate of mercury, as a priming for electric fuses, percussion-fuses for shells, &c.

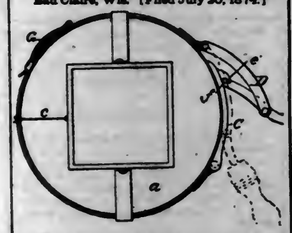
161,432. PRIMINGS FOR ELECTRIC BLASTINGS, &c. George M. Mowbray, North Adams, Mass. [Filed Mar. 19, 1873.]

The above-described composition of cadmium and fulminate of mercury, as a priming for electric fuses, friction-primers, percussion-fuses for shells, torpedoes, &c.



161,433. COAL-HODS. John H. Murphy, Worcester, Mass. [Filed Feb. 20, 1875.]

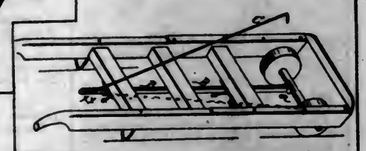
Brief.—As the cover is raised the discharge-opening is contracted.



161,434. CORDING MATERIALS FOR BOOTS AND SHOES. Alonzo P Nash, Weymouth, Mass. [Filed Jan. 6, 1875.]

Brief.—A cordal material in which the cords project only on the upper side, the under side being a plane surface. A piece of this material of the proper size is to be stitched to the vamp of a boot or shoe for ornamentation.

The herein-described cording material for boots and shoes, having parallel projecting ridges *a a a a* on one side of it, as and for the purposes set forth.



161,435. BAG-HOLDERS. Michael Olson, Eau Claire, Wis. [Filed July 20, 1874.]

The combination of the spout A, having the head or flange *a*, the band B, sustained by the supports *c c*, the link C, having hooks *e*, the link D, and the hand-lever E, all combined as shown.

161,436. HAND-TRUCKS. Henry Parker, Otsego, assignor of three-fourths his right to J. Jacobsen, St. Joseph, Mich. [Filed Sept. 5, 1874.]

Brief.—To hold packages on the truck.

In combination with an ordinary hand-truck, A, provided with the loops *a' a'* on the under edges of its cross-bars, the horizontally-sliding rod B, with hook *e*, and openings X X, and the rod C, with hooks at one end, and pivoted in the perforated end of the bar B, so as to be thrown over the top or folded under the bottom of the truck, substantially as set forth.

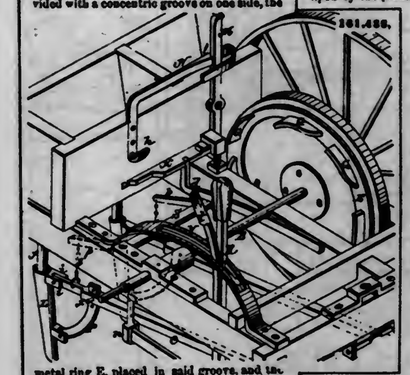
161,437.

161,437. LOOMS FOR WEAVING HAIR-CLOTH. Jos. Paradis, Brooklyn, assignor to Edward H. Faulkner, New York, N. Y. [Filed Nov. 8, 1873.]

Brief.—The selector consists of a fork or jaw so shaped at its narrowest part as to hold one hair only, and is provided with a pivoted hooked arm, the hook arranged to work across the fork in such manner as to pass between the innermost hair and the one next it, and retain it while the selector is passed through the shed.

In combination with the bed formed with discharge opening or spout, as described, the cover C, pivoted to the front of the bed at or near said spout or opening, substantially as set forth.

161,438.



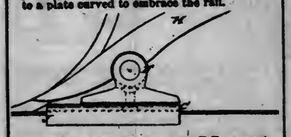
The selector formed of a jaw with a hook vibrated laterally to pass between the first hair and the next above it in said jaw, and acting to clamp said hair, substantially as set forth.

161,439. SEED-PLANTERS. Warren Post and Mason Colbert, Warsaw, Mo. [Filed July 6, 1874.]

Brief.—The cams which act upon the seed-slide are set in a metallic ring, which is fitted in a concentric groove in a wooden wheel.

1. The combination of the wheel D, provided with a concentric groove on one side, the

161,438.

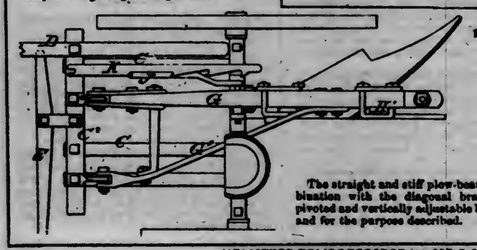


metal ring E, placed in said groove, and the cams G G, each provided with pins *e e*, passing through the ring and wheel, and riveted on the opposite side of the wheel, substantially as herein set forth.

2. The vertical pivoted lever M, and spring-arm N, with catch *s* and hook A, in combination with the plate K and seed-slide I, as and for the purposes set forth.

161,439. RAILROAD PINCH-BARS. C. Regan, Waterloo, Iowa. [Filed Jan. 16, 1875.]

Brief.—The bar works on a fulcrum-pin passing through a bearing, which is swiveled to a plate carved to embrace the rail.

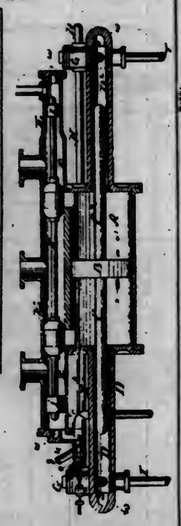


A railroad-pinch having jaws F F, connected by a pivot, E, with plate C, as and for the purpose specified.

161,440. SULKY-PLOWS. Edwin Robertson, Fairmount, Ill. [Filed Dec. 5, 1874.]

Brief.—The plow-beam, with a rigidly-attached diagonal brace, is made adjustable at their forward ends in a vertical direction. A cam and lever has its fulcrum upon the axletree of the bearing-wheels, and by the movement of the lever the cam acts upon a friction-wheel upon the under side of the beam, thus elevating the plow at pleasure.

161,440.



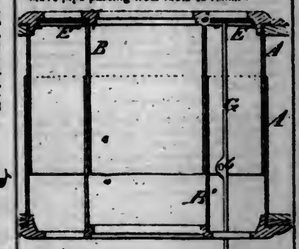
The straight and stiff plow-beam G, in combination with the diagonal brace G^1, both pivoted and vertically adjustable by the means and for the purpose described.

161,441. HYDRAULIC ENGINES. F. Rochow, Brooklyn, N. Y. [Filed Jan 26, 1875.]

Brief.—From the faces of the pistons in the main cylinder project plungers of smaller diameter, which fit into chambers projecting from the heads of the cylinder of the engine. The plungers and their chambers constitute pumps for forcing water or other fluid with a degree of pressure greater than that required to move the large pistons. May use for operating the engine a liquid different from that acted upon by the plungers—as, for instance, overflow water for the engine, and oil or equivalent liquid, in a continuous circuit, to be acted upon by the plungers.

161,441.

1. In combination, with the larger main cylinder A, piston B, and main valve-chamber E, the projecting smaller pressure-cylinder D, piston C, and valve-chamber G, the chamber E, having a valve for controlling the entry and discharge of the liquid which operates the piston B, and the chamber G having a separate suction and a delivery valve for the admission and discharge of the liquid which is acted upon by the piston C, substantially as described.

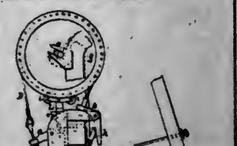


2. The valve-rod F, carrying the larger piston *j* at one end and the smaller piston I at the other end, to be affected automatically by continuous hydraulic pressure on the smaller piston, and alternate pressure on the larger piston, substantially as specified.

3. The reciprocating pistons *p*, placed within the cylinder *o*, and combined with the supply-pipe *q*, tubes *n* and *r*, and chamber E, substantially as and for the purpose herein shown and described.

4. The pocket *w*, arranged at the end of a hydraulic chamber, for the reception of a plunger moving in said chamber, and provided with tapering notches, substantially as set forth.

161,442. ADJUSTABLE VENTILATING-REGISTERS. Geo. W. Rogers, Lake City, Minn. [Filed Dec. 26, 1874.]



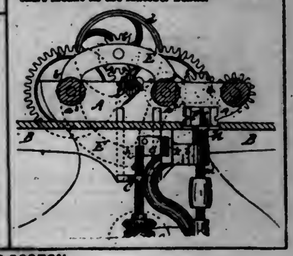
Brief.—Adapted for use as a thimble for a stove-pipe passing from room to room.

The adjustable perforated plate E, in combination with the lever G, pivoted to the cylinder A, and extending up through the plate E and through a slot, *e*, as and for the purpose set forth.

161,443. LET-OFF MECHANISMS FOR LOOMS. George P. Rose and Abel Cartwright, Slocumville, and Benoni S. Rose, Lafayette, R. I. [Filed Feb. 1, 1875.]

Brief.—The let-off is regulated by a friction-strap controlled by a padded lever bearing on the warp roll, and the beam is held at the beat-up by connection with the lay, which tightens the strap, and at the same time causes the padded lever to press on the warp. The beam is in part supported on an adjustable stand, and having friction-rollers, and the tension of the strap is removed by means of a cam-piece when the beam is to be reversed.

1. The combination of the arm *g*, rock-shaft F, cam *h*, lever *b*, strap D, and lever *a*, operated by the lay or any moving part of the loom, with the beam B, all operating together, substantially as and for the purposes set forth.



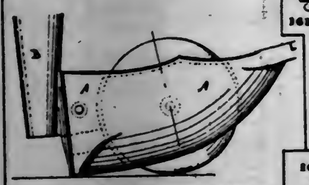
2. The combination of the beam B, arm *g*, cam *h*, lever *b*, strap D, and lever *a* with the cam *f*, all operating together, substantially as and for the purposes described.

3. The combination of the cam *f*, lever *a*, and friction-strap D with the beam B, substantially as and for the purpose specified.

4. The combination of the adjustable stand L with the pivoted friction-rolls *i i* and beam B, substantially as and for the purpose set forth.

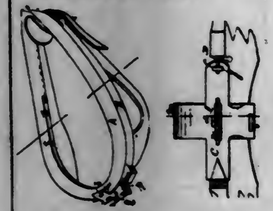
161,444. WOOD-PLANING MACHINES. J. Ross, Buffalo, N. Y. [Filed Jan. 13, 1875.]

Brief.—The bed upon which the lumber rests while being planed is made vertically adjustable in connection with and by the same means as the matcher-heads.



1. In combination with the frame A, having notches *a a* upon one side, the yoke E, having the boxes *b b* and lug *c*, all cast in one piece, and carrying the operating gears C, and connected with the feed-rollers *d' d''*, substantially as and for the purposes set forth.

2. In a rotary wood-planing machine, the adjustable table B, having the matcher cutter-head frames attached to and operating in connection therewith, substantially in the manner and for the purpose hereinbefore specified.

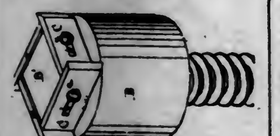


161,445. GRAIN-DRILL TEETH. I. B. Sandusky, Lexington, Ky. [Filed Feb. 20, 1875.]

Brief.—The conductor-spout and the furrow-opener are made in halves, and bolted together. The opener is recessed to receive the journal of the cutting-wheel that severs the vines in advance of the tooth.

The tooth A and conductor-spout B, made in halves, recessed to receive the cutter-wheel, and provided with bearings therefor, all as shown and described.

161,446. HORSE-COLLARS AND HAMES. J. J. Schneider and Alexd. S. Mook, Bedford, Iowa. [Filed Mar. 3, 1875.]

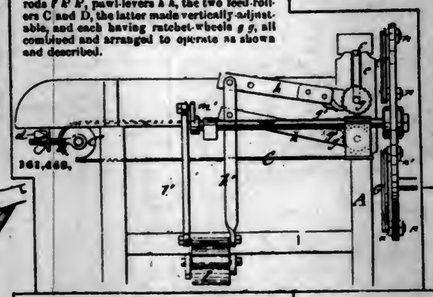


1. In combination with the hames B B', having projections *d d* and swinging hasp C, the collar A, divided at *a* and *b*, as described.

2. The swinging hasp, constructed with the eye *i*, opening *l*, staples *n o*, and curved projection *m*, as and for the purpose described.

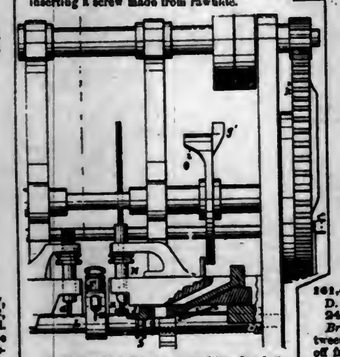
161,447. CUTTER-HEADS. F. Schwamb, Chicago, Ill. [Filed Feb. 7, 1873.]

Brief.—For cutting the entire surface inscribed by the cutters, downward onto a vertical line, in cutting pictures, frames, &c., the head of a cylindrical cutter head is cut away, so as to form an inscribed square, to each face of which an adjustable cutter is attached. The cutters extend beyond the line of the head, have their entire upper edge beveled from the outside to the inside, and are tapered from heel to point, so that the cutting-edge is slightly wider than the heel of the cutter.



The cutter-head B, with square portion B', cut away as described, in combination with cutters C, having beveled cutting-edges *c'* extending beyond the part B', all constructed substantially as and for the purpose specified.

161,448. FEED-CUTTERS. J. A. Schwerdt, New York, N. Y. [Filed Sept. 26, 1874.]



Brief.—The rolls are operated by ratchets upon each end; and a lever pivoted in the center under the feed-box communicates motion to the ratchet-arms.

In a feed-cutter, the wheel G, provided with two cutting-blades, G' G', the crank-shaft *w*, centrally pivoted treadle-lever *l*, connecting-rods *l' k' k'*, pawl-levers *h h*, the two feed-rollers C and D, the latter made vertically-adjustable, and each having ratchet-wheels *g g*, all combined and arranged to operate as shown and described.

161,449. MACHINES FOR INSERTING FIBROUS SCREW-FASTENINGS IN BOOTS AND SHOES. Geo. V. Sheffield, New York, N. Y. [Filed Mar. 1, 1875.]

Brief.—A screw tap is provided for screw-threading the punched hole preparatory to inserting a screw made from rawhide.

1. The combination, in a machine for fastening shoe-soles and other work with screws of fibrous material, of a boring-tool to make the holes for the screws, a screw-tap for screw-threading the holes, a chuck for inserting the screws, a cutter for cutting off the inserted screws, and suitable apparatus for operating the different instrumentalities in the order described, substantially as specified.

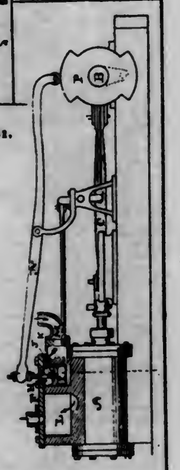
2. The combination, in a machine for fastening the soles and other work with screws of fibrous material, of a boring-tool to make the holes, a screw-tap for screw-threading the holes, a chuck for inserting the screws, a cutter for cutting off the inserted screws, and apparatus for operating them all, adapted to effect the several operations described for each successive screw in one and the same place, while the work remains in one and the same position, all substantially as and for the purpose specified.

3. The boring-tool, combined with the rod I, arranged in the inclined slots or bearings M and vibrating and rising and falling levers N, substantially as specified.

4. The combination, with the sliding screw-tap G, of pulley X, clutches Z and *f*, and the reversely-turning shafts Y and *g*, substantially as specified.

5. The combination, with the sliding chuck H, of the pulley K, toothed rim *t* and *q*, wheels *r*, spring-catches *p d'*, reversely-turning shafts Y and *g*, and the mechanism for working the spring-catches, substantially as specified.

161,450. HAND-STAMPS. John Sigwalt, Jr., Chicago, Ill. [Filed May 19, 1874.]



Brief.—The lugs are provided to prevent lateral movement of the arm.

The lugs A and A of the vibrating arm *a'*, in combination with the extensions B and B of the lugs *b''* and *b''* of the bed-piece, substantially as herein described, as and for the purpose set forth.

161,451. CUT-OFFS FOR STEAM-ENGINES. D. H. Smith, St. Louis, Mo. [Filed Feb. 24, 1875.]

Brief.—A single cut-off valve is used between the two steam-chests. As steam is cut off from one engine it is admitted to the other.

1. The compound cylinder A A', provided with suitable pistons, the shaft B, rods C C', cranks D D', valves E E', chest F, provided with the chambers G G' and H, valve I, ports J J' K K', and pipe M, combined and operating substantially as described and shown.

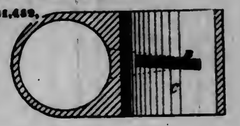
2. The valve I, chamber H, ports J J' K K', pipe M, rod N, cam P, and shaft B, combined and operating substantially as shown and described.

3. The valve I, chamber H, ports J J' K K', pipe M, combined and operating substantially as described and shown.

161,452. ROTARY REVERSING AND CUT-OFF VALVES. John C. H. Stut, San Francisco, Cal. [Filed Feb. 26, 1875.]

Brief.—As the valve is oscillated to admit and exhaust steam, the inclined edges of the valve steam-ports give a variable cut-off. The two sets of ports are arranged in reverse order, so that by moving the valve longitudinally, a steam-port takes the place of an exhaust-port, and vice versa, and reverses the engine.

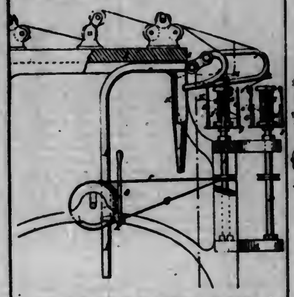
1. The cylindrical valve-chamber C, having the ports B B extending around the inside of the chamber spirally, or at an angle with a circular cutting-plane, in combination with a rotating valve having steam and exhaust ports to correspond with the ports B, substantially as herein described.



2. The valve E, having the two sets of steam and exhaust ports D E and F G situated in parallel planes, which cut the valve at right angles with its axis, so that one set may be used in admitting steam to move the engine in one direction, and the other set to reverse it, substantially as herein described.

3. The cylindrical rotary valve H, having two steam and two exhaust ports for forward and reverse motion, said valve being provided with a sliding steam-pipe, I, so that the valve may have a motion endwise in its chamber, to bring either set of ports in a line with the ports B B without causing leakage, substantially as herein described.

4. The rotary valve having the steam-ports E and G, one side, *e*, of which is made angular or inclining, so that by moving the valve endwise either of these ports will give a variable steam-opening in connection with the spirally arranged ports B B in the valve-chamber, substantially as herein described.



5. The cylindrical valve-face H, composed of two segments, and provided with the packing-strips *h* and *i*, the interior strips *j* and *k*, and springs *l*, and the end springs *n*, substantially as herein described.

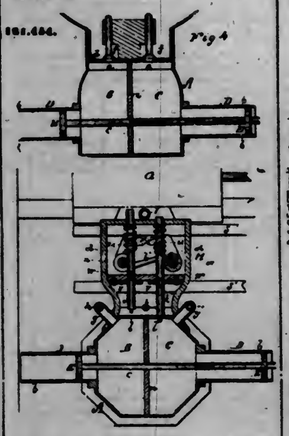
161,453.

161,455. TWISTERS FOR MAKING THREAD, TWINE, &c. L. M. Sutherland, Catskill, and Thos. Groves, Brooklyn, N. Y., administrators of James Sutherland, deceased. [Filed Jan. 4, 1875.]

Brief.—The strands, on the way from the bobbin to the tension-rollers, are dampened by being led through a slit in the bend of the water-pipe. The stop-cock of the water-pipe is connected to the belt-shifter, and the water is thus cut off when the machine is thrown out of operation.

1. The slitted bent pipes J, hinged or jointed to a water-pipe, I, and interposed between the fliers and the tension-rollers for wetting the strands while being twisted, substantially as herein shown and described.

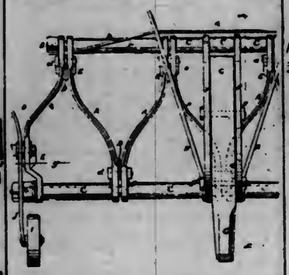
2. The combination of the cock P of the water-pipe I, that supplies water to wet the strands, with the ordinary belt-shifter O of the machine, substantially as herein shown and described.



161,454. AIR AND GAS ENGINES. John Taggart, Boston, Mass. [Filed Oct. 26, 1874.]

Brief.—Hydrogen gas and air automatically supplied are ignited within the explosion-cylinders, thereby heating air which is stored in a conservator, and constitutes the motive power of a common engine.

1. The air and gas engine, substantially as described, composed of the double-headed piston *e* B E', the two explosion-chambers B C, the perforated tubes D D', the conservator F, and its valves *f f*, and the two exploders *h h'*, provided with mechanism for operating them alternately, as set forth, all being combined and arranged and provided with gas-inducts and platina wires, essentially as explained.



2. The combination or mechanism, substantially as described, for actuating the exploders, such consisting of the springs *a a*, shafts *a' a''*, arms *b' b'*, studs *d' d''*, tops *e' e''*, gravitating latches *v v*, catches *w w*, and the slides *t t'*, provided with the trippers *z* and the triggers *e' f'*, all arranged together and with the case H as set forth.

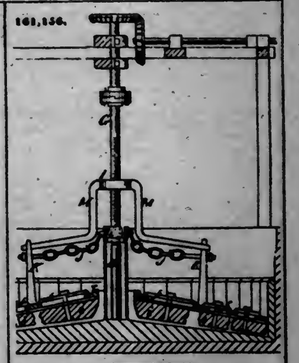
161,456.

161,463. CULTIVATORS. F. W. Tolley, Coxsackie, N. Y. [Filed Jan. 4, 1875.]

Brief.—The entire frame turns upward and forward to be transported upon the wheels.

1. A cultivator-frame consisting of curved bars A, long rods B, with and screws receiving nuts, and tubular washers C, all substantially as shown and described.

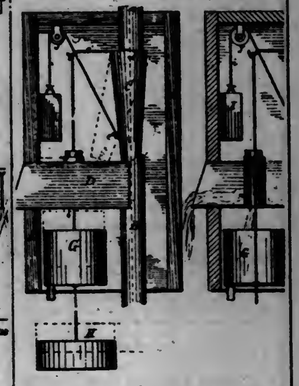
2. The combination, with frame and pivoted tongue, adjustable in slotted guides F, of the pivoted draft-hook K, having link L, adapted to couple with the hook M or N, in the manner and for the purpose specified.



161,456. ORE-CRUSHERS. D. Trumbull, Jr., Coulterville, Cal. [Filed Jan. 23, 1875.]

Brief.—Separate stones are attached to a skeleton muller by bars and bolts. The shaft may be removed after untaying it from collar I, screwing the collar upward and casting off the chains. Then the muller may be removed. The basin is lined with stones.

1. The pan A, with its stone bottom and stone sides, in combination with a skeleton muller, consisting of the hub *c*, with its radial arms *d*, rings *e e*, having stones *i i* bolted firmly thereto, substantially as and for the purpose above described.

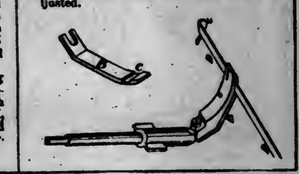


2. The vertical driving-shaft G, having its lower end formed into a screw, and stepping in the standards B, in combination with the collar A, chains *f*, standard K, and nut L, with its arms M, all combined and arranged to operate substantially as and for the purpose specified.

161,456.

161,457. AUTOMATIC CISTERN-SUPPLY REGULATOR. Theophilus Van Kannel, Cincinnati, Ohio. [Filed Oct. 9, 1874.]

Brief.—An apparatus which allows the first part of a rain-fall to pass off, carrying with it the soot, &c. A float, pulley, and a vibrating spout or tube, which works automatically, and carries the pure water into the cistern.

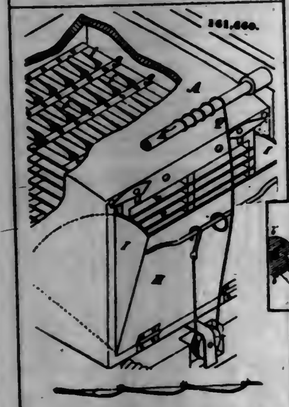


1. A cistern-supply regulator having the vibrating tube C, vessel G, float H, and weight I, combined to alternately change the stream of the supply, as and for the purpose described.

2. The tube E, with longitudinal opening *e*, combined with cut-off E', to divide the water conducted into vessel G and that wasted through trough D, as set forth.

161,458. GAGE QUILTERS AND CORDERS. Geo. Vincent, Stockton, Cal. [Filed Feb. 2, 1875.]

Brief.—The quilting-gage is held in a notch in the top of a plate bearing against the bottom of the presser-foot. The plate is screwed fast to the heel of the presser-foot, and has a square shoulder that fits the beveled heel, and prevents the plate from sliding sidewise. The elasticity of the plate allows the gage to be tilted.



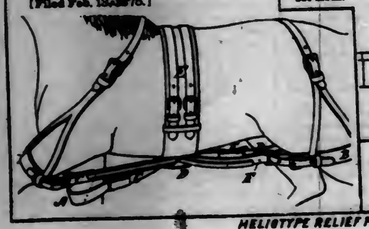
The gage-bar D, with its shutter c, in combination with the plate B, slotted at c and recessed to the heel of the presser-foot, substantially as and for the purpose herein described.

161,459. GUIDE ATTACHMENTS FOR SEWING-MACHINE PRESSER-FEET. George Vincent, Stockton, Cal. [Filed Feb. 2, 1875.]

The presser-foot D, constructed with the sharp bend a and the screw c, with its nut d, in combination with the attachment B constructed with the sharp bend b and slot e, as set forth.

161,460.

161,460. CON-CENTRATORS. John Vincent, Sr., San Francisco, Cal. [Filed Feb. 19, 1875.]



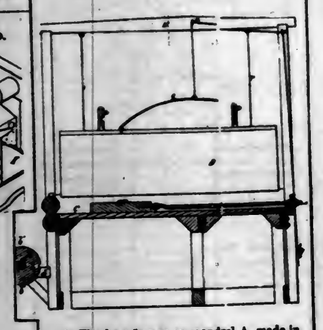
Brief.—A concentrator consisting of a number of shelves having pockets partly covered at their rear ends, the whole contained in a box mounted on journals and hangers. The box is given a vibrating and rocking motion to facilitate separation.

1. The box A, having a series of concentrating-trays, c, mounted on journals b, and suspended by hangers D, in combination with the bent-shaft K, having arms i, which are attached to the box by chains of the rod m, substantially as and for the purposes described.

2. The box A, provided with the hinged end H', having side-boards I, said box inclosing one or more concentrating-trays, c, substantially as and for the purposes described.

3. A concentrating device, in combination with an external cam mounted on journals, whereby it can be turned to any desired position on said journals, for the purpose of charging and discharging the ore and concentrates.

161,461. APPARATUS FOR BREAKING HORSES. J. S. Walling, Red Wing, Minn. [Filed Feb. 15, 1875.]



The diagonal straps I and G, in combination with straps C and F, surcingle E, for supporting the pulley-block D, and straps or bands A B, substantially as and for the purpose set forth.

161,462. NUT-LOCKS. Orrin T. Welch, Topeka, Kans. [Filed Sept. 22, 1874.]

A nut-lock formed of grooved nuts D, encircling wire E, and intermediate binding-wire F, substantially as and for the purpose described.

161,463. MACHINES FOR MANUFACTURING HYDRAULIC HOSE. John A. Wiley, North Andover, Mass. [Filed Feb. 12, 1875.]

1. The hose-former or mandrel A, made in sections *a b c d*, provided with tenons and mortises, as described.

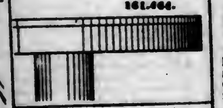
2. The hose-former A, made in sections, as described, and provided with the air-channel *s*, extending through them, as set forth.

3. The hose edge-clamp B, composed of the bar A and the series of bow-springs or clamps i, provided with clamping-screws, as set forth.

4. In combination with the table C, the boarder D, arranged with and applied to such table, substantially as and for the purpose specified.

5. In combination with the table C, the clincher F, and its rod G, arranged with and applied to the table, substantially as specified.

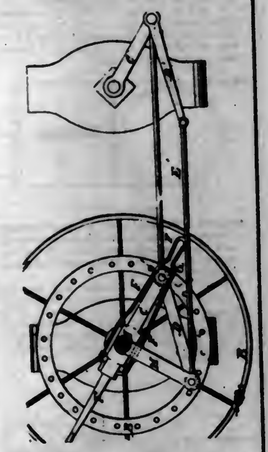
6. The combination of the flattening-rollers L L with the table C, the clincher F, and its rod G, applied to the table, as set forth.



7. The combination of the grooved receiving-roll K, provided with mechanism for operating it, as described, with the table C, the clincher F, and its rod G, applied to such table, as specified.

8. The combination of the table C, the grooved receiving-roller K, provided with mechanism for operating it, as described, the flattening-rollers L L, and the clincher F, applied to the table, all being arranged substantially as explained and represented.

161,464. BUTTER-PRINTS. R. S. Williams, Philadelphia, Pa. [Filed Dec. 17, 1874.]

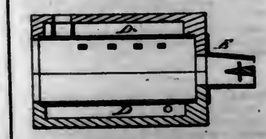


A butter-print having a porcelain or enamelled face, substantially as and for the purpose set forth.

161,464.

161,465. MECHANISMS FOR OPERATING THE ADJUSTING-SCREWS OF ROLLS. John S. Worth, Centerville, Pa. [Filed Feb 20, 1875.]

Brief.—The power to drive the screws is derived from a horizontal shaft, and transmitted through a reversing-clutch, a vertical shaft, and a sliding crank. Each screw is provided with a crank, to the end of which is fastened at an angle a secondary crank. One bar connects the ends of the two secondary cranks, and another the ends of the cranks proper. The driving-crank is attached to the center end of one of the secondary cranks. The crank on one of the screws is loose, but capable of being locked to the hand-wheel fastened to the screw, so that either end of the roll may be adjusted independently, or both ends simultaneously.



1. The combination of the hand-wheels B *b'*, the catch-block G, and the latch F with the cranks or wrenches C C', and the two pairs of connecting-rods D D' and E E', substantially as herein shown and described, to enable either of two screws to be turned separately, or both at the same time, as set forth.

2. The combination of the return-crank H, the extensible crank I, the gear-wheels J K L, shaft L, and the double clutch M, and its shifting-lever N with the two cranks or wrenches C C' and the two pairs of connecting-rods D D' and E E', substantially as herein shown and described.

161,466. PEAT-KILNS. William B. Wright, Rome, N. Y. [Filed Aug. 20, 1874.]

Brief.—By the operation of the central cone, the mass of peat is prepared to receive the heated air upon its interior as well as its exterior surface.

1. In combination with a drier for a peat-kiln, a cone, B', centrally arranged in its outlet E, for the purpose herein described.

2. The double-wall drier, having the upper portion of its inner wall D perforated, the annular outlet H, and the inclined cone B', all combined and arranged substantially as and for the purpose set forth.

161,467.

161,467. COMBINED PEN-HANDLES AND LEAD-PENCILS. Henry C. Benson, Yonkers, N. Y., assignor to Jos. Reckendorfer, New York city. [Filed Jan. 22, 1875.]

The herein-described article, consisting of a hollow pen holder or handle, or other article, and a lead-pencil received within said handle, and provided with a rubber head, that forms a plug to fit tightly in and close the upper open end of the handle, as shown and set forth.

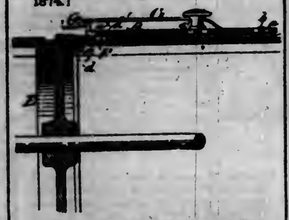
161,468. LUBRICATING COMPOUNDS. Ira G. Betts, Detroit, assignor of two-thirds his right to George B. Peters, Marshall, Mich. [Filed Feb. 16, 1875.]

1. The process of making a base for lubricating compounds by saponifying alkalies, water, and fats, and combining with the same, when cold, a quantity of cold oil, substantially as described.

2. A lubricating compound composed of a base made by partially saponified alkalies, water, and fats, combined, when cold, with cold oil, and asbestos, paper-pulp, or other suitable material, to hold said base mechanically, substantially as described.

161,469. LUBRICATING COMPOUNDS. Ira G. Betts, Detroit, assignor of two-thirds his right to George B. Peters, Marshall, Mich. [Filed Feb. 16, 1875.]

A lubricating compound adapted to be used in cups, wherein to a base made of alkali, water, and fat partially saponified, to which a certain quantity of cold oil has been added and a vehicle of asbestos and paper-pulp, or either, to take up and mechanically hold the greasy or oily substances, there is added an essential oil, substantially as and for the purpose set forth.

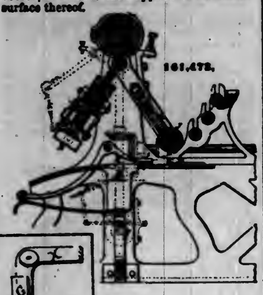


161,470. FEET FOR FENDERS, &c. F. S. Bissell, Pittsburg, Pa. [Filed Jan. 22, 1875.]

Brief.—To protect the surfaces of hearth or floor, and insure noiseless movement.

The combination, in a foot for fenders, coal-boxes, &c., of the socket *a*, ball C, of rubber, or similar material, and ring or circle-piece *b*, substantially as specified.

161,472. SEWING-MACHINES. Helen A. Blanchard, Boston, Mass. [Filed Oct. 27, 1874.]



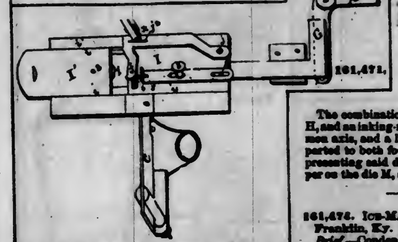
1. The combination of the horizontally-reciprocating feed-wheel, carrier-plate B, interlocked therewith, as described, cloth-gage A, and spring presser-bar G, both secured to and upon said carrier-plate, substantially as and for the purpose specified.

2. The horizontally-reciprocating feed-wheel E and carrier-plate B, interlocked therewith, as described, and provided with a slot, *f'*, in combination with the fixed and bossed needle-guide *F f*, substantially as and for the purpose specified.

161,473. MACHINES FOR NUMBERING, EMBOSSING, AND INKING BOOKS, &c. Louis O. Bodel, Jacques Masse, and Wm. Webster, Paris, France. [Filed Dec. 31, 1874.]

Brief.—The male numbering and embossing die is fixed in the table. An oscillating shaft above it has arms carrying the corresponding female die and an inking-roller. The paper, placed over the die on the table, is first embossed, and ink is then applied to the raised surface thereof.

161,473.



The combination of the relief-die M, the die H, and an inking-roller, J, mounted upon a common axis, and a like oscillating movement imparted to both for the purpose of alternately presenting said die H and roller J to the paper on the die M, substantially as described.

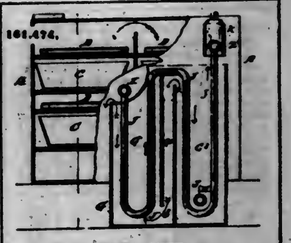
161,474. ICE-MACHINES. W. H. H. Bowers, Franklin, Ky. [Filed Mar. 9, 1875.]

Brief.—Condensed air is forced through pipes set in compartments, through which cold water flows in an opposite direction, and also through a valve set to yield at a predetermined pressure, and is then allowed to expand in a freezing-chamber divided by partitions having fines alternately at top and bottom. In each compartment are pans holding water to be frozen, set alternately against opposite sides of the apartment, and protected by superposed framed muslin screens.

1. The divided compartment A, in combination with the pans C and the muslin screens D, all as and for the purpose specified.

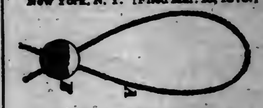
2. The combination of the radiator-compartments G^1 G^2 G^3, pipes I, J, and R, valve-chamber K, and water-pipe K', all constructed substantially as and for the purpose herein set forth.

161,471.



161,471. SEWING-MACHINES. Helen A. Blanchard, Boston, Mass. [Filed Sept. 16, 1874.]

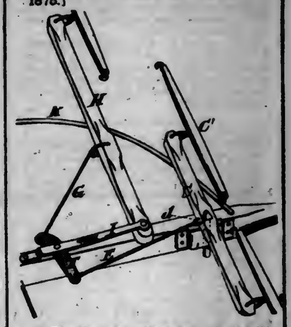
1. The combination of gear-wheel A, having cam-groove *e*, bell-crank X, having a stud working in said cam-groove, bar H, and plate I, substantially as and for the purpose specified.



2. The combination of the laterally-reciprocating plate I, spring presser-foot J *f*, secured thereto, and presser-bar K *h*, substantially as and for the purpose specified.

3. The combination of plates I and I', adapted to be reciprocated in the guide-plates *f* and *f'* of the spring connecting-book I, and the bottom 2, whereby said plates may be securely locked together or unlocked to afford access to the shuttle, substantially as set forth.

161,476.



161,475. METALLIC SEALS. R. J. Brooks, New York, N. Y. [Filed Mar. 13, 1875.]

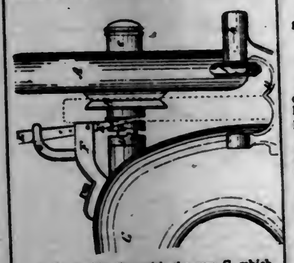
A metallic seal consisting of a wire bow, A, and a ball or disk, B, of soft metal, with apertures crossing each other, so as to cause the ends of the wire to afford a mutual anchorage and bearing to each other when the seal is compressed, as hereinbefore described.

161,476. DRAFT-EQUALIZERS. William M. Brown, La Fayette, Ind. [Filed Jan. 8, 1875.]

1. The pole A, in combination with the sliding double-tree C, rod E, lever F, rod G, and lever H, substantially as and for the purpose specified.

2. The rod K, in combination with the lever H and the pole A and its cross-bar B, substantially as and for the purposes specified.

161,477. CURTAIN-FIXTURES. Chauncey Buckley and Lodowick L. Sawyer, Meriden, Conn. [Filed Mar. 16, 1874.]

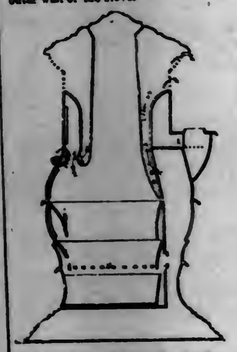


Brief.—A toothed pendulum-disk is provided with a friction-plate, bearing against a corresponding plate on the end of the roller, so that the curtain may be governed in its movement by either.

The combination of the roll B, bracket A, constructed with the bearing F and projection *f*, the toothed friction-plate D, and lever L, all constructed and arranged substantially as specified.

161,478. SEWING-MACHINES. Jas. H. Burr, Cahoba, Mo., assignor of one-third his right to G. White. [Filed Dec. 26, 1874.]

Brief.—One part of the clutch is stationary on the main shaft, and the other part, attached to the driving-wheel, loose on the shaft. When a bobbin is to be wound, the parts are thrown out of gear by a lever pivoted in a bracket on the arm of the machine, and are locked thus by a spring on the lever fitting into a notch in the bracket. When the lever is released, a spring on the end of the main shaft, bearing against its cap, forces the parts of the clutch into contact.

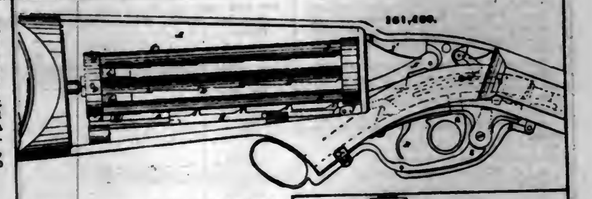


1. In combination with the arm G, which carries the driving-shaft and the axially-adjustable fly-wheel, of the bracched bracket F and the spring-lever E of the clutch device, arranged and held in the notched end of said bracket against the action of the spring c when the fly-wheel is made free for winding the bobbin, as herein set forth.

2. The combination, with the clutch-spring b, the fly-wheel A, and its shaft C, of the removable screw-cap sleeve c, arranged upon an extension of said shaft, and forming both a seat and cover for said spring, as and for the purpose set forth

---

161,479. MAGAZINE-STOVES. Enos Bussey, Troy, N. Y., assignor to himself and C. A. McLeod, same place. [Filed Mar. 3, 1875.]



Brief.—Air is introduced both from the chamber surrounding the magazine and through the outer wall of the stove.

1. In a heating-stove, substantially as herein described, the upper and lower combustion-chambers, communicating with each other by a narrow throat, into which external air is admitted through inclosed lateral passages or ducts, and constructed and combined substantially as and for the purposes set forth.

2. The combination of the upper and lower combustion-chambers, provided with an internal air-inlet in the throat between the two, with a hot-air chamber inclosing or surrounding the fuel-reservoir, and communicating with said throat, substantially as described.

3. In a magazine-stove, the hollow contracted neck or throat, formed by double walls between the upper and lower combustion-chambers, and combined therewith, substantially as described.

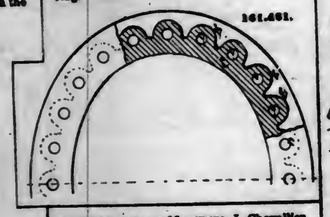
161,480. MAGAZINE FIRE-ARMS. Reuben S. Chaffee, Springfield, Ill., assignor of one-half his right to Bernard Stavi, same place. [Filed Feb. 9, 1875.]

1. The pins E of the revolving magazine, in combination with the spring-cam F and the loading-bar H, operating as described, for the purpose of turning the said magazine.

2. The tubes B, having notched openings D, in combination with the cartridge-driver C, provided with springs, substantially as and for the purpose described.

3. The loading-bar H, with its lugs I, its stop-plate G, the spring-cam F, and its hook J, all combined and arranged substantially as shown, and for the purpose described.

4. The hollow breech-block P P, having shoulders K K, its finger L, trigger E, hammer Q, and extractor V, all arranged substantially as and for the purpose described.

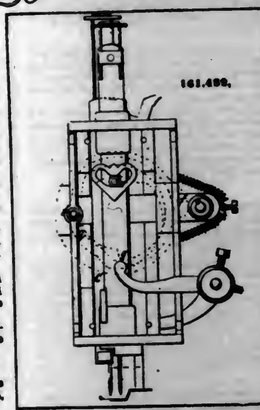


5. The cut-off N, with its cam and spring, in combination with the revolving magazine and the breech-block, substantially as and for the purpose described.

6. The stud M, in combination with the finger L, substantially as and for the purpose described

---

161,481. FIRE-BOX-DOOR RING. George F. Chalender, Aurora, Ill. [Filed Apr. 4, 1874.]

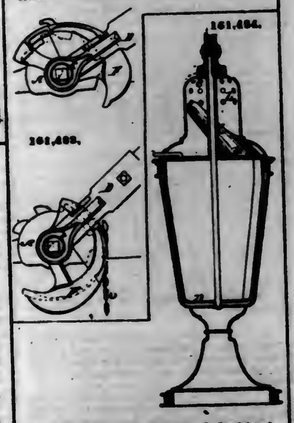


A fire-box-door ring, consisting of curved plates B B and intermediate ring C, the plates and ring being held together by rivets D, and the metal being cut away about the rivets, as shown and described, thus enabling the water to prevent too great a temperature in the ring.

161,482. LEVER ATTACHMENTS FOR MOWING-MACHINES. Alonzo B. Coonds, Trumansburg, N. Y. [Filed Aug. 13, 1874.]

Brief.—Repeated movements of the hand-lever, in connection with an intermediate hoisting-plate, operate the lifting-cam to raise the cutting apparatus.

The combination of the stationary holder-plate A, intermediate oscillatory lifting device F, and repeating hand-lever D, the combination of devices operating substantially as set forth.



161,483. SEWING-MACHINES. L. Chevallier, Brooklyn, E. D., N. Y. [Filed Oct. 9, 1874.]

Brief.—The vertical movements of the main awl are for piercing a hole in the leather being sewed, and its lateral motions are to feed the leather along, and moving out of the way of the needle; and the latter, besides its usual vertical motions, has a lateral motion to enter the hole, and to move out of the way of the awl. An additional awl opposite the main one destroys the burr made by the latter.

1. The combination of an eye-pointed needle and its needle-bar, a feeding-awl and its bar, with a shuttle, the needle and awl being situated on the same side of the sewing platform, and each adapted to move vertically and laterally, alternately and independently of the other, substantially as described.

2. The combination of an awl-bar and needle-bar, both located on the same side of the work-plate, and each adapted to move vertically and laterally independent of the other, substantially as described, for the object specified.

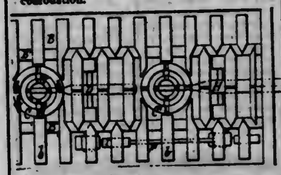
3. In combination with the piercing or feeding awl and the needle, a secondary awl, having its projecting point extending above the cloth-plate, for forcing back the beard or ragged edged produced by the penetration of the main awl, substantially as described.

161,484. SEASONING-CUPS. J. Coulthard, Brooklyn, N. Y. [Filed Oct. 23, 1874.]

Brief.—The different spices are contained in a removable divided vessel, with foraminous cover, provided with tube and perforated plate, whereby the contents of any one spice-receptacle may be used while the other receptacles are closed.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON

1. The combination, substantially as hereinbefore set forth, of the cup A, the foraminous cover, and a removable divided vessel having two or more compartments.



2. The combination, substantially as hereinbefore set forth, of the cup A, the foraminous cover, the divided vessel, the vertical rod, and the register provided with a spring and socket.

3. The combination, substantially as hereinbefore set forth, of the cup A, the foraminous cover, a removable divided vessel, and the stationary and movable plates.

4. The combination, substantially as hereinbefore set forth, of the cup A, the foraminous cover, the stationary and movable plates, and tube k.

161,485. GRATE-BARS. Alonzo W. Cram, Haverhill, Mass. (Filed Jan. 26, 1875.)

Brief.—The short transverse side bars project over the adjoining main bar, and form a passage for air the entire length of said bar. Air-tubes are arranged between the main bars, to supply additional air to the products of combustion.

1. A grate-bar, B, consisting of a central web, B', and side bars b b, arranged to form the opening c, substantially as set forth.

2. The open-top air-tubes C C, consisting of inner and outer tubes, and provided with slots or depressions h, as and for the purpose described.

3. The combination, with the air-tubes C C, constructed as described, of the rock-shafts E, levers D H, arms i k, and link F, arranged substantially as specified.

4. The combination of the grate-bars B, provided with side bars b b and opening c, with the open-top air-tubes C C, constructed as shown, and for the purpose described.

5. The combination of the grate-bars B, having side bars b b and opening c, with the air-tubes C C, rock-shafts E, levers D H, arms i k, and link F, all constructed and operated substantially as described.

161,486. DIRECT-ACTING RECIPROCATING ENGINES. Robt. Creusbaur, Williamsburg, (Brooklyn,) N. Y. [Filed May 26, 1874.]

Brief.—The shaft is at one side of the axes of the cylinders, to reduce the wear of the pistons. Steam is admitted through a rotary valve, with diametrical passages. The cut-off valve is stationary in the rotary valve. Its passage corresponds with the rotary valve by turning the rotary valve backward.

1. The combination of two or more single-acting cylinders arranged side by side, a crank-shaft arranged at one end of the said cylinders, in connection with the pistons thereof, and a rotary valve, common to all of said cylinders, arranged at the opposite end thereof to the crank-shaft, and driven by gearing from the said shaft, all substantially as herein described.

2. The combination, with the two or more single-acting cylinders A B C, arranged side by side, and their pistons and connecting-rods, of the crank-shaft F, placed to one side of the central plane of the several cylinders, substantially as and for the purpose herein specified.

3. The rotating distributing-valve, with its duplicate steam-ports s' s' and duplicate escape-cavities s² s², in combination with the valve-seat having ports a b c q q' q', the whole arranged substantially as herein described.

4. The variable cut-off valve, composed of a spindle, with transverse slots p' p' p' extending through it, one for each cylinder, in combination with the surrounding rotary main valve having two steam-ports, s' s', the whole arranged substantially as herein described.

5. The combination of a rotary valve, its stem, and a connection-piece, provided with tongues on opposite sides to fit into grooves in the adjoining ends of the valve and stem, substantially as set forth.

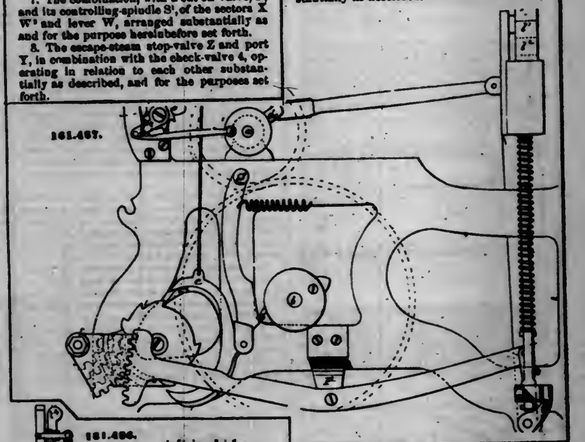
6. The combination, for reversing the engine, of the loose gear-wheel B², the valve-carrying wheel T, driving-bolt t', spring-lever c², and check-stud r², arranged to operate substantially as and for the purpose hereinbefore set forth.

7. The combination, with a cut-off valve, P, and its controlling-spindle S', of the sectors X W' and lever W, arranged substantially as and for the purpose hereinbefore set forth.

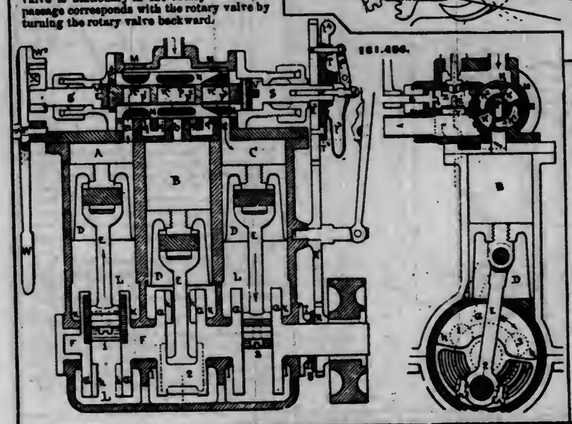
8. The escape-steam stop-valve Z and port Y, in combination with the check-valve 4, operating in relation to each other substantially as described, and for the purposes set forth.

161,487. SHUTTLE-BOX MECHANISMS. Geo. Crompton, Worcester, Mass. [Filed Jan. 18, 1875.]

1. The combination of a rocking lever, connected with and operating a shuttle-box rod, with toothed or notched sectors, adapted to engage with and actuate the rocking lever through different degrees of oscillation, substantially as described.



2. In combination, a rocking lever, connected with and operating a shuttle-box rod, toothed or notched sectors, adapted to engage with the rocking lever, and a pattern-cylinder, adapted to select the sector to be moved, and to govern the extent of movement of the rocking lever, substantially as described.



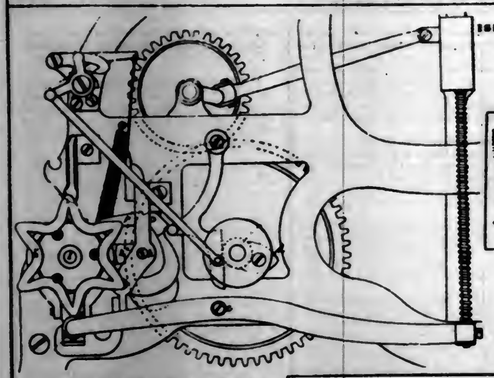
3. In combination, a rocking lever and toothed or notched sectors, adapted to engage with the lever, and to move the levers through different degrees of oscillation, substantially as set forth.

4. In combination, the rocking lever, a series of notched and toothed sectors, adapted to engage therewith, and pawls governed by pattern mechanism, and adapted to turn the lever through different degrees of oscillation, substantially as described.

5. The combination of the rocking lever and toothed sectors, adapted to engage with and move it through different degrees of oscillation, with the shuttle box lever and shuttle-box rod and boxes, substantially as described.

6. A rocking lever and toothed sectors engaged with it, and adapted to move the lever through different degrees of oscillation, in combination and connected with shuttle-box-carrying rods at opposite sides of the loom, to move a double series of shuttle-boxes, substantially as described.

161,488. SHUTTLE-BOX MECHANISMS. Geo. Crompton, Worcester, Mass. [Filed Jan. 18, 1875.]



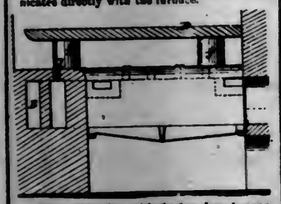
Brief.—The axis of the star wheel or cam, which operates the lifting-lever, is carried on a pivoted arm, and is raised or lowered by means of a second star-cam on the same axis, arranged to bear on an arm fixed on the loom-frame. Both star-cams are operated by pawls having shoulders, so arranged that sliding bolts or catches, controlled by a pattern-cylinder, hold the pawls out of working position when desired.

1. In combination with a shuttle-box lever, a cam to move the shuttle-box lever, and a cam to govern the position of the axis of the cam that moves the shuttle-boxes, substantially as described.

2. In combination, two cams mounted on a common movable axis, a friction-roller on a stationary arm or support, and a shuttle-box lever, all adapted to move a series of shuttle-boxes, substantially as described.

3. The combination of two cams—one actuating the shuttle-box lever, and the other controlling the position of the cam that actuates the shuttle-box lever—with a series of pawls

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON



and pattern mechanism, to govern the movement of the cams and the shuttle-boxes, substantially as described.

4. The combination of two cams, each having a series of elevations and depressions, substantially as described—one moving the shuttle-boxes through a distance equal to one box, and the other a distance equal to two boxes—with a movable cam-axis, a shuttle-box lever, and a series of shuttle-boxes having four operative dells, substantially as described.

161,489. FURNACES OF BAKERS' OVENS. Alex. Ormsbie, Nyack, and David Donald, Brooklyn, N. Y. [Filed Mar. 4, 1875.]

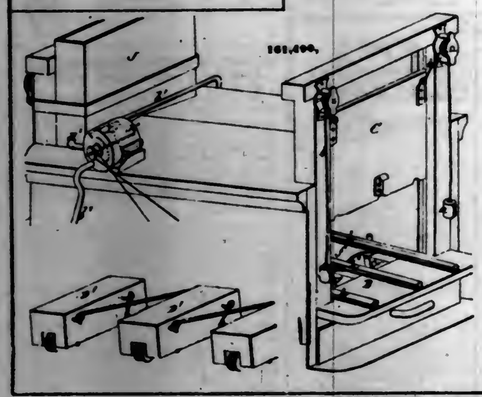
Brief.—The hot-air chambers are supplied from without, and communicate directly with the oven. The heated space outside communicates directly with the furnace.

The combination, with the fire-place A, open above, as described, and the outside heated space B, connected therewith, of the interposed hot air-chamber C, and the shield or cover D, substantially as shown and described.

161,490. LUMBER-DRIER. John J. Curran, Chicago, Ill. [Filed Feb. 15, 1875.]

Brief.—The drying-chamber is closed by vertically sliding doors. The lumber-car is composed of three independent timbers, connected by cross braces, each timber being provided with wheels or rollers in the same plane that is obtained from a furnace located beneath the tracks.

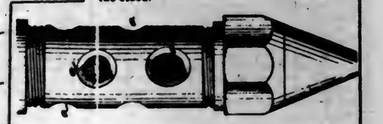
1. In a kiln for drying lumber, the inclined floor B, extending beyond the ends of the kiln to form the loading and unloading platforms, and provided with openings *c*, and sheet-metal part *f*, substantially as and for the purposes herein set forth.



2. The flexible self-adjusting car for lumber-driers, herein described, consisting of the independent beams D', provided with wheels *i*, and connected by means of hooks *k*, substantially as and for the purposes herein set forth.

3. In combination with the inlet and exit pipes, the steam-chamber D, provided with the valves *p*, operated by means of the rod *s*, substantially as and for the purposes herein set forth.

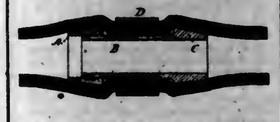
4. In a hot-air lumber-drier, the combination, with the inclined bottom B and steam-pipes E E, of the horizontal partition *o'* and the vertical partitions *w*, arranged alternately above and below the pipes, substantially as and for the purposes herein set forth.



5. The combination, in a hot-air lumber-drier, of the steam-chamber D, with valves *p* and pipes *t*, pipes F, steam-chamber G, and steam-trap H, all constructed substantially as and for the purposes herein set forth.

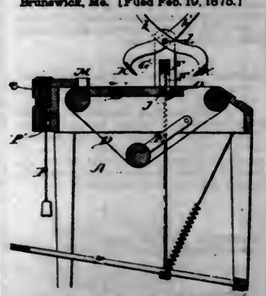
6. The combination of the kiln A, inclined bottom B, doors C C, steam-chambers D G, pipes E, trap H, wide chimney J, and suction-fan I, all constructed and arranged to operate substantially as and for the purposes herein set forth.

161,491. DRIVE-WELL POINTS. Delos A. Danforth, Elkhart, Ind., assignor to himself and A. N. Chamberlain, same place. [Filed Oct. 28, 1874.]



Brief.—The wire screen is secured to the tube by means of solder applied at the edges of the countersunk holes, and at the ends of the stock.

The combination, with the stock A, having countersunk holes *a a*, of the interior wire screen *b*, soldered to the edges of the holes *a*, and having its ends turned over and soldered to the ends of the stock, substantially as here in set forth.

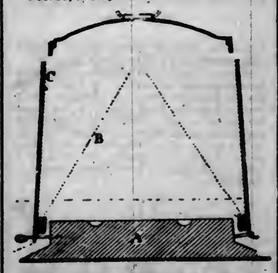


161,492. HOSE-JOINTS. Edwin Dayton, Meriden, Conn. [Filed Dec. 26, 1874.]

Brief.—A conical thimble, internally threaded, is entered into one of the ends to be joined. A hollow plug, externally threaded and formed at its rear end like the thimble, is similarly entered into the other end to be joined. The plug is then screwed into the thimble (the ends of the hose being embraced within a ring or sleeve) till the hose is clamped between the edges of the sleeve and the thimbles.

The herein-described union joint, consisting of the internal socket *A* and plug B, provided with an enlargement, C, at one end, and the external sleeve D, substantially as set forth.

161,493. MACHINES FOR MAKING CUSHIONS FOR FINGER-RING BOXES. B. L. Dennison, Brunswick, Me. [Filed Feb. 19, 1875.]



1. An endless apron or carrier, D, in combination with the removable bottom-less holder M, grooved bed-piece or mold J, and suitable compressing and folding devices, substantially as described, whereby the filling of a cushion is molded and compressed between its backing and covering, and the edges of the covering folded over the adhesive back of the backing, substantially as described, for the purpose specified.

2. A vertically-sliding pressure-bar, G, in combination with a grooved bed-plate, J, a removable holder, M, and a pair of swinging jaws, K, substantially as and for the purpose specified.

3. The jaws K, having the intersecting pivoted arms *b b'*, in combination with the groove *f* and holder M, substantially as described.

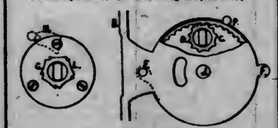
4. The receptacle O, having the sliding weighted bottom P' and steps S S, in combination with the holder M and apron D, substantially as described.

161,494. FLY-TRAPS. Henry B. Ewing, Peoria, Ill., assignor of one-half his right to Richard A. Culter, same place. [Filed Feb. 18, 1875.]

1. The stair-shaped cleats D D D, having two horizontal surfaces united by an intermediate riser, each attached by its vertical surface at equal distances to the interior lower edge of the cone B, to connect said cone and cage C jointly to the base A, substantially as and for the purposes set forth.

2. The arrangement of the cleats D D with the cone B, cage C, and base A, as described.

3. The base A, as constructed, with circular flat top and vertical periphery, in combination with the cleats D D D.

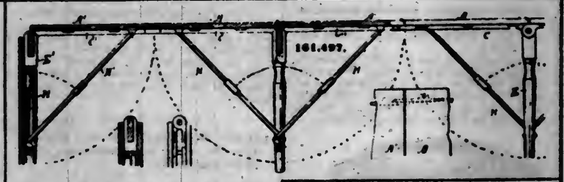


161,495. PANTALOONS-SHAPERS. Rufus M. Eastman, Boston, Mass., assignor to A. D. French, same place. [Filed Dec. 5, 1874.]

Brief.—Steam passes from one compartment of the former to the other through the flexible connecting-tube, which permits of their adjustability.

1. The combination, with one or more of formers A, of the post *b*, frame *a*, rod *c*, and lever *d*, substantially as and for the purpose above set forth.

2. The combination, with the two parts of the former A, of the flexible connecting-pipe *t*, as and for the purpose specified.



161,496. CURTAIN-FIXTURES. O. Ellsworth, Boston, Mass. [Filed July 29, 1874.]

1. In a spring curtain-fixture, the arrangement, with reference to the curtain-roller, of the spring E, internal gear C, and pinion D, substantially as described, for the purpose specified.

2. In combination with the roller H, pinion D, and internal gear C, the ratchet L, having inclined notches alternating with concave or plain portions, all constructed to operate substantially as described.

161,497. FOLDING EXTENSION-TABLES. A. W. Fay, Troy, assignor of one-half his right to Wm. R. Benedict, Cohoes, N. Y. [Filed Mar. 15, 1875.]

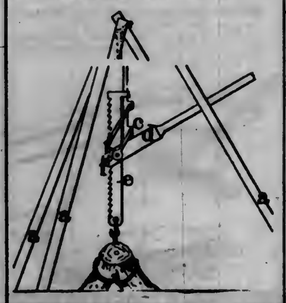
1. The pairs of leaves A A', fast on the cleats or brackets C C C C, that extend across the leaves and are pivoted to and upon the outer ends of the pairs of united legs E E', in combination with the jointed braces H H', all constructed and arranged to operate substantially as described.

2. In combination with the detachable pairs of leaves upon the cleats or brackets pivoted to the legs, the projecting extensions N N N N of the said cleats or brackets, having the lateral pins *p*, and sockets *q*, that engage together, and thereby connect the detachable pairs of folding leaves and legs, substantially as specified and shown.

161,498. SLIDE-VALVES. V. Forquenot, Paris, France. [Filed Dec. 24, 1874.]

In combination with the valve-seat, the steam-valve A, having that face which is in contact with the valve-seat fitted with numerous separate and independent cells *a*, which, while so formed and arranged as not to permit live steam to interpose and exercise material pressure between the valve and its seat, will take up particles of steam and convey them to the parts of the valve and seat to be lubricated, as shown and described.

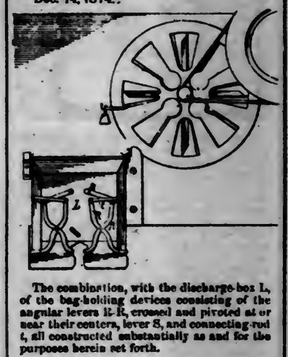
161,499. PAINTINGS AND BANNERS. Gottfried Probe, Buffalo, N. Y. [Filed Feb. 26, 1874.]



Brief.—The picture portion of the banner is composed of velvet painted in the manner indicated in the claim.

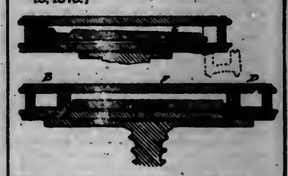
1. As a new article of manufacture, a banner, the body of which is composed of the ordinary silk or other light material, while the picture portion secured thereto is composed of velvet painted, substantially as and for the purposes set forth.

2. The process of painting on velvet, by first applying the ground-colors mixed with turpentine or other suitable volatile liquid, which will evaporate, for coloring the body of the velvet without rendering it unpliable, and then painting with oil-colors on the nap of the velvet, substantially as herein before set forth.



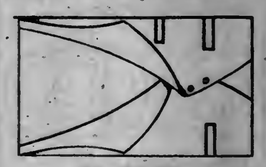
161,500. STUMP-EXTRACTORS. W. H. Fulton, Foxcroft, Me. [Filed Oct. 20, 1874.]

Brief.—Suspended from triangles is a rod with two links, the upper one working into the teeth of a rack sliding upward on it, the lower one attached by its lower end to a lever forked onto the rack, and taking a purchase on its teeth by a pin through the fork.



In combination with the frame *a*, supporting-rod *b*, pointed fulcrum-yoke *c*, and lever *d*, the rack bar *e*, and link *f* jointed to said suspending-rod, all arranged and operating substantially as herein shown and described.

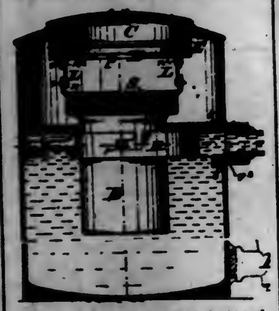
161,501. BAG-HOLDERS. Daniel Garver and Cyrus Garver, Hagerstown, Md. [Filed Dec. 14, 1874.]



The combination, with the discharge-box L, of the bag-holding devices consisting of the angular levers E E, crossed and pivoted at or near their centers, lever S, and connecting-rod *t*, all constructed substantially as and for the purposes herein set forth.

161,502. CONVERTIBLE TABLES. Frederick A. Gilbert, New Haven, Conn. [Filed Feb. 13, 1875.]

The frame, consisting of the stationary sides B C D, grooved upon their inner sides to receive the panels, and the hinged side A, combined with the interchangeable panels F G H, each constructed to be inserted into either of the grooves in the said frame, and inclosed by the said hinged side, substantially as set forth.



161,503. SHIRT-ENVELOPES. Jos. Gilbert, Philadelphia, Pa. [Filed Nov. 12, 1874.]

A shirt or shirt-bosom envelope having a pocket, with the front cut and marked to represent the front of a vest, as and for the purpose set forth.

161,504. CHEMICAL FIRE-EXTINGUISHERS. Adam Gray, Cincinnati, assignor to Mrs. A. Gray, College Hill, Ohio. [Filed Mar. 3, 1875.]

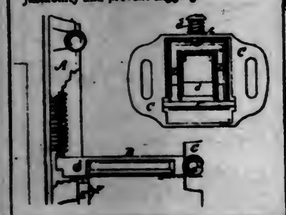
Brief.—The stopper is pivoted above the acid-bottle, so as to be displaced in the act of tilting the bottle by the movement of the latter. The pivoted frame of the bottle is connected with the discharge-faucet, so that the bottle can be tilted by turning the faucet.

1. An acid-bottle supported by horizontal pivots or trunnions, so as to be tilted or inverted to discharge its contents, in combination with a stopper supported above the same by parallel pivots, so as to be displaced by the movement of the bottle, substantially as herein illustrated and described.

2. An acid-bottle supported by pivots or trunnions in a frame having pivots or trunnions at right angles to those of the bottle, to adapt the bottle to accommodate itself to a stopper supported above the same.

3. An acid-bottle mounted in a pivotal frame attached to a discharge-faucet, so that the latter shall constitute its handle.

4. In combination with the acid-bottle B and its frame K, the lugs or trunnions r and bayonet-slots q, forming pivotal supports, and adapting the bottle to be readily removed and replaced.

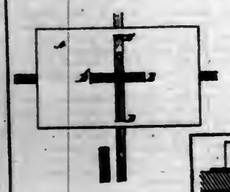


5. The combination of the faucet F, the bottle-frame M, having the hollow trunnion r^2 and external flange or collar t, the gasket s, interposed between the said collar and the wall of the tank, and the clamping-nut u, applied to the protruding neck of the bottle-frame, substantially as herein specified, for attaching and packing the faucet and bottle-frame by the same means.

6. In combination with the pivoted acid-bottle, the stopper S and its supporting-ring D, having pivotal ears or lugs $n n'$, and united by vertical links L, adapted to afford a solid support when in line, and to yield laterally when the bottle is tilted, as set forth.

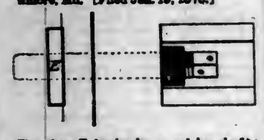
7. The combination of the screw-cap C, the supporting-ring D, having lugs $n n'$, the notched flange p within the neck of the tank, and the vertical links L, for applying, securing, and relieving the stopper, in the manner set forth.

161,505. DOOR-CHECKS. Daniel Gundelfinger, Jefferson City, Mo. [Filed Jan. 16, 1875.]



Brief.—Improvement on Patent No. 185,942, October 13, 1874. The catch with which the folding lever engages is formed of a quadrangular slide having a spring-pin, thumb-piece, and cross-bar. There is also a slotted slide on the opposite box or casing, so arranged with respect to the folding lever as to give adjustability and prevent sagging.

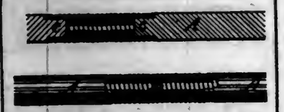
1. The quadrangular slide *d*, having shank d^1, thumb-piece d^2, and spring d^3, combined with a case, C, having groove *c* and cross-bar c^1, as and for the purpose described.



2. The slotted slide E, combined with a clamp-screw, F, placed on the box A, and with respect to lever B, as and for the purpose specified.

161,506. FILE-WRAPPERS. Wm. Grinsted and John A. Darling, Washington, D. C. [Filed Mar. 2, 1875.]

As a new article of manufacture, a file-wrapper, A, provided with the tapes *c c*, and openings B B and B' B', substantially as and for the purpose described.



161,507. DEVICES FOR FASTENING BED-PLATES TO PRESS FORMS. Louis Guienot, Baltimore, Md. [Filed Jan. 19, 1875.]

The plate E, having lug *c*, and loosely fitting a mortise in the rail A, in combination with the bolt C, fitting a hole in the rail B, and having an angular groove, D, at one end, and a screw-thread and nut at the other end, whereby the parts A B can be drawn together and locked, as also the locking device adjusted without separating the parts, substantially as described.

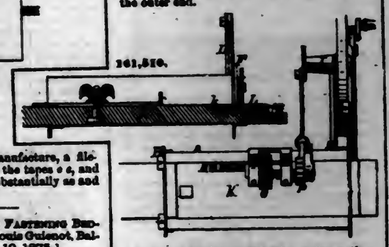
161,508. BELT-COUPLINGS. James Hare, Providence, R. I. [Filed Nov. 16, 1874.]

Brief.—Any tension of the belt reduces the diameter of the spring, and it therefore clamps the ends of the strap or cord more firmly.

The method of uniting the ends of a round belt by means of a helical spring, substantially as described.

161,509. DITCHING-PLOWS. A. L. Harned, Benton, Ky. [Filed Mar. 6, 1875.]

Brief.—A ditching-plow having a long share or neck and a cutter projecting upward from the heel of the share.

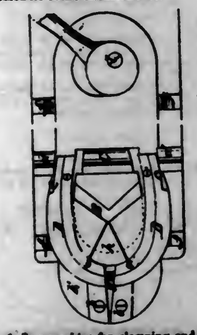


The share D, having an elongated neck, D', and mold-board E, in combination with a fixed cutter, F, and revolving adjustable cutter G, all constructed and arranged substantially as and for the purpose specified.

161,510. MEAT-CUTTERS. John P. Harris, Newburg, N. Y. [Filed Nov. 13, 1874.]

Brief.—A horizontal knife is reciprocated in a shear-like movement at the end of the feeding-box, the knife being connected with a crank-pin on the main wheel. A like crank movement on the reverse side of the wheel operates a system of gearing beneath the box, giving motion to the bed-plate, at the cutting end of which a changeable surface block is inserted, and held by an adjustable clamp at the outer end.

161,510.



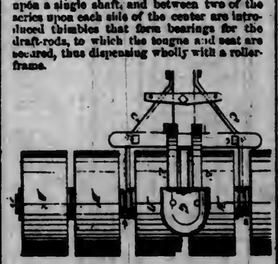
1. In combination with the reciprocating cutter F, the bed-piece K, moved longitudinally beneath the same by means of the rack M, worm-wheel O, ratchet-wheel P, pivoted arm Q, pawl R, connecting-rod S, and disk T, said parts being constructed and combined to operate substantially as and for the purpose shown.

2. In combination with the bed piece K, provided with the rabbet *k*, the cutting-block L, clamp M, and screws *m* and *n*, substantially as and for the purpose set forth.

161,511. MACHINES FOR CONSTRUCTING BOOT AND SHOE HEELS. Eben N. Higley, Great Falls, N. H. [Filed July 20, 1874.]

Brief.—The laterally and longitudinally movable hinge jaws rest upon a sliding bed. Their outer ends are beveled to pass through cam-shaped slots formed by the stationary jaw and fixed cams, one upon each side of the jaw, by which means the heel-blank is compressed its entire circumference.

1. In a machine for clamping and holding the lifts of boot and shoe heels, the combination of clamping-jaws D D, adapted to receive a lateral closing movement, and, simultaneously therewith, a longitudinal motion toward a fixed jaw or stop, C, with the said stop, for the purpose of producing compression against the entire edges of the heel-lifts, substantially as herein specified.



2. The combination of the movable jaws D D, having inclined or cam-acting surfaces *o o* thereon, the fixed studs or cams *d d*, and the stationary jaw C, substantially as and for the purpose herein specified.

3. In a machine for clamping and holding pieced lifts of boots and shoe heels, the combination of a base, A, fixed jaw C, pivoted movable jaws D D, sliding carrier E, and stationary cams *d d*, substantially as and for the purpose herein specified.

161,512. AIR-COOLING APPARATUS. Frank A. Hyatt, Denison, Tex. [Filed Oct. 13, 1874.]

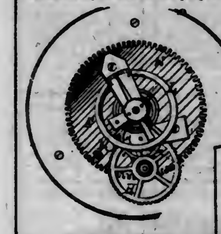
Brief.—The tank is provided on its bottom with bars *a*, which extend to within three inches of the ends of the box, for the purpose of furnishing supports for the air-box. Said box is divided by bars into air-chambers, which are provided at the ends with air-pipes E and *d*, and nozzle G, to which nozzle an air-blower is attached. The tank is filled with brine.

161,512.

In combination with the tortuous pipe H and box or tank A, having longitudinal bars *a a* on its bottom, the air-box D, divided by bars *b* into longitudinal spaces, the air-inlet pipes E, exit-pipes D of varying size, and the nozzle G, all constructed substantially as and for the purposes herein set forth.

161,513. FIELD-ROLLERS. Anthony Hilts, Springdale, Ohio. [Filed Feb. 23, 1875.]

Brief.—A series of free rollers are placed upon a single shaft, and between two of the series upon each side of the center are introduced thimbles that form bearings for the draft-rods, to which the tongue and seat are secured, thus dispensing wholly with a roller-frame.



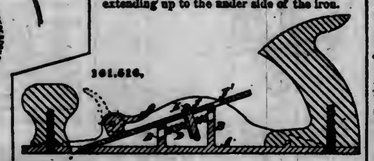
1. The combination of the draft-irons C C, sleeves *d d*, having collars *e e* and projections *f f*, and the rollers D D and D^1 D^1, substantially as and for the purpose herein set forth.

2. The combination of the tongue A, draft-irons C C, seat G, headed rod *b*, sleeves *d*, rollers D D, D^1 D^1, and D^2 D^2, and the spring-key b^1, all constructed substantially as and for the purposes herein set forth.

161,514. WATCHES. Jason R. Hopkins, Washington, D. C. [Filed Nov. 13, 1873.]

A watch-movement in which the operative parts are placed upon and revolve with a centrally-pivoted spring-barrel, and the balance-wheel is pivoted at the center of such motion, substantially as and for the purpose specified.

161,514.



161,515. BENCH-PLANES. Wm. Johnstone, Montreal, Canada, assignor of one-half his right to Wm. W. Robertson, same place. [Filed Mar. 1, 1875.]

Brief.—The plane-iron is adjusted, as desired, by means of transverse slots in the same, and a screw-threaded rod provided with a flat nut, working upon two cross-bars or partitions formed on the body of the plane, and extending up to the under side of the iron.

161,515.

161,516.

The plane A, having bars B B, in combination with screw D, nut E, and plane-iron C, having slits F and F', substantially as and for the purposes described.

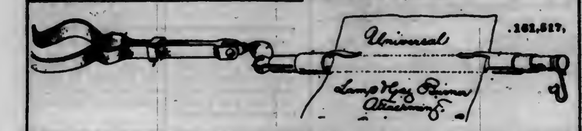
161,516. PROP NUTS AND RIVETS FOR CARRIAGES. George A. Keene, Lynn, Mass. [Filed July 28, 1874.]

A metallic prop nut or rivet, having its head A enveloped as far as the shoulder C with the resilient rubber cover B molded and vulcanized thereon, substantially as and for the purpose described.

161,517. CARTRIDGE-SHELLS. N. C. Hunting, Lincoln, Ill. [Filed Oct. 1, 1874.]

1. The combination, with a cartridge-shell open at both ends, of the flanged head B, rubber disk C, and plate D, united by the priming-tube *d*, substantially as set forth.

2. The combination of the shell A, enlarged at its rear, and having flange *a*, with the removable head composed of the flanged plate B, rubber disk C, plate D, and the priming-tube *d*, all constructed substantially as set forth.

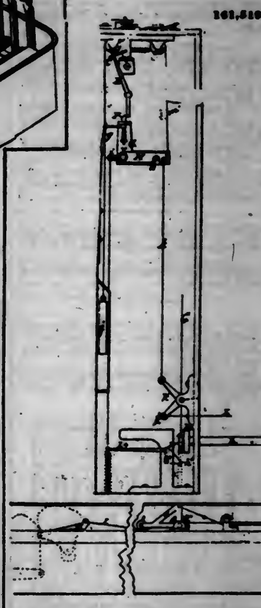


161,517. LAMP AND GAS-BURNER ATTACHMENTS. Thos. V. Keam, Santa Fé, N. Mex. [Filed Mar. 11, 1875.]

Brief.—The clasps for holding the article are adjustable upon the extension-arm, which is, in turn, adjustable through the flexible joint.

1. The combination, as before set forth, of a clamp for attachment to a standard, a flexible joint, and a sliding clasp upon the extension.

2. The combination, as before set forth, of a clamp, a joint, springs for holding the object, and a telescopic portion.

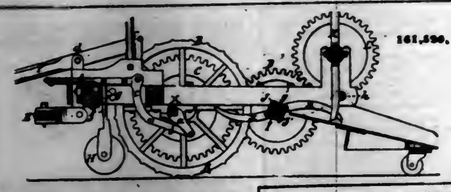


161,517.

161,518. RAILROAD-SIGNALS. Robt. L. Kilpatrick, Springfield, Ohio. [Filed Dec. 30, 1874.]

Brief.—The treadle or operating lever, which is operated by a passing train, has a clutch which works when the train passes in one direction, and is disconnected when the train moves in the opposite direction. This lever is connected by a wire with an alarm mechanism, to sound an alarm and display a signal on the approach of a train.

161,519.



1. The combination, with a shaft, O, that operates an alarm mechanism, of the treadles P Q, having lugs *p p'*-*q q'*, and the spring-pressed sliding part-sixth R *r' s*, arranged to operate in the manner described.

2. The combination, with wire L, of the angle-lever S, having pulley *t*, spring-shaft T, and holding-wire *r*, applied as and for the purpose specified.

3. The combination, with hammer-shaft, of the armed shaft O D, lever E, cross-bar E^1, angle-lever G, having spring-catch F, shaft I, arm H, and wires *k l*, extending to treadle, as and for the purpose described.

4. The combination of loose arm H^1, shaft I, having arm *i*, the wire *l*, and spring-catch lever A^1, as and for the purpose set forth.

5. The combination of treadle H^2, shaft A, having rigid hook-arm HP, the wire G^1, spring F^1, lever E^1, slotted arm D^1, and signal-card shaft A^1, as and for the purpose specified.

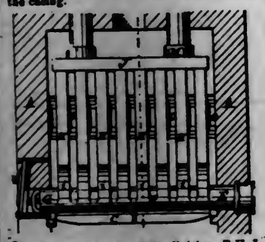
161,520.

161,520. POTATO-DIGGERS. H. W. King, Canaan, N. J. [Filed Mar. 10, 1875.]

Brief.—The digging is accomplished by a rotating digger, consisting of a series of curved arms upon a shaft, which receives motion from the driving-wheels. A clearing-wheel of similar construction conveys the potatoes to an inclined screen or table, by means of which the earth is separated from the potatoes.

1. The revolving digger I, consisting of the S-shaped fingers *e*, having shoulders *f*, the section J', and the detachable section J, all combined and arranged substantially as and for the purpose described.

2. The combination of the digger I with the clearer K and the table M, substantially as and for the purpose described.



3. The combination, with the wheels D and the digging devices, of the wheels B B, carrying the cog-wheels C, the crank-axle X, and the devices for shifting the same, substantially as and for the purpose described.

161,521. LUBRICATING COMPOUNDS. J. J. Koch, St. Louis, Mo. [Filed Nov. 16, 1874.]

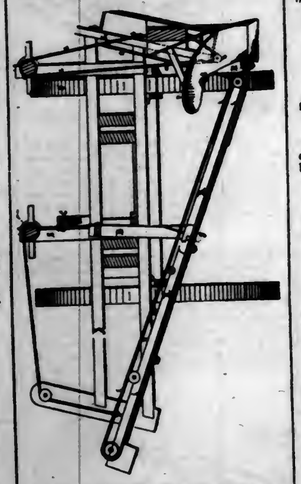
The lubricating compound, substantially as herein described.

161,522. BOILERS FOR WATER-HEATERS. Jos. R. Lamb, Jacksonville, Ill., assignor to Ambrose Marriott, St. Louis, Mo. [Filed Mar. 1, 1875.]

Brief.—The spaces between the sections are reached through the opening in the wall of the casing.

1. The combination of the divisions E H J, which constitute the single casting, substantially as set forth.

2. In combination with the cast boiler E H J, the case A, provided with the opening O, as and for the purpose set forth.



161,523. FRUIT-GATHERERS. Nathan Lash, Montpelier, Ohio. [Filed Mar. 18, 1875.]

Brief.—The jaws, made of bent wire, are attached to and project from the side of the staff, their upper ends being brought together at an acute angle for seizing the fruit.

The curved jaws A A, having their upper ends united and secured to the upper end of the staff C, and their lower ends separated and secured to each side of the said staff, the bag B being attached to the staff and to the jaws, all combined substantially as and for the purpose specified.

161,524. EXCAVATORS. Morgan R. Lasher, Champaign, Ill., assignor of one-half his right to George F. Beardsley, same place. [Filed Dec. 12, 1874.]

Brief.—The chains for elevating the plow-beam pass over pulleys secured at lower end of framing to the windlass. The elevator-frame has an overlap-joint, to which cords are secured and pass over a windlass in standards to raise and lower it. A revolving roller is secured, at the lower end of the elevator, to prevent it from being cut or injured. A chain connects a projecting bar to the guide-standards of the plow.

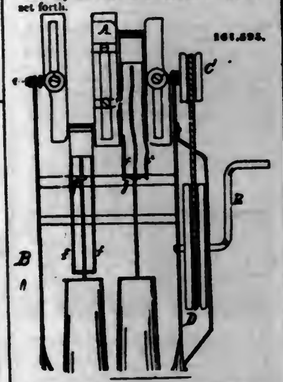
1. The chains *a*, in combination with the plow-beam M, by means of the pulleys *b* and the windlass N, substantially as and for the purposes specified.

2. The projecting bar *d*, in combination with the chain *a* and the foot of the front guide-standard L.

3. The lever C, in combination with the elevator-frame E, by means of the overlap-joint *g*, the pivot bar or pin *h*, and the standards S, with the sliding frame B, the check-pin *m*, and the guide-rod *L*, substantially as and for the purposes specified.

4. The revolving roller E, in combination with the elevator-frame E, substantially as and for the purposes specified.

161,525. CRUSHES. P. La Tourrette, Vestal, N. Y. [Filed Dec. 21, 1874.]



Brief.—The stroke of the dashers is regulated by means of a reciprocal adjustment of sections forming the crank-shaft.

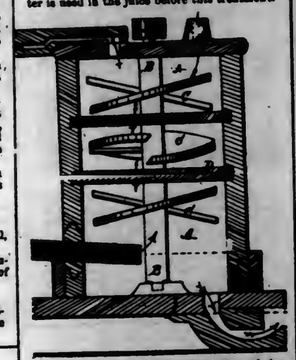
1. The combination of the double adjustable crank-plate A' and plates *d d* with the shafts *a c*, substantially as set forth.

161,526.

2. The combination of the adjustable crank A, of the frame B, pulley C on the end of shaft *c*, driving-pulley D, hung on the side of frame B, hand-crank E, projecting guides *g g*, and connecting-rods *f f*, all constructed substantially as herein described, for the purpose set forth.

161,526.

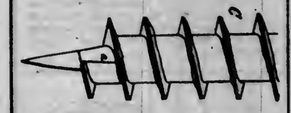
161,526. DEVICES FOR EXHIBITING SHOES. Robert T. Leaverton, Holden Mo. [Filed Feb. 9, 1875.]



Brief.—A frame-work of wire provided with clamps and hooks adapted to hold a shoe or boot for exhibition.

The wire clasp A, formed with the hook *a*, bend *b*, coil *d*, bend *e*, and part *h*, with or without the bend *i*, in combination with the hooks B and C, the former having the pin *f*, all as and for the purposes herein set forth.

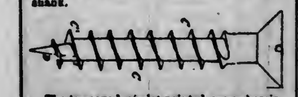
161,527. APPARATUS FOR BLEACHING CANE-JUICE. John M. Lesoe'a, Paincourtville, La. [Filed Dec. 10, 1874.]



Brief.—Spiral revolving wings elevate the sulphurous-acid gas, and spray the falling juice, which drops onto and passes through holes in the intervening partitions. To counteract too much acidity from the gas, lime-water is used in the juice before this treatment.

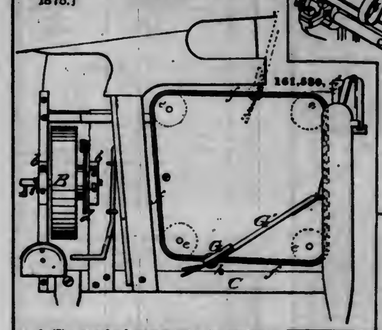
The bleaching apparatus consisting of the outer casing A, shelves D, having central openings *a*, the revolving shaft B, and the spirally-arranged wings C, attached to the shaft and alternating with the shelves, all combined and arranged substantially as and for the purpose described.

161,528.



161,528. WOOD-SCREWS. Chas. T. Litchfield and Reinhold Boeklen, Brooklyn, N. Y. [Filed Mar. 20, 1875.]

The improved wood-screw herein described and shown, the same having a reduced threaded body, C, and a thread of equal radius—greater than that of the shank B—and of equal pitch or spirality throughout its entire length, terminating on the conical point of the screw in a broad radial blade or edge, and having also (starting from said terminal points of the thread) a cutting-shoulder, *a*, extending longitudinally along the body of the screw upward to the next convolution of the thread, for the purpose herein described.

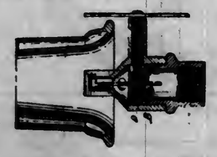


161,529. WOOD-SCREWS. Chas. T. Litchfield and Reinhold Boeklen, Brooklyn, N. Y. [Filed Mar. 20, 1875.]

Brief.—A screw with a reduced threaded shank and a long conical central point, on which commences the screw-thread, of which the second spiral may be said to constitute the base of the conical point, except on one side, where the space between the first and second spirals has a longitudinal cutting-shoulder, formed of a prolongation of the shank.

The improved gimlet-pointed screw herein described and shown, the same having a reduced threaded body, C, the thread of which is of equal and uniform radius greater than that of the shank B, and of uniform pitch or spirality, a conical point, D, having a thread of equal pitch with that of the body of the screw, but of which the breadth or radius gradually diminishes until it vanishes entirely in the conical point, and the cutting-shoulder *b* of the same radius as the body of the screw, extending from the first to the second spiral of the thread, at a point where the radius of the thread is as great or greater than that of the shoulder, for the purpose specified.

161,530. HARVESTERS. S. S. Loudenslager, Polo, Ill., assignor of one-half his right to W. T. Smith, same place. [Filed Jan. 16, 1875.]



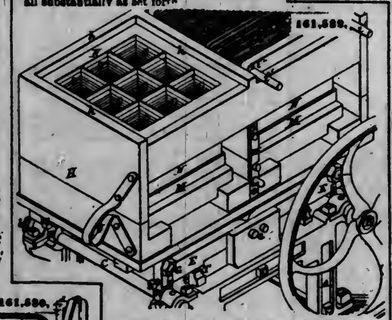
161,530.

1. The standard-segments *b b* in combination with the chain *a*, and the wheel B, turning loosely upon the axle *a*, and provided with an operating crank, substantially as and for the purpose set forth.

2. The rake G provided with the stiffening-bar *h*, having perforations for the adjustment of the rake, in combination with the adjusting-pin *p*, bearing *h*, endless belt *f*, and the hinged arms G^1, G^2 substantially as and for the purpose set forth.

161,531. GAS-BURNERS. James W Lyon, Brooklyn, E. D., N. Y. [Filed Mar 17, 1874.]

Brief.—A bent lever or cam, playing loosely in the stem of the valve, when rotated, raises or lowers the valve.

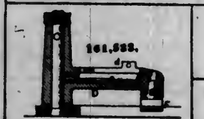


The combination, with a gas-burner, B C, of the loose valve D, provided with the slotted head *b* and the crank or cam shaft *a*, the latter projecting loosely into the slotted head *b*, substantially as and for the purpose specified.

161,532. MACHINES FOR BOXING MATCHES. Fielding Mansfield, St. Louis, Mo. [Filed Dec. 16, 1874.]

Brief.—The racks of matches, after being dipped, are placed upon a shaking-bot, which shakes them out of the racks and into receptacles, each of which contain an ordinary bunch.

1. The combination of the dipping-frame I, and body H, having a vertical reciprocal motion, and constructed to support the dipping-frame while the matches are shaken therefrom, as set forth.



2. The shaking-box or body H, having funnels O P, and receivers M, and constructed to receive the matches in the funnels as they are shaken from the dipping-frames, and to deposit them in the receptacles L of the receiver, all substantially as set forth.

161,532.

3. In combination with a body, H, having funnels O P, and receiver M, the jointed arms E E, &c., and cams R R, &c., all constructed substantially as and for the purpose set forth.

4. In combination with the body H, arms E E, &c., and cams R R, &c., the anvils T T, &c., to receive the impact of the arms, and relieve the cams and cam-shafts from the jar of said impact, as set forth.

161,533.

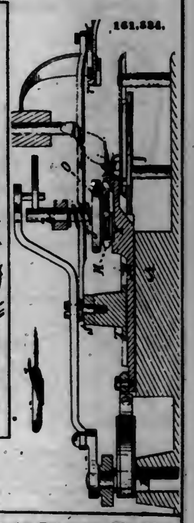
161,533. MOWING-MACHINES. Homer C. Markham and D. Clinton Markham, Lyon's Falls, N. Y. [Filed Dec. 22, 1874.]

The combination of the rock-shaft, the hollow arm of which, D, is provided with the tightening-screw *d*, and the eccentric arm *c*, in the outer end of which is a thimble-shaped socket, engaging with a stud, *g*, upon the knife-bar.

161,534. SEWING-MACHINES FOR STITCHING BUTTON-HOLES, &c. J. McCloskey, New York, assignor of one-third his right to Deborah C. Folk, Brooklyn, N. Y. [Filed Nov. 19, 1874.]

Brief.—The shuttle, provided with a recess for the bobbin, a hook for deflecting the thread, and an eye-pointed needle, is arranged in a depression formed in the end of a horizontally-reciprocating slide, and is held in place by a disk which is hung in an arm above, in such a manner as to be revolved thereon, so that, as the machine is operated and the needle perforates the cloth, a hook on the revolving disk takes the loop from the needle on the back of the cloth, and carries it around and over the shuttle. An oscillating take-up is pivoted on the opposite side of the cloth from the needle-operating mechanism, and is actuated by means of a rod from the reciprocating slide that carries the shuttle.

1. A sewing-machine in the working or operation of which the loop of thread from the sewing-needle is passed entirely over said needle, substantially as specified.



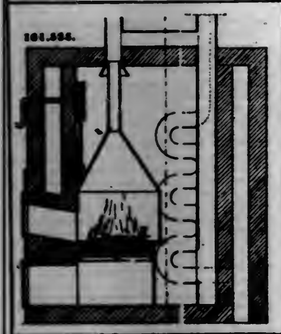
2. The shuttle H, provided with an eye-pointed needle, as and for the purpose specified.

3. The combination of a bobbin, O, and a shuttle provided with an eye-pointed needle, essentially as described.

4. The combination of the revolving hook O with the shuttle, provided with an eye-pointed needle, the whole being arranged to reciprocate in common, essentially as described.

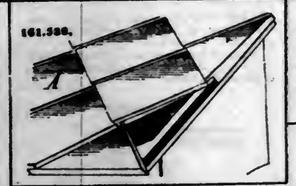
5. The combination of the reciprocating needle-thread take-up or secondary looper R with the hook O, having, in addition to its revolving motion, a reciprocating movement in common with the shuttle, having the eye-pointed needle, substantially as specified.

6. The combination of the revolving hook-disk J with its rib *d*, the lenticular shuttle H, with its crease *e*, the bobbin O, the spring *f*, the revolving stud *h*, and the cam *i*, essentially as and for the purpose herein set forth.



161,534.

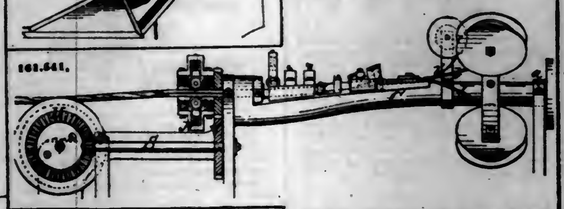
161,535. HOT-AIR FURNACES. Wm. McFarland, Trenton, N. J. [Filed Sept. 23, 1874.]



Brief.—An adjustable hood hung over the fire-box, and connected by means of a sliding pipe and flue with the chimney.

The combination, in a hot-air furnace, of a fire-place, a flue communicating with the chimney, air-heating pipes arranged in a chamber, and a hood or cap, on the adjustment of which the heated gases from the fire-place may be directed either to the chimney or to the said chamber, as set forth.

161,536.



161,537.

3. The pitmen H H' h' and eye m, in combination with the clutch I and vibrating post A, substantially as and for the purpose set forth.

4. The combination, with the gatherer n o q r, of the uprights G G, segmental toothed or rack bars N N, pinions O O, and crank and pawl P P', substantially as and for the purpose set forth.

161,541.

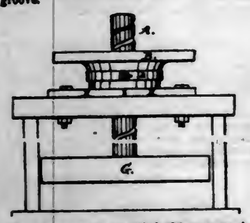
161,536. SEWING-MACHINE ATTACHMENTS. Davis M. Mallon, Tremont, Pa. [Filed May 5, 1874.]

Brief.—An arm projecting from the plate of the attachment extends up through a hole in the slotted plate, and, projecting backward, engages notches formed on the slotted plate, thus locking the two together firmly.

A sewing-machine attachment, A, provided with an arm or projection entering an aperture in the slotted arm B from underneath, and provided with a pin or leg to take into holes or their equivalents, on the upper surface of the arm

161,537. CHILDREN'S ROCKERS. Benjamin R. Meyenbeck, Philadelphia, Pa. [Filed Jan. 28, 1875.]

1. The removable cradle C or seat E, having beveled or inclined supports c, in combination with the rocker-platform G, having the transverse beveled cleats G', substantially as shown and described.



2. The combination, with the rockers A A, of the flat springs f, projecting outwardly and upwardly from said rockers, constructed and arranged substantially as shown and described, and for the purpose set forth.

161,538. ROOFING-TILE. Saml. Mills, New Castle, Ohio. [Filed Feb. 6, 1875.]

A quadrilateral roofing-tile, A, increasing in thickness from the upper to the lower angle, and having rabbets c in the bottom surface along the two lower sides only, increasing in width toward their junction, substantially as and for the purpose specified

161,539. SCREW-PRESSES. W. H. H. Minge, Mobile, Ala. [Filed Mar. 26, 1874.]

Brief.—The barrel has on it a spiral groove with a lessening pitch. This works through the nut equivalent, where, projecting into the interior, are two loose pins, which enter the groove.

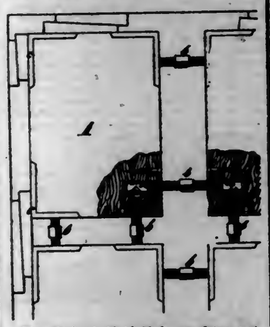
1. A screw-press, provided with a screw, A, formed with a thread of diminishing pitch, in combination with follower G, substantially for the purpose set forth.

2. In combination with a screw, A, having a thread of varying pitch, the nut B, provided with pins C, to form the female thread, substantially as set forth.

3. The screw A, in combination with the nut B, pins C, and head D, substantially as described, and for the purposes set forth.

161,540. HARVESTER-RAKES. Jno. F. Monnett, Bucyrus, Ohio. [Filed Feb. 6, 1875.]

1. The vibrating post A and the stationary toothed track or sector C, in combination with the rake D, with its cranked portion or axis d provided with the ratchet e, engaged by a pawl, f, and the loose cog g, and clutch h, substantially as and for the purpose set forth.



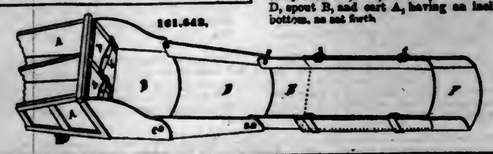
2. The cut-off device consisting of the pivoted angular bar or frame s', depressed by the cord or chain j, pulley l, and vibrating post A, and elevated by a spring, k, substantially as shown and described, and for the purpose set forth.

161,541. MACHINES FOR MAKING LIGHTNING-RODS. William B. Munn, Camden, N. J. [Filed Mar. 1, 1875.]

The shaft C in a lightning-rod machine, distorted or cut away, as shown, so that a series of tools may be secured thereto, and the finished rod passed through the true axis of the shaft, substantially as and for the purposes set forth.

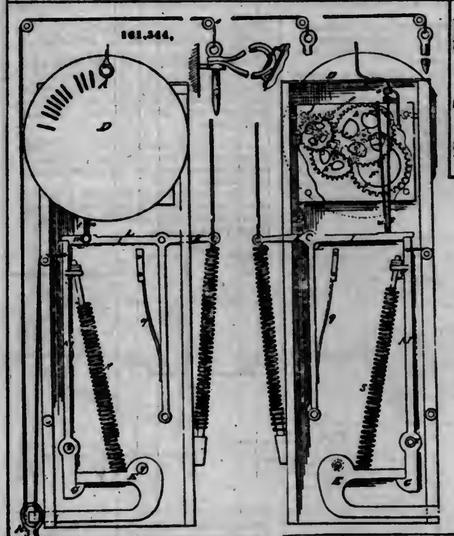
161,542. REGISTERING DEVICES FOR STEREOTYPE-BLOCKS. Andw. Jackson O'Shea, Jersey City, N. J. [Filed Feb. 12, 1875.]

Brief.—The corners of stereotype-blocks have applied to them right-and-left-hand screw-bolts, nut-formed at the center, through which the position of the blocks in relation to each other may be adjusted for registering colors printed therefrom.



The blocks A A' A² A³, for receiving and holding the plates from which to print the desired color, each provided with screw-threaded sockets a a, in combination with the right and left hand screws b b, adapted to the screw-threaded sockets of the blocks, substantially as and for the purposes described.

161,543. TROUSERS FOR COAL-CARTS. Wm. P. Patton, Harrisburg, Pa., assignor to Eby Byers & Son, same place. [Filed Feb. 6, 1875.]



Brief.—Body of trough flexible and end stiff.

The combination of two or more sliding telescopic chutes, B F, with a pivoted section, D, spout E, and cart A, having an inclined bottom, as set forth

161,543.

161,544.

161,544. FIRE-ALARM REGISTERS. Daniel T. Phelps and Charles W. Edmonds, San Francisco, Cal. [Filed June 29, 1874.]

1. In a fire-alarm-registering device, the marker A, dial D, wires f w s, and pin p in the wheel h of the clock-work h h' h'' h''' F, in combination with the T-shaped lever L, bar M, detaching-rig R E e e, spiral spring T, alarm-hammer connection, and bell attachment v, arranged substantially as and for the purposes described.

2. The combination of the T-shaped lever L with perpendicular bar M, fitted with spring S, catch N, registering and stopping wires f w s, respectively, alarm-hammer connection, and detaching-rig R E e e, with spring T and fire-alarm attachment v, arranged in the manner described, substantially as and for the purposes specified.

161,545. LOOM-SHUTTLES. R. W. Porter, Nashua, N. H. [Filed Jan. 9, 1875.]

In combination with a loom-shuttle having a contracted throat, the tension-regulating screw-post C, having an open-end slot, i, and nick in its bottom to effect the adjustment of the post from the under side of the shuttle, as and for the purposes set forth.

161,546. FILTER-WELLS. Wm. P. Powers, La Crosse, Wis. [Filed Oct. 16, 1874.]

Brief.—The filter is made from fine-wire fabric or finely-perforated sheet metal, which is secured around the tube over the V-shaped grooves. The wall of the tube is provided with a series of vertical slots, which communicate with the cavity of the tube.

The tube A, provided with the V-shaped grooves a and longitudinal slots C, in combination with filter D, all constructed as specified.

161,547. RAILWAY-RAIL CHAIRS. J. Reddin, Lynn, Mass. [Filed Oct. 26, 1874.]

Brief.—The elastic bearing is compressed between an adjustable plate and the bottom of the chair, the rails resting upon said plate.

1. In a railway-joint, the combination of the chair A, compressible packing c, and covering-plate b, securely bolted to the chair and compressing the packing, substantially as described.

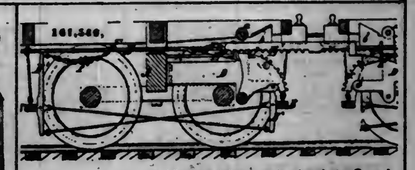
2. The combination of the splicing-plates B and rails C with the chair A, when constructed with a plate confining an elastic cushion, as described, all bolted together, substantially as specified.

161,548. COMBINED BOOT AND GLOVE BUTTONERS. Greenleaf Stackpole, Elizabeth, assignor to G. D. Collard, Mount Clair, N. J. [Filed Mar. 26, 1875.]

161,545.

161,546.

161,548.



As an article of manufacture, the implement herein described, consisting of the frame B C, which combines the boot-buttoner, glove-buttoner, and ear-spoon, having the movable tweezers thereon, and adapted for the purpose set forth.

161,549. CAR-BRAKES. Henry F. Rice, Jas. M. Rice, and Wm. B. Rice, Dubuque, Iowa. [Filed Mar. 16, 1875.]

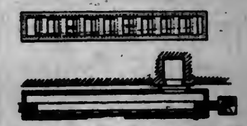
1. Vibrating sectors, made with a partly toothed and partly plain perimeter, in combination with rods having teeth on their free ends and brakes, substantially as and for the purpose set forth.

161,550.

2. The pendulous spring-brackets G and the springs H, in combination with the rods E, substantially as and for the purpose set forth.

3. The guiding-brackets D, having a friction-roller stop, a, and a funnel-shaped mouth, b, in combination with the sectors and toothed rods, substantially as set forth.

4. The combination of the vertically-vibrating partly toothed sectors with toothed rods and a car-brake, the sectors being pivoted so as to fall by their own weight to their original position when released, substantially as and for the purpose set forth.



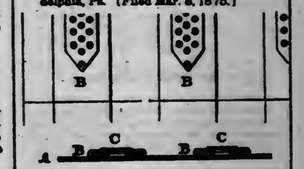
161,550. COMPOSITIONS FOR PAVEMENTS. James P. Richardson, Washington, D. C. [Filed Aug. 1, 1874.]

Brief.—Gum-copal, five pounds; asphaltum, twenty pounds; coal-tar, forty gallons. Are mixed with the aid of heat, and broken stone or ashes is added. Applied hot and afterward rolled until compact.

The composition of copal gum, asphaltum, and coal-tar, alone or mixed with crushed stone, ashes, or equivalent material, for the formation of pavements, carriage-ways, and the like, as herein described.

161,551. VENTILATING BEDS. Ebenezer L. Roberts, Plainfield, N. J. [Filed Sept. 5, 1874.]

Brief.—The construction of the trunk with a graduated opening, which is narrowest adjacent to the escape-flue, is designed to obtain a uniform current or draft. By the use of the guide-cleats and hooks, the bedstead is adjusted to its proper position and held therein, and the elastic packing makes a tight joint between the trunk and the ventilating-flue. The guard or grating prevents the obstruction of the flue-opening by the bed-clothing or pillows.



1. A horizontal trunk connected with a bedstead, and provided with a graduated opening contiguous to the head-rests, which opening is narrowest adjacent to the escape-flue, for the purposes specified.

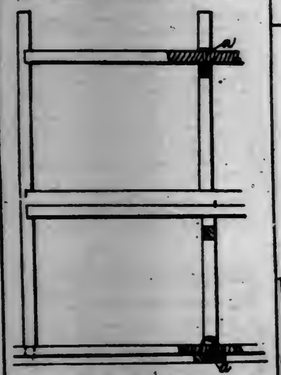
2. The guide-cleats *f*, secured to the floor or skirting-board, in combination with the bedstead and ventilating-flue trunk thereon, for the purposes specified.

3. In combination with a bedstead, *a*, flue-trunk *b*, and the wall of the building, having a flue, *c*, and mouth contiguous to the opening in the trunk *b*, the elastic packing *h*, cleats *f*, and hooks *i*, substantially as and for the purposes specified.

4. A guard or grating applied in front of the horizontal opening passing into the flue-trunk at the head of the bedstead, for the purposes specified.

161,552. TRIMMINGS. John T. Ross, Philadelphia, Pa. [Filed Mar. 3, 1875.]

1. As a new article of manufacture, trimming composed of a body, A, with plaits B, in combination with inserting C, constituting portions of the visible faces of the plaits, substantially as and for the purposes set forth.



2. The body A, plaits B, inserting C in said plaits, and border E, combined and arranged substantially as and for the purposes set forth.

161,553. FEED-REGULATORS. Jas. M. Ross, Morrisonville, Ill., assignor to M. C. Ross, same place. [Filed Mar. 11, 1875.]

An oral mill-burr feeder, A, divided into the conical chambers c^1 c^2 by the central shelf c, having opening c^3 and valve d, and exhaust-pipe f, connecting with the chamber c^2 immediately under the shelf c, as and for the purposes specified.

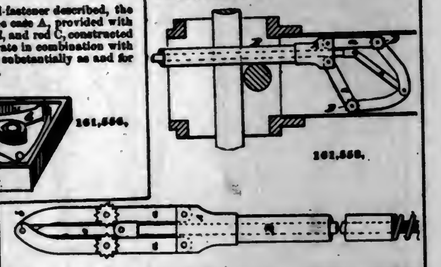
161,554. CLOTHES-FRAMES. Chas. T. Rowe, Brooklyn, N. Y. [Filed Feb. 13, 1875.]

The combination, in a clothes-frame, of the two folding frames, each composed of a series of horizontal bars connected at each end to a standard, said frames crossing each other, and pivoted at or near their middle by the pivots c, substantially as shown and described.

161,555. TRIGGERS. John L. Rowe, New York, N. Y. [Filed Mar. 10, 1875.]

Brief.—A pawl and ratchet, for adjusting the pressure, is combined with a bent spring, which connects the pad with a plate in the rear.

The rest f upon the frame-pad d, and the pawl e, connected with the plate c, in combination with the spring f, pad d, plate c, and supporting-straps, substantially as set forth.



161,556. SHUTTER-FASTENERS. Chas. Russell, Worcester, Mass., assignor of one-half his right to Edwin Schofield, same place. [Filed Dec. 15, 1874.]

Brief.—A small case, inclosing a pivoted pawl and U-shaped spring, is attached to the under side of the lower cross-bar of the shutter, the pawl swinging freely in a lateral direction, and being operated by a push-and-pull rod projecting through the side of the case. There are also two notched staples, one bent at right angles, driven into the window-sill, and the other straight, and driven into the side of the building. These notched staples alternately enter the case, and, engaging with the pawl, secure the blind open or shut, as may be desired.

The improved blind-fastener described, the same consisting of the case A, provided with the pawl B, spring d d, and rod C, constructed and arranged to operate in combination with the notched staple F, substantially as and for the purpose specified.

161,556.

161,558.

161,557. SAW-GUMMERS. David Stettler, Napoleon, Ohio. [Filed Jan. 27, 1875.]

Brief.—The roughened under surface of the die prevents the saw-plate from slipping during the gumming operation. The die-holder rests upon washers. As the upper die wears away, said washers are gradually removed, and the die allowed to descend to the same depth as when new and of full size.

1. In a saw-gummer, the die having its under surface inclined, and provided with teeth or corrugations b, or otherwise roughened, substantially for the purposes set forth.

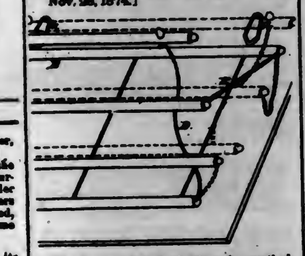
2. The hollow die-holder G, with adjustable central bar H, connecting it with the operating eccentric lever I, substantially as and for the purposes herein set forth.

3. The combination of the hollow die-holder G, headed connecting-bar H, and one or more washers, f, for the purposes herein set forth.

161,558. BOILER-TUBE CLEANERS. Charles Schmandt, Baltimore, Md. [Filed Mar. 6, 1875.]

Brief.—Levers are connected to a head-block, which allows the scrapers to vibrate from a horizontal line, so that the said scrapers may be introduced into tubes, through which bolts pass, and is then expanded by means of toggle-joints.

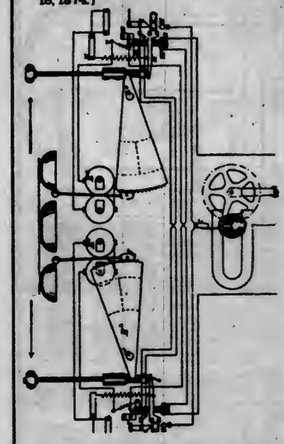
1. The jointed arms e, pivoted to the block A, and provided with the revolvable cutters D, in combination with the rod e, substantially as described.



2. The combination of the block A, jointed arms e, cutters D, rod e, pipe B, spiral spring C, and thumb-nut d, substantially as and for the purposes specified.

161,559. BREECH-LOADING FIRE-ARMS. W. M. Scott, Birmingham, England. [Filed Feb. 23, 1875.]

1. In drop-down breech-loading fire-arms, the combination, with the barrel or barrels, formed with side enlargements, as described, of two outer sliding locking-bolts carried by the break-off, and taking into sockets formed in said side enlargements, substantially as shown and set forth.



2. In fire-arms such as specified, the combination, with the ordinary central sliding bolt, of the two outer sliding locking-bolts arranged to take into side enlargements on the barrel or barrels, substantially in the manner shown and set forth.

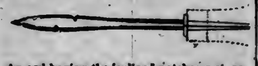
161,560. FOLDING RACKS FOR TOWELS. Jas. T. Sherwin, Philadelphia, Pa. [Filed Nov. 20, 1874.]

The improved rack, having the vertical back and pivoted outwardly-inclining front, formed of horizontal rounds and connecting-wires, the wires D D of the front being pivoted to the bar B of the back and bent laterally between the rounds O O, to produce springs, and the front and back being coupled by means of chains or connections E, all substantially as and for the purpose specified.

161,561. ELECTRICAL RAILWAY-SIGNALING APPARATUS. Ernst W. Siemens and Carl L. Frischen, Berlin, Germany. [Filed Aug. 18, 1874.]

1. The toothed semaphore arm or segment B^1 B^2, biased by a weight or spring to move either upward or downward, in combination with an anchor engaging with its teeth, and connected to the armature of an electro-magnet, which is rendered active by a number of successive and alternating electric currents, whereby the arm or segment, being moved tooth by tooth in obedience to its bias, is not materially affected in its position by accidental or defective currents, or by atmospheric electricity, substantially as herein described.

2. The combination of the said semaphore arm or segment B^1 or B^2 with a knob or handle, T^1 or T^2, and its rod for moving a sliding weight, f^1 or f^2, to give the bias to the arm or segment, and at the same time moving a commutating-lever, i, to alter the electric circuits of the apparatus, substantially as herein described.



3. The combination, in one instrument or apparatus, of two sets of biased arms or segments, B^1 B^2, and their appropriate knobs or handles T^1 T^2, with their rods and commutating-levers i, with one magneto-inductor, b, and with line-wires L^1 L^2, connecting them to distant instruments or apparatus of like kind, substantially in the manner and for the purposes herein set forth.

4. The combination of the biasing and commutating knobs or handles T^1 or T^2 and their rods with extended rods G, acting, by means of spring-pawls, on point-rods or signal-pulleys, and held down or released by detent-levers L M being engaged with or escaping the arms Z of the arms, substantially as herein described.

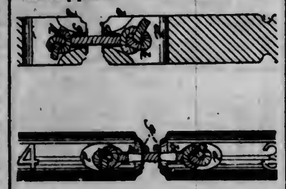
5. The combination, in one apparatus, of two or more sets of biased arms or segments, E, and their knobs T, rods and commutators i, with extended rods G, acting, in the manner above referred to, on two or more sets of point or signal motors, substantially in the manner and for the purposes herein set forth.

161,562. AWLS FOR SHOEMAKERS. S. A. Smith, Muscatine County, Iowa. [Filed Feb. 13, 1875.]

Brief.—A notch is cut on each side of the awl. The opening on one side is toward the point, and on the opposite side toward the head, so that when the awl is forced through the material, it will carry through with it a thread, and when withdrawn will pull a thread through from the opposite side.

An awl having the inclined notches a a', as and for the purpose described.

161,563. PUMP-BOXES. Wm. A. Spooner, Springfield, Mass. [Filed Jan. 7, 1874.]



1. The combination and arrangement of the valve b, provided with the protuberance c, the valve-leather e, metallic washer f, and the screw g, extending up into, but not through, the said valve, whereby the leather is secured thereto without inability of leakage through the valve, substantially as set forth.

2. The combination of a tapered pump-box, e, having a shoulder, h, with a tapered leather packing-ring, f, and metallic ring e, secured in place by screws c passing up into, but not through, the main part of the box, substantially as described.

161,564. SASH-WEIGHTS. E. J. Sprague, Youngstown, Ohio. [Filed Jan. 16, 1875.]

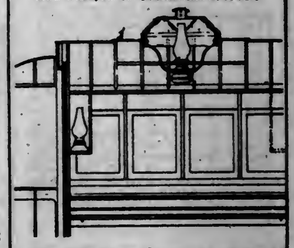
Brief.—A sash-weight, provided at each end with a lateral open eye, is deeply grooved at or near the middle, so that dealers can easily break in parts, and adjust to the desired weight. The coupling may be a short double-headed bolt, but is preferably a short knotted cord; and to prevent this cord from working out, a metallic thimble-guard is inserted in the lateral openings of the suspension-eyes. There may also be light cap-pieces or sectional weights added at the top, and for this purpose the eyed ends are cast with shouldered seats, to receive the concave bottoms of these cap-pieces.

1. A sash-weight, having a suspension-eye at each end, and divided into two distinct weights by a deep annular groove, to form a double weight of equal or unequal number of pounds, so that when broken at the groove will form two complete eyed weights, substantially as herein set forth.

2. The combination with sash-weights, provided with laterally-open eyes b, and coupled by shoot-cords h, of the thimble-guards g, whereby the side openings are closed, and the accidental working out of the coupling prevented, as herein set forth.

161,565. STREET-CARS. John Stephenson, New York, N. Y. [Filed Mar. 2, 1875.]

1. In combination with a car-body a removable seat, B, substantially as set forth.



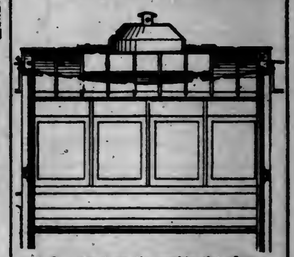
2. A removable car-seat, B, in combination with the dowel h and car-body, substantially as and for the purpose set forth.

3. A removable car-seat, in combination with bolts f and car-body, substantially as and for the purpose set forth.

4. A removable car-seat, B, in combination with bolts f, rail a, and hooks and sockets, substantially as and for the purpose set forth.

5. A removable car-seat, B, in combination with bolts f, dowels h, and car-body, substantially as and for the purposes set forth.

161,566. STREET-CARS. John Stephenson, New York, N. Y. [Filed Mar. 2, 1875.]



1. A street-car roof having a central opening combined with a lamp partly beneath and partly above the plane of the roof, substantially as and for the purpose set forth.

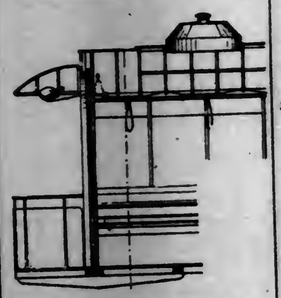
2. A street-car roof in combination with a lamp near its center, and with a reflector above the point for the flame of the lamp, consisting of two inclined surfaces, a and c, for casting light in reverse directions, substantially as and for the purpose set forth.

3. In a street-car, the combination of a lamp near the center of its roof, and a lamp or lamps located in one or both ends of the car, to serve the double purpose of a signal and of illuminating the interior of the car, substantially as set forth.

161,567. STREET-CARS. John Stephenson, New York, N. Y. [Filed Mar. 2, 1875.]

1. In a street-car, the combination of one or more adjustable truss-rods, b, with a short roof, B, and detachable canopies, substantially as set forth.

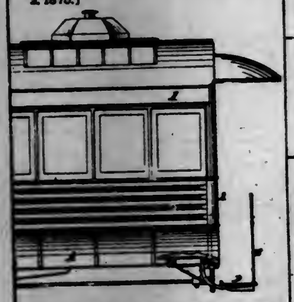
2. The combination of one or more curved adjustable truss-rods, b, with the roof and ends of a car, substantially as and for the purposes set forth.



3. A street-car roof, with an opening therein, in combination with one or more adjustable truss-rods, substantially as and for the purpose set forth.

4. In a street-car, the combination of an elevation above the general plane of the roof with one or more adjustable truss-rods, as and for the purpose set forth.

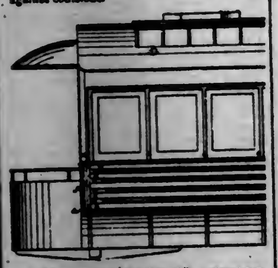
5. The combination of a street-car roof, with seats thereon, and one or more adjustable truss-rods, as and for the purpose set forth.



6. In a street-car, the combination of supporting-frames with the roof and ends, having openings for ventilation between the under side of the roof and the upper side of the respective bonnets, substantially as set forth.

161,568. SIGNALING DEVICES FOR STREET-CARS. John Stephenson, New York, N. Y. [Filed Mar. 2, 1875.]

In a street-car, two bell-cords, each provided with a system of pull-straps, and arranged in such manner as to pass along the lower margin of the roof on the opposite sides of the car, and connect directly with a signal bell or gong attached to the outside of the driver's end of the car, substantially as and for the purposes set forth.

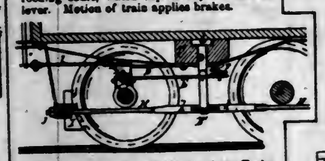


161,569. STREET-CAR PLATFORMS. John Stephenson, New York, N. Y. [Filed Mar. 2, 1875.]

The railing E, and platform-step D, in combination with the main body A of a street-car, the platform being below the level of the car-floor, substantially as and for the purposes set forth.

161,570. STREET-CAR BODIES. J. Stephenson, New York, N. Y. [Filed Mar. 2, 1875.]

Brief.—Detachable plating for protection against collisions.



1. Ribs c, in combination with a street-car body, to form the external surface of its main side panels, substantially as set forth.

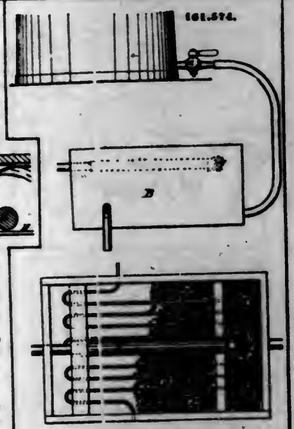
2. The combination of the ribs c and plates f with a car-body, substantially as set forth.

161,571. CAR-BRAKES. E. Stewart, Fort Madison, Iowa. [Filed Feb. 26, 1875.]

Brief.—Sectional sleeve easily clamped on ordinary car axle, and having screw-thread, in which works a point attached to the end of a lever having both vertical and lateral play, and connected through rods with brakes at the other end. Engineer controls operation by rocking shaft, which depresses point end of lever. Motion of train applies brakes.

1. The combination of vibrating lever E, the screw on the axle, rock-shaft D, and connecting-rods H b for actuating the brakes, substantially as set forth.

2. The longitudinally-divided axle-sleeve A', provided with screw-threads, substantially as set forth.



161,572. DIES FOR RAISING ARTICLES OF SHEET METAL. Norman C. Stiles, Middletown, Conn. [Filed Feb. 18, 1875.]

Brief.—The blank is held between the follower B and part D, while the central portion is operated upon by the punch A. The part D is seated in a spherical seat, so that it may have a slight movement therein, and maintain a true bearing with the follower, notwithstanding any inequalities in the thickness of blank.

161,573. MANUFACTURE OF MEDICATED BEER. Robt. W. Tavener, Bay City, Mich. [Filed Feb. 24, 1875.]

Brief.—The contents of the vat are drawn slowly into a purifier, and enter beneath a steam-coil, the spaces between which are packed with sponge, wherein is absorbed the impurities. The contents then flow through a sponge plug into a pipe, and from thence into the bottles.

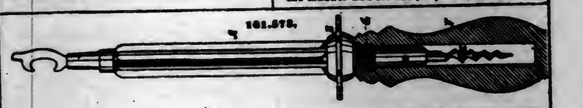
161,574.

1. A brewers' compound for the manufacture of cooling and tonic beverages, formed of the ingredients specified, prepared in the manner set forth.

2. An apparatus consisting of the connected vat and purifier A B, the latter provided with heating-coil and absorbent, as and for the purpose described.

161,575.

161,576.



In combination with a central punch, A, and external follower or punch B, the part D, arranged substantially as described, so as to be universally self-adjusting relatively to the plane of the follower B, substantially as specified.

161,577. SCALE-BEAMS. Theodore Tebow, Lexington, Ky., assignor to himself and John F. Miller, same place. [Filed Dec. 5, 1874.]

Brief.—Two shafts are geared together, so as to revolve simultaneously. The upper one supports a drum having in a spiral line upon its face figures to indicate the weight. The lower one actuates a slide provided with a pointer bearing against the spiral line on the drum. The scale-weight is attached to the slide.

1. The combination of beam A, screw-shaft D, sliding weight L M O, gearing G H, and indicating-drum F, operating substantially in the manner and for the purpose specified.

161,578.

161,579.

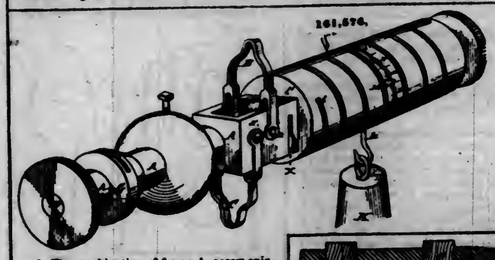
161,580. TABLE IMPLEMENTS. O. W. Taft, New York, N. Y. [Filed Jan. 16, 1875.]

Brief.—The guard that protects the hand when the sharpening-steel is used also serves as a handle to the corkscrew.

The steel A, the guard H, and the corkscrew E, permanently united to the bolster B, and the hollow handle F, screw-threaded at its open end, to adapt it for detachable connection with the bolster, all as shown and described, for the purpose specified.

161,581. MANUFACTURE OF MEDICATED BEER. Robt. W. Tavener, Bay City, Mich. [Filed Feb. 24, 1875.]

Brief.—The contents of the vat are drawn slowly into a purifier, and enter beneath a steam-coil, the spaces between which are packed with sponge, wherein is absorbed the impurities. The contents then flow through a sponge plug into a pipe, and from thence into the bottles.



2. In combination with the shafts D E and gearing G H, the spring I, substantially as and for the purpose specified.

3. In combination with the slide L n and screw-shaft D, the nut M having flanges m, and tongue N, operating substantially as and for the purpose specified.

161,582. SCALE-BEAMS. Theodore Tebow, Lexington, Ky. [Filed Jan. 22, 1875.]

Brief.—A screw-shaft revolved by thumb-nut I' passes supporting-frame and drum with spiral slot graduated as thus to indicate weight. A screw, having attached the suspending rod of weight and arm of indicating-finger, moves the traversing-weight. Indicating-finger kept in horizontal position while it revolves. Weight traverses until an equilibrium is established with article suspended from yoke attached to beam. The finger then points out on graduated face of drum the weight of article.

161,576.

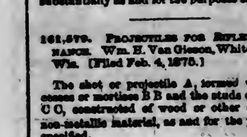
1. The combination of frame A, screw-spindle D, box N, weight K, indicator M, and spirally-slotted drum L i, the parts being connected and the whole operating substantially in the manner and for the purpose specified.

2. In combination with the hollow frame A, the double-jawed yokes B C, and fulcrums a a a a' a' a', constructed and operating substantially as and for the purpose specified.

161,577. COAL-HODS. Charles F. Thomas, New York, N. Y., assignor of one-half his right to H. Joerns, same place. [Filed Feb. 13, 1875.]

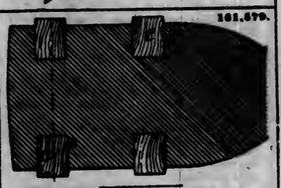
Brief.—The spout extends into a discharge-chamber, which is divided into compartments by the abutments.

1. The base or bottom of a coal box or hod, constructed with abutments or strips for dividing the discharge-chamber into compartments, said abutments extending from the rear of the extension projecting from each base in combination with the magazine inclosing the spout, having a contracted mouth, which extends downward into the discharge-chamber, substantially as herein shown and described.



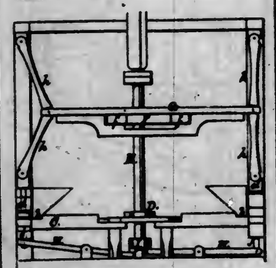
2. The combination, with the magazine and the spout arranged therein, and having a contracted mouth, of the false or secondary spout, and the discharge-chamber beneath, substantially as described.

161,578. WHIP-SOCKETS. John M. Underwood, Newark, N. J. [Filed Jan. 9, 1875.]



The combination, with a whip-socket, of the rubber bulb formed of the two dish-shaped pieces B B, having openings c and flanges b, substantially as and for the purposes set forth.

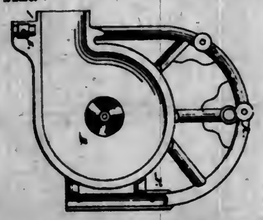
161,579. PROJECTILES FOR RIFLED ORDNANCE. Wm. H. Van Gieson, Whitewater, Wis. [Filed Feb. 4, 1875.]



The shot or projectile A, formed with recesses or mortises B B and the studs or plugs C C, constructed of wood or other suitable non-metallic material, as and for the purpose specified.

161,579.

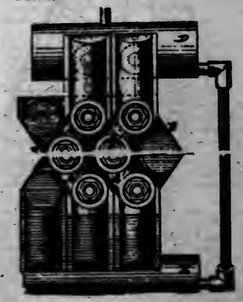
161,580. BRICK-MACHINES. Wm. S. Wallace, Mount Vernon, Ill., assignor of one-half his right to Willis Duff Green, same place. [Filed Dec. 29, 1874.]



Brief.—A vertical shaft operates by three cams, respectively, a horizontal reciprocating bar and toggle-joint plungers below it, and parallel thereto an ejecting-bar, and at bottom levers to press upward the bricks from the molds. The shaft is central to duplicate devices.

The combination of the vertical shaft E, eccentric F, friction-rollers f f, and rigid sliding bar G, connected with the toggle-jointed levers h h, and plunger d, substantially as and for the purposes herein set forth.

161,581. FORGE-BLOWERS. L. H. Watson, Cleveland, Ohio. [Filed Jan. 27, 1875.]



Brief.—One-half of the fan-case is cast in the same piece with the upper portion of the frame.

1. A frame, as shown in Fig. II, with one-half of a fan-box cast therein and forming a part of said frame, as shown and described.

2. The frame, as shown in Fig. II, in combination with the detachable half of fan-box D, legs t, F, and H, and gearing to drive the fan, as shown and described.

161,582. SECTIONAL STEAM-BOILERS. H. Whittingham, New York, N. Y. [Filed Feb. 4, 1875.]
